L4Re Operating System Framework

Generated on Sat Sep 26 2026 14:14:36 for L4Re Operating System Framework by Doxygen 1.15.0

Sat Sep 26 2026 14:14:36

1 Overview 1

2 Introduction 3

2.1 L4Re Microkernel . . . 3
2.1.1 Communication . . . 3
2.1.2 Kernel Objects . . . 4
2.2 L4Re System Structure . . . 4
2.3 L4Re Runtime Environment . . . 6

3 Programming for L4Re 7

3.1 L4 Inter-Process Communication (IPC) . . . 7
3.1.1 IPC mechanism . . . 8
3.1.1.1 Syscall Flags . . . 8
3.1.1.2 Partner capability selector . . . 9
3.1.1.3 IPC Label . . . 9
3.1.1.4 IPC Message Tag . . . 9
3.1.1.5 IPC Timeouts . . . 10
3.1.1.6 User-level Thread Control Block . . . 11
3.1.1.7 Transfer of Typed Send Items . . . 13
3.1.2 Examples . . . 13
3.1.2.1 User Thread to Kernel Object . . . 14
3.1.2.2 User Thread to User Thread . . . 14
3.1.2.3 User Thread to User Object . . . 16
3.2 Kernel ABI . . . 16
3.2.1 Capability selector and syscall flags . . . 17
3.2.2 Label . . . 17
3.2.3 Message tag . . . 17
3.2.4 Timeouts . . . 18
3.2.5 User-level thread control block (UTCB) . . . 19
3.2.5.1 Buffer descriptor register . . . 19
3.2.6 Typed message items . . . 20
3.2.6.1 Flexpages . . . 20
3.2.6.2 Send items . . . 21
3.2.6.3 Receive items . . . 21
3.2.6.4 Return items . . . 22
3.3 Capabilities and Naming . . . 23
3.4 Spaces and Mappings . . . 24
3.5 Initial Environment and Application Bootstrapping . . . 25
3.5.1 Configuring an application before startup . . . 26
3.5.2 Connecting clients and servers . . . 26
3.6 Memory management - Data Spaces and the Region Map . . . 27
3.6.1 User-level paging . . . 27
3.6.1.1 Data spaces . . . 27

3.6.1.2 Virtual Memory Handling . . . 27
3.6.1.3 Memory Allocation . . . 27
3.7 Program Input and Output . . . 28
3.8 Initial Memory Allocator and Factory . . . 28
3.9 Application and Server Building Blocks . . . 28
3.9.1 Creating Additional Application Threads . . . 28
3.9.2 Providing a Service . . . 29
3.10 Pthread Support . . . 29
3.11 Interface Definition Language . . . 30
3.11.1 Parameter types for RPC . . . 31
3.11.2 Server Side Interface . . . 32
3.11.3 RPC Return Types . . . 32
3.11.4 RPC Method Declaration . . . 33
3.12 L4Re Build System . . . 33
3.12.1 Building L4Re . . . 34
3.12.2 Writing BID Make Files . . . 35
3.12.3 prog.mk - Application Role . . . 35
3.12.4 include.mk - Header File Role . . . 38
3.12.5 test.mk - Test Application Role . . . 39
3.13 Kernel Factory . . . 46
3.13.1 Passing parameters for the create stream . . . 46

4 L4Re Servers **49**
4.1 Sigma0, the Root-Pager . . . 50
4.1.1 Factory . . . 51
4.2 Moe . . . 51
4.2.1 Description . . . 51
4.2.2 Moe objects . . . 51
4.2.2.1 Factory . . . 51
4.2.3 Capabilities . . . 53
4.2.4 Command Line Options . . . 53
4.2.5 Namespace . . . 54
4.2.6 Dataspace . . . 55
4.2.7 DMA space . . . 55
4.2.8 Region Map . . . 56
4.2.9 Virtual console . . . 56
4.2.10 Scheduler . . . 57
4.2.11 Factory . . . 57
4.3 Ned, the Init Process . . . 57
4.3.1 Lua Bindings for L4Re . . . 58
4.3.1.1 Tutorial . . . 58
4.3.1.2 Capabilities in Lua . . . 58

4.3.1.3 Access to L4Re::Env Capabilities . . . 58
4.3.1.4 Constants . . . 58
4.3.1.5 Application Startup Details . . . 59
4.3.1.6 Reacting on task termination . . . 60
4.3.1.7 Control scheduling . . . 60
4.3.1.8 Access to the kernel debugger . . . 61
4.3.1.9 Using the interactive ned prompt . . . 61
4.3.2 Command Line Options . . . 61
4.4 Io, the Io Server . . . 61
4.5 Virtio Net P2P, a virtual network point-to-point link . . . 67
4.5.1 Description . . . 67
4.5.2 Capabilities . . . 67
4.5.3 Command Line Options . . . 67
4.5.4 Building and Configuration . . . 68
4.5.5 Starting the service . . . 68
4.5.6 Factory Options . . . 68
4.5.6.1 Virtual p2p port . . . 68
4.5.7 Examples . . . 68
4.6 Virtio Net Switch, a virtual network switch . . . 69
4.6.1 Description . . . 69
4.6.2 Capabilities . . . 69
4.6.3 Command Line Options . . . 69
4.6.4 Configuration . . . 70
4.6.5 Starting the service . . . 70
4.6.6 Factory Options . . . 70
4.6.6.1 Virtual switch port . . . 70
4.6.6.2 Interface for the switch statistics . . . 72
4.6.7 Examples . . . 72
4.7 Uvmm, the virtual machine monitor . . . 72
4.7.1 Description . . . 72
4.7.2 Capabilities . . . 72
4.7.3 Command Line Options . . . 72
4.7.4 RAM configuration . . . 79
4.8 RTC driver . . . 80
4.9 Mag, the GUI Multiplexer . . . 80
4.9.1 Description . . . 80
4.9.2 Capabilities . . . 80
4.9.3 Command Line Options . . . 80
4.9.4 Session Factory . . . 80
4.9.5 Mag Client Session . . . 81
4.9.6 Mag Client Framebuffer Session . . . 81
4.9.7 Examples . . . 82

4.10 Cons, the Console Multiplexer . . . 82

5 uvmm_dtg The device tree generator for Uvmm **85**

5.1 Description . . . 85
5.2 Capabilities . . . 85
5.3 Command Line Options . . . 85
5.4 Examples . . . 86

6 Bootstrap, the L4 kernel bootstrapper **87**

7 Deprecated List **91**

8 Topic Index **93**

8.1 Topics . . . 93

9 Namespace Index **97**

9.1 Namespace List . . . 97

10 Hierarchical Index **99**

10.1 Class Hierarchy . . . 99

11 Data Structure Index **113**

11.1 Data Structures . . . 113

12 File Index **131**

12.1 File List . . . 131

13 Topic Documentation **145**

13.1 Base API . . . 145
13.1.1 Detailed Description . . . 148
13.1.2 Basic Macros . . . 148
13.1.2.1 Detailed Description . . . 150
13.1.2.2 Macro Definition Documentation . . . 150
13.1.2.3 Function Documentation . . . 152
13.1.3 Fiasco extensions . . . 153
13.1.3.1 Detailed Description . . . 154
13.1.3.2 Function Documentation . . . 154
13.1.3.3 Kernel Debugger . . . 156
13.1.3.4 Kernel Information Dump . . . 163
13.1.3.5 Kernel Tracing . . . 164
13.1.4 Flexpages . . . 168
13.1.4.1 Detailed Description . . . 170
13.1.4.2 Enumeration Type Documentation . . . 171
13.1.4.3 Function Documentation . . . 174
13.1.5 C++ IPC Interface Definition . . . 185
13.1.5.1 Detailed Description . . . 185

13.1.5.2 Internal Helpers . . . 186
13.1.6 Cache Consistency . . . 186
13.1.6.1 Detailed Description . . . 187
13.1.6.2 Function Documentation . . . 187
13.1.7 Memory related . . . 189
13.1.7.1 Detailed Description . . . 190
13.1.7.2 Macro Definition Documentation . . . 190
13.1.7.3 Enumeration Type Documentation . . . 192
13.1.7.4 Function Documentation . . . 193
13.1.8 Error codes . . . 196
13.1.8.1 Detailed Description . . . 196
13.1.8.2 Enumeration Type Documentation . . . 197
13.1.9 Object Invocation . . . 198
13.1.9.1 Detailed Description . . . 199
13.1.9.2 Timeouts during IPC . . . 200
13.1.9.3 Function Documentation . . . 200
13.1.9.4 Message Items . . . 213
13.1.9.5 Timeouts . . . 220
13.1.9.6 Syscall flags . . . 228
13.1.9.7 Error Handling . . . 230
13.1.9.8 Realtime API . . . 235
13.1.9.9 Message Tag . . . 235
13.1.9.10 Virtual Registers (UTCBs) . . . 246
13.1.10 Kernel Objects . . . 258
13.1.10.1 Detailed Description . . . 260
13.1.10.2 IPC-Gate API . . . 261
13.1.10.3 DMA space . . . 264
13.1.10.4 L4 kernel object type information . . . 265
13.1.10.5 Factory . . . 267
13.1.10.6 Virtual Machines . . . 278
13.1.10.7 Interrupt controller . . . 297
13.1.10.8 IRQs . . . 312
13.1.10.9 Priority Inheritance Mutex C API . . . 325
13.1.10.10 Platform Control C API . . . 328
13.1.10.11 Scheduler . . . 332
13.1.10.12 Kernel-provided semaphore . . . 339
13.1.10.13 Task . . . 341
13.1.10.14 Thread . . . 352
13.1.10.15 Thread groups . . . 384
13.1.10.16 Virtual Console . . . 387
13.1.11 Kernel Interface Page . . . 400
13.1.11.1 Detailed Description . . . 401

13.1.11.2 Typedef Documentation . . . 401
13.1.11.3 Enumeration Type Documentation . . . 402
13.1.11.4 Function Documentation . . . 402
13.1.11.5 Memory descriptors (C version) . . . 406
13.1.12 Page fault trampoline handlers . . . 410
13.1.12.1 Detailed Description . . . 411
13.1.12.2 Typedef Documentation . . . 411
13.1.12.3 Enumeration Type Documentation . . . 411
13.1.12.4 ARM page fault trampoline handler. . . . 412
13.1.12.5 ARM64 page fault trampoline handler. . . . 412
13.1.12.6 AMD64 page fault trampoline handler. . . . 413
13.1.12.7 x86 page fault trampoline handler. . . . 413
13.1.12.8 RISC-V page fault trampoline handler. . . . 414
13.1.13 Capabilities . . . 414
13.1.13.1 Detailed Description . . . 415
13.1.13.2 Macro Definition Documentation . . . 415
13.1.13.3 Typedef Documentation . . . 415
13.1.13.4 Enumeration Type Documentation . . . 416
13.1.13.5 Function Documentation . . . 417
13.1.14 Memory Operations . . . 418
13.1.14.1 Detailed Description . . . 419
13.1.14.2 Enumeration Type Documentation . . . 419
13.1.14.3 Function Documentation . . . 419
13.1.15 Integer Types . . . 421
13.1.15.1 Detailed Description . . . 422
13.2 EDID parsing functionality . . . 422
13.2.1 Detailed Description . . . 423
13.2.2 Enumeration Type Documentation . . . 423
13.2.2.1 Libedid_consts . . . 423
13.2.3 Function Documentation . . . 423
13.2.3.1 libedid_check_header() . . . 423
13.2.3.2 libedid_checksum() . . . 424
13.2.3.3 libedid_dump() . . . 424
13.2.3.4 libedid_dump_standard_timings() . . . 424
13.2.3.5 libedid_num_ext_blocks() . . . 424
13.2.3.6 libedid_pnp_id() . . . 425
13.2.3.7 libedid_prefered_resolution() . . . 425
13.2.3.8 libedid_revision() . . . 425
13.2.3.9 libedid_version() . . . 425
13.3 IO interface . . . 426
13.3.1 Detailed Description . . . 427
13.3.2 Typedef Documentation . . . 427

13.3.2.1 l4io_resource_t . . . 427
13.3.3 Enumeration Type Documentation . . . 427
13.3.3.1 l4io_device_types_t . . . 427
13.3.3.2 l4io_iomem_flags_t . . . 427
13.3.3.3 l4io_resource_types_t . . . 427
13.3.4 Function Documentation . . . 428
13.3.4.1 l4io_has_resource() . . . 428
13.3.4.2 l4io_lookup_device() . . . 428
13.3.4.3 l4io_lookup_resource() . . . 428
13.3.4.4 l4io_release_iomem() . . . 429
13.3.4.5 l4io_release_ioport() . . . 429
13.3.4.6 l4io_request_iomem() . . . 430
13.3.4.7 l4io_request_iomem_region() . . . 430
13.3.4.8 l4io_request_ioport() . . . 431
13.3.4.9 l4io_request_resource_iomem() . . . 431
13.4 IPC Helpers . . . 432
13.4.1 Detailed Description . . . 432
13.4.2 Function Documentation . . . 432
13.4.2.1 throw_ipc_exception() [1/2] . . . 432
13.4.2.2 throw_ipc_exception() [2/2] . . . 433
13.5 IRQ handling library . . . 433
13.5.1 Detailed Description . . . 434
13.5.2 Interface using direct functionality. . . . 434
13.5.2.1 Detailed Description . . . 434
13.5.2.2 Function Documentation . . . 434
13.5.2.3 Interface using direct functionality. . . . 438
13.5.3 Interface for asynchronous ISR handlers. . . . 440
13.5.3.1 Detailed Description . . . 440
13.5.3.2 Function Documentation . . . 440
13.5.3.3 Interface for asynchronous ISR handlers with a given IRQ capability. . . . 441
13.6 L4 IPC Opcodes . . . 442
13.6.1 Detailed Description . . . 443
13.6.2 Enumeration Type Documentation . . . 443
13.6.2.1 L4_icu_opcode . . . 443
13.6.2.2 L4_ipc_gate_ops . . . 444
13.6.2.3 L4_pi_mutex_ops . . . 444
13.6.2.4 L4_platform_ctl_ops . . . 444
13.6.2.5 L4_task_ops . . . 445
13.6.2.6 L4_thread_ops . . . 445
13.6.2.7 L4_vcon_ops . . . 445
13.7 L4 VIRTIO Interface . . . 446
13.7.1 Detailed Description . . . 446

13.7.2 L4 VIRTIO Transport Layer . . . 446
13.7.2.1 Detailed Description . . . 448
13.7.2.2 Typedef Documentation . . . 448
13.7.2.3 Enumeration Type Documentation . . . 449
13.7.2.4 Function Documentation . . . 451
13.7.3 L4 VIRTIO Block Device . . . 454
13.7.3.1 Detailed Description . . . 455
13.7.3.2 Enumeration Type Documentation . . . 455
13.7.4 L4 VIRTIO Input Device . . . 456
13.7.4.1 Detailed Description . . . 456
13.7.5 L4 VIRTIO Network Device . . . 456
13.7.5.1 Detailed Description . . . 457
13.8 L4 Vbus functions . . . 457
13.8.1 Detailed Description . . . 458
13.8.2 Enumeration Type Documentation . . . 458
13.8.2.1 L4vbus_dma_domain_assign_flags . . . 458
13.8.3 Function Documentation . . . 459
13.8.3.1 l4vbus_assign_dma_domain() . . . 459
13.8.3.2 l4vbus_get_adr() . . . 459
13.8.3.3 l4vbus_get_device() . . . 460
13.8.3.4 l4vbus_get_device_by_hid() . . . 460
13.8.3.5 l4vbus_get_hid() . . . 461
13.8.3.6 l4vbus_get_next_device() . . . 462
13.8.3.7 l4vbus_get_resource() . . . 463
13.8.3.8 l4vbus_is_compatible() . . . 463
13.8.3.9 l4vbus_release_ioport() . . . 464
13.8.3.10 l4vbus_request_ioport() . . . 465
13.8.3.11 l4vbus_vicu_get_cap() . . . 465
13.8.4 L4vbus GPIO functions . . . 466
13.8.4.1 Detailed Description . . . 467
13.8.4.2 Enumeration Type Documentation . . . 467
13.8.4.3 Function Documentation . . . 467
13.8.5 L4vbus PCI functions . . . 475
13.8.5.1 Detailed Description . . . 475
13.8.5.2 Function Documentation . . . 475
13.8.6 L4vbus power management functions . . . 480
13.8.6.1 Detailed Description . . . 480
13.8.6.2 Function Documentation . . . 480
13.9 L4Re C Interface . . . 481
13.9.1 Detailed Description . . . 483
13.9.2 L4Re Util C Interface . . . 483
13.9.3 Dataspace interface . . . 484

13.9.3.1 Detailed Description . . . 485
13.9.3.2 Enumeration Type Documentation . . . 485
13.9.3.3 Function Documentation . . . 485
13.9.4 Debug interface . . . 489
13.9.4.1 Detailed Description . . . 489
13.9.4.2 Function Documentation . . . 489
13.9.5 DMA Space Interface . . . 489
13.9.5.1 Detailed Description . . . 490
13.9.5.2 Typedef Documentation . . . 490
13.9.5.3 Function Documentation . . . 491
13.9.6 Event interface . . . 496
13.9.6.1 Detailed Description . . . 497
13.9.6.2 Function Documentation . . . 497
13.9.7 Log interface . . . 499
13.9.7.1 Detailed Description . . . 499
13.9.7.2 Function Documentation . . . 499
13.9.8 Memory allocator . . . 502
13.9.8.1 Detailed Description . . . 502
13.9.8.2 Enumeration Type Documentation . . . 502
13.9.8.3 Function Documentation . . . 503
13.9.9 Namespace interface . . . 506
13.9.9.1 Detailed Description . . . 506
13.9.9.2 Enumeration Type Documentation . . . 507
13.9.9.3 Function Documentation . . . 507
13.9.10 Parent interface . . . 509
13.9.11 Region map interface . . . 509
13.9.11.1 Detailed Description . . . 511
13.9.11.2 Enumeration Type Documentation . . . 511
13.9.11.3 Function Documentation . . . 511
13.9.12 Capability allocator . . . 525
13.9.12.1 Detailed Description . . . 526
13.9.12.2 Function Documentation . . . 526
13.9.13 Kumem allocator utility . . . 526
13.9.14 Video API . . . 526
13.9.14.1 Detailed Description . . . 528
13.9.14.2 Typedef Documentation . . . 528
13.9.14.3 Enumeration Type Documentation . . . 528
13.9.14.4 Function Documentation . . . 529
13.9.15 Initial Environment . . . 533
13.9.15.1 Detailed Description . . . 534
13.9.15.2 Function Documentation . . . 534
13.10 L4Re C++ Interface . . . 538

13.10.1 Detailed Description . . . 539
13.10.2 L4Re Util C++ Interface . . . 539
13.10.2.1 Detailed Description . . . 540
13.10.2.2 L4Re Capability API . . . 540
13.10.2.3 Kumem utilities . . . 542
13.10.3 Console API . . . 543
13.10.3.1 Detailed Description . . . 543
13.10.4 Debugging API . . . 543
13.10.4.1 Detailed Description . . . 544
13.10.5 L4Re ELF Auxiliary Information . . . 544
13.10.5.1 Detailed Description . . . 545
13.10.5.2 Macro Definition Documentation . . . 545
13.10.5.3 Enumeration Type Documentation . . . 546
13.10.6 Event API . . . 546
13.10.6.1 Detailed Description . . . 546
13.10.7 Auxiliary data . . . 547
13.10.7.1 Detailed Description . . . 547
13.10.8 Logging interface . . . 547
13.10.8.1 Detailed Description . . . 547
13.10.9 Name-space API . . . 548
13.10.9.1 Detailed Description . . . 548
13.10.10 Parent API . . . 548
13.10.10.1 Detailed Description . . . 548
13.10.11 L4Re Protocol identifiers . . . 549
13.10.11.1 Detailed Description . . . 549
13.10.11.2 Enumeration Type Documentation . . . 549
13.10.12 Region map API . . . 550
13.10.12.1 Detailed Description . . . 550
13.10.13 Video API . . . 551
13.10.13.1 Detailed Description . . . 551
13.10.14 C++ Exceptions . . . 551
13.10.14.1 Detailed Description . . . 552
13.10.15 Vbus API . . . 552
13.10.15.1 Detailed Description . . . 553
13.11 L4SHM-based ring buffer implementation . . . 553
13.11.1 Detailed Description . . . 553
13.11.2 Sender . . . 554
13.11.3 Receiver . . . 554
13.11.4 Internal . . . 554
13.11.4.1 Detailed Description . . . 555
13.11.4.2 Macro Definition Documentation . . . 555
13.12 Shared Memory Library . . . 555

13.12.1 Detailed Description . . . 556
13.12.2 Function Documentation . . . 557
13.12.2.1 l4shmc_area_overhead() . . . 557
13.12.2.2 l4shmc_area_size() . . . 557
13.12.2.3 l4shmc_area_size_free() . . . 557
13.12.2.4 l4shmc_attach() . . . 558
13.12.2.5 l4shmc_chunk_overhead() . . . 558
13.12.2.6 l4shmc_connect_chunk_signal() . . . 558
13.12.2.7 l4shmc_create() . . . 559
13.12.2.8 l4shmc_get_client_nr() . . . 559
13.12.2.9 l4shmc_get_initialized_clients() . . . 559
13.12.2.10 l4shmc_mark_client_initialized() . . . 560
13.12.3 Chunks . . . 561
13.12.3.1 Detailed Description . . . 561
13.12.3.2 Function Documentation . . . 561
13.12.3.3 Producer . . . 564
13.12.3.4 Consumer . . . 567
13.12.4 Signals . . . 571
13.12.4.1 Detailed Description . . . 572
13.12.4.2 Function Documentation . . . 572
13.12.4.3 Producer . . . 574
13.12.4.4 Consumer . . . 575
13.13 Sigma0 API . . . 578
13.13.1 Detailed Description . . . 579
13.13.2 Enumeration Type Documentation . . . 579
13.13.2.1 l4sigma0_return_flags_t . . . 579
13.13.3 Function Documentation . . . 579
13.13.3.1 l4sigma0_debug_dump() . . . 579
13.13.3.2 l4sigma0_map_anypage() . . . 580
13.13.3.3 l4sigma0_map_errstr() . . . 580
13.13.3.4 l4sigma0_map_iomem() . . . 580
13.13.3.5 l4sigma0_map_kip() . . . 581
13.13.3.6 l4sigma0_map_mem() . . . 581
13.13.4 Internal constants . . . 582
13.13.4.1 Detailed Description . . . 583
13.14 Small C++ Template Library . . . 583
13.14.1 Detailed Description . . . 584
13.14.2 Function Documentation . . . 584
13.14.2.1 clamp() . . . 584
13.14.2.2 max() [1/2] . . . 585
13.14.2.3 max() [2/2] . . . 585
13.14.2.4 min() [1/2] . . . 585

13.14.2.5 min() [2/2] . . . 586
13.14.2.6 operator new() . . . 586
13.15 The L4Re IPC Framework . . . 586
13.15.1 Detailed Description . . . 587
13.15.2 Server-Side IPC framework . . . 587
13.15.2.1 Detailed Description . . . 588
13.15.2.2 Enumeration Type Documentation . . . 588
13.16 Utility Functions . . . 588
13.16.1 Detailed Description . . . 590
13.16.2 Function Documentation . . . 590
13.16.2.1 l4_sleep() . . . 590
13.16.2.2 l4_touch_ro() . . . 591
13.16.2.3 l4_touch_rw() . . . 591
13.16.2.4 l4_usleep() . . . 592

Chapter 1

Overview

Welcome to the documentation of the L4Re Operating System Framework, or L4Re for short. There are two parts to this documentation: a user manual, which provides a birds eye view of L4Re and its environment, and a reference section which documents the complete programming API.

User Manual

1. Introduction shortly explains the concept of microkernels and introduces the basic terminology.
2. Programming for L4Re explains in detail the most important programming concepts.
3. L4Re Servers provides a quick overview over standard services running on the L4Re operating system.

Reference

The second part provides the complete reference of all classes and functions of the L4Re Operating System Framework as well as a list of example code.

Chapter 2

Introduction

The intention of this section is to provide a short overview about the L4Re Operating System Framework.

The general structure of a microkernel-based system will be introduced and the principal functionality of the servers in the basic environment outlined.

2.1 L4Re Microkernel

The L4Re Microkernel is the lowest-level component of software running in an L4Re-based system. The microkernel is the only component that runs in privileged processor mode. It does not include complex services such as program loading, device drivers, or file systems; those are implemented in user-level programs on top of it (a basic set of these services and abstractions is provided by the L4 Runtime Environment).

Microkernel services are implemented in kernel objects. Tasks hold references to kernel objects in their respective *"object space"*, which is a kernel-protected table. These references are called *capabilities*. System calls to the microkernel are function invocations on kernel objects through the corresponding capabilities. These can be thought of as function invocations on object references in an object-oriented programming environment. Furthermore, if a task owns a capability, it may grant other tasks the same (or fewer) rights on this object by passing the capability from its own to the other task's object space.

From a design perspective, capabilities are a concept that enables flexibility in the system structure. A thread that invokes an object through a capability does not need to care about where this object is implemented. In fact, it is possible to implement all objects either in the kernel or in a user-level server and replace one implementation with the other transparently for clients.

2.1.1 Communication

The basic communication mechanism in L4-based systems is called *"Inter Process Communication (IPC)"*. It is always synchronous, i.e. both communication partners need to actively rendezvous for IPC. In addition to transmitting arbitrary data between threads, IPC is also used to resolve hardware exceptions, faults and for virtual memory management.

2.1.2 Kernel Objects

The following list gives a short overview of the kernel objects provided by the L4Re Microkernel:

- **Task** A task comprises a memory address space (represented by the task's page table), an object space (holding the kernel protected capabilities), and on x86 an IO-port address space.
- **Thread** A thread is bound to a task and executes code. Multiple threads can coexist in one task and are scheduled by the microkernel's scheduler.
- **Factory** A factory is used by applications to create new kernel objects. Access to a factory is required to create any new kernel object. Factories can control and restrict object creation.
- **IPC Gate** An IPC gate is used to create a secure communication channel between different tasks. It embeds a label (kernel protected payload) that securely identifies the gate through which a message is received. The gate label is not visible to and cannot be altered by the sender.
- **IRQ** IRQ objects provide access to hardware interrupts. Additionally, programs can create new virtual interrupt objects and trigger them. This allows to implement a signaling mechanism. The receiver cannot decide whether the interrupt is a physical or virtual one.
- **Vcon** Provides access to the in-kernel debugging console (input and output). There is only one such object in the kernel and it is only available, if the kernel is built with debugging enabled. This object is typically interposed through a user-level service or without debugging in the kernel can be completely based on user-level services.
- **Scheduler** Implements scheduling policy and assignment of threads to CPUs, including CPU statistics.

2.2 L4Re System Structure

The system has a multi-tier architecture consisting of the following layers depicted in the figure below:

- **Microkernel** The microkernel is the component at the lowest level of the software stack. It is the only piece of software that is running in the privileged mode of the processor.
- **Tasks** Tasks are the basic containers (address spaces) in which system services and applications are executed. They run in the processor's deprivileged user mode.

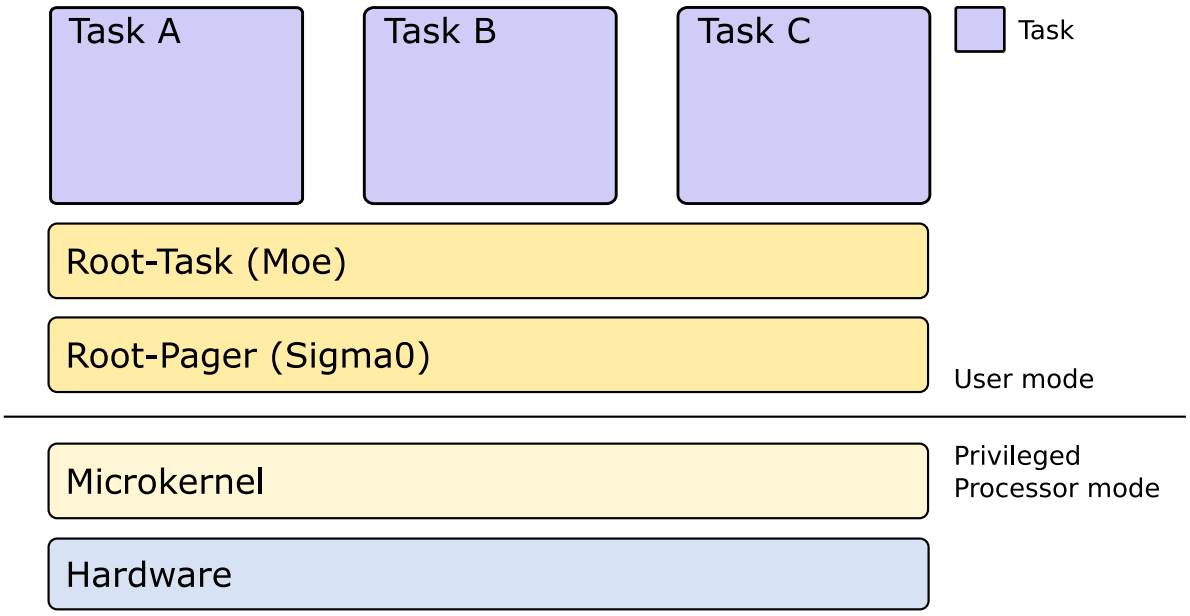

Figure 2.1 Basic Structure of an L4Re based system

In terms of functionality, the system is structured as follows:

- **Microkernel** The kernel provides primitives to execute programs in tasks, to enforce isolation among them, and to provide means of secure communication in order to let them cooperate. As the kernel is the most privileged, security-critical software component in the system, it is a general design goal to make it as small as possible in order to reduce its attack surface. It provides only a minimal set of mechanisms that are necessary to support applications.

- **Runtime Environment** The small kernel offers a concise set of interfaces, but these are not necessarily suited for building applications directly on top of it. The L4Re Runtime Environment aims at providing more convenient abstractions for application development. It comprises low-level software components that interface directly with the microkernel. The root pager *sigma0* and the root task *Moe* are the most basic components of the L4Re Runtime Environment. Other services (e.g., for device enumeration) use interfaces provided by them.

- **Applications** Applications run on top of the system and use services provided by the runtime environment – or by other applications. There may be several types of applications in the system and even virtual machine monitors and device drivers are considered applications in the terminology used in this document. They are running alongside other applications on the system.

Lending terminology from the distributed systems area, applications offering services to other applications are usually called *servers*, whereas applications using those services are named *clients*. Being in both roles is also common, for instance, a file system server may be viewed as a server with respect to clients using the file system, while the server itself may also act as a client of a hard disk driver.

2.3 L4Re Runtime Environment

The L4Re Runtime Environment provides a basic set of services and abstractions, which are useful to implement and run user-level applications on top of the L4Re Microkernel. They form the L4Re Operating System Framework.

The L4Re Operating System Framework consists of a set of libraries and servers. L4Re follows an object-oriented design. Server interfaces are object-oriented, and the implementation is also object-oriented.

A minimal L4Re-based application needs 3 components to be booted beforehand: the L4Re Microkernel, the root pager (Sigma0), and the root task (Moe). The Sigma0 root pager initially owns all system resources, but is usually used only to resolve page faults for the Moe root task. Moe provides the essential services to normal user applications such as an initial program loader, a region-map service for virtual memory management, and a memory (data space) allocator.

Chapter 3

Programming for L4Re

This part of the documentation discusses the concept of microkernel-based programming in more detail.

You should already have a basic understanding of the L4Re programming environment from the tutorials available on l4re.org(https://l4re.org/).

- L4 Inter-Process Communication (IPC)
- Kernel ABI
- Capabilities and Naming
- Spaces and Mappings
- Initial Environment and Application Bootstrapping
- Memory management - Data Spaces and the Region Map
- Program Input and Output
- Initial Memory Allocator and Factory
- Application and Server Building Blocks
- Pthread Support
- tasks and threads
- communication channels
- server loops
- Interface Definition Language
- hardware access
- L4Re Build System
- Kernel Factory

3.1 L4 Inter-Process Communication (IPC)

Inter-process communication (IPC) is the fundamental communication mechanism in the L4Re Microkernel.

Basically IPC invokes a subroutine in a different context using input and output parameters. It is used to communicate between userland threads and, as a special case, to communicate between a userland thread and a kernel object. IPC provides the only (non-debugging) way of doing system calls.

3.1.1 IPC mechanism

When using this API, an IPC operation can be conducted using the l4_ipc() function (or one of its related helpers). In general it causes a method to be invoked on the called kernel object. An IPC operation consists of a send and receive phase, but either of them can be skipped, that is, an IPC operation can consist of only either a send or a receive phase. IPC is always synchronous and blocking and can be given a timeout. Timeouts can be specified separately for each phase. Invoking the IPC syscall without any phase is deprecated.

On the lowest abstraction level, IPC operations need the following arguments:

- syscall flags describing the IPC mode,
- the capability selector of the communication partner,
- a label,
- a message tag, and
- a pair of timeout values.

During an IPC operation the kernel accesses the UTCB of the current thread to read parameters which are not passed as direct arguments.

As result of an IPC operation the kernel returns a message tag and a label and the kernel also changes UTCB content. For the detailed call signature, refer to l4_ipc(). Furthermore, depending on the IPC parameters, the kernel might have transferred the FPU state and capabilities (memory, I/O ports, and/or object capabilities) from the sender to the receiving thread.

When both, a send phase and the a receive phase, are requested, the receive phase is entered only after the send phase was finished successfully. A relative receive timeout does not start before the send phase has finished (see also below). When a thread received an IPC call from another thread, it is guaranteed that there won't be a send timeout when the thread replies to the call using a reply capability, i.e., the reply can be done with a send timeout of zero, see IPC Timeouts.

For performance optimization and under certain conditions, the kernel may perform a context switch from the IPC sender to the IPC receiver without consulting the scheduler after the send phase finished. For instance, a client performing an IPC call to a server has to wait for the server anyway. Hence, after the client request was sent to the server, the kernel switches directly to the server thread. This behavior can be disabled by setting the L4_MSGTAG_SCHEDULE flag in the sender message tag (see below).

3.1.1.1 Syscall Flags

The *syscall flags* (L4_SYSF_SEND, L4_SYSF_RECV, L4_SYSF_OPEN_WAIT, L4_SYSF_REPLY) are used by the invoking thread to define the intended IPC operation. The variants of l4_ipc() (see Object Invocation) use the flags

- to request the IPC phases (send-only IPC, receive-only IPC, IPC with send and receive phase), and
- to decide, if the reply capability (see below) should be used instead of the capability of a dedicated kernel object as target for the send phase (*reply*), and
- to decide, if receiving should wait for an incoming message from any possible sender (*open wait*) instead of a message from a dedicated sender (*closed wait*).

3.1.1.2 Partner capability selector

The *partner capability selector* defines a kernel object as partner of the IPC operation. Some kernel objects forward IPC to a userland thread.

Basically an object capability is represented by l4_cap_idx_t where the bits starting from L4_CAP_SHIFT are used as index into the local capability table of the current address space.

Specifying L4_INVALID_CAP as target for an IPC operation is equivalent to specifying a thread capability of the current thread with full permissions. As a result, the userland thread either communicates with its corresponding kernel thread object (if L4_PROTO_THREAD is specified as protocol value, see the description of the message tag below) or the IPC target is the current userland thread. In the latter case, no IPC will be performed and the send phase and the receive phase will block until the corresponding timeout has expired, see below.

A special partner is defined by the *reply capability*. Since it would be impractical (and a security flaw) to always pass an explicit object capability to reply to for each IPC, the kernel generates an implicit one that can be used for just that purpose if the IPC contains an **open wait** phase. The reply capability is valid after a receive phase and points to the kernel object that sent the IPC just received. It can be used only once. The reply capability is selected by setting the L4_SYSF_REPLY flag, see above.

3.1.1.3 IPC Label

The IPC label is a machine word which is transferred unchanged from the IPC sender to the IPC receiver when directly sending to a userland thread. However, the primary purpose of the label is to create a relationship between an L4::Rcv_endpoint (L4::Ipc_gate or L4::Irq) and the bound thread.

During L4::Rcv_endpoint::bind_thread(), a label is specified. If the thread receives an IPC message through the endpoint, that label is delivered to the receiving thread as output parameter of l4_ipc() instead of the label specified during the corresponding IPC send operation (see the detailed description of L4::Ipc_gate for more details on the label with IPC gates). The label is usually used by the receiving thread to invoke the object which is responsible for handling the IPC request of the corresponding endpoint. This mechanism is used by the L4::Epiface mechanism for server loops.

3.1.1.4 IPC Message Tag

The *message tag* (l4_msgtag_t) describes the payload of the IPC and can also be used to enable certain features. It contains:

- a *protocol value* (cf. l4_msgtag_t::label(), also called the tag's *label*),
- the number of items in UTCB message registers to transfer (cg. l4_msgtag_t::words() and l4_msgtag_t::items()), and
- flags (cf. l4_msgtag_t::flags() and L4_msgtag_flags, may be 0).

The information from the message tag is required by the kernel to transfer the message. The IPC system call returns a message tag as result of the IPC operation. On success, a copy of the message tag specified by the sender is returned if there is a receive phase. Without receive phase, a successful IPC syscall returns the message tag specified as input parameter.

Failures during IPC are signalled using the L4_MSGTAG_ERROR flag in the message tag. If this bit is set by the kernel, the content of the returned message tag apart from that bit is undefined and the kernel wrote the actual error code into the l4_thread_regs_t::error register of the UTCB (see also IPC Thread Control Registers). When an IPC error occurs after the rendezvous of the IPC partners, both partners observe the same error information. If, for

instance, the IPC was aborted using L4::Thread::ex_regs(), the sender gets an L4_IPC_SECANCELED error while the receiver gets an L4_IPC_RECANCELED error. The function L4Re::chkipc() can be used to verify that an IPC operation finished successfully: It throws an error if the IPC failed.

The *protocol value* is usually used to distinguish between different protocols of the same interface. Certain protocol IDs are pre-defined when talking to kernel objects, see L4_msgtag_protocol. From IPC point of view, the protocol value is just payload that is transferred from sender to receiver and hence doesn't have a dedicated meaning.

By convention, during IPC calls, the protocol value is used for return values, where negative values signify errors. See the section about L4 RPC return types for further information. The function L4Re::chksys() can be used to verify that an RPC call using IPC was successful: It throws an error if the IPC failed or if the returned protocol value is negative.

3.1.1.5 IPC Timeouts

As written above, IPC *timeouts* are specified separately for the send phase (IPC send timeout) and the receive phase (IPC receive timeout). The timeout of one phase is encapsulated by l4_timeout_s. Both timeouts are combined into a single l4_timeout_t parameter. Timeouts are either relative to the current time of the invoking thread or absolute. In the latter case, the absolute time of the deadline of the respective phase is written into a UTCB buffer register (see l4_timeout_abs()). The relative timeout of the receive phase starts immediately after the send phase has finished.

Two specific timeout values are sufficient for most IPC operations:

- L4_IPC_TIMEOUT_NEVER is used if the IPC partner might not yet be ready. Usually a client trusting a server will perform an IPC call with an infinite timeout for both phases. The send phase will take some time if the IPC receiver is currently not ready. The receive phase will take some time as the server needs time to serve the request. Also, a server will usually wait with an infinite receive timeout for the next request (see below for a possible exception).
- L4_IPC_TIMEOUT_0 is used when it is certain that the IPC receiver is currently ready, when the IPC sender doesn't want to wait if the IPC receiver is not ready, or when replying to an IPC call using a reply capability. The latter case applies for example to a server that received a call from a client. The reply to the IPC call should use a reply capability and a timeout of zero to ensure that a client doesn't block a server (server could not deliver the result of the request). See also L4::Ipc_svr::Default_timeout. Another case is an IPC send operation for waking up another thread from an IPC receive operation. If the other thread is not ready to receive, then it might be already woken up and it does not make sense to wait any longer. Also triggering an IRQ is usually done with a send timeout of 0, see L4::Triggerable::trigger().

In certain cases it also makes sense to specify an IPC timeout different from "never" or "zero":

- A server might leave the server loop after some time to perform idle work (see L4::Ipc_svr::Server_iface::add_timeout()).
- A thread does not want to wait for an infinite time if the partner is not ready. This could be also some safety measure.
- A thread wants to block for a certain amount of time without consuming CPU time. The l4_ipc_sleep() function specifies the L4_INVALID_CAP as target for an IPC receive operation and specifies the intended relative waiting period as IPC timeout. Waiting for an absolute timeout would be possible with similar code.

Note

The kernel IPC path is optimized for the two special cases using L4_IPC_TIMEOUT_NEVER and L4_IPC_TIMEOUT_0. Specifying a different timeout causes more maintenance effort for the kernel.

Special care is required if a finite timeout for the receive phase of an IPC call is specified: The IPC receive operation could abort before the partner was able to send the reply message. Under certain circumstances the partner may still have the temporary reply capability to the calling thread and may use this capability to reply to the caller at a later, unexpected time specifying an arbitrary IPC label. This case is relevant for servers which call another, possibly untrusted, server while serving a client request.

3.1.1.6 User-level Thread Control Block

The UTCB is located on a power-of-2-sized and power-of-2-aligned memory area shared between userland and the kernel (L4::Task::add_ku_mem()). The UTCB is bound to a thread during the L4::Thread::control() operation with the L4::Thread::Attr parameters set up using L4::Thread::Attr::bind(). The UTCB is used for IPC-related data exchange and is set up before invoking l4_ipc(). To access certain parts of the UTCB, the corresponding functions have to be used (there is no data type L4_utcb or similar). The UTCB consists of:

- the message registers `MR[0]`, `MR[1]`, ..., `MR[n-1]` with n = L4_UTCB_GENERIC_DATA_SIZE (access using l4_utcb_mr()),
- the buffer descriptor register `BDR` (access using l4_utcb_br(), see l4_buf_regs_t::bdr),
- the buffer registers `BR[0]`, `BR[1]`, ..., `BR[m-1]` with m = L4_UTCB_GENERIC_BUFFERS_SIZE (access using l4_utcb_br()),
- the thread control registers (access using l4_utcb_tcr(), includes the IPC error code), and
- in case of an exception IPC, the register state of the thread which triggered the exception (access using l4_utcb_exc()).

IPC to a kernel object requires the setup of the UTCB of the corresponding userlevel thread. IPC between userlevel threads requires the setup of UTCBs of both partners.

The kernel changes only the following UTCB content:

- The message registers of the UTCB of the receiver of an IPC, and
- the IPC error field of the thread invoking l4_ipc() if there was an error during IPC.

3.1.1.6.1 IPC Message registers

The *message registers* contain *untyped items* and *typed items*. The sender's typed items are interpreted by the kernel in conjunction with the receiver's *receive items*. Each typed send item occupies two message registers. The untyped items, on the other hand, are free to be used by the communication partners to exchange data: The content of all message registers used for untyped items (l4_msgtag_t::words()) is copied from the UTCB of the IPC sender to the UTCB of the IPC receiver.

A typed send item consists of a *flexpage* (see l4_fpage(), l4_obj_fpage(), and l4_iofpage()) of the to be transferred capabilities (*flexpage word*) and a *message word*. There are two types of send items: *map items* and *void items*. For a void item, the message word is all zero. For a map item, the message word contains:

- the *compound bit* allowing to use the same receive buffer for the subsequent typed send item (scatter-gather behavior, see L4_ITEM_CONT of l4_msg_item_consts_t),
- the *type bit* defining this typed send item as a *map item*,
- the *grant flag* for delegating the access to the flexpage from the sender to the receiver and atomically removing the rights from the sender (see l4_msg_item_consts_t),
- *attributes* with semantics depending on the item type; for memory mappings, they contain cacheability information (see l4_fpage_cacheability_opt_t); for objects, they contain additional rights (see Attributes and additional permissions for object send items),
- the *send base* (also called *hot spot*) defining what is actually mapped when send and receive flexpages have a different size.

A typed send item can be created using l4_sndfpage_add(). This function sets the compound bit unconditionally. Alternatively, the functions l4_map_control() and l4_map_obj_control() can be used to set up the message word of a map item for a memory flexpage respective for objects.

See below for a description how typed items are transferred.

3.1.1.6.2 IPC Buffer Registers

The *buffer registers* and *buffer descriptor register* are interpreted by the kernel during the receive phase (if any). Buffer registers define *receive items* which are required to receive typed send items (memory, I/O ports or object capabilities). To specify a receive item, up to three buffer registers are required:

- A *small receive item* (L4::Ipc::Small_buf) occupying one buffer register is sufficient to receive one object capability.
- A *receive item* (L4::Ipc::Rcv_fpage) occupying two or three buffer registers (*message word*, a *flexpage*, and an optional destination task capability index) is required to receive memory flexpages, I/O ports, or multiple object capabilities.

3.1.1.6.3 IPC Buffer Descriptor Register

The buffer descriptor register defines indices of buffer registers used to receive dedicated types of send items and also contains a flag:

- 5 bits starting at L4_BDR_MEM_SHIFT define the index of the first receive item used for memory flexpages.
- 5 bits starting at L4_BDR_IO_SHIFT define the index of the first receive item used for I/O flexpages.
- 5 bits starting at L4_BDR_OBJ_SHIFT define the index of the first receive item used for object flexpages.
- The L4_UTCB_INHERIT_FPU can be set using l4_utcb_inherit_fpu() and allows to receive the FPU state from the IPC sender. This is only relevant if the sender set L4_MSGTAG_TRANSFER_FPU in the message tag.

For most use cases, a BDR value of zero is sufficient. In that case, if `BR[0]` contains a void item, no capabilities are received. Otherwise, only one type of capabilities (memory, I/O ports or objects) can be received even if there are several receive items. For more complex setups that require receiving different types of capabilities in one receive operation, other BDR values are necessary.

The BDR of the receiving thread is only used by the kernel if at least one typed item is transferred during the IPC or if L4_MSGTAG_TRANSFER_FPU is set in the UTCB of the sending thread.

3.1.1.6.4 IPC Thread Control Registers

The l4_thread_regs_t::error register contains the IPC error code in case the L4_MSGTAG_ERROR flag is set in the message tag returned by an IPC syscall. Otherwise this register is not touched by the kernel. See l4_ipc_tcr_error_t for a detailed enumeration of all possible error codes during an IPC operation.

The l4_thread_regs_t::free_marker is set by the kernel to zero immediately before a thread is destroyed. This value indicates that the kernel does not longer use the UTCB and it can be re-used by other threads.

The other members of l4_thread_regs_t are never touched by the kernel.

3.1.1.7 Transfer of Typed Send Items

The kernel interprets all typed items in the sender UTCB (l4_msgtag_t::items()) and performs the following operations while modifying the corresponding typed items in the receiver UTCB:

- If the message item of the sender is void, this item is ignored and the message word of the corresponding typed item in the receiver UTCB is set to zero (making it a void item). The flexpage word of this item is not changed.
- Otherwise, if the type bit of the message item of the sender is not set, the IPC is aborted with L4_IPC_SEMSGCUT / L4_IPC_REMSGCUT.
- Otherwise, if there is a receive item corresponding to the flexpage type of the send item available (see IPC Buffer Descriptor Register), information described by the flexpage is transferred to the receiver.

In the last case, the message word of the typed item in the receiver UTCB is modified to contain the send base, the type and the size of the transferred flexpage, as well as a copy of the compound bit and the type bit of the send item. If the receiver ordered a local ID in the corresponding receive item, the kernel attempts to apply special rules, see L4_RCV_ITEM_LOCAL_ID. Otherwise, regular mappings as described by the flexpage of the send item are created in the receiver space.

A receive item forms a *receive window* of a specific address and size in the receiver space. Each typed send item that is a map item requires a corresponding receive item. By default, there is a one-to-one mapping (one receive item per typed send item) but it is also possible to use one receive item to receive several typed send items: The compound bit (see l4_msg_item_consts_t) of a send item defines if the following typed send item shall use the same receive item as the current one for receiving the flexpage. If the compound bit is set, proper values of the send base shall be used to prevent overlapping of addresses in the receiver space.

The send base is relevant when the size of the receive flexpage differs from the size of the transferred resource. As a typical example, triggering a memory page fault opens a receive window covering the entire memory address space of the faulting thread. The pager will usually reply a memory flexpage smaller than the entire address space of the faulting thread. Hence, the pager has to specify a proper base which is used as offset of the sent object in the receive flexpage in the *receiver space*. If the sender flexpage is bigger than the receive window, a flexpage of the size of the receive window starting at the send base in the *sender space* is transferred to the receiver.

The kernel will stop transmission of typed items before l4_msgtag_t::items() is reached either if it finds a void item as receive buffer or if the flexpage type of the send item does not match the flexpage type of the corresponding receive item. Under both conditions, the IPC is aborted with L4_IPC_SEMSGCUT / L4_IPC_REMSGCUT.

Note

The kernel ignores the flexpage access rights of the receive items. The actual rights for a transferred resource in the target address space are defined by the access rights to that resource of the IPC sender address space and the flexpage access rights in the typed send item. Additionally, when transferring object capabilities, the transferred rights also depend on the sender's rights on the capability invoked for IPC.

The kernel does not unmap capabilities in the receive window when there is no capability present at the corresponding index at the sender. Further, the receiver cannot reliably detect at which capability indices it received capabilities in its receive windows. Therefore, before receiving from an untrusted source, all receive windows should be cleared. Otherwise the receiver may erroneously associate a capability in one of its receive windows with his last IPC partner although it was actually received in an earlier IPC.

However, the kernel indicates if at least one object capability was received or not, see L4::Ipc::Snd_fpage::cap_received().

3.1.2 Examples

A number of examples show the interplay of the concepts introduced so far.

3.1.2.1 User Thread to Kernel Object

The L4::Scheduler kernel object has a method L4::Scheduler.idle_time(). It takes a set of CPUs to query, represented by two machine words.

In user space, the function L4::Cap<L4::Scheduler>->idle_time() is called, which does the following:

- Fill `MR[0]` with a constant identifying the method being called (L4_SCHEDULER_IDLE_TIME_OP).
- Fill `MR[1]` and `MR[2]` with the two words making up the CPU set.
- Set up the message tag with the protocol value (L4_PROTO_SCHEDULER), the number of untyped and typed items (3 and 0), and some flags.
- Call l4_ipc() with the partner capability ID, the tag, the pointer to the filled UTCB, infinite timeouts, and with flags indicating a send and receive phase. (The label does not matter in this case.)

This function traps into kernel space using standard platform specific mechanisms. The kernel reads the protocol value on the message tag, checks that the partner capability ID refers to a valid object that speaks that protocol, and dispatches the message to the appropriate handler. The handler fills the first 64 bits of the message registers with the computed time value. This will cover `MR[0]` on 64-bit architectures and `MR[0]` and `MR[1]` on 32-bit architectures. It then sets up the return message tag:

- The number of untyped items is 1 or 2.
- The number of typed items is 0.
- The protocol value contains the return value and is set to 0.
- An error would be signalled as a negative protocol value. Under certain conditions (e.g. wrong kernel object capability specified), the error is signalled as IPC error (see L4_MSGTAG_ERROR in the description of the IPC Message Tag).
- (The return label is as irrelevant in this case as the send label.)

This reply is received by the receive phase of the original l4_ipc() call from userland. Finally the l4_ipc() function copies the time value out of the message registers and forwards it with a possible error from the message tag flags to its caller.

3.1.2.2 User Thread to User Thread

When the target kernel object is of type L4::Thread (or L4::Ipc_gate, but we will cover this in the example below) and the message tag's protocol value is not L4_PROTO_THREAD, the kernel will forward the IPC message to the userland thread represented by the kernel object. There it can be received by a call to l4_ipc(). The restriction of the protocol number is necessary because one also wants to invoke L4::Thread's control methods such as L4::Thread.switch_to() or L4::Thread.ex_regs(). Besides this restriction, the interpretation of all the IPC parameters and the untyped items of the UTCB is up to the communication partners.

3.1.2.2.1 Simple Messages

A simple example is a client calling a server to have a computation performed on a value: Similar to IPC from a userland thread to a kernel object, the client writes the value to `MR[0]`. It sets up the message tag with some agreed upon protocol value (which, as explained above, must be different from L4_PROTO_THREAD), number of untyped items to 1, typed items to 0, and no flags set. The client may want to pass a label that identifies itself, as many clients can use the server. In this context, the identifier might also be passed via the message registers, but the label is the proper place for this, as it gets a special treatment by the kernel for IPC gates (covered by the example below). The client then calls l4_ipc() with the tag, label and flags indicating it wants a send phase and a receive phase (as it wants a result back). The target is the capability index referring to a capability for the L4::Thread kernel object of the server.

To be able to receive an IPC message, the server has set up a UTCB of its own and called l4_ipc() with flags indicating it only wants to enter a receive phase and it accepts IPCs from any partner. This is called an **open wait**. (The alternative would be to specify a capability index referring to a L4::Thread capability to exclusively receive from.)

Both system calls (the send IPC initiated by the client and the receive IPC initiated by the server) may be seen by the kernel in any order but the IPC will not start before sender and receiver are ready. In that case the kernel will copy the relevant message registers the client specified in the message tag from the client's UTCB to the server's UTCB, in the current example just `MR[0]`. It will then switch the client to the receive phase of its call (which cannot yet be executed) and return the server's call with the message tag and label.

The server inspects the tag for the correct protocol value and number of untyped items passed, inspect the label to decide whether it maybe wants special treatment of this particular client, performs the computation on `MR[0]` and writes the result back to `MR[0]` (or to more words, depending on what exactly it computes). It sets up the tag in the usual way, but probably needs to pass no label, as the client knows who it is talking to.

For the reply, the server makes use the reply capability (see above). Since the client sent the last IPC to the server, the reply capability will point to it. So when the server calls l4_ipc() with the computed result in the message registers and using the reply capability as target, the kernel knows to forward this to the client's thread. The kernel copies the message registers from the server's UTCB to the client's UTCB, and the client's l4_ipc() system call, which is still stuck in the receive phase, is returned with the tag.

The client looks at the tag and then the message registers for its wanted result and the example is concluded.

3.1.2.2.2 Send Items

IPC between userland threads is also used to transfer typed items: Memory, I/O ports, and objects, all represented as flexpages. Typed items and untyped items can be part of the same IPC. As general rule, the sender specifies what he wants to send, the receiver where and how much it wants to receive, and the kernel checks the required permissions before doing the actual transfer. As written before, this mechanism is synchronous and the receiver cannot be transferred items against its will.

See also

Flexpages

Suppose a client wants a server to have read only access to a page of its memory. The client sets up a flexpage covering the page and with only the L4_FPAGE_RO right set. The server sets up a flexpage of a memory region where it will receive the mapping. This may be larger than one page, suppose for our case four pages, in which case the exact position of the mapping will be resolved by the send base provided by the sender. The client combines the hot spot and some flags into a machine word and writes it to `MR[0]` (see also l4_map_control()). At `MR[1]` follows the flexpage it wants to send (see also l4_fpage()). The server does almost the same but writes the words to `BR[0]` and `BR[1]`. (The server could also specify a hot spot, but it is currently ignored by the kernel.) The

client specifies 1 typed and 0 untyped items in the message tag. The server writes 0 to `BDR` to specify that the first receive item starts at the first buffer register.

Both client and server initiate their IPC, the client with only a send phase to the server, and the server with an open wait receive phase. The kernel checks the compatibility of the send items and the receive buffers (e.g. that no object capability flexpage is sent to a receive buffer describing a memory mapping flexpage) and updates its internal structures to reflect the change. In our case, the sender's hot spot indicates to which of the four pages that make up the receive buffer the sent page should be mapped. The kernel also translates the typed send item to the server's address space and stores it in the server's UTCB at `MR[0]` and `MR[1]`.

Once the server returns from its syscall, it will have read access to the client's shared page.

3.1.2.3 User Thread to User Object

A common use case for thread to thread communication is when a server implements a number of object interfaces and a client wants to invoke methods on them. For security reasons, the server does not want to hand out its thread capability to everyone it nonetheless wants to serve. It also may not want to allow every client access to everyone of its interfaces. For this purpose, IPC gates implemented by the kernel object L4::Ipc_gate can be used. An IPC gate can be bound to a thread and forwards IPC to it. In doing so it applies two transformations

1. It sets the label to a predefined value.
2. It changes the rights of transferred items (see L4_CAP_FPAGE_S).

For each object of every interface the server implements, it creates an IPC gate and binds it to itself (see L4::Ipc_gate::bind_thread()). It sets the gate's label to a unique value identifying the object. Then it hands the gate out to clients. Several clients can be handed the same gate and will all end up invoking methods on the same object.

Instead of setting the target as the server's thread kernel object, the client uses the IPC gate's instead. The label the client sends is irrelevant, as the gate will overwrite it with the value the server has set during the bind operation. The server executes an open wait, and the kernel performs the same operation as in the above example with the transformed IPC finally ending up in the server's thread.

The server checks that the received label refers to one of its objects. It then checks if the protocol value in the message tag matches the interface the object implements. Then it invokes the method specified in `MR[0]` with the rest of the arguments. Finally it returns the results via UTCB and message tag to the reply capability and waits for the next IPC.

3.2 Kernel ABI

This section details the binary representation of the IPC interface of the kernel.

It accompanies the L4 Inter-Process Communication (IPC) section. The details presented here are usually not relevant when developing L4Re applications and can therefore be skipped by many readers.

Note

The kernel ABI is subject to change. Please use the API instead of relying on particular binary representations.

The following notation is used to indicate how particular data fields are used:

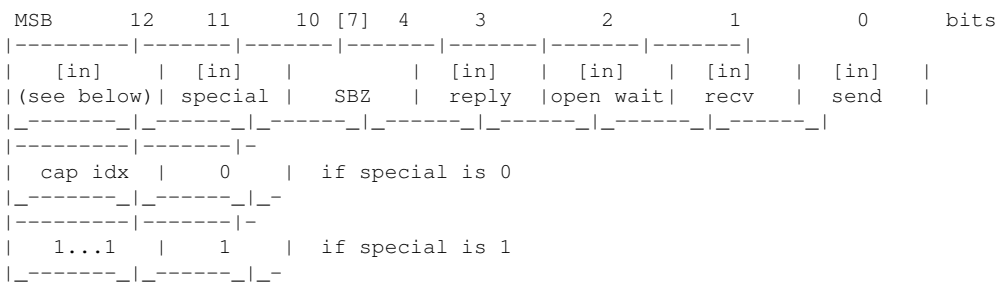
- [in]: The kernel reads and interprets this field.
- [out]: The kernel writes this field with information provided by the kernel.
- [cpy]: The kernel copies this field from sender to receiver (without interpretation if [in] is not listed as well).

The above indications may be combined.

3.2.1 Capability selector and syscall flags

See partner capability selector and syscall flags.

The kernel reads and interprets all the fields ([in]).



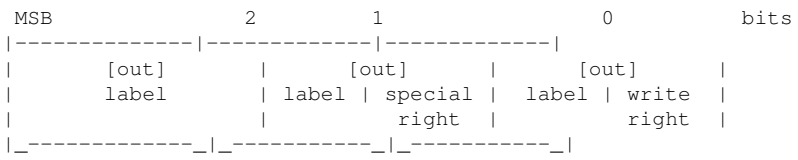
- Bits 0...3 [in]: These bits correspond to the syscall flags. The individual bits correspond to L4_SYSF_REPLY, L4_SYSF_OPEN_WAIT, L4_SYSF_RECV, L4_SYSF_SEND. Note that not all combinations of those bits are valid.
- Bits 4...10 [in] `SBZ`: should be zero
- Bit 11 [in] `special`: Set when using L4_INVALID_CAP, otherwise unset.
- Bits 12...MSB [in]: Capability index if `special` is unset, otherwise all those bits should be one (see L4_INVALID_CAP, partner capability selector and l4_cap_idx_t).

3.2.2 Label

See IPC label.

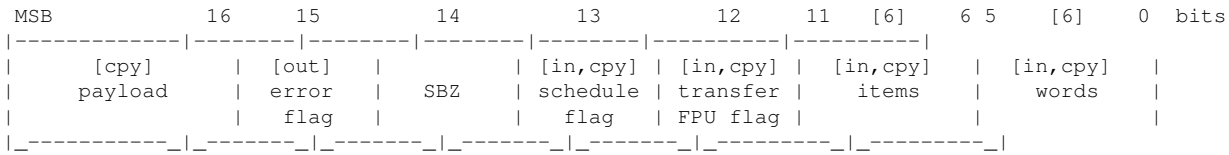
When IPC is sent via a thread capability, the label is copied to the receiver unchanged ([cpy]).

When IPC is sent via an IPC gate, the sent label is ignored and the kernel provides the bitwise OR (|) of the IPC gate label and the sender's write and special permissions (see L4_CAP_FPAGE_W and L4_CAP_FPAGE_S) of the used capability ([out]):



3.2.3 Message tag

See IPC message tag. Note that, for a message tag returned by the kernel, if the error flag is set, all other contents of the message tag is undefined.



- Bits 0...5 [in,cpy] `words`: Number of (untyped) message words in the UTCB's message registers. See l4_msgtag_words() and l4_msgtag_t::words().
- Bits 6...11 [in,cpy] `items`: Number of typed message items in the UTCB's message registers. See l4_msgtag_items() and l4_msgtag_t::items().
- Bit 12 [in,cpy] `transfer FPU flag`: See L4_MSGTAG_TRANSFER_FPU.
- Bit 13 [in,cpy] `schedule flag`: See L4_MSGTAG_SCHEDULE.
- Bit 14 `SBZ`: should be zero
- Bit 15 [out] `error`: See L4_MSGTAG_ERROR, l4_msgtag_has_error() and l4_msgtag_t::has_error().
- Bits 16...MSB [cpy] `payload`: Transferred to receiver unchanged; not interpreted by kernel (unless it is the communication partner). For IPC calls or send-only IPC, this is usually the protocol. For replies, this is usually used for return values and server error signaling. See l4_msgtag_label() and l4_msgtag_t::label().

3.2.4 Timeouts

See IPC timeouts and l4_timeout_t.

The kernel reads and interprets all the fields ([in]).

```
 31     [16]    16 15     [16]     0  bits
|-------------|-------------|
|       [in]      |       [in]      |
|  send timeout   | receive timeout |
|_-----------_|_-----------_|
```

A timeout has the following format. There are two special timeout values:

- *Zero timeout:* Only bit 10 is set. See L4_IPC_TIMEOUT_0.

```
 15  [5]  11  10   9        [10]        0  bits
|---------|-----|----------------|
|     0     |  1  |          0           |
|_-------_|_---_|_---------------_|
```

- *Infinite timeout:* All bits are unset. See L4_IPC_TIMEOUT_NEVER.

```
 15                [16]                0  bits
|----------------------------|
|                   0                   |
|_---------------------------_|
```

Otherwise, the timeout is either relative or absolute, which is specified by bit 15.

- *Relative timeout:* If bit 15 is unset, the timeout is `mantissa * 2 ^ exponent` micro seconds relative to the current time. The `mantissa` must not be zero:

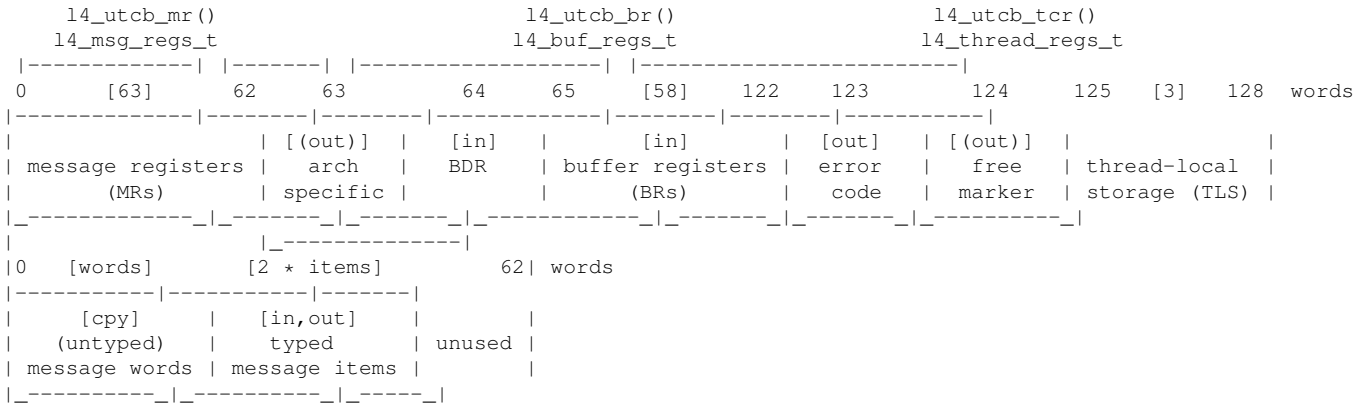
```
  15   14  [5]  10 9        [10]        0  bits
|-----|---------|----------------|
|  0  | exponent  |     mantissa ≠ 0     |
|_---_|_-------_|_---------------_|
```

- *Absolute timeout:* If bit 15 is set, an absolute timeout is specified in the UTCB's buffer registers starting at `buf reg idx` (the particular number of registers depends on the architecture; see l4_timeout_s):

```
  15   14       [9]       6 5    [6]    0  bits
|-----|---------------|----------|
|  1  |         SBZ        | buf reg idx |
|_---_|_-------------_|_---------_|
```

3.2.5 User-level thread control block (UTCB)

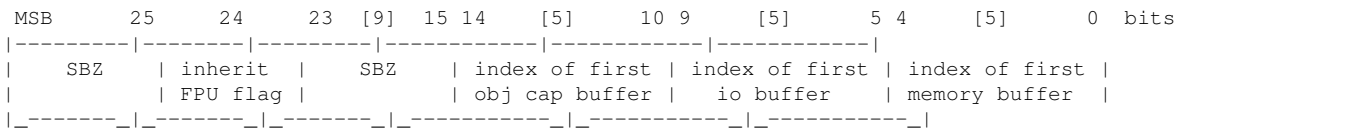
See User-level thread control block (UTCB).



- Words 0...62 `MRs`: See IPC Message registers and l4_utcb_mr(). The number of message registers is defined by L4_UTCB_GENERIC_DATA_SIZE. The actually used message registers are defined by `words` and `items` in the message tag. The layout of a typed message item varies depending on being an input or output value, see typed message items.
- Word 63 [(out)]: Depending on the architecture, this word may be used by the kernel to signify the position of a thread's UTCB in memory. See architecture-specific implementation of l4_utcb(). If at all, the kernel writes this word when kernel-user memory is set up as UTCB while binding a thread to a task; see l4_thread_control_bind(), L4::Thread::Attr::bind().
- Word 64 [in] `BDR`: See buffer descriptor register.
- Words 65...122 [in] `BRs`: See IPC Buffer Registers, receive items and l4_utcb_br()->br. The number of buffer registers is defined by L4_UTCB_GENERIC_BUFFERS_SIZE.
- Word 123 [out] `error code`: See IPC Thread Control Registers and l4_utcb_tcr()->error.
- Word 124 [(out)] `free marker`: Written by the kernel, but not necessarily during IPC. See IPC Thread Control Registers and l4_utcb_tcr()->free_marker.
- Word 125...128 `TLS`: Ignored and left untouched by the kernel. See IPC Thread Control Registers and l4_utcb_tcr()->user.

3.2.5.1 Buffer descriptor register

See IPC Buffer Descriptor Register and l4_utcb_br()->bdr.



3.2.6 Typed message items

The number of words in a typed message item varies depending on the particular kind of item. However, for the first word, the following properties are shared:

- *Void item:* If all bits of the first word of a typed message item are zero, then it is a void item.
- *Non-void item:* The first word of a non-void typed message item has the following binary layout:

  Bit 3 (`t`) is the type bit. If `t` is set, the item is a map item. Currently, map item is the only supported type. Hence, this bit must be set for all items except for void items.

There are three sub-types of typed message items: *send items*, *receive items*, and *return items*; see Message Items.

Many typed items make use of flexpages, therefore, these are described before the various kinds of typed items. Note that flexpages are also used outside of typed message items, e.g., for L4::Task::unmap().

3.2.6.1 Flexpages

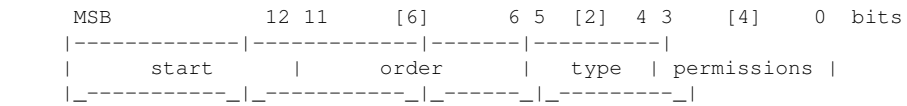
A flexpage consists of a single word and, except for some special values, describes a range in an address space, see flex pages.

The general layout is defined as follows:

- Bits 4...5 `type`: See l4_fpage_type() and L4_fpage_type.

The type L4_FPAGE_SPECIAL only supports some selected values, which are only supported for selected interfaces; see L4_FPAGE_SPECIAL.

The other types share the same layout:



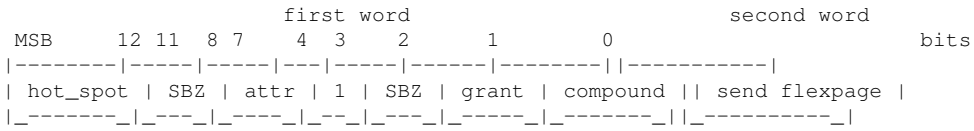
- Bits 0...3 `permissions`: See l4_fpage_rights(), L4_fpage_rights (memory space) and L4_cap_fpage_rights (object space). Should be zero for I/O port space.
- Bits 6...11 `order`: The $\log_2$ size of the flexpage. See l4_fpage_size.
- Bits 12...MSB `start`: The starting page number / I/O port number / capability index of the flexpage. Must be aligned to the flexpage size. See l4_fpage_page(), l4_fpage_memaddr(), l4_fpage_ioport() and l4_fpage_obj().

Also see l4_fpage() (memory space), l4_iofpage() (I/O port space) and l4_fpage_obj() (object space).

3.2.6.2 Send items

A send item consists of two words. The second word of a non-void send item is a flexpage. The type of the flexpage determines the interpretation of the `attr` bits in the first word (see below).

If not void, the layout of the first word is defined as follows:



`SBZ` means “should be zero”.

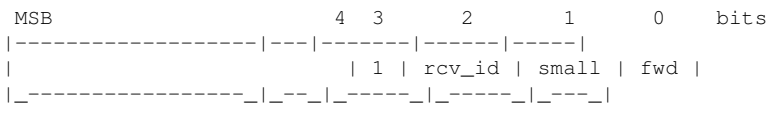
- Bit 0 (`compound`): Compound bit. See L4_ITEM_CONT and L4::Ipc::Snd_fpage::is_compound().
- Bit 1 (`grant`): Grant flag. See L4_ITEM_MAP, L4_MAP_ITEM_GRANT and L4::Ipc::Snd_fpage::Map_type.
- Bits 7..4 (`attr`): Attributes. See Attributes and additional permissions for object send items and l4_fpage_cacheability_opt_t, L4::Ipc::Snd_fpage::Cacheopt.
- Bits MSB..12 (`hot_spot`): Send base (also called hot spot). See L4::Ipc::Snd_fpage::snd_base().

For details, see IPC Message registers.

3.2.6.3 Receive items

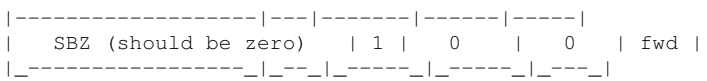
A non-void receive item consists of up to three words.

If not void, the general layout of the first word is defined as follows:

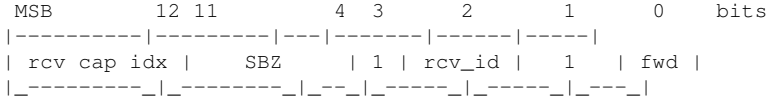


The `small` and `fwd` bits determine the details of the layout of the whole message item.

If `small` is unset, then also `rcv_id` must be unset, and the most significant bits should be zero:

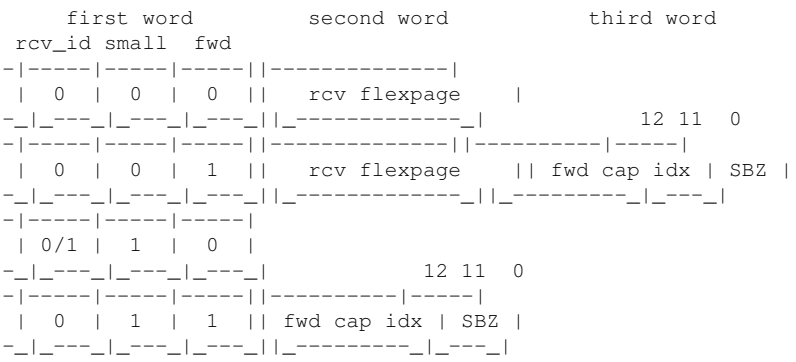


If `small` is set, the most significant bits are layouted as follows:



At most one of `rcv_id` and `fwd` may be set.

The number and meaning of the words in the whole item are determined by the `small` and `fwd` bits:

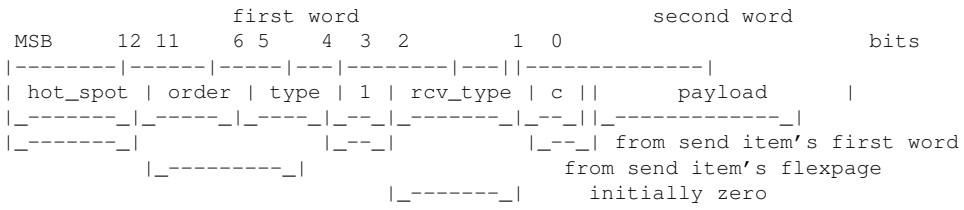


The meaning of the bits in detail:

- Bit 0 (`fwd`): See L4_RCV_ITEM_FORWARD_MAPPINGS and L4::Ipc::Rcv_fpage::forward_mappings(). For `fwd cap idx` see L4::Ipc::Rcv_fpage::rcv_task().
- Bit 1 (`small`): See L4_RCV_ITEM_SINGLE_CAP and L4::Ipc::Small_buf vs. L4::Ipc::Rcv_fpage.
- Bit 2 (`rcv_id`): See L4_RCV_ITEM_LOCAL_ID.

3.2.6.4 Return items

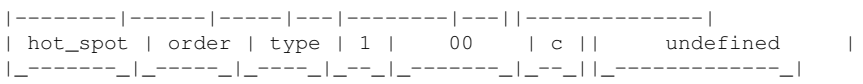
A return item always consists of two words. The general layout of a non-void return item is defined as follows:



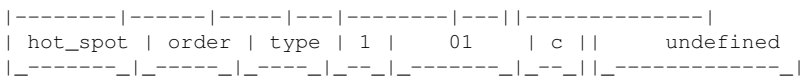
As indicated above, the `hot_spot`, `1`, and `c` (`compound`) are copied from the sender's send item's first word, and `order` and `type` are copied from the sender's send item's flexpage. The `rcv_type` and `payload` are determined by what is actually transferred, which is also affected by the `rcv_id` bit in the receiver's receive item. The `rcv_type` determines the content and layout of the payload.

There are four cases for `rcv_type`:

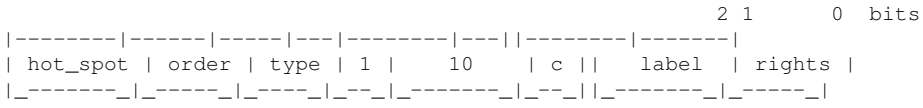
`00`: Used if at least one mapping was actually transferred for the corresponding send item. The payload is undefined: (also see L4::Ipc::Snd_fpage::cap_received()):



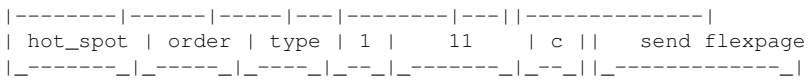
`01`: Used if transfer of mappings was attempted, but actually nothing was transferred, because nothing was mapped on the sender's side for the corresponding send item. The payload is undefined:



10: Used if the receive item's rcv_id bit was set and the conditions for transferring an IPC gate label were fulfilled. In that case, no mapping is done for this item and the payload consists of the bitwise OR (|) of the IPC gate label and the write and special permissions (see L4_CAP_FPAGE_W and L4_CAP_FPAGE_S) that would have been mapped (also see L4::Ipc::Snd_fpage::id_received()):



11: Used if the receive item's rcv_id bit was set and the conditions for transferring the sender's flexpage word were fulfilled. In that case, no mapping is done for this item and the payload is a copy of the sender's flexpage word (also see L4::Ipc::Snd_fpage::local_id_received()):



3.3 Capabilities and Naming

The L4Re system is a capability based system which uses and offers capabilities to implement fine-grained access control.

Generally, owning a capability means to be allowed to communicate with the object the capability points to. All user-visible kernel objects, such as tasks, threads, and IRQs, can only be accessed through a capability. Please refer to the Kernel Objects documentation for details. Capabilities are stored in per-task capability tables (the object space) and are referenced by capability indices or object flexpages. In a simplified view, a capability index is a natural number indexing into the capability table of the current task.

As a matter of fact, a system designed solely based on capabilities uses so-called 'local names' because each task can only access those objects made available to this task. Other objects are not visible to and accessible by the task.

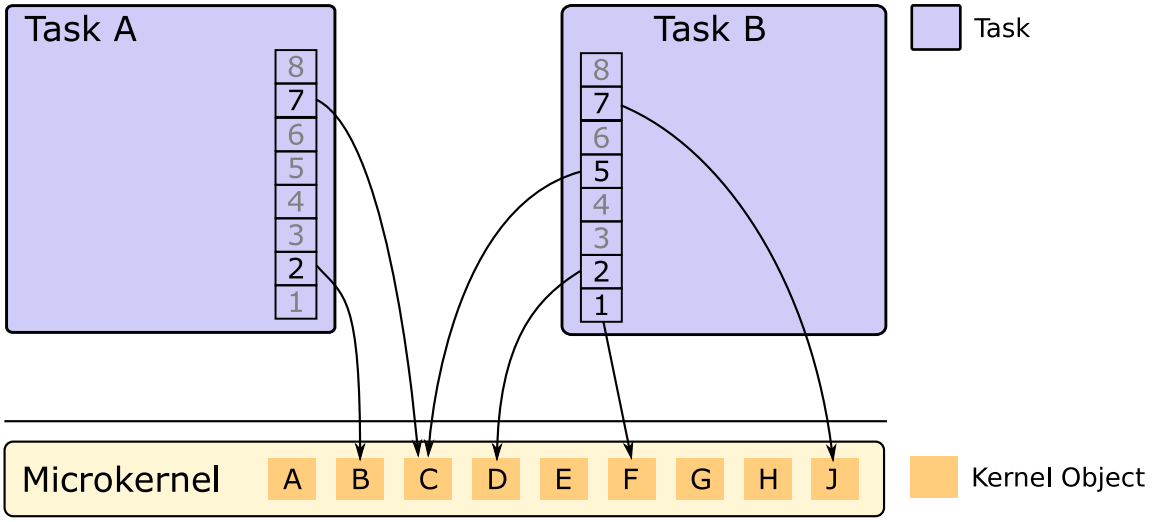


Figure 3.1 Capabilities and Local Naming in L4

So how does an application get access to a service? In general all applications are started with an initial set of available objects. This set of objects is predetermined by the creator of a new application process and granted directly to the new task before starting the first application thread. The application can then use these initial objects to request access to further objects or to transfer capabilities to its own objects to other applications. A central L4Re object for exchanging capabilities at runtime is the name-space object, implementing a store of named capabilities.

From a security perspective, the set of initial capabilities (access rights to objects) completely define the execution environment of an application. Mandatory security policies can be defined by well known properties of the initial objects and carefully handled access rights to them.

3.4 Spaces and Mappings

Each task in the L4Re system has access to two resource spaces (three on IA32) which are maintained by the kernel.

These are the

1. object space,
2. memory space, and
3. IO-port space (only on IA32).

The entities addressed in each space are capabilities to objects, virtual memory pages, and IO ports. The addresses are unsigned integers and the largest valid address depends on which space is referenced, the hardware, and the configuration of the kernel. Although a program can access memory at byte granularity, from the kernel's point of view the address granularity in the memory space is not bytes but pages, as determined by the hardware. The address of a capability is also called its *capability index* or, synonymously, capability slot∗.

Flexpages describe a range in any of the spaces that has a power-of-two length and is also aligned to this length. They additionally hold access rights information and further space specific information.

When a resource is present at some address in a task's corresponding resource space, then we say that resource is mapped to that task. For example, a capability to the task's main thread may be mapped to capability slot 5, or the first page of the code segment a thread executes is mapped to virtual memory page 12345. However, there need not be any resource mapped to an address.

Tasks can exchange resources through a process called "mapping" during IPC and using the L4::Task::map() method. The sending task specifies a send flexpage and the receiving task a receive flexpage. The resources mapped to the send flexpage will then be mapped to the receive flexpage by the kernel.

Memory mappings and IO port mappings are hierarchical: If a resource of such a type is subject of a map operation, the received mapping is a child mapping of the corresponding mapping in the sending task (parent mapping). The kernel usually respects the relationship between these two mappings (granting is an exception; see below): If rights of a parent mapping are revoked using L4::Task::unmap(), these rights are also removed from its child mappings. Also, if a mapping is completely removed (via L4::Task::unmap() or by mapping something else at its place), then also all child mappings are removed. In contrast, revoking rights of a child mapping leaves the rights of its parent mapping untouched.

The mapping of a resource can be performed as *grant* operation (see L4_MAP_ITEM_GRANT): Such an operation includes the removal of all involved mappings from the send flexpage (basically a move operation). While with a map operation without grant the mapping in the send flexpage remains the parent of all child mappings (including the new child mapping in the receive flexpage), a grant operation moves the mappings covered by the send flexpage to the corresponding addresses from the receive flexpage while leaving the parent/child relationship of the moved mappings with other mappings untouched.

During a map operation at most the access rights of the source mapping(s) can be transferred but no additional rights can be added. So only rights that are present in the source mapping and that are specified in the send item/flexpage are transferred. This also holds for grant mappings, however, rights revocation is *not* guaranteed to be applied to descendant mappings in case of grant.

There are cases where a grant operation is not or cannot be performed as requested; see L4_MAP_ITEM_GRANT for details.

Object capabilities are not hierarchical – they have no children. The result of the map operation on an object capability is a copy of that capability in the object space of the destination task.

3.5 Initial Environment and Application Bootstrapping

New applications that are started by a loader conforming to L4Re get provided an Initial Environment.

This environment comprises a set of capabilities to initial L4Re objects that are required to bootstrap and run this application. These capabilities include:

- A capability to an initial memory allocator for obtaining memory in the form of data spaces
- A capability to a factory which can be used to create additional kernel objects
- A capability to a Vcon object for debugging output and maybe input

- A set of named capabilities to application specific objects

During the bootstrapping of the application, the loader establishes data spaces for each individual region in the ELF binary. These include data spaces for the code and data sections, and a data space backed with RAM for the stack of the program's first thread.

One loader implementation is the `moe` root task. Moe usually starts an *init* process that is responsible for coordinating the further boot process. The default *init* process is `ned`, which implements a script-based configuration and startup of other processes. Ned uses Lua (`https://www.lua.org`) as its scripting language, see Ned Script example for more details.

3.5.1 Configuring an application before startup

The default L4Re init process (Ned) provides a Lua script based configuration of initial capabilities and application startup. Ned itself also has a set of initial objects available that can be used to create the environment for an application. The most important object is a kernel object factory that allows creation of kernel objects such as IPC gates (communication channels), tasks, threads, etc. Ned uses Lua tables (associative arrays) to represent sets of capabilities that shall be granted to application processes.

```
local caps = {
    name = some_capability
}
```

The L4 Lua package in Ned also has support functions to create application tasks, region-map objects, etc. to start an ELF binary in a new task. The package also contains Lua bindings for basic L4Re objects, for example, to generic factory objects, which are used to create kernel objects and also user-level objects provided by user-level servers.

```
L4.default_loader:start({ caps = { some_service = service } }, "rom/program --arg");
```

3.5.2 Connecting clients and servers

In general, a connection between a client and a server is represented by a communication channel (IPC gate) that is available to both of them. You can see the simplest connection between a client and a server in the following example.

```
local loader = L4.default_loader; -- which is Moe
local svc = loader:new_channel();  -- create an IPC gate
loader:start({ caps = { service = svc:svr() }}, "rom/my_server");
loader:start({ caps = { service = svc:m("rw") }}, "rom/my_client");
```

As you can see in the snippet, the first action is to create a new channel (IPC gate) using `loader:new_channel()`. The capability to the gate is stored in the variable `svc`. Then the binary `my_server` is started in a new task, and full (`:svr()`) access to the IPC gate is granted to the server as initial object. The gate is accessible to the server application as "service" in the set of its initial capabilities. Virtually in parallel a second task, running the client application, is started and also given access to the IPC gate with less rights (`:m("rw")`, note, this is essential). The server can now receive messages via the IPC gate and provide some service and the client can call operations on the IPC gate to communicate with the server.

Services that keep client specific state need to implement per-client server objects. Usually it is the responsibility of some authority (e.g., Ned) to request such an object from the service via a generic factory object that the service provides initially.

```
local loader = L4.default_loader; -- which is Moe
local svc = loader:new_channel():m("rws");  -- create an IPC gate with rws rights
loader:start({ caps = { service = svc:svr() } }, "rom/my-service");
loader:start({ caps = { foo_service = svc:create(object_to_create, "param") }}, "rom/client");
```

This example is quite similar to the first one, however, the difference is that Ned itself calls the create method on the factory object provided by the server and passes the returned capability of that request as "foo_service" to the client process.

Note

The `svc:create(..)` call blocks on the server. This means the script execution blocks until the my-service application handles the create request.

3.6 Memory management - Data Spaces and the Region Map

3.6.1 User-level paging

Memory management in L4-based systems is done by user-level applications, the role is usually called *pager*. Tasks can give other tasks full or restricted access rights to parts of their own memory. The kernel offers means to give access to memory in a secure way, often referred to as *memory* mapping.

The mapping mechanism allows one task to resolve page faults of another: A thread usually has a pager assigned to it. When the thread causes a page fault, the kernel sends an IPC message to the pager with information about the page fault. The pager answers this IPC by either providing a backing page, or with an error. The kernel will map the backing page into the address space of the faulting thread's task.

These mechanisms can be used to construct a memory and paging hierarchy among tasks. The root of the hierarchy is `sigma0`, which initially gets all system resources and hands them out once on a first-come-first-served basis. Memory resources can be mapped between tasks at a page-size granularity. This size is predetermined by the CPU's memory management unit and is commonly set to 4 kB.

3.6.1.1 Data spaces

A data space is the L4Re abstraction for objects which may be accessed in a memory mapped fashion (i.e., using normal memory read and write instructions). Examples include the sections of a binary which the loader attaches to the application's address space, files in the ROM or on disk provided by a file server, the registers of memory-mapped devices and anonymous memory such as the heap or the stack.

Anonymous memory data spaces in particular (but in general all data spaces except memory mapped IO) can either be constructed entirely from a portion of the RAM or the current working set may be multiplexed on some portion of the RAM. In the first case it is possible to eagerly insert all pages (more precisely page-frame capabilities) into the application's address space such that no further page faults occur when this data space is accessed. In general, however, only the pages for some portion are provided and further pages are inserted by the pager as a result of page faults.

3.6.1.2 Virtual Memory Handling

The virtual memory of each task is constructed from data spaces backing virtual memory regions (VMRs). The management of the VMRs is provided by an object called *region map*. A dedicated region-map object is associated with each task; it allows attaching and detaching data spaces to an address space as well as reserving areas of virtual memory. Since the region-map object possesses all knowledge about the virtual memory layout of a task, it also serves as an application's default pager.

3.6.1.3 Memory Allocation

Operating systems commonly use anonymous memory for implementing dynamic memory allocation (e.g., using `malloc` or `new`). In an L4Re-based system, each task gets assigned a memory allocator providing anonymous memory using data spaces.

See also

L4Re::Dataspace and L4Re::Rm.

3.7 Program Input and Output

The initial environment provides a Vcon capability used as the standard input/output stream.

Output is usually connected to the parent of the program and displayed as debugging output. The standard output is also used as a back end to the C-style printf functions and the C++ streams.

Vcon services are implemented in Moe and the loader as well as by the L4Re Microkernel and connected either to the serial line or to the screen if available.

See also

Virtual Console

3.8 Initial Memory Allocator and Factory

The purpose of the memory allocator and of the factory is to provide the application with the means to allocate memory (in the form of data spaces) and kernel objects respectively.

An initial memory allocator and an initial factory are accessible via the initial L4Re environment.

See also

L4Re::Mem_alloc

The factory is a kernel object that provides the ability to create new kernel objects dynamically. A factory imposes a resource limit for kernel memory, and is thus a means to prevent denial of service attacks on kernel resources. A factory can also be used to create new factory objects.

See also

Factory

3.9 Application and Server Building Blocks

So far we have discussed the environment of applications in which a single thread runs and which may invoke services provided through their initial objects.

In the following we describe some building blocks to extend the application in various dimensions and to eventually implement a server which implements user-level objects that may in turn be accessed by other applications and servers.

3.9.1 Creating Additional Application Threads

To create application threads, one must allocate a stack on which this thread may execute, create a thread kernel object and setup the information required at startup time (instruction pointer, stack pointer, etc.). In L4Re this functionality is encapsulated in the pthread library.

3.9.2 Providing a Service

In capability systems, services are typically provided by transferring a capability to those applications that are authorised to access the object to which the capability refers to.

Let us discuss an example to illustrate how two parties can communicate with each other: Assume a simple file server, which implements an interface for accessing individual files: read(pos, buf, length) and write(pos, data, length).

L4Re provides support for building servers based on the class L4::Server_object. L4::Server_object provides an abstract interface to be used with the L4::Server class. Specific server objects such as, in our case, files inherit from L4::Server_object. Let us call this class File_object. When invoked upon receiving a message, the L4::Server will automatically identify the corresponding server object based on the capability that has been provided to its clients and invoke this object's *dispatch* function with the incoming message as a parameter. Based on this message, the server must then decide which of the protocols it implements was invoked (if any). Usually, it will evaluate a protocol specific opcode that clients are required to transmit as one of the first words in the message. For example, assume our server assigns the following opcodes: Read = 0 and Write = 1. The `dispatch` function calls the corresponding server function (i.e., `File_object::read()` or `File_object::write()`), which will in turn parse additional parameters given to the function. In our case, this would be the position and the amount of data to be read or written. In case the write function was called the server will now update the contents of the file with the data supplied. In case of a read it will store the requested part of the file in the message buffer. A reply to the client finishes the client request.

3.10 Pthread Support

L4Re supports the standard pthread library functionality.

Therefore L4Re itself does not contain any documentation for pthreads itself. Please refer to the standard pthread documentation instead.

The L4Re specific parts will be described herein.

- Include pthread-l4.h header file:
  ```
  #include <pthread-l4.h>
  ```
- Return the local thread capability of a pthread thread:

  Use `pthread_l4_cap(pthread_t t)` to get the capability index of the pthread t.

  For example:
  ```
  pthread_l4_cap(pthread_self());
  ```
- Setting the L4 priority of an L4 thread works with a special scheduling policy (other policies do not affect the L4 thread priority):
  ```
  pthread_t t;
  pthread_attr_t a;
  struct sched_param sp;

  pthread_attr_init(&a);
  sp.sched_priority = l4_priority;
  pthread_attr_setschedpolicy(&a, SCHED_L4);
  pthread_attr_setschedparam(&a, &sp);
  pthread_attr_setinheritsched(&a, PTHREAD_EXPLICIT_SCHED);

  if (pthread_create(&t, &a, pthread_func, NULL))
    // failure...

  pthread_attr_destroy(&a);
  ```

- You can prevent your pthread from running immediately after the call to `pthread_create(..)` by adding `PTHREAD_L4_ATTR_NO_START` to the `create_flags` of the pthread attributes. To finally start the thread you need to call `scheduler()->run_thread()` passing the capability of the pthread and scheduling parameters.

```
pthread_t t;
pthread_attr_t attr;

pthread_attr_init(&attr);
attr.create_flags |= PTHREAD_L4_ATTR_NO_START;

if (pthread_create(&t, &attr, pthread_func, nullptr))
  // failure...

pthread_attr_destroy(&attr);

// do stuff

auto ret = L4Re::Env::env()->scheduler()->run_thread(pthread_l4_cap(t),
                                                     l4_sched_param(2));
if (l4_error(ret))
  // failure...
```

Constraints on pthread_t, user-land capability slot, and kernel thread-object

- `pthread_l4_cap()` is guaranteed to return the valid capability slot of the pthread (A) until `pthread_join()` or `pthread_detach()` is invoked on (A)'s `pthread_t`.
- `pthread_l4_cap()` exposes internal state of the pthread management, take the necessary precautions as you would for any shared data in concurrent environments. If you use `pthread_l4_cap()` guarding against concurrency issues is your duty.
- There is no guarantee that a valid capability slot points to a present capability.
- **Example**

  It is possible to obtain a valid thread capability slot and for `l4_task_cap_valid()` to return the capability as not present. The following example showcases a possible sequence of events.

```
// Assume: void some_func(void *)
pthread_t pthread = nullptr;
pthread_create(&pthread, nullptr, some_func, nullptr);

// pthread running some_func()
l4_cap_idx_t cap_idx = pthread_l4_cap(pthread);
l4_is_valid_cap(cap_idx); // ---> true

long valid = l4_task_cap_valid(L4RE_THIS_TASK_CAP, cap_idx).label());
// valid == 1 --> capability object is present (refers to a kernel object).

// some_func() exits

cap_idx = pthread_l4_cap(pthread);
l4_is_valid_cap(cap_idx); // ---> true

valid = l4_task_cap_valid(L4RE_THIS_TASK_CAP, cap_idx).label());
// valid == 0 --> capability object is not present (refers to no kernel object).

pthread_join(pthread, nullptr); // invalidates the cap slot and frees
                                // the pthread's data structures

// using cap_idx here is undefined behavior.
```

3.11 Interface Definition Language

An interface definition in L4Re is normally declared as a class derived from L4::Kobject_t.

For example, the simple calculator example declares its interface like that:

```
struct Calc : L4::Kobject_t<Calc, L4::Kobject>
{
```

```
  L4_INLINE_RPC(long, sub, (l4_uint32_t a, l4_uint32_t b, l4_uint32_t *res));
  L4_INLINE_RPC(long, neg, (l4_uint32_t a, l4_uint32_t *res));

  using Rpcs = L4::Typeid::Rpcs<sub_t, neg_t>;
};
```

The signature of each function is first declared using one of the RPC macros (see below) and then all the functions need to be listed in the Rpcs type.

Clients invoke these functions with the name given to the RPC macros, `sub` and `neg` above. Servers implement them by defining functions with an `op_` prepended, `op_sub` and `op_neg`. The types of the parameters in the macro definition, on the server side, and on the client side are not the same. The following section describes how they are related to each other.

3.11.1 Parameter types for RPC

Generally all value parameters, const reference parameters, and const pointer parameters to an RPC interface are considered as input parameters for the RPC and are transmitted from the client to the server.

Note

This means that `char const *` is treated as an input `char` and not as a zero terminated string value, for strings see L4::Ipc::String<>.

Parameters that are non-const references or non-const pointers are treated as output parameters going from the server to the client.

There are special data types that appear on only one side (client or server) when used, see the following table for details.

```
L4_RPC(l4_ret_t, test, (int arg1, char const *arg2, unsigned *ret1));
```

The example shows the declaration of a method called `test` with `l4_ret_t` as return type, `arg1` is an `int` input, `arg2` a `char` input, and `ret1` an `unsigned` output parameter.

Type	Direction	Client-Type	Server-Type
`T`	Input	`T`	`T`
`T const &`	Input	`T const &`	`T const &`
`T const *`	Input	`T const *`	`T const &`
`T &`	Output	`T &`	`T &`
`T *`	Output	`T *`	`T &`
`L4::Ipc::In_out<T &>`	In/Out	`T &`	`T &`
`L4::Ipc::In_out<T *>`	In/Out	`T *`	`T &`
`L4::Ipc::Cap<T>`	Input	`L4::Ipc::Cap<T>`	`L4::Ipc::Snd_fpage`
`L4::Ipc::Out<L4::Cap<T> >`	Output	`L4::Cap<T>`	`L4::Ipc::Cap<T> &`
`L4::Ipc::Rcv_fpage`	Input	`L4::Ipc::Rcv_fpage`	`void`
`L4::Ipc::Small_buf`	Input	`L4::Ipc::Small_buf`	`void`

Array types can be used to transmit arrays of variable length. They can either be stored in a client-provided buffer (L4::Ipc::Array), copied into a server-provided buffer (L4::Ipc::Array_in_buf) or directly read and written into the UTCB (L4::Ipc::Array_ref).

Constraints on L4::Ipc::Array_ref:

- the start position of this array type needs to be known in advance.
- it must be the last parameter of a message.
- the size of the array type is not transmitted to the server, only the client side knows the intended size of the input array. The server assumes the rest of the UTCB as the actual array. Different server-side behavior must be steered otherwise, e.g. through another parameter.

Type	Direction	Client-Type	Server-Type
L4::Ipc::Array<const T>	Input	L4::Ipc::Array<const T>	L4::Ipc::Array_ref<const T>
L4::Ipc::Array<const T>	Input	L4::Ipc::Array<const T>	L4::Ipc::Array_in_buf<T> const &
L4::Ipc::Array<T> &	Output	L4::Ipc::Array<T> &	L4::Ipc::Array_ref<T> &
L4::Ipc::Array_ref<T> &	Output	L4::Ipc::Array_ref<T> &	L4::Ipc::Array_ref<T> &

Finally, there are some optional types where the sender can choose if the parameter should be included in the message. These types are for the implementation of some legacy message formats and should generally not be needed for the definition of ordinary interfaces.

Type	Direction	Client-Type	Server-Type
L4::Ipc::Opt<T>	Input	L4::Ipc::Opt<T>	T
L4::Ipc::Opt<const T*>	Input	L4::Ipc::Opt<const T*>	T
L4::Ipc::Opt<T &>	Output	T &	L4::Ipc::Opt<T> &
L4::Ipc::Opt<T *>	Output	T *	L4::Ipc::Opt<T> &
L4::Ipc::Opt<Array_ref<T> &>	Output	Array_ref<T> &	L4::Ipc::Opt<Array_ref<T>> &

3.11.2 Server Side Interface

The server side function signature for the Calc example above is

```
long op_sub(Calc::Rights, l4_uint32_t a, l4_uint32_t b, l4_uint32_t &res);
```

The first rights parameter is a bitfield encoding the rights the client has on the used capability in the lower two bits. Currently, the W-right and S-right are supported. The rest of the Rights-bitfield is reserved.

The second and third arguments are input parameters as can be deduced from the tables above. The fourth parameter is an output parameter, delivered to the client with the return value of type long.

3.11.3 RPC Return Types

On the server side, the return type of an RPC handling function is always `l4_ret_t`. The return value is transmitted via the label field in l4_msgtag_t and is therefore restricted to its length. Per convention, a negative return value is interpreted as an error condition. If the return value is negative, output parameters are not transmitted back to the client.

Attention

The client must never rely on the content of output parameters when the return value is negative.

On the client-side, the return value of the RPC is set as defined in the RPC macro. If `l4_msgtag_t` is given, then the client has access to the full message tag, otherwise the return type should be `l4_ret_t`. Note that the client might not only receive the server return value in response but also an IPC error code.

3.11.4 RPC Method Declaration

RPC member functions can be declared using one of the following C++ macros.

For inline RPC stubs, where the RPC stub code itself is `inline`:

- `L4_INLINE_RPC(res, name, (args...), flags)`
  Define an inline RPC call (type and callable).
- `L4_INLINE_RPC_OP(op, res, name, (args...), flags)`
  Define an inline RPC call with specific opcode (type and callable).
- `L4_INLINE_RPC_NF(res, name, (args...), flags)`
  Define an inline RPC call type (the type only, no callable).
- `L4_INLINE_RPC_NF_OP(opcode, Ret_type, func_name, (args...), flags)`
  Define an inline RPC call type with specific opcode (the type only, no callable).

For external RPC stubs, where the RPC stub code must be defined in a separate compile unit (usually a `.cc` file):

- `L4_RPC(Ret_type, func_name, (args...), flags)`
  Define an RPC call (type and callable).
- `L4_RPC_OP(opcode, Ret_type, func_name, (args...), flags)`
  Define an RPC call with specific opcode (type and callable).
- `L4_RPC_NF(Ret_type, func_name, (args...), flags)`
  Define an RPC call type (the type only, no callable).
- `L4_RPC_NF_OP(opcode, Ret_type, func_name, (args...), flags)`
  Define an RPC call type with specific opcode (the type only, no callable).

To generate the implementation of an external RPC stub:

- `L4_RPC_DEF(class_name::func_name)`
  Generate the definition of an RPC stub.

The `NF` versions of the macro generally do not generate a callable member function named `<name>` but do only generate the type `<name>_t`. This data type can be used to call the RPC stub explicitly using `<name>_t::call(L4::Cap<Iface_class> cap, args...)`.

3.12 L4Re Build System

L4Re uses a custom make-based build system, often simply referred to as *BID*.

This section explains how to use BID when writing applications and libraries for L4Re.

3.12.1 Building L4Re

Setting up the Build Directory

L4Re must be built out-of-source. Therefore the first mandatory step is creating and populating a build directory. From the root of the L4Re source tree run

```
make B=<builddir>
```

Other targets that can be executed in the source directory are

update

Update the source directory from svn. Only makes sense when you have downloaded L4Re from the official subversion repository.

help

Show a short help with the most important targets.

Invoking Make

Once the build directory is set up, BID make can be invoked in one of two ways:

1. Go to the build directory and invoke make without special options.
2. Go to a source directory with a BID make file and invoke `make O=<builddir> ...`

The default target builds the source (as you would expect), other targets that are available in build mode are

cleanfast

Quickly cleans the build directory by removing all subdirectories that contain generated files. The configuration will remain untouched.

clean

Remove generated files. Slower than `make cleanfast` but can be used on selected packages. Use `S=...` to select the target package.

In addition to these targets, there are a number of targets to generate images which are explained elsewhere.

3.12.2 Writing BID Make Files

The BID build system exports different roles that define what should be done in the subdirectory. So a BID make file essentially consists of defining the role and a number of role-dependent make variables. The basic layout should look like this:

```
PKGDIR  ?= <path to package's root directory>  # e.g., '.' or '..'
L4DIR   ?= <path to L4Re source directory>     # e.g. '$(PKGDIR)/../..'

<various definitions>

include $(L4DIR)/mk/<role>.mk
```

`PKGDIR` in the first line defines the root directory of the current package. `L4DIR` in the next line must be pointed to the root of the L4Re source tree the package should be built against. After this custom variable definitions for the role follow. In the final line of the file, the make file with the role-specific rules must be sourced.

The following roles are currently defined:

- project.mk - Sub-project Role
- subdir.mk - Directory Role
- prog.mk - Application Role
- lib.mk - Library Role
- include.mk - Header File Role
- doc.mk - Documentation Role
- test.mk - Test Application Role
- idl.mk - IDL File Role (currently unused)
- runux.mk - Tests in FiascoUX Role

BID-global Variables

This section lists variables that configure how the BID build system behaves. They are applicable for all roles.

Variable	Description
CC	C compiler for target
CXX	C++ compiler for target
HOST_CC	C compiler for host
HOST_CXX	C++ compiler for host

3.12.3 prog.mk - Application Role

The prog role is used to build executable programs.

General Configuration Variables

The following variables can only be set globally for the Makefile:

`MODE`

Kind of target to build for. The following values are possible:

- `static` - build a statically linked binary (default)
- `shared` - build a dynamically linked binary
- `l4linux` - build a binary for running on L4Linux on the target platform
- `host` - build for host system
- `targetsys` - build a binary for the target platform with the compiler's default settings

`SYSTEMS`

List of architectures the target can be built for. The entries must be space-separated entries either naming an architecture (e.g. amd64) or an architecture and ABI (e.g, arm-l4f). When not defined, the target will be built for all possible platforms.

`TARGET`

Name or names of the binaries to compile. This variable may also be postfixed with a specific architecture.

Target-specific Configuration Variables

The following variables may either be used with or without a description suffix. Without suffix they will be used for all operations. With a specific description their use is restricted to a subset. These specifications include a target file and the architecture, both optional but in this order, separated by underscores. The specific variables will be used in addition to the more general ones.

`SRC_C` / `SRC_CC` / `SRC_F` / `SRC_S`

.c, .cc, .f90, .S source files.

`REQUIRES_LIBS`

List of libraries the binary depends on. This works only with libraries that export a pkg_config configuration file. Automatically adds any required include and link options.

DEPENDS_PKGS

List of packages this binary depends on. If one these packages is missing then building of the binary will be skipped.

CPPFLAGS / CFLAGS / CXXFLAGS / FFLAGS / ASFLAGS

Options for the C preprocessor, C compiler, C++ compiler, Fortran compiler and assembler. When used with suffix, the referred element is the source file, not the target file.

LDFLAGS

Options for the linker ld.

LIBS

Additional libraries to link against (with -l).

PRIVATE_LIBDIR

Additional directories to search for libraries.

CRT0 / CRTN

(expert use only) Files containing custom startup and finish code.

LDSCRIPT

(expert use only) Custom link script to use.

3.12.4 include.mk - Header File Role

The header file role is responsible for installing header file at the appropriate location.

The following variables can be used for customizing the process:

`INCSRC_DIR`

Source directory where the headers can be found. Default is the directory where the Makefile resides.

`TARGET`

List of header files to install. If left undefined, then `INCSRC_DIR` will be scanned for files with suffix `.h` or `.i`.

Supports the specification of special filenames to allow for different source and target filenames to be installed. The syntax is `TARGET<SRC`, where a filename including the path of `SRC` is installed as `TARGET`. An example is

```
libfoo.h<contrib/libfoo_linux.h
```

which installs the header from the contrib directory under the name without that contrib directory and without the platform specific suffix.

`EXTRA_TARGET`

When TARGET is undefined, then add these files to the headers found by scanning the source directory. Has no effect if `TARGET` has been defined.

The filenames specified allow for the same rule specifications as supported by `TARGET`.

`CONTRIB_HEADERS`

When set, the headers will be installed in `${BUILDDIR}/include/contrib/${PKGNAME}` rather than `${BUILDDIR}/include/l4/${PKGNAME}`.

`INSTALL_INC_PREFIX`

Base directory where to install the headers. Overwrites `CONTRIB_HEADERS`. The headers will then be found under `${BUILDDIR}/include/${INSTALL_INC_PREFIX}`.

`PC_FILENAME`

When set, a pkg_config configuration file is created with the given name.

3.12.5 test.mk - Test Application Role

The test role is very similar to the application role, it also builds an executable binary.

The difference is that is also builds for each target a test script that executes the test target either on the host (MODE=host) or a target platform (currently only qemu).

The role accepts all make variables that are accepted by the application role. The only difference is that the `TARGET` variable is not required. If it is missing, the source directory will be scanned for source files that fit the pattern `test_*.c[c]` and create one target for each of them.

Note

It is possible to still use SRC_C[C] when targets are determined automatically. In that case the specified sources will be used in addition* to the main `test_*.c[c]` source.

In addition to the variables above, there are a number of variables that control how the test is executed. All these variables may be used as a global variable that applies to all test or, if the target name is added as a suffix, set for a specific target only.

`TEST_TARGET`

Name of binary containing the test (default: same as `TARGET`).

`TARGET_$(ARCH)`

When TARGET is undefined, these targets are added to the list of targets for the specified architecture. For all targets `SRC_C[C]` files must be defined separately.

`TEST_KERNEL_ARGS`

Arguments to append to the kernel command line. These are also appended when specifying custom ones via a .t-file's -f parameter or when using -d.

`TEST_EXPECTED`

File containing expected output. By default the variable is empty, which means the test binary is expected to produce TAP test output, that can be directly processed. When the `TEST_TAP_PLUGINS` variable is given, `TEST_EXPECTED` is ignored.

`TEST_EXPECTED_REPEAT`

Number of times the expected output should be repeated, by default 1. When set to 0 then output is expected to repeat forever. This is particularly useful to make sure that stress tests that are meant to run in an endless loop are still alive. Note that such endless tests can only be run by directly executing the test script. They will be skipped when run in a test harness like `prove`.

TEST_TAP_PLUGINS

Specify the plugins that are used to process the output of the test run. The syntax is of the values is:

plugin1:arg1=a,arg2=b plugin2:arg=foo

Multiple plugins separated by a space are loaded in order. Spaces are not allowed inside a plugin specification. One or more arguments are optionally passed to the plugin separated by commas and delimited by a colon.

If the variable is not specified the plugins for TAPOutput and OutputMatching (depending on the TEST_EXPECTED variable) are automatically loaded.

For the supported plugins and their options please refer to their in-line documentation in tool/lib/L4/TapWrapper/↩ Plugin/. The plugin name corresponds to the file stem name in that directory.

TEST_TIMEOUT

Non-standard timeout after which the test run is aborted (useful for tests involving sleep).

NED_CFG

LUA configuration file for startup to give to Ned

REQUIRED_MODULES

Additional modules needed to run the test. By adding `[opts]` to the name of a module you can add module options that are reflected in the generated modules.list.

BOOTSTRAP_ARGS

Additional parameters to supply to bootstrap.

QEMU_ARGS

Additional parameters to supply to QEMU.

MOE_ARGS

Additional parameters to supply to moe.

TEST_ARGS

Additional arguments for the TEST_STARTER (tapper-wrapper per default).

TEST_ROOT_TASK

Alternative root task to be used during a test instead of moe.

TEST_ROOT_TASK_ARGS

Arguments passed to TEST_ROOT_TASK if TEST_ROOT_TASK is different from moe.

KERNEL_CONF

Features the L4Re Microkernel must have been compiled with. A space-separated list of config options as used by Kconfig. `run_test` looks for a `globalconfig.out` file in the same directory as the kernel and checks that all options are enabled. If not, the test is skipped. Has only an effect if the `globalconfig.out` file is present.

L4RE_CONF

Features the L4Re userland must have been compiled with. A space-separated list of config options as used by Kconfig. `run_test` will look for these in the `.kconfig` file in the L4Re build directory.

L4LINUX_CONF

Features the L4Linux kernel must have been compiled with. Similar to KERNEL_CONF but checks for a `.config` file in the directory of the L4Linux kernel.

TEST_SETUP

Command to execute before the test is run. The test will only be executed if the command returns 0. If the exit code is 69, the test is marked as skipped with the reason provided in the final line of stdout.

TEST_LOGFILE

Append output of test execution to the given file unless TEST_WORKDIR is given.

TEST_WORKDIR

Create logs, temp and other files below the given directory. That directory is taken as base dir for more automatically created subdir levels using the current test path, in order to guarantee conflict-free usage when running many different tests with a common workdir. When TEST_WORKDIR is provided then TEST_↩ LOGFILE is ignored as it is organized below workdir.

TEST_TAGS

List of conditions for tags provided during execution of a test. A tag can be set to 1, set to 0 or be unspecified via TEST_RUN_TAGS during execution. Therefore there are 4 possible conditions for a tag that can be specified in TEST_TAGS: tag, !tag, +tag and -tag. The following table shows the conditions they represent.

TEST_RUN_TAGS \ TEST_TAGS	tag	!tag	+tag	-tag
tag or tag=1	y		y	
unspecified		y	y	
tag=0		y		y

Example usage:

The tag `long-running` is used by tests which take a long time and should be skipped by default. These tests are marked with the tag long-running unprefixed.

The tag `hardware` is set to 1 at runtime when the tests will run on real hardware. Tests that must not run on real hardware are marked with `!hardware`.

The tag `+impl-def` is used by tests that test implementation details. Due to the nature of this flag we require the "+" prefix to be used, so they are run by default but can be excluded from execution by setting TEST_RUN_TAGS to impl-def=0 at runtime.

If you want to specify multiple tag conditions they need to be separated with a comma.

TEST_PLATFORM_ALLOW **and** TEST_PLATFORM_DENY

Deny and allow lists of platforms a test is banned from or limited to. If you list platforms in the TEST_↩ PLATFORM_ALLOW variable the test will only be run on these listed platforms and will be skipped on any other platform. If you list platforms in the TEST_PLATFORM_DENY variable the test will be skipped on the listed platforms and will be run on any other platform. You can only use one of these variables per test, not both. See mk/platforms/ for the various identifiers.

Example usage:

```
# Do not run this test on the Raspberry Pi platform
TEST_PLATFORM_DENY_test_xyz := rpi

# Only run this test on this test on the RCar3 platform.
TEST_PLATFORM_ALLOW_test_abc := rcar3
```

TAPARCHIVE

Filename for an archive file to store the resulting TAP output.

In addition to compiled tests, it is also possible to create tests where the test binary or script comes from a different source. These tests must be listed in EXTRA_TARGET and for each target a custom TEST_TARGET must be provided.

Running Tests

The make role creates a test script which can be found in <builddir>/test/t/<arch>/<api>. It is possible to organise the tests further in subdirectories below by specifying a TEST_GROUP.

To be able to execute the test, a minimal test environment needs to be set up by exporting the following environment variables:

KERNEL_<arch>, KERNEL

L4Re Microkernel binary to use. The test runner is able to check if the kernel has all features necessary for the test and skip tests accordingly. In order for this to work, the globalconfig.out config file from the build directory needs to be available in the same directory as the kernel.

L4LX_KERNEL_<arch>, L4LX_KERNEL

L4Linux binary to use. This is only required to run tests in mode=l4linux. If no L4Linux kernel is set then these tests will simply be skipped. The test runner is also able to check if the kernel has all features compiled in that are required to run the test successfully (see make variable L4LINUX_CONF above). For this to work, the .config configuration file from the build directory needs to be available in the same directory as the kernel.

LINUX_RAMDISK_<arch>, LINUX_RAMDISK

Ramdisk to mount as root in L4Linux. This is only required to run tests in mode=l4linux. If not supplied, L4Linux tests will be skipped. The ramdisk must be set up to start the test directly after the initial startup is finished. The name of the test binary is supplied via the kernel command line option l4re_testprog. The tool/test directory contains an example script launch-l4linux-test. which can be copied onto the ramdisk and started by the init script.

TEST_HWCONFIG and TEST_FIASCOCONFIG

Some userland tests rely on external information about the underlying platform and the configuration of the L4Re Microkernel to decide whether or not to test specific features or to determine which and how much resources are available. Some examples for this are whether or not virtualization is supported by the platform, how many cores the platform has, how many cores the kernel supports or how much memory the platform provides. To convey this information to these tests you can set the two environment variables TEST_↩HWCONFIG and TEST_FIASCOCONFIG.

Using TEST_HWCONFIG requires a plain text document containing key-value pairs separated by a = symbol. On top of that comment lines starting with # are supported. Simply create a plain text file such as the following and set TEST_HWCONFIG to its absolute path.

```
VIRTUALIZATION=y
MP=y
NUM_CORES=4
MEMORY=2048
```

Using TEST_FIASCOCONFIG is easier since it only needs to contain the absolute path of the globalconfig.↩out file in the L4Re Microkernel's build directory. The build system will then extract the information when a test is started.

When starting a test the build system will read both files and provide their content as a lua table to the test. A ned script can then make decisions based on them. To simplify some decisions the build system merges some information by itself, e.g. virtualization is only available if both the platform and the L4Re Microkernel support this feature. More details can be obtain from the perl module in tool/lib/L4/TestEnvLua.pm.

In addition to these variables, the following BID variables can be overwritten at runtime: PT (for the plaform type) and TEST_TIMEOUT. You may also supply QEMU_ARGS and MOE_ARGS which will be appended to the parameters specified in the BID test make file.

Once the environment is set up, the tests can be run either by simply executing all of them from the build directory with

```
make test
```

or executing them directly, like

```
test/t/amd64_amdfam10/l4f/l4re-core/moe/test_namespace.t
```

or running one or more tests through the test harness prove, like

```
prove test/t/amd64_amdfam10/l4f/l4re-core/moe/test_namespace.t
prove -r test/t/amd64_amdfam10/l4f/l4re-core/
prove -rv test/t/amd64_amdfam10/l4f/l4re-core/
```

TEST_TAGS allow for a way to include or exclude whole groups of tests during execution, primarily with prove. You can specify which tests to run at runtime using one of the following ways:

```
$ test/t/amd64_amdfam10/l4f/l4re-core/test_one.t --run-tags slow,gtest-shuffle=0
$ test/t/amd64_amdfam10/l4f/l4re-core/test_one.t -T slow,gtest-shuffle=0
$ prove -r test/t/amd64_amdfam10/l4f/l4re-core/ :: -T slow,gtest-shuffle=0
$ TEST_RUN_TAGS=slow,gtest-shuffle=0 prove -r test/t/amd64_amdfam10/l4f/l4re-core/
```

For each test tag requirements defined in the corresponding TEST_TAGS Makefile variable are tested. If the requirements for tags do not match the test is skipped. The SKIP message will provide insight why the test was skipped:

```
$ make test
...
test/t/amd64_amdfam10/test_one.t .... ok
test/t/amd64_amdfam10/test_two.t .... skipped: Running this test requires tag slow to be set to 1.
test/t/amd64_amdfam10/test_three.t .. ok
```

When tags are provided, the tests requiring those tags are now also executed while the tests that forbid them are skipped:

```
$ TEST_RUN_TAGS=slow,gtest-shuffle
$ make test
...
test/t/amd64_amdfam10/test_one.t .... ok
test/t/amd64_amdfam10/test_two.t .... ok
test/t/amd64_amdfam10/test_three.t .. skipped: Running this test requires tag gtest-shuffle to be set to 0 or
```

For further details on how values in TEST_TAGS and TEST_RUN_TAGS interact, see the help text for TEST_TAGS.

Running Tests in External Programs

You can hand-over test execution to an external program by setting the environment variable `EXTERNAL_TEST↩_STARTER` to the full path of that program:

```
export EXTERNAL_TEST_STARTER=/path/to/external/test-starter
make test
```

`EXTERNAL_TEST_STARTER`

This variable is evaluated by `tool/bin/run_test` (the backend behind `make test`) and contains the full path to the tool which actually starts the test instead of the test itself.

The `EXTERNAL_TEST_STARTER` can be any program instead of the default execution via `make qemu E=maketest`. Its output is taken by `run_test` as the test output.

Usually it is just a bridge to prepare the test execution, e.g., it could create the test as image and start that image via a simulator.

Running Tests in a Simulator

Based on above mechanism there is a dedicated external test starter `tool/bin/teststarter-image-telnet.↩pl` shipped in BID which assumes an image to be started with another program which provides test execution output on a network port.

This can be used to execute tests in a simulator, like this:

```
export EXTERNAL_TEST_STARTER=$L4RE_SRC/tool/bin/teststarter-image-telnet.pl
export SIMULATOR_START=/path/to/configured/simulator-exe
make test
```

After building the image and starting the simulator it contacts the simulator via a network port (sometimes called "telnet" port) to pass-through its execution output as its own output so it gets captured by `run_test` as usual.

The following variables control `teststarter-image-telnet.pl`:

SIMULATOR_START

This points to the full path of the program that actually starts the prepared test image. Most often this is the frontend script of your simulator environment which is pre-configured so that it actually works in the way that `teststarter-image-telnet.pl` expects from the following settings.

SIMULATOR_IMAGETYPE

The image type to be generated via `make $SIMULATOR_IMAGETYPE E=maketest`. Default is `elfimage`.

SIMULATOR_HOST

The simulator will be contacted via socket on that host to read its output. Default is `localhost`.

SIMULATOR_PORT

The simulator will be contacted via socket on that port to read its output. Default is `11111`.

SIMULATOR_START_SLEEPTIME

After starting the simulator it waits that many seconds before reading from the port. Default is `1` (second).

Running tests without tapper-wrapper

In case you want to replace the tapper-wrapper test starter, you can replace the default one by setting the environment variable `TEST_STARTER` to the path of your test starter. Then your test starter can use the same environment which is normally set up for the default starter, which includes environment variables provided by the build system as well as the test itself. Among these are `SEARCHPATH`, `MODE`, `ARCH`, `MOE_CFG`, `MOE_ARGS`, `TEST_TIMEOUT`, `TEST_TARGET`, `TEST_EXPECTED`, `QEMU_ARGS` and many more.

Debugging Tests

The test script is only a thin wrapper that sets up the test environment as it was defined in the make file and then executes two scripts: `tapper-wrapper` and `run_test`.

The main work horse of the two is `tool/bin/run_test`. It collects the necessary files and starts qemu to execute the test. This script is always required.

There is then a second script wrapped around the test runner: `tool/bin/tapper-wrapper`. This tool inspects the output of the test runner and reformats it, so that it can be read by tools like `prove`. If the test produces tap output, then the script scans for this output and filters away all the debug output. If `TEST_EXPECTED` was defined, then the script scans the output for the expected lines and prints a suitable TAP message with success or failure. It also makes sure that qemu is killed as soon as the test is finished.

There are a number of command-line parameters that allow to quickly change test parameters for debugging purposes. Run the test with '–help' for more information about available parameters.

3.13 Kernel Factory

The kernel factory is a kernel object that provides the ability to create new kernel objects dynamically.

The kernel factory enforces a memory quota. This quota defines the maximum amount of kernel memory the factory service can use to construct the requested objects. When the quota is depleted, the factory refuses the creation of new objects.

The quota may be higher than the amount of available kernel memory; ultimately, the amount of available kernel memory is the strict limit for the factory to remain operational.

The kernel factory creates the following kinds of objects:

- DMA space
- L4::Factory
- L4::Ipc_gate (L4_PROTO_NONE, L4_PROTO_KOBJECT)
- L4::Irq (L4_PROTO_IRQ_SENDER)
- L4::Semaphore
- L4::Task
- L4::Thread
- L4::Vm
- L4::Vcpu_context

The protocol IDs for objects in this list are given in L4_msgtag_protocol. Kernel objects whose protocol ID is not immediately clear from the documentation of L4_msgtag_protocol have their protocol IDs stated within parenthesis. As an exception, L4::Ipc_gate can be identified by more than one protocol IDs. The protocol ID shall be used as the second argument for L4::Factory.create(Cap<void>, long, l4_utcb_t *).

For the C++ interface see L4::Factory, for the C interface see Factory.

3.13.1 Passing parameters for the create stream

L4::Factory.create() returns a create stream that allows arguments to be forwarded to the constructor of the object to be created.

Objects that support additional parameters on their creation are presented with a non-empty list of parameters. The parameters are listed in the order they should be provided to a create stream returned by L4::Factory.create().

- Dmar_space()
- L4::Factory(l4_umword_t)
  - Argument: factory quota (in bytes).
  - See L4::Factory.create_factory() for details.
- L4::Ipc_gate()
  - Creates an unbound IPC gate.
  - Alternatively, an IPC gate can be immediately bound to a thread upon creation using L4::Factory.create_gate().

- L4::Irq()
- L4::Semaphore()
- L4::Task(l4_fpage_t)
  - Argument: utcb_area
  - See L4::Factory.create_task() for details.
- L4::Thread()
- L4::Vm()
- L4::Vcpu_context()

Chapter 4

L4Re Servers

Here you shall find a quick overview over the standard services running on the L4Re Microkernel.

Sigma0, the Root Pager

Sigma0 is a special server running on L4 because it is responsible of resolving page faults for the root task, the first useful task on L4Re. Sigma0 can be seen as part of the kernel, however it runs in unprivileged mode. To run something useful on the L4Re Microkernel you usually need to run Sigma0, nevertheless it is possible to replace Sigma0 by a different implementation.

For more details see Sigma0, the Root-Pager

Moe, the Root Task

Moe is our implementation of the L4 root task that is responsible for bootstrapping the system, and to provide basic resource management services to the applications on top. Therefore Moe provides L4Re resource management and multiplexing services:

- **Memory** in the form of memory allocators (L4Re::Mem_alloc, L4::Factory) and data spaces (L4Re::Dataspace)
- **Cpu** in the form of basic scheduler objects (L4::Scheduler)
- **Vcon** multiplexing for debug output (output only)
- **Virtual memory management** for applications, L4Re::Rm

Moe further provides an implementation of L4Re name spaces (L4Re::Namespace), which are for example used to provide a read only directory of all multi-boot modules. In the case of a boot loader, like grub that enables a VESA frame buffer, there is also a single instance of an L4Re graphics session (L4Re::Goos).

To start the system Moe starts a single ELF program, the init process. The init process (usually Ned, see the next section) gets access to all resources managed by Moe and to the Sigma0 root pager interface.

For more details see Moe, the Root-Task.

Ned, the Default Init Process

To keep the root task free from complicated scripting engines and to avoid circular dependencies in application startup (that could lead to dead locks) the configuration and startup of the real system is managed by an extra task, the init process.

Ned is such an init process that allows system configuration via Lua scripts.

For more information see Ned.

Io, the Platform and Device Resource Manager

Because all peripheral management in L4Re is done in user-level applications, there is the need to have a centralized management of the resources belonging to the platform and to peripheral devices.

This is the job of Io. Io provides portable abstractions for iterating and accessing devices and their resources (IRQ's, IO Memory...), as well as delegating access to those resources to other applications (e.g., device drivers).

For more details see Io, the Io Server.

Other Servers

The following additional server package are available on top of the core L4Re environment.

- Rtc, the Real-Time Clock Server

  is a simple multiplexer for real-time clock hardware on your platform.

- fb-drv, the Low-Level Graphics Driver

  provides low-level access and initialization of various graphics hardware. It has support for running VESA BIOS calls on Intel x86 platforms, as well as support for various ARM display controllers. `fb-drv` provides a single instance of the L4Re::Goos interface and can serve as a back end for the Mag server, in particular, if there is no graphics support in the boot loader.

- Virtio Net P2P, a virtual network point-to-point link
- Virtio Net Switch, a virtual network switch
- Uvmm, the virtual machine monitor
- RTC driver
- Mag, the GUI Multiplexer
- Sigma0, the Root-Pager
- Cons, the Console Multiplexer

4.1 Sigma0, the Root-Pager

Sigma0 is a special L4 server that serves as the origin for mapping memory.

It is started by the Fiasco kernel on system boot and gets full access to all userland RAM and device memory. It functions as the pager (main memory provider) for Moe and as the provider for device memory for Io. Moe and Io are trusted and usually the only applications besides Ned that get a capability for Sigma0. Memory can be requested from Sigma0 directly via an IPC, or indirectly by causing page faults and having them resolved by Sigma0.

4.1.1 Factory

There is only one instance of Sigma0 in an L4Re system, which is made accessible to Moe via an IPC gate capability. Using this capability, Moe can request Sigma0 to create new communication channels to itself by creating additional IPC gate capabilities. This request is done using the L4::Factory interface. This is the only kind of object that can be created by the factory in Sigma0.

List of objects that the Sigma0 Factory can create:

- Sigma0 ()
  - Use protocol id L4_PROTO_SIGMA0 for creation
  - No arguments supported

Sigma0 API

4.2 Moe

4.2.1 Description

Moe is the default root-task implementation for L4Re-based systems.

Moe is the first task which is usually started in L4Re-based systems. The microkernel starts *Moe* as the Root-Task.

4.2.2 Moe objects

Moe provides a default implementation for the basic L4Re abstractions, such as data spaces (L4Re::Dataspace), region maps (L4Re::Rm), memory allocators (L4::Factory, L4Re::Mem_alloc), name spaces (L4Re::Namespace) and so on (see L4Re Interface). These are described in the following subsections.

4.2.2.1 Factory

The factory in Moe is responsible for all kinds of dynamic object allocation.

Moe's factory allows allocation of the following objects:

- L4Re::Namespace
- L4Re::Dataspace, RAM allocation
- L4Re::Dma_space, memory management for DMA-capable devices
- L4Re::Rm, virtual memory management for application tasks
- L4::Vcon (output only)
- L4::Scheduler, to provide a restricted priority / CPU range for clients
- L4::Factory, to provide a quota limited allocation for clients

Note

Creating L4::Scheduler objects requires the *scheduler* permission of the factory (see Factory configuration). By default only the factory that Moe provides to the initial application holds this permission.

4.2.2.1.1 Passing parameters to the create stream

L4::Factory.create() returns a create stream that allows arguments to be forwarded to the object creation in Moe.

4.2.2.1.2 Factory configuration

Every factory in Moe carries a configuration that determines the physical memory the factory may hand out and the operations it is allowed to perform. The configuration of the root factory, which Moe provides to the init process, is set with the `--root-factory` command line option. The configuration of a sub-factory is provided when creating the factory.

A configuration consists of a list of physical memory regions and a set of permissions. It is described by the following arguments:

- `untyped=<size>@<base>`, or short `ut=<size>@<base>`

  Adds an untyped memory region. Untyped memory backs ordinary dataspace allocations of a factory. Additionally, moe's internal allocations are governed by the untyped memory of the root factory. If any regions were specified on the root factory, at least one untyped region must be present.

- `typed=<name>=<size>@<base>`, or short `t=<name>=<size>@<base>`

  Adds a typed memory region named `<name>`. Typed memory is never used for ordinary allocations. It is handed out only to clients that request it explicitly by passing `type=<name>` when creating a dataspace. The name must consist of alphanumeric characters only and must not be longer than 23 characters. Multiple regions may carry the same name, in which case they form a single pool.

- `allow=<permissions>`, or short `a=<permissions>`

  Grants permissions to the factory. `<permissions>` is a string built from the following characters:

  - `p`: *Physical address constraints* permission — the factory may create sub-factories that specify their own memory regions.
  - `d`: *DMA constraints* permission — the factory may constrain allocations by a DMA mask.
  - `s`: *Scheduler* permission — the factory may create L4::Scheduler proxy objects.

  This argument must be given at most once.

`<size>` and `<base>` are unsigned numbers, written either in decimal, in hexadecimal with a `0x` prefix or in octal with a leading `0`. Both may carry a single `K`, `M` or `G` suffix, which multiplies the value by 1024, 1024^2 or 1024^3 respectively.

`<size>` must not be zero and a region must not extend beyond the end of the physical address space. Regions carrying the same name must neither overlap nor exceed the number of 15 regions per configuration. Adjacent regions of the same name are merged.

The configuration of a sub-factory must be covered by the configuration of the factory that creates it:

- Specifying any memory region requires the *physical address constraints* permission in the creating factory.
- Each specified region must be contained in a region of the creating factory.
- Only permissions held by the creating factory can be granted.

If a sub-factory does not specify any memory region, it inherits the untyped regions of the creating factory. Likewise, a root factory that does not specify any memory region get's all memory of the system as untyped memory. Typed regions and permissions are never inherited implicitly.

Namespace

Moe provides a name space conforming to the L4Re::Namespace interface (see Namespace. Per default Moe creates a single name space for the Boot FS. That is available as `rom` in the initial objects of the init process.

4.2.2.1.3 Boot FS

The Boot FS subsystem provides access to the files loaded during the platform boot (or available in ROM). These files are either linked into the boot image or loaded via a flexible boot loader, such as GRUB.

The subsystem provides an L4Re::Namespace object as directory and an L4Re::Dataspace object for each file.

By default all files are read only and visible in the namespace *rom*. As an option, files can be supplied with the argument `:rw` to mark them as writable modules. Moe will allow read and write access to these dataspaces and make them visible in a different namespace called *rwfs*.

An example entry in 'modules.list' would look like this:

```
module somemodule :rw
```

Note

In order for a client to receive write permissions to the dataspace, the corresponding cap also needs write permissions.

4.2.3 Capabilities

- `svr`

  Server Capability of application. Endpoint for IPC calls

  Mandatory capability.

4.2.4 Command Line Options

- `--debug=<flags>`

  This option enables debug messages from Moe itself.

  Multiple Flags in one string separated through '|', '+' or ','.

  Possible values for `<flags>` are

  - info
  - warn
  - boot
  - server
  - exceptions
  - loader
  - ns
  - all

- `--init=<init_process>`

  This options allows to set the init process binary.

  String value.

  Default: `rom/ned`

- `--root-factory=<config>`

  This option provides the configuration of the root factory, that is the physical memory regions the factory may allocate from and the permissions it holds. The value is a comma separated list of configuration arguments, see Factory configuration.

  At least one untyped memory region must be specified. Note that no permission is granted implicitly, in particular `allow=s` is required to let the init process create L4::Scheduler proxy objects.

  The option must be given at most once and is mutually exclusive with the `--brk` option.

  Example: `--root-factory=ut=256M@0x40000000,t=vram=16M@0x80000000,a=ps`

  If the option is not given, the root factory may allocate from the whole physical address space and holds the *scheduler* permission.

  String value.

- `--l4re-dbg=<flags>`

  This option allows to set the debug options for the L4Re runtime environment of the init process.

  Multiple Flags in one string separated through '|', '+' or ','.

  Possible values for `<flags>` are

  - info
  - warn
  - boot
  - server
  - exceptions
  - loader
  - ns
  - all

- `--ldr-flags=<flags>`

  This option allows setting some loader options for the L4Re runtime environment.

  Multiple Flags in one string separated through '|', '+' or ','.

  Possible values for `<flags>` are

  - pre_alloc
  - all_segs_cow
  - pinned_segs

- `--brk=<address>`

  This option is only present on systems without MMU. It restricts dynamic allocations to addresses equal or higher than `<address>`. Use it to prevent moe from allocating memory in regions that shall later be used by other applications or virtual machines.

  This option is obsolete and only kept for backwards compatibility. Use the `--root-factory` option instead, which is mutually exclusive with this option.

  Hexadecimal number without '0x' prefix.

- `-- <init_options>`

  All command-line parameters after the special `--` option are passed directly to the init process.

4.2.5 Namespace

Call: `create(L4.Proto.Namespace)`

4.2.6 Dataspace

Dataspaces can be allocated with an arbitrary size. The granularity for memory allocation however is the machine page size (L4_PAGESIZE). A dataspace user must be aware that, as a result of this page-size granularity, there may be padding memory at the end of a dataspace which is accessible to each client. Moe currently allows most dataspace operations on this padding area. Nonetheless, the client must not make any assumptions about the size or content of the padding area, as this behaviour might change in the future.
The provided data spaces can have different characteristics:

- Physically contiguous and pre-allocated
- Non contiguous and on-demand allocated with possible copy on write (COW)

Dataspaces allocated via the Moe's factory allow mappings with any combination of the read-write-execute (RWX) rights, subject to a possible restriction of the writable right for client capabilities lacking the 'W' right.
The physical memory backing a dataspace is taken from the memory regions of the factory the dataspace is created by, see Factory configuration. By default the untyped regions of the factory are used. The optional `type` argument selects the typed regions of the given name instead.
Allocations can be further constrained to a range of physical addresses, as required by devices with a limited DMA addressing capability. Use `L4Re::Mem_alloc::Dma_mask()` to construct the `flags` value that restricts the allocation to physical addresses that fit into the given number of bits. Together with the `L4Re::Mem_alloc::Invert_dma_mask` flag the allocation is restricted to the addresses above that limit instead. Both require the `Continuous` flag to be set and the *DMA constraints* permission of the factory (see Factory configuration), otherwise the allocation is rejected with -L4_EPERM. A DMA mask of less than L4_PAGESHIFT bits is rejected with -L4_EINVAL.
Call: `create(L4.Proto.Dataspace, size [, flags, align, base, type])`

- `size`

  Size in bytes.

  Numerical value.

- `flags`

  Special dataspace properties

  Bitmap of length 4 with the single bits holding the following meaning:

  - 0x01: Continuous Allocate physically contiguous memory.
  - 0x02: Pinned Deprecated, use L4Re::Dma_space instead.
  - 0x04: Super pages Allocate super pages.
  - 0x08: Fixed physical Address Allocate at fixed physical address. Only honored on no-MMU systems. Will fail on MMU systems.

- `align`

  Log2 alignment of dataspace if supported by allocator

  Numerical value.

- `base`

  Physical base address of the dataspace. Only consumed if the `Fixed physical Address` flag is set. The requested address range must be covered by the memory regions of the factory.

  Numerical value.

- `type`

  Allocate from typed memory. The argument is the string `type=<name>`, where `<name>` refers to the typed memory regions of the factory. Without this argument the dataspace is allocated from untyped memory.

  String value.

4.2.7 DMA space

Call: `create(L4.Proto.Dma_space)`

4.2.8 Region Map

Call: `create(L4.Proto.Rm)`

4.2.9 Virtual console

The logging facility of Moe provides per application tagged and synchronized log output.
Call: `create(L4.Proto.Log [, label, "color=(string|int)"])`

- `label`
  Label used as prefix for the console output.
  String value.
- `"color=(string|int)"`
  Color of client's output
  The Value for this parameter can be one of the following:
  - `string`
    Define the color by the first character of the given string
    Possible values are
    - `n`: gray
    - `r`: red
    - `g`: green
    - `y`: yellow
    - `b`: blue
    - `m`: magenta
    - `c`: cyan
    - `w`: white
    - `N`: black
    - `R`: light red
    - `G`: light green
    - `Y`: light yellow
    - `B`: light blue
    - `M`: light magenta
    - `C`: light cyan
    - `W`: bright white
  - `int`
    Define the color by integer.
    Possible values are
    - `0`: gray
    - `1`: red
    - `2`: green
    - `3`: yellow
    - `4`: blue
    - `5`: magenta
    - `6`: cyan
    - `7`: white
    - `8`: black
    - `9`: light red
    - `10`: light green
    - `11`: light yellow
    - `12`: light blue
    - `13`: light magenta
    - `14`: light cyan
    - `15`: bright white

  Default: `white`

4.2.10 Scheduler

The scheduler subsystem provides a simple scheduler proxy for scheduling policy enforcement.
The priority offset provided on the creation of a scheduler proxy defines the minimum priority assigned to threads which are scheduled by that instance of the scheduler proxy. The offset is implicitly added to priorities provided to L4::Scheduler.run_thread().
Call: `create(L4.Proto.Scheduler, limit, offset [, bitmap])`

- `limit`

  Maximum priority.

  Numerical value.

- `offset`

  Priority offset.

  Numerical value.

- `bitmap`

  Bitmap of CPUs - can be repeated to address higher order CPUs

  Numerical value.

4.2.11 Factory

Creates a sub-factory with a restricted quota and, optionally, a restricted factory configuration.
The configuration of the sub-factory must be covered by the configuration of the factory that creates it. Otherwise the creation fails with -L4_EPERM. Malformed configuration arguments are rejected with -L4_EINVAL.
If no memory region is specified, the sub-factory inherits the untyped memory regions of the creating factory. Typed memory regions and permissions are never inherited implicitly.
Call: `create(L4.Proto.Factory [, quota, config])`

- `quota`

  Limit in bytes. The limit is deducted from the limit of the factory that creates the new factory.

  Numerical value.

  - Must not be zero.

- `config`

  Factory configuration argument, either `untyped=<size>@<base>`, `typed=<name>=<size>@<base>` or `allow=<permissions>` - can be repeated to provide multiple arguments.

  String value.

4.3 Ned, the Init Process

Ned's job is to bootstrap the system running on L4Re.
The main thing to do here is to coordinate the startup of services and applications as well as to provide the communication channels for them. The central facility in Ned is the Lua (`http://www.lua.org`) script interpreter with the L4Re and ELF-loader bindings.
The boot process is based on the execution of one or more Lua scripts that create communication channels (IPC gates), instantiate other L4Re objects, organize capabilities to these objects in sets, and start application processes with access to those objects (or based on those objects).
For starting applications, Ned depends on the services of Moe or another *loader*, which must provide data spaces and region maps. Ned also uses the 'rom' capability as source for Lua scripts and at least the 'l4re' binary (the runtime environment core) running in each application.
Each application Ned starts is equipped with an L4Re::Env environment that provides information about all the initial objects made accessible to this application.

4.3.1 Lua Bindings for L4Re

Ned provides various bindings for L4Re abstractions. These bindings are located in the 'L4' package (`require "L4"`).

4.3.1.1 Tutorial

For a verbose example using the Ned Lua bindings, see tutorial.lua.

4.3.1.2 Capabilities in Lua

Capabilities are handled as normal values in Lua. They can be stored in normal variables or Lua compound structures (tables). A capability in Lua possesses additional information about the access rights that shall be transferred to other tasks when the capability is transferred. To support implementation of the Principle of Least Privilege, minimal rights are assigned by default. Extended rights can be added using the method `mode("...")` (short `m("...")`) that returns a new reference to the capability with the given rights.

Note

It is generally impossible to elevate the real access rights to an object. This means that if Ned has only restricted rights to an object it is not possible to upgrade the access rights with the `mode` method.

The capabilities in Lua also carry dynamic type information about the referenced objects. They thereby provide type-specific operations on the objects, such as the `create` operation on a generic factory or the `query` and `register` operations on a name space.

4.3.1.3 Access to L4Re::Env Capabilities

The initial objects provided to Ned itself are accessible via the table `L4.Env`. The default (usually unnamed) capabilities are accessible as `factory`, `log`, `mem_alloc`, `parent`, `rm`, and `scheduler` in the `L4.Env` table.

4.3.1.4 Constants

Protocols

The protocol constants are defined by default in the L4 package's table `L4.Proto`. The definition is not complete and only covers what is usually needed to configure and start applications. The protocols are for example used as first argument to the `Factory:create` method.

```
Proto = {
  Dataspace = 0x4000,
  Namespace = 0x4001,
  Goos      = 0x4003,
  Mem_alloc = 0x4004,
  Rm        = 0x4005,
  Event     = 0x4006,
  Inhibitor = 0x4007,
  Sigma0    = -6,
  Log       = -13,
  Scheduler = -14,
  Factory   = -15,
  Vm         = -16,
  Dma_space  = -17,
  Irq_sender = -18,
  Semaphore  = -20,
  Iommu      = -22,
  Ipc_gate  = 0,
}
```

Rights

The rights of a Lua capability can be defined in two ways via the `:mode()` interface. Either via a string representation of the rights or via an integer value. An example for the former is `:mode("rsnc")` while the latter equivalent is `:mode(L4.Rights.r | L4.Rights.s | L4.Rights.n | L4.Rights.c)`. The following listing shows the integer constants. The constant names can be used in the string parameter to `:mode()`.

```
Rights = {
  s   = 2,
  w   = 1,
  r   = 4,
  d   = 8,
  n   = 16,
```

```
  c   = 32,
  ro  = 4,
  rw  = 5,
  rws = 7,
}
```

Debugging Flags

Debugging flags used for the applications L4Re core:

```
Dbg = {
  Info       = 1,
  Warn       = 2,
  Boot       = 4,
  Server     = 0x10,
  Exceptions = 0x20,
  Cmd_line   = 0x40,
  Loader     = 0x80,
  Name_space = 0x400,
  All        = 0xffffffff,
}
```

Loader Flags

Flags for configuring the loading process of an application.

```
Ldr_flags = {
  eager_map    = 0x1, -- L4RE_AUX_LDR_FLAG_EAGER_MAP
  all_segs_cow = 0x2, -- L4RE_AUX_LDR_FLAG_ALL_SEGS_COW
  pinned_segs  = 0x4, -- L4RE_AUX_LDR_FLAG_PINNED_SEGS
}
```

4.3.1.5 Application Startup Details

The central facility for starting a new task with Ned is the class `L4.Loader`. This class provides interfaces for conveniently configuring and starting programs. It provides three operations:

- `new_channel()` Returns a new IPC gate that can be used to connect two applications
- `start()` and `startv()` Start a new application process and return a process object

The `new_channel()` call is used to provide a service application with a communication channel to bind its initial service to. The concrete behavior of the object and the number of IPC gates required by a server depends on the server implementation. The channel can the be passed to client applications as well or can be used for operations within the script itself.
`start()` and `startv()` always require at least two arguments. The first one is a table that contains information about the initial objects an application shall get. The second argument is a string, which for `start()` is the program name plus a white-space-separated list of program arguments (argv). For `startv()` the second argument is just the program binary name – which may contain spaces –, and the program arguments are provided as separate string arguments following the binary name (allowing spaces in arguments, too). The last optional argument is a table containing the POSIX environment variables for the program.
The Loader class uses reasonable defaults for most of the initial objects. However, you can override any initial object with some user-defined values. The main elements of the initial object table are:

- `factory` The factory used by the new process to create new kernel objects, such as threads etc. This must be a capability to an object implementing the L4::Factory protocol and defaults to the factory object provided to Ned.
- `mem` The memory allocator provided to the application and used by Ned allocates data spaces for the process. This defaults to Ned's memory allocator object (see L4Re::Mem_alloc).
- `rm_fab` The generic factory object used to allocate the region-map object for the process. (defaults to Ned's memory allocator).
- `log_fab` The generic factory to create the L4Re::Log object for the application's output (defaults to Ned's memory allocator). The `create` method of the `log_fab` object is called with `log_tag` and `log_color`, from this table, as arguments.
- `log` A table with parameters passed to the `log_fab`:
  - The first item is a short string defining the tag used for tagging log output of this process (defaults to the program name).
  - The second item is a string defining the color used for the log tag and the log string (defaults to "white").

  - Further parameters might be evaluated by certain implementations of the L4Re::Log interface.

- `scheduler` The scheduler object used for the process' threads (defaults to Ned's own scheduler).
- `caps` The table with application-specific named capabilities (default is an empty table). If the table does not contain a capability with the name 'rom', the 'rom' capability from Ned's initial caps is inserted into the table.

Less frequently used parameters:

- `l4re_dbg` An integer value overriding the debug level of the ITAS used for this application. Default is 2 (Warn). See *Debugging Flags* above.
- `ldr_flags` An integer value for setting additional flags for attaching regions, see *Loader Flags* above.

The `start()` and `startv()` calls return a task object that supports a number of operations.

- `state()` returns a string with the current task state: "running" or "zombie" if the task has terminated. If the task was already reaped (`wait()` returned) or if `kill()` was called, then the function will return `nil`.
- `exit_code()` returns the exit code if the task has terminated or `nil` if it was either killed or has been reaped.
- `kill()` forcefully terminates the task. Returns "killed" if the task was terminated or the exit code if the task was already gone. Returns `nil` if the task was already reaped.
- `exit_handler(function)` registers a Lua function that is invoked when the task terminates. If the task has already terminated, the function is called immediately. Returns `true` if the callback is pending, otherwise `false`. The callback function gets the exit code (`nil` if killed) of the task as its only parameter. The return value of the function is ignored. Only one callback can be registered.
- `wait()` suspends execution until the task has terminated. It's better to use `exit_handler()` instead. While the Lua code executes `wait()`, no `exit_handler()` will be dispatched.

4.3.1.6 Reacting on task termination

Ned can react on the termination of child tasks. The preferred mechanism is to register an `exit_handler()` for a task:

```
task = L4.default_loader:start(...)
task:exit_handler(function(exit_code)
  if exit_code == nil then
    print("Task was killed")
  else
    print("Task has terminated w/ code [" .. exit_code .. "]")
  end
end)
```

If the task did already terminate then the callback is invoked immediately. It is also possible to suspend execution of the Ned script until a task has terminated:

```
task = L4.default_loader:start(...)
task:wait()
```

This method should be used with caution, though. The Ned script will wait until the child task has terminated. Neither will any of the registered `exit_handler()` be called during this time, nor will the remote command interface be able to execute commands.

4.3.1.7 Control scheduling

Scheduling of L4Re applications is controlled by creating scheduler proxies. The proxy restricts the threads of an application to run on a subset of the available CPUs and to set their minimum and maximum priority. Use the loader factory function to create the proxy and pass it to the application:

```
sched_proxy = L4.default_loader:create_sched_proxy{ cpus=L4.Cpu_set:new("0-3") }
L4.default_loader:start({ scheduler = sched_proxy }, ...)
```

The `create_sched_proxy` function takes the following table arguments. All arguments are optional:
`cpus`: Set of allowed CPUs. Default: all CPUs. `prio_offset`: Base priority of all threads. Default: `0`. `prio_limit`: Maximum priority of all threads. Default `priority + 10`. `fab`: Scheduler proxy factory capability. Default: loader `sched_fab`.
The `Cpu_set` constructor takes any number of CPU numbers or ranges:

```
Cpu_set:new()          -- all CPUs (because no argument was passed)
```

```
Cpu_set:new{}          -- empty CPU set (because an empty table was passed)
Cpu_set:new(42)        -- single CPU: 42
Cpu_set:new("0-3")     -- 4 CPUs: 0..3
Cpu_set:new{"0-3", 42} -- 5 CPUs: 0..3, 42
```

A limited number of operations are defined on CPU sets. To compute the union of two sets (all CPUs of both sets), use the | operator. To compute the intersection of two sets (all CPUs common to both sets), use the & operator.

4.3.1.8 Access to the kernel debugger

Applications can enrich the kernel debugger with information using the API defined in l4/sys/debugger. In order to do so, the developer has to assign access to the kernel debugger kernel object to the application. This can be done like this:

```
L4.default_loader:start({ caps = { jdb = L4.Env.jdb; }}, "rom/example")
```

4.3.1.9 Using the interactive ned prompt

Ned can be used in interactive mode by connecting the small ned-prompt helper tool to the command capability. Add the following code snippet at the end of your ned script:

```
local L4 = require("L4");
local l = L4.default_loader;

cmd = l:new_channel()

l:start({ log = L4.Env.log, caps = { svr = cmd} }, "rom/ned-prompt")

L4.server_loop(cmd)
```

The script hands in ned's own log capability to `ned-prompt`. This ensures that input and output of ned and the prompt appear on the same console.
`ned-prompt` needs to be added to your modules list.

4.3.2 Command Line Options

Ned's command line syntax is:

```
[--exit|--wait-and-exit] [--disable-backtracer-autoload] [--execute|-e STATEMENT] <lua script> [options passed
```

Ned interprets the first non-option argument `<lua script>` as the Lua script which it should load and run. All arguments following the first non-option argument are passed as arguments to the Lua script via Lua's global `arg` table.

- Exit Options: **exit**, **wait-and-exit** (must be first if used)
  - **exit**: terminates the application after the script has run through even if there are still tasks running. `wait` for tasks at the end of the script to ensure they do not die forcefully.
  - **wait-and-exit**: terminates the application after the script has run through and all tasks started by ned have signaled their exit.
- Execute Statement Option: **execute**, **e**

  Execute the Lua statement `STATEMENT`.
- **disable-backtracer-autoload**: Do not load the backtracer automatically.

4.4 Io, the Io Server

The Io server handles all platform devices and resources such as I/O memory, ports (on x86) and interrupts, and grants access to those to clients.
Upon startup Io discovers all platform devices using available means on the system, e.g. on x86 the PCI bus is scanned and the ACPI subsystem initialised. Available I/O resource can also be configured via configuration scripts.
Io's configuration consists of two parts:

- the description of the real hardware

- the description of virtual buses

Both descriptions represent a hierarchical (tree) structure of device nodes. Where each device has a set of resources attached to it. And a device that has child devices can be considered a bus.

Hardware Description

The hardware description represents the devices that are available on the particular platform including their resource descriptions, such as MMIO regions, IO-Port regions, IRQs, bus numbers etc.
The root of the hardware devices is formed by a system bus device (accessible in the configuration via Io.system↩_bus()). As mentioned before, platforms that support methods for device discovery may populate the hardware description automatically, for example from ACPI. On platforms that do not have support for such methods you have to specify the hardware description by hand. A simple example for this is `x86-legacy.devs`.

Virtual Bus Description

Each Io server client is provided with its own virtual bus which it can iterate to find devices. A virtual PCI bus may be a part of this virtual bus.

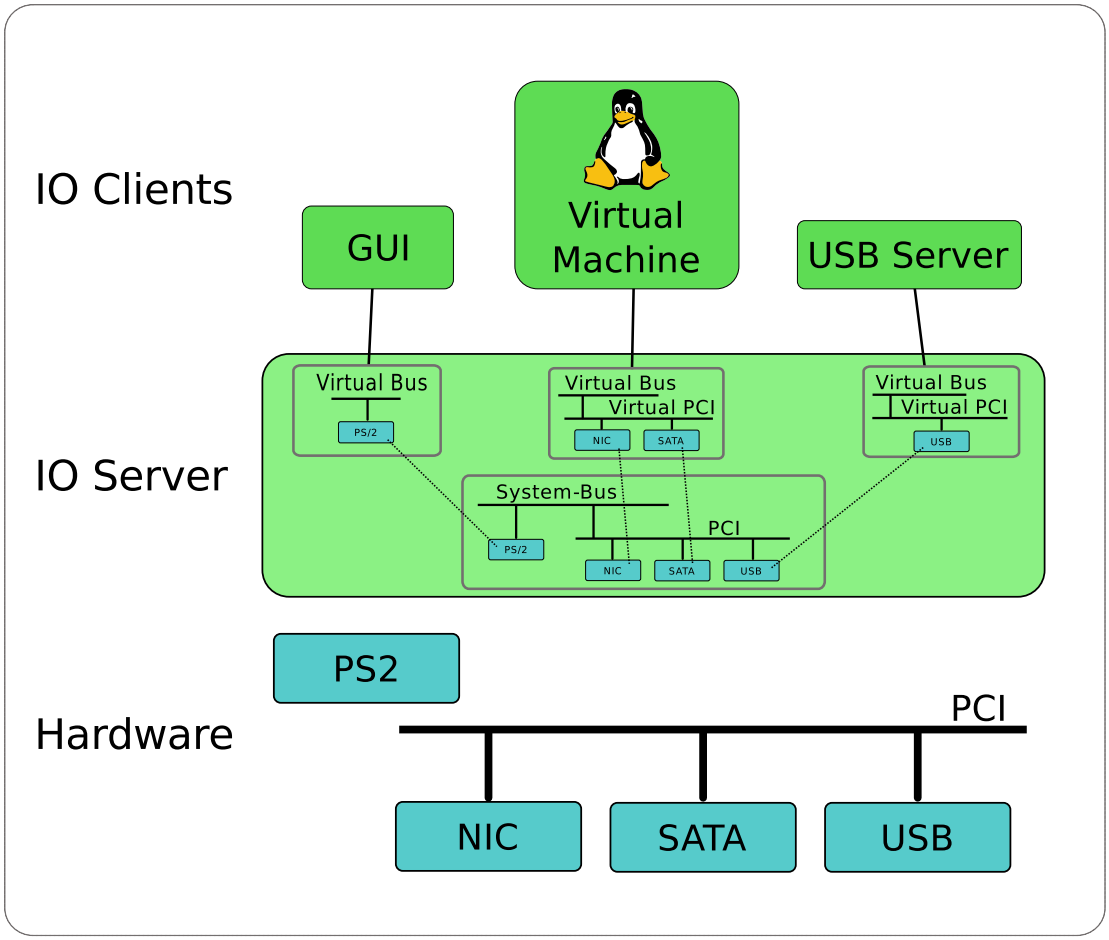

Figure 4.1 IO Service Architecture Overview

The Io server must be configured to create virtual buses for its clients.
This is done with at least one configuration file specifying static resources as well as virtual buses for clients. The configuration may be split across several configuration files passed to Io through the command line.
To allow clients access to available devices, a virtual system bus needs to be created that lists the devices and their resources that should be available to that client. The names of the buses correspond to the capabilities given to Io in its launch configuration.
A very simple configuration for Io could look like this:

```
-- vim:ft=lua
```

```
-- Example configuration for io

-- Configure two platform devices to be known to io
Io.Dt.add_children(Io.system_bus(), function()

  -- create a new hardware device called "FOODEVICE"
  FOODEVICE = Io.Hw.Device(function()
    -- set the compatibility IDs for this device
    -- a client tries to match against these IDs and configures
    -- itself accordingly
    -- the list should be sorted from specific to less specific IDs
    compatible = {"dev-foo,mmio", "dev-foo"};

    -- set the 'hid' property of the device, the hid can also be used
    -- as a compatible ID when matching clients
    Property.hid  = "dev-foo,Example";

    -- note: names for resources are truncated to 4 letters and a client
    -- can determine the name from the ID field of a l4vbus_resource_t
    -- add two resources 'irq0' and 'reg0' to the device
    Resource.irq0 = Io.Res.irq(17);
    Resource.reg0 = Io.Res.mmio(0x6f000000, 0x6f007fff);
  end);

  -- create a new hardware device called "BARDEVICE"
  BARDEVICE = Io.Hw.Device(function()
    -- set the compatibility IDs for this device
    -- a client tries to match against these IDs and configures
    -- itself accordingly
    -- the list should be sorted from specific to less specific IDs
    compatible = {"dev-bar,mmio", "dev-bar"};

    -- set the 'hid' property of the device, the hid can also be used
    -- as a compatible ID when matching clients
    Property.hid  = "dev-bar,Example";

    -- Specify that this device is able to use direct memory access (DMA).
    -- This is needed to allow clients to gain access to DMA addresses
    -- used by this device to directly access memory.
    Property.flags = Io.Hw_device_DF_dma_supported;

    -- note: names for resources are truncated to 4 letters and a client
    -- can determine the name from the ID field of a l4vbus_resource_t
    -- add three resources 'irq0', 'irq1', and 'reg0' to the device
    Resource.irq0 = Io.Res.irq(19);
    Resource.irq1 = Io.Res.irq(20);
    Resource.reg0 = Io.Res.mmio(0x6f100000, 0x6f100fff);
  end);
end);

Io.add_vbusses
{
-- Create a virtual bus for a client and give access to FOODEVICE
  client1 = Io.Vi.System_bus(function ()
    dev = wrap(Io.system_bus():match("dev-foo,mmio"));
  end);

-- Create a virtual bus for another client and give it access to BARDEVICE
  client2 = Io.Vi.System_bus(function ()
    dev = wrap(Io.system_bus():match("dev-bar,Example"));
  end);
}
```

Each device supports a 'compatible' property. It is a list of compatibility strings. A client matches itself against one (or multiple) compatibility IDs and configures itself accordingly. All other device members are handled according to their type. If the type is a resource (Io.Res) it is added as a named resource. Note that resource names are truncated to 4 letters and are stored in the ID field of a l4vbus_resource_t. If the type is a device it is added as a child device to the current one. All other types are treated as a device property which can be used to configure a device driver. Right now, device properties are internal to Io only.

Matching and Assigning PCI Devices

Assigning clients PCI devices could look like this:

```
-- This is a configuration snippet for PCI device selection

local hw = Io.system_bus();

Io.add_vbusses
{
  pciclient = Io.Vi.System_bus(function ()
    PCI = Io.Vi.PCI_bus(function ()
      pci_mm      = wrap(hw:match("PCI/CC_04"));
```

```
      pci_net     = wrap(hw:match("PCI/CC_02"));
      pci_storage = wrap(hw:match("PCI/CC_01"));
    end)
  end)
}
```

The "PCI/" is followed by a bus-specific ID string. The format of the PCI ID string may be one of the following:

- PCI/CC_cc
- PCI/CC_ccss
- PCI/CC_ccsspp
- PCI/VEN_vvvv
- PCI/DEV_dddd
- PCI/SUBSYS_ssssssss
- PCI/REV_rr
- PCI/ADR_xxxx:xx:xx.x

Where:

- `cc` is the hexadecimal representation of the class code byte
- `ss` is the hexadecimal representation of the subclass code byte
- `pp` is the hexadecimal representation of the programming interface byte
- `vvvv` is the hexadecimal representation of the vendor ID
- `dddd` is the hexadecimal representation of the device ID
- `ssssssss` is the hexadecimal representation of the subsystem ID
- `rr` is the hexadecimal representation of the revision byte
- `xxxx:xx:xx.x` is the bus address in PCI nomenclature

As a special extension Io supports replacing the ID string with a human-readable common PCI class name. The following table gives an overview of the names known to Io and their respective PCI class and subclass.

Common Name	Description	PCI ID string
storage	Mass storage controller	CC_01
scsi	SCSI storage controller	CC_0100
ide	IDE interface	CC_0101
floppy	Floppy disk controller	CC_0102
raid	RAID bus controller	CC_0104
ata	ATA controller	CC_0105
sata	SATA controller	CC_0106
sas	Serial attached SCSI controller	CC_0107
nvm	Non-volatile memory controller	CC_0108
-	-	-
network	Network controller	CC_02
ethernet	Ethernet controller	CC_0200
token_ring	Token ring network controller	CC_0201
fddi	FDDI network controller	CC_0202

Common Name	Description	PCI ID string
atm	ATM network controller	CC_0203
isdn	ISDN controller	CC_0204
picmg	PICMG controller	CC_0206
net_infiniband	Infiniband controller	CC_0207
fabric	Fabric controller	CC_0208
network_nw	Network controller e.g. Wifi	CC_0280
-	-	-
display	Display controller	CC_03
vga	VGA compatible controller	CC_0300
xga	XGA compatible controller	CC_0301
-	-	-
media	Multimedia controller	CC_04
mm_video	Multimedia video controller	CC_0400
mm_audio	Multimedia audio controller	CC_0401
telephony	Computer telephony device	CC_0402
audio	Audio device	CC_0403
-	-	-
bridge	Bridge	CC_06
br_host	Host bridge	CC_0600
br_isa	ISA bridge	CC_0601
br_eisa	EISA bridge	CC_0602
br_microchannel	MicroChannel bridge	CC_0603
br_pci	PCI bridge	CC_0604
br_pcmcia	PCMCIA bridge	CC_0605
br_nubus	NuBus bridge	CC_0606
br_cardbus	CardBus bridge	CC_0607
br_raceway	RACEway bridge	CC_0608
br_semi_pci	Semi-transparent PCI-to-PCI bridge	CC_0609
br_infiniband_to_pci	InfiniBand to PCI host bridge	CC_060a
-	-	-
com	Communication controller	CC_07
com_serial	Serial controller	CC_0700
com_parallel	Parallel controller	CC_0701
com_multiport_ser	Multiport serial controller	CC_0702
com_modem	Modem	CC_0703
com_gpib	GPIB controller	CC_0704
com_smart_card	Smart card controller	CC_0705
-	-	-
serial_bus	Serial bus controller	CC_0c
firewire	FireWire (IEEE 1394)	CC_0c00
access_bus	ACCESS bus	CC_0c01

Common Name	Description	PCI ID string
ssa	SSA	CC_0c02
usb	USB controller	CC_0c03
fibre_channel	Fibre channel	CC_0c04
smbus	SMBus	CC_0c05
bus_infiniband	InfiniBand	CC_0c06
ipmi_smic	IPMI SMIC interface	CC_0c07
sercos	SERCOS interface	CC_0c08
canbus	CAN bus	CC_0c09
-	-	-
wireless	Wireless controller	CC_0d
bluetooth	Bluetooth	CC_0d11
w_8021a	802.1a controller	CC_0d20
w_8021b	802.1b controller	CC_0d21

Strong Matching of PCI Devices

If more specific matching of PCI devices is required it is possible to concatenate multiple ID strings using `&`. An example where a specific device from a specific vendor at a fixed bus address is matched would use the string `PCI/VEN_vvvv&DEV_dddd&ADR_xxxx:xx:xx.x`.

Isolation of PCIe devices

PCIe encodes device communication with a network-like protocol with destination headers and packet fragmentation allowing a devices to talk directly to other devices. This potentially works against security boundaries for a system. E.g. two network cards could exchange packets and thereby leak information from one security domain to the other without involvement of the OS.
PCIe introduced an optional capability named PCI Access Control Services (PCI/ACS) to control communication between PCIe devices.
With PCI/ACS it is possible to restrict inter-device communication between PCIe devices.
PCI/ACS is optional and for Intel chipsets, it is usually only implemented on high-end PCI platform controller hubs (PCHs), and is missing on low-end and mobile PCHs. On some Intel-PCHs there exist facilities that allow for similar isolation.
If IO encounters a supported PCH, it will enable those facilities in order to enforce device isolation.

Command Line Options

The Io Server supports the following optional parameters:

```
[--verbose|v] [--transparent-msi] [--trace <trace_mask>] [--acpi-debug-level <debug_level>] [config_files]
```

- **verbose**|**v**

  By default, error debug messages are enabled. This option increments the verboseness level, and can be applied multiple times to reach the desired debug level. The available debug levels are ordered as: `DBG_ERR` (default, level 1), `DBG_WARN`, `DBG_INFO`, `DBG_DEBUG`, `DBG_DEBUG2` and `DBG_ALL` (level 6).

- **transparent-msi**

  Enable MSI on PCI devices which support this feature. This is transparent to clients, as there are no changes in the API used to interact with PCI device via interrupts.

- **acpi-debug-level** <**level_mask**>

  Set the ACPI debug level. The `<level_mask>` is a mask that selects components of interest for debugging. It can be constructed from the ACPI debug constants defined in the linux kernel, see ACPI Debug Output for details. By default, the ACPI debug level is set to `ACPI_LV_INIT | ACPI_LV_TABLES | ACPI_LV_VERBOSE_INFO`.

- **trace <trace_mask>**

  Enable tracing of events matching `trace_mask`. The only supported trace mask is `1` and this matches ACPI events.

- **config_files**

  Space separated list of Lua configuration files specifying real hardware and virtual buses. See example on Virtual Bus Description.

Vbus end points

The IO server provides access to the configured vbus via capabilities

- passed to IO as named capability during startup, the capability names have to match the name of the vbus they are supposed to provide access to.
- created using the factory protocol, which IO provides if a capability name svr is present in IOs capability space, e.g. using

  vbus = L4.cast(L4.Proto.Factory, io):create(0, "vbus=<vbus name>");

  in a ned script.

4.5 Virtio Net P2P, a virtual network point-to-point link

4.5.1 Description

The virtual network point-to-point server (p2p) connects two clients with a virtual network connection. It uses virtio as the transport mechanism. Each virtual network p2p endpoint implements the device-side of a virtio network device. Each client can access its endpoint using the driver-side semantics of a virtio network device.

4.5.2 Capabilities

- `dataspace`

  Trusted dataspaces

  Multiple capability names can be provided by the `-d <cap_name>`, `--register-ds <cap_name>` command line parameter.

- `svr`

  Server Capability of application. Endpoint for IPC calls

  Mandatory capability.

4.5.3 Command Line Options

The following command line options are supported:

- `-p <num_usec>`, `--poll <num_usec>`

  Enable polling mode and set the poll interval. IRQ notification is disabled for queues while in polling mode.

  Numerical value.

  - Must be a positive integer specified in microseconds.

- `-s <num>`, `--size <num>`

  Set the maximum queue size for the device-side virtio queues.

  Numerical value.

  - Must be a power of 2 in the range of 1 to 32768 inclusive.

  Default: `256`

- `-d <cap_name>, --register-ds <cap_name>`

  Register a trusted dataspace capability. If this option is used, it is not possible to communicate with the server via dataspaces other than the registered ones.

  Can be used multiple times.

  This command has the following side effects:

  – A capability with the given name is expected in the capability space of this task.

  String value.

4.5.4 Building and Configuration

The virtual network p2p server can be built using the L4Re build system by placing this project into the `pkg` directory.

4.5.5 Starting the service

The virtual network p2p server can be started with Lua like this:

```
local p2p = L4.default_loader:new_channel();
L4.default_loader:start(
{
  caps = {
    svr = p2p:svr(),
  },
},
"rom/l4vio_net_p2p [<options>]");
```

First an IPC gate (`p2p`) is created which is used between the virtual network p2p server and a client to create new virtual ports. The server-side is assigned to the mandatory `svr` capability of the virtual network p2p server. See the section below on how to create a new virtual port and connect a client to it.

4.5.6 Factory Options

4.5.6.1 Virtual p2p port

Prior to connecting a client to a virtual network p2p server port it has to be created using the following Lua function. It has to be called on the client side of the IPC gate capability whose server side is bound to the virtual network p2p server.
The "key=value" pairs passed to create() can be omitted and their order is not important.
Call: `create(0 [, "ds-max=<max>", "mac=<addr>"])`

- `"ds-max=<max>"`

  Specifies the upper limit of the number of dataspaces the client is allowed to register with the server for virtio DMA.

  Numerical value.

  – Must be in the range of 1 to 80 inclusive.

  Default: `2`

- `"mac=<addr>"`

  Specify the MAC address of the endpoint where `<mac_address>` is of the form xx:xx:xx:xx:xx:xx.

  String value.

  – Must be in the form xx:xx:xx:xx:xx:xx.

If the `create()` call is successful a new capability which references a virtual network p2p server port is returned. A client uses this capability to talk to the virtual network p2p server using the virtio network protocol.

4.5.7 Examples

A couple of examples on how to create ports with different properties are listed below.

```
-- two normal ports with at most 4 data spaces
net0 = p2p:create(0, "ds-max=4")
net1 = p2p:create(0, "ds-max=4")
-- normal port with 4 data spaces and MAC address
net0 = p2p:create(0, "ds-max=4", "mac=11:22:33:44:55:66")
```

4.6 Virtio Net Switch, a virtual network switch

4.6.1 Description

The virtual network switch connects multiple clients with a virtual network connection. It uses Virtio as the transport mechanism. Each virtual switch port implements the host-side of a Virtio network device (virtio-net).

4.6.2 Capabilities

- `dataspace`

  Trusted dataspaces

  Multiple capability names can be provided by the `-d <cap_name>`, `--register-ds <cap_name>` command line parameter.

- `svr`

  Server Capability of application. Endpoint for IPC calls

  Mandatory capability.

4.6.3 Command Line Options

In the example above the virtual network switch is started in its default configuration with a maximum of 5 virtual ports. To customize the configuration the virtual network switch accepts the following command line options:

- `-D <component=level>`, `--debug <component=level>`

  Configure individual debug levels per component. Verbosity increases from `quiet` up to `trace`.

  Can be used multiple times.

  Possible values for component are | `core`, `virtio`, `port`, `request`, `queue`, `packet`.

  Possible values for level are | `quiet`, `warn`, `info`, `debug`, `trace`.

- `-m`, `--mac`

  Ignored. Provided for compatibility with older switch versions.

  Flag. True if provided.

- `-M`, `--no-random-mac`

  Do not assign a random MAC address to ports by default. It is always possible to set an explicit MAC address by passing the `mac=` to the factory call, regardless of this option. If `-M` is passed and no `mac=` address was given, it is the responsibility of the Virtio driver to choose an appropriate address.

  Flag. True if provided.

- `-p <num>`, `--ports <num>`

  Set the maximum number of virtual ports.

  Numerical value.

  Default: `256`

- `-q`, `--quiet`

  Silence all output except for error messages.

  Flag. True if provided.

- `-s <num>`, `--size <num>`

  Set the maximum queue size for the device-side Virtio queues.

  Numerical value.

  – Must be a power of 2 in the range of 1 to 32768 inclusive.

  Default: `256`

- `-v`, `--verbose`

  Increase the global verbosity level. Individual levels per component can be set using the `-D` option.

  Can be used up to 3 times.

  Flag. True if provided.

- `-d <cap_name>`, `--register-ds <cap_name>`

  Register a trusted dataspace capability. If this option gets used, it is not possible to communicate with the server via dataspaces other than the registered ones. Can be used multiple times for multiple dataspaces.

  You need to ensure to add the dataspace capabilities to the named capabilities table with the same access rights as the clients will later register them, e.g.

  ```
  ...
    caps = {
      ...
      <cap_name> = vm_ram:m("rw"),
      ...
    },
  ...
  ```

  Can be used multiple times.

  This command has the following side effects:

  – A capability with the given name is expected in the capability space of this task.

  String value.

The virtual network switch can be setup to feature exactly one monitor port. All traffic passing through the switch is mirrored to the monitor port. The monitor port is read-only, and has no TX capability. An optional packet filter can be configured and implemented to filter data sent to the monitor port.

4.6.4 Configuration

Certain features of the virtual network switch are configurable at compile-time. Configuration is done through the build-time configuration of the L4Re build tree.

4.6.5 Starting the service

The virtual network switch can be started in Ned like this:

```
local switch = L4.default_loader:new_channel();
L4.default_loader:start(
{
  caps = {
    svr = switch:svr(),
  },
},
"rom/l4vio_switch");
```

First a communication channel (`switch`) is created which is used to create virtual network ports. It is connected to the switch component via its mandatory `svr` capability. See the section below on how to create a new virtual port and connect a client to it.

Hardware devices

To plug hardware devices into the switch, provide a Vbus capability with the name `vbus` when starting the switch. To use this feature, you have to enable the `VNS_IXL` config option.

4.6.6 Factory Options

4.6.6.1 Virtual switch port

First, a virtual network port has to be created using the following Ned-Lua function. It has to be called on the communication channel called `switch`, which has been created earlier.
Call: `create(0 [, "ds-max=<max>", "name=<name>", "type=<port type>", "vlan=(access=<vlan id>|trunk=<vlan id>[,<vlan id>]*)", "mac=<addr>"])`

- "ds-max=<max>"

  Specifies the upper limit of the number of dataspaces the client is allowed to register with the virtual network switch for Virtio DMA.

  Numerical value.

  - In the range of 1 to 80 inclusive

- "name=<name>"

  Sets the name of port in debug messages to <name>. A name may consist of at most 19 characters, all other characters are dropped. If there is enough space left, the name will get a postfix of "[<port number>]", e.g. "name=foo" -> foo[1].

  String value.

- "type=<port type>"

  Optionally specify the port type.

  Possible values for <port type> are

  - monitor: Monitor Port
  - none: Normal Port

  Default: none

- "vlan=(access=<vlan id>|trunk=<vlan id>[,<vlan id>]*)"

  Configure the port to participate in an IEEE 802.1Q compatible VLAN. Fundamentally there are two types of ports: access ports and trunk ports.

  The Value for this parameter can be one of the following:

  - "access=<vlan id>"

    Configures the port as access port for VLAN <vlan id> where the id must be a decimal number greater than 0 and less than 4095 in accordance to the standard. Packets on an access port belong to the configured VLAN and are only forwarded to ports that belong to the same VLAN or trunk ports that participate in the particular VLAN. The packets on this port will not have a VLAN tag attached to them so that a guest connected to this port does not see that the port is part of a VLAN.

    An optional monitor port will see packets from an access port as VLAN tagged packets with the <vlan id> given for the port.

    Numerical value.

    * In the range of 0 to 4095 exclusive

  - "trunk=<vlan id>[, <vlan id>]*"

    Configures the port as trunk port. It participates either in all VLANs, if specified by the keyword 'all', or in the list of VLANs given as comma separated list. There must be no whitespace in the list. Each id must be a decimal number greater than 0 and less than 4095 in accordance to the standard. Outgoing packets on this port will be tagged with an IEEE 802.1Q compatible tag. Incoming packets must be tagged with a VLAN tag from the given list. Packets that have no tag or a tag not in the vlan id list are dropped silently. They are not forwarded to the monitor port either. Currently there is no support for IEEE 802.1p. The PCP and DEI sub-fields in the TCI field will be set to zero on outgoing packets and are ignored for incoming packets.

    Numerical value.

- "mac=<addr>"

  Explicitly sets the MAC address of the port. It will be checked that no other port on the switch has the same address. It is the responsibility of the user to ensure the validity of the address and its global uniqueness, though.

  String value.

  - In form xx:xx:xx:xx:xx:xx

If the create() call is successful, a new capability which references a virtual switch port is returned. A client uses this capability to talk to the virtual network switch using the Virtio network protocol.

4.6.6.2 Interface for the switch statistics

The statistics interface is a privileged interface that allows the client to retrieve statistical information about all the virtual network ports of the switch. To create a statistics interface, use the factory interface on the communication channel called `switch`, which has been created earlier.
Call: `create(1)`
If the `create()` call is successful, a new capability which references a statistics interface is returned. A client uses this capability to retrieve statistical information about the switch.

4.6.7 Examples

Here are couple of examples on how to create ports with different properties:

```
-- normal port with at most 4 data spaces
net0 = switch:create(0, "ds-max=4")
-- like the previous but with name foo
net0 = switch:create(0, "ds-max=4", "name=foo")
-- like the previous but the port is a monitor port
net0 = switch:create(0, "ds-max=4", "name=foo", "type=monitor")
-- normal port with 4 data spaces as access port to VLAN 1
net0 = switch:create(0, "ds-max=4", "name=vl1", "vlan=access=1")
-- normal port with 4 data spaces as trunk port participating in VLAN 1 & 2
net0 = switch:create(0, "ds-max=4", "name=vl1", "vlan=trunk=1,2")
```

Here is an example on how to create a statistics interface:

```
-- a statistics interface
stats0 = switch:create(1)
```

4.7 Uvmm, the virtual machine monitor

4.7.1 Description

Uvmm provides a virtual machine for running an unmodified guest in non- privileged mode.

4.7.2 Capabilities

- `ram`

  The memory for the guest provided via a simple dataspace.

- `pfc`

  Uvmm can be instructed to inform a PM manager of PM events through the L4::Platform_control interface. To that end, uvmm may be equipped with a `pfc` cap. On suspend, uvmm will call l4_platform_ctl_system_suspend().

  The `pfc` cap can also be implemented by IO. In that case the guest can start a machine suspend/shutdown/reboot.

4.7.3 Command Line Options

- `--mon <option>`

  Control the handling of guest reads/writes to non-existing memory.

  Possible values for `<option>` are

  - `true`: The monitor interface is enabled but no server implementing the client side of the monitor interface is started. The monitor interface can still be utilized via cons but no readline functionality will be available.
  - `some_binary`: If a string is passed as the value of mon, the monitor interface is enabled and the string is interpreted as the name of a server binary which implements the client side of the monitor interface. This server is automatically started and has access to a vcon capability named mon at startup through which it can make use of the monitor interface. Unless you have written your own server you should specify 'uvmm_cli' which is a server implementing a simple readline interface.
  - `false`: The monitor interface is disabled at runtime.

  Default: `true`

- `-c <guest command line>`, `--cmdline <guest command line>`

  Command line that is passed to the guest on boot.

  String value.

- `-k <kernel image name>`, `--kernel <kernel image name>`

  The name of the guest-kernel image file present in the ROM namespace.

  File path in ROM namespace.

- `-d <DTB overlay>`, `--dtb <DTB overlay>`

  The name of the device tree file present in the ROM namespace. The device tree will be placed in the upmost region of guest memory. Optionally, a user may use an additional parameter in the form of "<DTB overlay>:limit=0xffffffff" to set an upper limit for the device tree location.

  This option can be issued multiple times. uvmm will merge all provided device tree overlays.

  File path in ROM namespace.

- `-r <RAM disk name>`, `--ramdisk <RAM disk name>`

  The name of the RAM disk file present in the ROM namespace

  File path in ROM namespace.

- `-b <Base address of the guest RAM>`, `--rambase <Base address of the guest RAM>`

  Physical start address for the guest RAM. This value is platform specific.

  Numerical value.

- `-D <component=level>`, `--debug <component=level>`

  Control the verbosity level of the uvmm.

  Using the `component` prefix, the verbosity level of each uvmm component is configurable.

  For example, the following command line sets the verbosity of all uvmm components to `info` except for IRQ handling, which is set to `trace`:

  ```
  uvmm -D info -D irq=trace
  ```

  Can be used multiple times.

  Possible values for component are | `core`, `cpu`, `mmio`, `irq`, `dev`, `pm`, `vbus_event`.

  Possible values for level are | `quiet`, `warn`, `info`, `trace`.

  Options `-q, --quiet`, `-v, --verbose` and `-D, --debug` cancel each other out.

- `-f`, `--fault-mode`

  Control the handling of guest reads/writes to non-existing memory.

  Possible values are

  - `ignore`: Invalid writes are ignored. Invalid reads either return 0 or are skipped. The guest may experience undefined behaviour.
  - `halt`: Halt the VM on the first invalid memory access.
  - `inject`: Try to forward the invalid access to the guest. This is not supported on all architectures. Falls back to `halt` if the error could not be forwarded to the guest.

  Default: `ignore`

- `-q`, `--quiet`

  Silence all uvmm output.

  Flag. True if provided.

  Options `-q, --quiet`, `-v, --verbose` and `-D, --debug` cancel each other out.

- `-v`, `--verbose`

  Increase the verbosity of the uvmm. Repeating the option increases the verbosity by another level.

  Can be used multiple times.

  Flag. True if provided.

  Options `-q, --quiet`, `-v, --verbose` and `-D, --debug` cancel each other out.

- `-W`, `--wakeup-on-system-resume`

  When set, the uvmm resumes when the host system resumes after a suspend call.

  Flag. True if provided.

Setting up guest memory

In the most simple setup, memory for the guest can be provided via a simple dataspace. In your ned script, create a new dataspace of the required size and hand it into uvmm as the `ram` capability:

```
local ramds = L4.Env.user_factory:create(L4.Proto.Dataspace, 0x4000000)

L4.default_loader::startv({caps = {ram = ramds:m("rw")}}, "rom/uvmm")
```

The memory will be mapped to the most appropriate place and a memory node added to the device tree, so that the guest can find the memory.
For a more complex setup, the memory can be configured via the device tree. uvmm scans for memory nodes and tries to set up the memory from them. A memory device node should look like this:

```
memory@0 {
  device_type = "memory";
  reg = <0x00000000 0x00100000
         0x00200000 0xffffffff>;
  l4vmm,dscap = "memcap";
  dma-ranges = <>;
};
```

The `device_type` property is mandatory and needs to be set to `memory`.
`l4vmm,dscap` contains the name of the capability containing the dataspace to be used for the RAM. `reg` describe the memory regions to use for the memory. The regions will be filled up to the size of the supplied dataspace. If they are larger, then the remaining area will be cut.
If the optional `dma-ranges` property is given, the host-physical address ranges for the memory regions will be added here. Note that the property is not cleared first, so it should be left empty.
For more details see RAM configuration.

Memory layout

uvmm populates the RAM with the following data:

- kernel binary
- (optional) ramdisk
- (optional) device tree

The kernel binary is put at the predefined address. For ELF binaries, this is an absolute physical address. If the binary supports relative addressing, the binary is put to the requested offset relative to beginning of the first 'memory' region defined in the device tree.
The ramdisk and device tree are placed as far as possible to the end of the regions defined in the first 'memory' node.
If there is a part of RAM that must remain empty, then define an extra memory node for it in the device tree. uvmm only writes to memory in the first memory node it finds.
Warning: uvmm does not touch any unpopulated memory. In particular, it does not ensure that the memory is cleared. It is the responsibility of the provider of the RAM dataspace to make sure that no data leakage can happen. Normally this is not an issue because dataspaces are guaranteed to be cleaned when they are newly created but users should be careful when reusing memory or dataspaces, for example, when restarting the uvmm.

Forwarding hardware resources to the guest

Hardware resources must be specified in two places: the device tree contains the description of all hardware devices the guest could see and the Vbus describes which resources are actually available to the uvmm.
The vbus allows the uvmm access to hardware resources in the same way as any other L4 application. uvmm expects a capability named 'vbus' where it can access its hardware resources. It is possible to leave out the capability for purely virtual guests (Note that this is not actually practical on some architectures. On ARM, for example, the guest needs hardware access to the interrupt controller. Without a 'vbus' capability, interrupts will not work.) For information on how to configure a vbus, see the IO documentation.
The device tree needs to contain the hardware description the guest should see. For hardware devices this usually means to use a device tree that would also be used when running the guest directly on hardware.
On startup, uvmm scans the device tree for any devices that require memory or interrupt resources and compares the required resources with the ones available from its vbus. When all resources are available, it sets up the appropriate forwarding, so that the guest now has direct access to the hardware. If the resources are not available, the device will be marked as 'disabled'. This mechanism allows to work with a standard device tree for all guests in the system while handling the actual resource allocation in a flexible manner via the vbus configuration.
The default mechanism assigns all resources 1:1, i.e. with the same memory address and interrupt number as on hardware. It is also possible to map a hardware device to a different location. In this case, the assignment between vbus device and device tree device must be known in advance and marked in the device tree using the `l4vmm,vbus-dev` property.
The following device will for example be bound with the vbus device with the HID 'l4-test,dev':

```
test@e0000000 {
  compatible = "memdev,bar";
  reg = <0 0xe0000000 0 0x50000>,
        <0 0xe1000000 0 0x50000>;
  l4vmm,vbus-dev = "l4-test,dev";
  interrupts-extended = <&gic 0 139 4>;
};
```

Resources are then matched by name. Memory resources in the vbus must be named `reg0` to `reg9` to match against the address ranges in the device tree `reg` property. Interrupts must be called `irq0` to `irq9` and will be matched against `interrupts` or `interrupts-extended` entries in the device tree. The vbus must expose resources for all resources defined in the device tree entry or the initialisation will fail.
An appropriate IO entry for the above device would thus be:

```
MEM = Io.Hw.Device(function()
  Property.hid = "l4-test,dev"
  Resource.reg0 = Io.Res.mmio(0x41000000, 0x4104ffff)
  Resource.reg1 = Io.Res.mmio(0x42000000, 0x4204ffff)
  Resource.irq0 = Io.Res.irq(134);
end)
```

Please note that HIDs on the vbus are not necessarily unique. If multiple devices with the HID given in `l4vmm,vbus-dev` are available on the vbus, then one device is chosen at random.
If no vbus device with the given HID is available, the device is disabled.

How to enable guest suspend/resume

Note

Currently only supported on ARM. It should work fine with Linux version 4.4 or newer.

Uvmm (partially) implements the power state coordination interface (PSCI), which is the standard ARM power management interface. To make use of this interface, you have to announce its availability to the guest operating system via the device tree like so:

```
psci {
  compatible = "arm,psci-0.2";
  method = "hvc";
};
```

The Linux guest must be configured with at least these options:

```
CONFIG_SUSPEND=y
CONFIG_ARM_PSCI=y
```

How to communicate power management (PM) events

Uvmm can be instructed to inform a PM manager of PM events through the L4::Platform_control interface. To that end, uvmm may be equipped with a `pfc` cap. On suspend, uvmm will call l4_platform_ctl_system_suspend().
The `pfc` cap can also be implemented by IO. In that case the guest can start a machine suspend/shutdown/reboot.

Ram block device support

The example ramdisk works by loading a file system into RAM, which needs RAM block device support to work. In the Linux kernel configuration add: CONFIG_BLK_DEV_RAM=y

Framebuffer support for uvmm/amd64 guests

Uvmm can be instructed to pass along a framebuffer to the Linux guest. To enable this three things need to be done:

1. Configure Linux to support a simple framebuffer by enabling
   ```
   CONFIG_FB_SIMPLE=y
   CONFIG_X86_SYSFB=y
   ```
2. Configure a simple framebuffer device in the device tree (currently only read by uvmm, linearer framebuffer at [0xf0000000 - 0xf1000000])
   ```
   simplefb {
     compatible = "simple-framebuffer";
     reg = <0x0 0xf0000000 0x0 0x1000000>;
     l4vmm,fbcap = "fb";
   };
   ```
3. Start a framebuffer instance and connect it to uvmm e.g.
   ```
   -- Start fb-drv (but only if we need to)
   local fbdrv_fb = L4.Env.vesa;
   if (not fbdrv_fb) then
     fbdrv_fb = l:new_channel();
     l:start({
               caps = {
                 vbus = io_busses.fbdrv,
                 fb   = fbdrv_fb:svr(),
               },
               log = { "fbdrv", "r" },
             },
             "rom/fb-drv");
   end
   vmm.start_vm{
     ext_caps = { fb = fbdrv_fb },
   -- ...
   ```

Requirements on the Fiasco.OC configuration on amd64

The kernel configuration must feature `CONFIG_SYNC_TSC=y` in order for the emulated timers to reach a sufficiently high resolution.

Recommended Linux configuration options for uvmm/amd64 guests

The following options are recommended in additon to the amd64 defaults provided by a `make defconfig`:
Virtio support is required to access virtual devices provided by uvmm:

```
CONFIG_VIRTIO=y
CONFIG_VIRTIO_PCI=y
CONFIG_VIRTIO_BLK=y
CONFIG_BLK_MQ_VIRTIO=y
CONFIG_VIRTIO_CONSOLE=y
CONFIG_VIRTIO_INPUT=y
CONFIG_VIRTIO_NET=y
```

It is highly recommended to use the X2APIC, which needs virtualization awareness to work under uvmm:

```
CONFIG_X86_X2APIC=y
CONFIG_PARAVIRT=y
CONFIG_PARAVIRT_SPINLOCKS=y
```

KVM clock for uvmm/amd64 guests

When executing L4Re + uvmm on QEMU, the PIT as clock source is not reliable. The paravirtualized KVM clock provides the guest with a stable clock source.
A KVM clock device is available to the guest, if the device tree contains the corresponding entry:

```
kvm_clock {
  compatible = "kvm-clock";
  reg = <0x0 0x0 0x0 0x0>;
};
```

To make use of this clock, the Linux guest must be built with the following configuration options:

```
CONFIG_HYPERVISOR_GUEST=y
CONFIG_KVM_GUEST=y
CONFIG_PTP_1588_CLOCK_KVM is not set
```

Note

KVM calls besides the KVM clock are unhandled and lead to failure in the uvmm, e.g. vmcall 0x9 for the PTP_1588_CLOCK_KVM.

This is considered a development feature. The KVM clock is not required when running on physical hardware as TSC calibration via the PIT works as expected.

Development notes for amd64

When you are developing on Linux using QEMU please note that nested virtualization support is necessary on your host system to run uvmm guests. Your host Linux version should be 4.12 or greater, **excluding 4.20**.
Check if your KVM module has nested virtualization enabled via:

```
cat /sys/module/kvm_intel/parameters/nested
Y
```

In case it shows `N` instead of `Y` enable nested virtualization support via:

```
modprobe kvm_intel nested=1
```

On AMD platforms the module name is `kvm_amd`.

QEMU network setup for a uvmm guest on amd64

```
qemu-system-x86_64 -M q35 -cpu host -enable-kvm  -device intel-iommu
                   -device e1000e,netdev=net0 -netdev bridge,id=net0,br=virbr0
```

where 'virbr0' is the name of the host's bridge device. The line 'allow virbr0' needs to be present in `/etc/qemu/bridge.conf`. The bridge can either be created via the network manager or via the command line:

```
brctl addbr virbr0
ip addr add 192.168.124.1/24 dev virbr0
ip link set up dev virbr0
```

In the guest linux with eth0 as network device:

```
ip a a 192.168.124.5/24 dev eth0
ip li se up dev eth0
```

Now the host and guest can ping each other using their respective IPs.
Of course, uvmm needs to be connected to Io and Io needs a vbus configuration for the uvmm client like this:

```
Io.add_vbusses
{
  vm_pci = Io.Vi.System_bus(function ()
    Property.num_msis = 6
    PCI = Io.Vi.PCI_bus(function ()
      pci_net = wrap(Io.system_bus():match("PCI/CC_0200"))
    end)
  end)
}
```

QEMU emulated VirtIO devices and IO-MMU on amd64

QEMU does not route VirtIO devices through the IO-MMU per default. To use QEMU emulated VirtIO devices add the `disable-legacy=on,disable- modern=off,iommu_platform=on` flags to the option list of the device. The e1000e card in the network example above can be replaced with an virtio-net-pci card like this:

```
-device virtio-net-pci,disable-legacy=on,disable-modern=off,
        iommu_platform=on,netdev=net0
```

For more information on VirtIO devices and their options see https://wiki.qemu.org/Features/VT-d.

Using the uvmm monitor interface

Uvmm implements an interface with which parts of the guest's state can be queried and manipulated at runtime. This monitor interface needs to be enabled during compilation as well as during startup of uvmm. This is described in detail below.

Compiling uvmm with monitor interface support

To compile uvmm with monitor interface support pass the `CONFIG_MONITOR=y`, option during the `make` step (or set in in the Makefile.config). This option is available on all architectures but note that the set of available monitor interface features may vary significantly between them. Also note that the monitor interface will always be disabled in release mode, i.e. if `CONFIG_RELEASE_MODE=y`.

Enabling the monitor interface at runtime

When starting a uvmm instance from inside a `ned` script using the `vmm.start_vm` function, the `mon` argument controls whether the monitor interface is enabled at runtime. There are three cases to distinguish:

- `mon=true` (default): The monitor interface is enabled but no server implementing the client side of the monitor interface is started. The monitor interface can still be utilized via `cons` but no readline functionality will be available.
- `mon='some_binary'`: If a string is passed as the value of `mon`, the monitor interface is enabled and the string is interpreted as the name of a server binary which implements the client side of the monitor interface. This server is automatically started and has access to a vcon capability named `mon` at startup through which it can make use of the monitor interface. Unless you have written your own server you should specify `'uvmm_cli'` which is a server implementing a simple readline interface.
- `mon=false`: The monitor interface is disabled at runtime.

Using the monitor interface

If the monitor interface was enabled you can connect to it via `cons` under the name `mon<n>` where `<n>` is a unique integer for every uvmm instance that is started with the monitor interface enabled (numbered starting from one in order of corresponding `vmm.start_vm` calls). If `mon='uvmm_cli'` was specified, readline functionality such as command completion and history will be available. Enter a command followed by enter to run that command. To obtain a list of all available commands issue the `help` command, to obtain usage information for a specific command `foo` issue `help foo`.

Note

Some commands will modify the guests state. Since it should be obvious to which ones this applies this is usually not specifically highlighted. Exercise reasonable caution.

Using the guest debugger

The guest debugger provides monitoring functionality akin to a very bare-bone GDB interface, e.g. guest RAM and page table dumping, breakpointing and single stepping. Additional functionality might be added in the future.

Note

The guest debugger is currently still under development. The guest debugger may also not be available on all architectures. To check whether the guest debugger is available check if `help dbg` returns usage information.

If the guest debugger is available, you have to manually load it at runtime using the monitor interface. This saves resources if the guest debugger is not used. To enable the guest debugger, issue the `dbg on` monitor command. Once enabled, the guest debugger can not be disabled again.
To list available guest debugger subcommands, issue `dbg help` after `dbg on`.

Note

When using SMP, most guest debugger subcommands require you to explicitly specify a guest vcpu using an index starting from zero.

4.7.4 RAM configuration

RAM configuration for uvmm

DMA setup

If the vBus contains DMA capable devices, uvmm maps the guest RAM into a DMA address space so that those devices can access it. The shape of that DMA address space depends on whether the platform provides an IO-↩ MMU:

- with an IO-MMU, the DMA address space is independent of host-physical addresses;
- without an IO-MMU, DMA addresses are the host-physical addresses of the backing dataspace.

If the vBus has no DMA capable devices, no DMA mapping is performed and RAM is placed at the guest-physical address requested by the configuration.
Other components in the system may reserve DMA address ranges. RAM placement within the configured range therefore searches for free DMA addresses and may shift inside the configured range or be split into multiple chunks.

Congruent vs. incongruent placement

Per memory region, uvmm chooses one of two placement modes:

- **Congruent** (default, no `dma-ranges` property): the guest-physical address equals the DMA address. The actual placement is the DMA address found by searching the configured range. On a system without IO-MMU, this is the host-physical address of the backing dataspace, so the guest sees its RAM at its host-physical address.
- **Incongruent** (`dma-ranges` property present): the guest-physical address is honoured as configured, but the corresponding DMA addresses may differ. uvmm fills the `dma-ranges` property with the resulting (DMA address, guest address, size) triplets. Use of this property **requires** modification of guest code so that DMA-capable devices are programmed with the correct DMA addresses.

Without a memory node in the device tree

uvmm uses the dataspace bound to the `ram` capability with congruent placement. The base address defaults to 0x0 or the value of the `-b` command-line option. If a DMA address space is in use, the actual base address may be shifted upwards to the first free DMA address at or above the requested base. On a system without IO-MMU this is the host-physical address of the backing dataspace.
If a device tree is loaded, uvmm adds a synthesized `memory@<addr>` node with the resulting `reg` value. No `dma-ranges` property is added.

With a memory node in the device tree

The memory node needs at least the properties device_type, l4vmm,dscap and reg:

```
memory@0 {
  device_type = "memory";
  l4vmm,dscap = "ram";
  reg = < ... >;
}
```

A memory node without a `reg` property is invalid and uvmm refuses to boot. The given l4vmm,dscap name must be accessible in the capability namespace of the uvmm. If the capability is invalid, the memory node is disabled.
The `reg` property describes the allowable guest-physical placement range(s) for the dataspace. It is mandatory for explicit memory nodes. uvmm fills the listed `reg` ranges in order with chunks of the dataspace, potentially using multiple chunks per `reg` entry if DMA address space reservations require it. A `reg` entry with `size == 0` means "use the remaining dataspace size". After setup, uvmm rewrites the `reg` property to reflect the actual placement(s) used.
If the listed `reg` ranges cannot accommodate the full dataspace, uvmm emits a warning and stops mapping; the guest sees only the portion that fitted.
The optional `dma-ranges` property, if present, switches the memory node to incongruent placement (see above). uvmm fills it with the resulting DMA mappings.
If memory nodes are given, but none provides valid RAM, the configuration is invalid and uvmm refuses to boot.

4.8 RTC driver

The RTC driver can drive various real-time clocks and provides an interface for other components, e.g., uvmm, to read and write the time.
It needs access to the hardware, depending on the clock, either via a vbus or via an I2C device.

Command Line Options

There are no command line options.

Environment

Several capabilities can be used to interact with the environment:

- 'rtc' (server)

  The capability with which clients talk to the service. Note that writing to the RTC is only possible when having the rtc capability with write rights, read-only clients must have the capability with read rights only.

- 'vbus'

  The vbus used to access hardware for port-based clock on X86 and pl031 on arm.

  The vbus is also needed for receiving the inhibitor signal from IO.

- 'ds3231' (optional)

  The capability that provides access to an I2C DS3231 device. The capability needs to be created with type 1 (i2c-device).

- 'pcf85063a' (optional)

  The capability that provides access to an I2C PCF85063A device. The capability needs to be created with type 1 (i2c-device).

4.9 Mag, the GUI Multiplexer

4.9.1 Description

Mag is the default multiplexer for graphics hardware. Mag is a Nitpicker derivate that allows secure multiplexing of the graphics and input hardware among multiple applications and multiple complete windowing environments. It is not, and does not attempt to be, a fully-fledged window manager.

4.9.2 Capabilities

None.

4.9.3 Command Line Options

The following command line options are supported:
`<$FILE.lua | libmag-$LIBNAME.so>`
As Mag's only command line option it supports loading additional plugins via the application's command line.
Can be used multiple times.
File path in ROM namespace.

- Plugins must be either a Lua file or a shared library. Shared libraries must be named libmag-$LIBNAME.so.

4.9.4 Session Factory

As a simple nitpicker clone Mag supports the so-called Xray mode. This mode displays all session labels and draws a colored frame around them. The session that currently has the input focus is highlighted. The Xray mode is activated via the special keys Scroll or NEXTSONG.
Call: `create(0 [, "label|l=<LABEL>", "col=(string|hex)"])`

- "label|l=<LABEL>"

  Set the session's text label to LABEL.

  String value.

  - The label is restricted to a length of 256 characters.

- "col=(string|hex)"

  Set the session's color which is used in Xray mode to tint the session's screen area and the border drawn around it. The argument can be either one of the following letters or a hexadecimal representation of the RGB values.

  The Value for this parameter can be one of the following:

  - string
    Define the color by the given character
    Possible values are
    * r, R: Red color
    * g, G: Green color
    * b, B: Blue color
    * w, W: White color
    * y, Y: Yellow color
    * v, V: Magenta color
  - hex
    Define the color by its RGB values in hexadecimal representation.
    Hexadecimal number without '0x' prefix.

4.9.5 Mag Client Session

A client with a mag client session gets access to the whole screen. The client has to allocate and manage it's own buffers and has to position them on the screen on its own.
Call: create(L4.Proto.Goos [, "default-background|dfl-bg"])

- "default-background|dfl-bg"

  Marks this session as the default background.

  Flag. True if provided.

4.9.6 Mag Client Framebuffer Session

For a client framebuffer session mag allocates a view of the requested size and displays it at the requested coordinates on the screen.
Call: create(L4.Proto.Goos [, "geometry|g=<GEOMETRY>", "focus", "shaded", "fixed", "barheight=<X>"])

- "geometry|g=<GEOMETRY>"

  Set the session's geometry and position on the screen. GEOMETRY is provided in an X11-style format: WIDTHxHEIGHT+X_OFFSET+Y_OFFSET.

  String value.

- "focus"

  Set the focus to this session.

  Flag. True if provided.

- "shaded"

  The window is collapsed and only the title bar is visible. The window can be expanded by clicking into the title bar with the middle mouse button. Collapsing and expanding works also independently of this option.

  Flag. True if provided.

- `"fixed"`

  The window cannot be moved on the screen.

  Flag. True if provided.

- `"barheight=<X>"`

  Set the height of the title bar in pixels.

  Numerical value.

4.9.7 Examples

Creating a session

```
-- set label to "Linux" and use a light blue color
fb = mag_client:create(L4.Proto.Goos, "l=Linux", "col=98d9ff");
```

Requesting a framebuffer via a client framebuffer session

```
-- create a window of 640x480 pixels at position (100,100) on the screen.
fb = mag_fb:create(L4.Proto.Goos, "g=640x480+100+100");
```

4.10 Cons, the Console Multiplexer

`cons` is an interactive multiplexer for console input and output. It buffers the output from different L4 clients and allows to switch between them to redirect input.

Multiplexers and Frontends

cons is able to connect multiple clients to multiple console I/O servers. All clients are connected to all configured multiplexers
Multiplexers and frontends come in pairs where the actual I/O is handled by the frontend. From the point-of-view of cons, a frontend consists of an IPC channel to a server that speaks an appropriate server protocol. By default the L4.Env.log capability is used. Only frontends that speak the L4::Vcon protocol are supported.
A multiplexer handles and routes the I/O of each client to and from its respective frontend.
Each client's console settings (e.g. color, visibility) apply to all multiplexers and cannot be changed individually. A user can connect to all clients through all multiplexers. It is not possible to assign individual clients to distinct multiplexers.

Client sessions

For clients cons implements the L4::Vcon and the Virtio console interface. A client session can be requested through a `create` call to cons' factory. cons binds its factory capability to the `cons` capability. See the example below on how this can be set up.

Starting the service

The cons server can be started with Lua like this:

```
local log_server = L4.default_loader:new_channel()
L4.default_loader:start({
  caps = {
    cons = log_server:svr(),
  },
  log = L4.Env.log,
},
"rom/cons")
```

First an IPC gate (`log_server`) is created which is used between the cons server and a client to request a new session. The server side is assigned to the mandatory `cons` capability of cons. This example explicitly assigns the kernel's log capability (`L4.Env.log`) to cons' `log` capability in order to allow cons to provide input and output for its clients. The default log factory (usually provided by `moe`) doesn't provide input capabilities.

Command Line Options

cons accepts the following command line switches:

- `-a`, `--show-all`

  Initially show output from all clients.

- `-B <size>`, `--defaultbufsize <size>`

  Default buffer size per client in bytes. Default: 40960

- `-c <client>`, `--autoconnect <client>`

  Automatically connect to the client with the given name. That means that output of this client will be visible and input will be routed to it.

- `-f <cap>`, `--frontend <cap>`

  Set the frontend for the current multiplexer. Output for the multiplexer is then sent to the capability with the given name `<cap>`. The server connected to the capability needs to understand the L4::Vcon protocol.

- `-V <cap>`, `--virtio-device-frontend <cap>`

  Set a virtio-console frontend for the current multiplexer. This behaves identical to the `--frontend` option except that this frontend implements a virtio-console device that –for example– can be connected to a virtio proxy in uvmm.

  Example lua:

```
-- use 'cons_svr' to create client sessions
local cons_svr = loader:new_channel()
-- connect 'virtio_device' with a virtio driver (e.g. Uvmm)
local virtio_device = loader:new_channel()
loader:start(
  {
    caps = {
      virtio = virtio_device,
      cons = cons_svr:svr(),
    },
   log = {"cons", "blue"},
  }, "cons -m guests -V virtio")
```

- `-k`, `--keep`

  Keep the console buffer when a client disconnects.

- `-l`, `--no-line-buffering`

  By default, merge the client output to entire lines. If the client writes characters without a final newline, the following client output is merged with the current line content. Specifying this switch disables the line buffered mode by default.

- `--line-buffering-ms <timeout>`

  Timeout in milliseconds before buffered client output is written even without a newline. Default value is 50.

- `-m <prompt name>`, `--mux <prompt name>`

  Add a new multiplexer named `<prompt name>`. This is necessary if output should be sent to different frontends. This option must be used in conjunction with the `-f` frontend option

- `-n`, `--defaultname`

  Default name for the multiplexer prompt. Default: `cons`.

- `-t`, `--timestamp`

  Prefix the output with timestamps.

Connecting a client

```
create(backend_type, ["client_name"], ["color"], ["option"] [,"option"] ...)
```

- `backend_type`

  The type of backend that should be created for the client. The type is a positive integer and currently the following types are supported:

  - `L4.Proto.Log`: L4::Vcon client
  - `1`: Virtio console client

cons accepts the following per-client options:

- `bufsz=n`

  Use a buffer of `n` bytes for this client, deviating from the default buffer size.

- `keep` / `no-keep`

  The console buffer is kept / thrown away when the client disconnects.

- `key=<key>`

  Assign `<key>` as keyboard shortcut to this client.

- `line-buffering` / `no-linux-buffering`

  Line buffering is enabled / disabled for this client.

- `show` / `hide`

  Output from this client is initially shown / hidden.

- `timestamp` / `no-timestamp`

  Do / do not prefix the output of this client with timestamps.

Chapter 5

uvmm_dtg The device tree generator for Uvmm

5.1 Description

A virtual machine in Uvmm is configured with a device tree that contains information about the VMs resources, memory layout, virtual CPUs and peripheral devices.
Uvmm_dtg is a tool to generate such a device tree at runtime according to its command line.

5.2 Capabilities

- `dt`

  The dataspace that the device tree is put into.

5.3 Command Line Options

`<file | -->`
`--` prints to stdout. On L4Re, the string given as `<file>` is interpreted as a named capability which needs to be backed by a sufficiently large Dataspace. On Linux, a file with the given name is created. In both cases, uvmm_dtg will output into the named file.
String value.

- `-h`, `--help`

  Show help.

  Flag. True if provided.

- `--arch <target architecture>`

  Select the target architecture.

  Possible values for `<target architecture>` are `x86`, `x86_64`, `arm32`, `arm64`, `mips32`, `mips64`

- `--format <format>`

  Select the output format.

  Possible values for `<format>` are

  - `txt`: The device tree will be printed as plain text (`dts`).
  - `bin`: The device tree will be output as binary (`dtb`).

- `--mem-base <membase>`

  Configure the start of the memory distribution. `membase` can be defined in both decimal and hex notations. uvmm_dtg rounds the given base up to the platforms page size.

  This value can be overridden by memory devices with fixed addresses.

  Numerical value.

- `--device <devicename:[Option1,Option2=value,Option3=value,...]>`

  This configures a device.

  To get a list of supported devices, use `--device help`.

  To get help for a specific device, use `--device devicename:help`.

  String value.

5.4 Examples

Usage in L4Re

Example lua script for Ned:

```
-- Create DS holding device tree
local dt = L4.Env.user_factory:create(L4.Proto.Dataspace, 4 * 1024):m("rw");

-- Start the generator
L4.default_loader:start(
{
  caps = { dt = dt },
}, "rom/uvmm_dtg dt"):wait();

-- Start uvmm
vmm.start_vm
{
  ...
  ext_caps = { dt = dt },
  fdt = "dt",
  ...
}
```

Please notice the `:wait()` when starting `uvmm_dtg`. This makes Ned pause until uvmm_dtg has exited and put the device tree into the dataspace such that Uvmm can commence.

Chapter 6

Bootstrap, the L4 kernel bootstrapper

Bootstrap Command Line Options

`bootstrap` and the kernel can be configured through command line switches. `bootstrap` is responsible for parsing both command lines: `bootstrap` options are the ones directly given to bootstrap, whereas kernel options are those directly given to the kernel, respectively.
When using Multiboot boot, the first module directly after bootstrap is considered the kernel: An example using GRUB2 might look like this:

```
multiboot /path/to/bootstrap bootstrap -bs-boolean-opt -bs-opt-with-argument=foo
module /path/to/fiasco fiasco -kernel-opt-with-argument=bar -kernel-boolean-opt
```

Note

The exact way to provide the command line to `bootstrap` is platform-dependent. On platforms supporting booting via Multiboot Specification the command line can be specified in the boot configuration (currently x86/amd64 only, e.g. using GRUB) whereas other platforms need the command line to be compiled into the `bootstrap` binary.

Platforms utilising flattened device trees usually also allow specifying a command line through the DT. This mechanism is **not** currently supported in `bootstrap`!

Note

`bootstrap` will ignore options it does not understand. For most cases, this also holds true if an option's arguments cannot be understood.

`bootstrap` options

Command line options directly understood by `bootstrap` itself are as follows (passed via `bootstrap` command line):

- `-comirq=<irqno>` (x86/amd64 only)

  If serial logging is enabled (default on), `<irqno>` defines which IRQ to use for serial port communication. This option is ignored if `-noserial` is also specified (see below).

- `-comport=<portspec>` (x86/amd64 only)

  If serial logging is enabled (default on), `<portspec>` defines which serial port to use, being one of:

  - `<number>`
    Use legacy port `<number>`, e.g. use `-comport=1` for the port commonly known as *COM1*, or
  - `pci:<card>:<port>`
    Use serial port number `<port>` at PCI card number `<card>`, e.g. use `-comport=pci:0:1` for the second port on the first PCI card.
  - `pci:probe`
    Use this to have `bootstrap` autodiscover all PCI serial lines. On each discovered line a message will be displayed, telling the correct `<portspec>` to be given to use the respective line.

Note

`bootstrap` does not support specifying the serial port's baudrate and always uses 115200 bps.

- `-noserial`

  Disable serial logging.

- `-wait`

  Wait for key press at early startup.

  Note

  This is not to be confused with the kernel's `-wait` option, see below.

- `-maxmem=<mbytes>`

  Limit the available memory to at most `<mbytes>` MiB.

- `-mem=<size>@<offset>`

  Add a region of memory of `<size>` at `<offset>` to the system's memory map. Both `<size>` and `<offset>` may be suffixed by either `G`, `M`, or `K` to denote GiB, MiB, or KiB, respectively.

  This option may be specified multiple times. If the option is not given, a platform-specific method for determining the memory layout will be used, if available.

- `-sysalloc=<size>@<offset>`

  Designate a region of memory of `<size>` at `<offset>` for loading the modules. Both `<size>` and `<offset>` may be suffixed by either `G`, `M`, or `K` to denote GiB, MiB, or KiB, respectively.

  This option may be specified multiple times. If the option is not given, all system memory regions are used. If this option is given at least once and there are no intersections with any system memory region, `bootstrap` panics.

- `-presetmem=<intval>`

  Initialise memory regions with `<intval>` before starting the kernel.

- `-modaddr=<paddr>`

  Relocate modules to the physical address `<paddr>`. Use this when utilising a version of GRUB that lacks support for the `modaddr` command.

Kernel Options

Command line options for the kernel (passed on kernel command line, i.e. to first module) `bootstrap` understands are as follows.

Note

Availability of individual options might depend on used platform and/or actual kernel configuration.

- `-wait`

  Enter debugger directly after startup, prior to executing any task.

- `-serial_esc`

  Enable entering the debugger over serial line by pressing `Esc`. This option also activates `-serial_input`.

- `-serial_input`

  Allow the kernel to read from the serial line either triggered by the UART receive interrupt or (if that is not possible) by polling the UART receive register from the kernel timer interrupt handler. This is required for Vlog clients to receive input.

- `-noserial`

  Disable serial logging.

Note

If this is given as kernel command line argument, it does not affect `bootstrap` but only the kernel.

- `-noscreen`

  Disable VGA console.

- `-esc`

  Enable entering the debugger by pressing `Esc` on attached keyboard.

- `-nojdb`

  Disable the kernel debugger.

- `-nohlt`

  Enable quirk for broken HLT instruction.

- `-apic`

  Use Advanced Programmable Interrupt Controller (APIC) if available and known to be well-behaving.

- `-oneshot-timer`

  Use the timer in one-shot mode instead of periodic mode. This can reduce the number of timer interrupts and thus improve performance of user-land applications. Selecting the mode via parameter requires the kernel option CONFIG_PARAM_ONE_SHOT=y.

- `-perf_profile=<profile number>` (x86/amd64 only)

  Define the desired CPU performance profile selected by the kernel. The following profiles are supported:

  - `0` - *low power*
    Prefer low power consumption over performance.
  - `1` - *distributed*
    Prefer evenly distributed power consumption and performance over all cores and limit the maximum single core turbo frequency.
  - `2` - *maximum single core*
    Maximum single core performance.

  If this command line option is not passed, the kernel uses the CPU performance profile according to the "Default CPU performance profile" kernel option, which in turn defaults to the *distributed* performance profile.

- `-loadcnt`

  Use load counter for performance counting.

- `-watchdog`

  Enable watchdog timer.

- `-irq0`

  Allow IRQ 0 to be used by userland. This enables some sanity checks to ensure IRQ 0 is not used by the kernel, e.g. for profiling or scheduling purposes. This only has an effect on x86.

- `-nosfn`

  Disable SFN (special fully nested) mode of interrupt controller. This only has an effect on x86 with PIC8259 interrupt controller.

- `-jdb_never_stop`

  Prevent system from stopping to enter JDB. This only has an effect on x86.

- `-kmemsize=<KB>`

  Reserve `<KB>` KiB of memory for the kernel.

- -kmemarea=<size>@<offset>

  Reserve a region of memory of <size> at <offset> to be used as kernel memory. Both <size> and <offset> may be suffixed by either G, M, or K to denote GiB, MiB, or KiB, respectively. The kernel allocates memory for internal use from this pool. The amount of kernel memory is either defined by -kmemsize= or by the kernel itself.

  This option may be specified multiple times. If the option is not given, there are no address constraints for kernel memory.

- -tbuf_entries=<number>

  Specify the <number> of trace buffer entries.

- -out_buf=<length>

  Specify length of console buffer to be <length> bytes.

- -jdb_cmd=<ctrlseq>

  Execute JDB command sequence <ctrlseq> right after start-up. If -wait is also given, <ctrlseq> is executed right before entering JDB.

Module options

Bootstrap supports module attributes for sigma0 and the roottask. They need to be specified in modules.list, e.g.:

```
sigma0[attr:nodes=4-7] ...
```

Attributes are not supported when using multi-boot on platforms that support it. The following attributes are supported:

- nodes

  This is a colon separated list of AMP node ranges. A range can also be a single number. Examples:

  - nodes=1 – Only node 1
  - nodes=1-3 – Nodes 1 to 3 (inclusive)
  - nodes=0:2-3 – Nodes 0, 2 and 3

  If not present, the sigma0/roottask module is applicable to all AMP nodes.

- reloc

  Normally the sigma0 or roottask images are loaded at the preferred load address if the RAM is available at the desired location. If this is not possible, they will be reloacted to some free RAM region. Setting the "reloc" module attribute to a non-empty string will always request the dynamic relocation.

  This attribute can be used on no-MMU systems to maximize the size of contiguous free RAM regions.

Chapter 7

Deprecated List

Global L4::Rcv_endpoint::bind_thread (Ipc::Cap< Thread > t, l4_umword_t label)

Use bind_snd_destination() instead.

Global L4_CAP_SIZE

Superseded by L4_CAP_OFFSET.

Global l4_fpage_size (l4_fpage_t f) L4_NOTHROW

Use l4_fpage_order() instead.

Global l4_kip_clock_lw (l4_kernel_info_t const *kip) L4_NOTHROW

Use l4_kip_clock() instead.

Global L4Re::Dma_space::Direction

Ignored by the API. Use function overloads without the direction parameter instead.

Global L4Re::Dma_space::map (L4::Ipc::Cap< L4Re::Dataspace > src, L4Re::Dataspace::Offset offset, l4_size_t *size, Attributes attrs, Direction dir, Dma_addr *dma_addr)

Use the other overload without `dir` parameter.

Global L4Re::Dma_space::unmap (Dma_addr dma_addr, Dma_size size, Attributes attrs, Direction dir)

Use the overload without `attrs` and `dir` because they are ignored.

Global L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server (l4_utcb_t *, L4::Cap< L4::Thread > server, L4::Cap< L4::Factory > factory)

Note that this variant of the constructor is deprecated, please do not supply the UTCB pointer, it's not used.

Global l4util_kip_for_each_feature (s)

Use l4_kip_for_each_feature().

Global l4util_kip_kernel_has_feature (l4_kernel_info_t const *k, char const *str)

Use l4_kip_kernel_has_feature().

Global l4util_micros2l4to (l4_uint64_t us) L4_NOTHROW

Use l4_timeout_from_us().

Global start_virtio_switch (ports, prio, cpus, switch_type, ext_caps)

This function exists for backwards compatiblity reasons and calls start_virtio_switch_tbl with an appropriate `options` table

Chapter 11

Data Structure Index

11.1 Data Structures

Here are the data structures with brief descriptions:

Buffer
: Data buffer used to transfer packets . . . 739

cxx::arith::Ld< V >
: Computes the binary logarithm of the given number at compile time . . . 741

cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >
: AVL tree based associative container . . . 741

cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >
: AVL set for simple comparable items . . . 748

cxx::Avl_tree< Node, Get_key, Compare >
: A generic AVL tree . . . 752

cxx::Avl_tree_node
: Node of an AVL tree . . . 759

cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >
: Basic slab allocator . . . 762

cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::Slab_i
: Type of a slab . . . 766

cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >
: Merged slab allocator (allocators for objects of the same size are merged together) . . . 766

cxx::Bitfield< T, LSB, MSB >
: Definition for a member (part) of a bit field . . . 770

cxx::Bitfield< T, LSB, MSB >::Value< TT >
: Internal helper type . . . 778

cxx::Bitfield< T, LSB, MSB >::Value_base< TT >
: Internal helper type . . . 779

cxx::Bitfield< T, LSB, MSB >::Value_unshifted< TT >
: Internal helper type . . . 780

cxx::Bitmap< BITS >
: A static bitmap . . . 781

cxx::Bitmap_base
: Basic bitmap abstraction . . . 784

cxx::Bitmap_base::Bit
: A writable bit in a bitmap . . . 796

cxx::Bitmap_base::Char< BITS >
: Helper abstraction for a byte contained in the bitmap . . . 797

cxx::Bitmap_base::Word< BITS >
: Helper abstraction for a word contained in the bitmap . . . 797

cxx::Bits::Avl_map_get_key< KEY_TYPE >
: Key-getter for Avl_map . . . 798

cxx::Bits::Avl_set_get_key< KEY_TYPE >
: Internal, key-getter for Avl_set nodes . . . 799

cxx::Bits::Avl_set_iter< Node, Key, Node_op >
Generic iterator for the AVL-tree based set . . . 800
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >
AVL set with internally managed nodes . . . 802
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node
A smart pointer to a tree item . . . 811
cxx::Bits::Basic_list< POLICY >
Internal: Common functions for all head-based list implementations . . . 813
cxx::Bits::Bst< Node, Get_key, Compare >
Basic binary search tree (BST) . . . 816
cxx::Bits::Bst_node
Basic type of a node in a binary search tree (BST) . . . 827
cxx::Bits::Direction
The direction to go in a binary search tree . . . 830
cxx::Bits::Smart_ptr_list< ITEM >
List of smart-pointer-managed objects . . . 832
cxx::Bits::Smart_ptr_list_item< T, STORE_T >
List item for an arbitrary item in a Smart_ptr_list . . . 834
cxx::Buddy_alloc
Buddy allocator backed by a perfect binary tree . . . 835
cxx::Elide_dtor< T >
Wrapper class to remove destructor calls . . . 841
cxx::Error
Error value . . . 841
cxx::H_list< T, POLICY >
General double-linked list of unspecified cxx::H_list_item elements . . . 842
cxx::H_list_item_t< ELEM_TYPE >
Basic element type for a double-linked H_list . . . 849
cxx::H_list_t< T >
Double-linked list of typed H_list_item_t elements . . . 852
cxx::List< D, Alloc >
Doubly linked list, with internal allocation . . . 855
cxx::List< D, Alloc >::Iter
Iterator . . . 856
cxx::List_alloc
Standard list-based allocator . . . 857
cxx::List_item
Basic list item . . . 860
cxx::List_item::Iter
Iterator for a list of ListItem-s . . . 863
cxx::List_item::T_iter< T, Poly >
Iterator for derived classes from ListItem . . . 865
cxx::Lt_functor< Obj >
Generic comparator class that defaults to the less-than operator . . . 866
cxx::New_allocator< _Type >
Standard allocator based on `operator new ()` . . . 867
cxx::Nothrow
Helper type to distinguish the `operator new` version that does not throw exceptions . . . 868
cxx::Pair< First, Second >
Pair of two values . . . 869
cxx::Pair_first_compare< Cmp, Typ >
Comparison functor for Pair . . . 871
cxx::Ref_obj_list_item< T >
Item for list linked via cxx::Ref_ptr with default refence counting . . . 872
cxx::Ref_ptr< T, CNT >
A reference-counting pointer with automatic cleanup . . . 874
cxx::Result< T >
A result of a function call . . . 878

cxx::S_list< T, POLICY >
Simple single-linked list . . . 879
cxx::Slab< Type, Slab_size, Max_free, Alloc >
Slab allocator for object of type Type . . . 883
cxx::Slab_static< Type, Slab_size, Max_free, Alloc >
Merged slab allocator (allocators for objects of the same size are merged together) . . . 887
cxx::static_vector< T, IDX >
Simple encapsulation for a dynamically allocated array . . . 891
cxx::String
Allocation free string class with explicit length field . . . 892
cxx::Tree_alloc
Standard tree-based allocator . . . 900
cxx::Weak_ref< T >
Typed weak reference to an object of type T . . . 903
cxx::Weak_ref_base
Generic (base) weak reference to some object . . . 905
cxx::Weak_ref_base::List
The list type for keeping all weak references to an object . . . 908
Elf32_Auxv
Auxiliary vector (32-bit) . . . 911
Elf32_Dyn
ELF32 dynamic entry . . . 911
Elf32_Ehdr
ELF32 header . . . 912
Elf32_Phdr
ELF32 program header . . . 915
Elf32_Rel
ELF32 relocation entry w/o addend . . . 916
Elf32_Rela
ELF32 relocation entry w/ addend . . . 916
Elf32_Shdr
ELF32 section header . . . 917
Elf32_Sym
ELF32 symbol table entry . . . 919
Elf64_Auxv
Auxiliary vector (64-bit) . . . 919
Elf64_Dyn
ELF64 dynamic entry . . . 920
Elf64_Ehdr
ELF64 header . . . 921
Elf64_Phdr
ELF64 program header . . . 923
Elf64_Rel
ELF64 relocation entry w/o addend . . . 924
Elf64_Rela
ELF64 relocation entry w/ addend . . . 925
Elf64_Shdr
ELF64 section header . . . 925
Elf64_Sym
ELF64 symbol table entry . . . 927
Enum_bitops::Enable< T >
Check whether the given enum type opts in for the bitwise operators . . . 928
Enum_bitops::Has_marker< typename, typename >
Marker for the opt-in ADL function . . . 929
Enum_bitops::Has_marker< T, Void< decltype(enum_bitops_enable(declval< T >()))> >
Marker for the opt-in ADL function . . . 932
L4::Alloc_list
A simple list-based allocator . . . 934

L4::Arm_smccc
Wrapper for function calls that follow the ARM SMC/HVC calling convention . . . 934
L4::Base_exception
Base class for all exceptions, thrown by the L4Re framework . . . 936
L4::Basic_registry
This registry returns the corresponding server object based on the label of an Ipc_gate . . . 938
L4::Bounds_error
Access out of bounds . . . 941
L4::Cap< T >
C++ interface for capabilities . . . 944
L4::Cap_base
Base class for all kinds of capabilities . . . 950
L4::Com_error
Error conditions during IPC . . . 963
L4::Debugger
C++ kernel debugger API . . . 967
L4::Element_already_exists
Exception for duplicate element insertions . . . 976
L4::Element_not_found
Exception for a failed lookup (element not found) . . . 979
L4::Epiface
Base class for interface implementations . . . 982
L4::Epiface_t< Derived, IFACE, BASE, bool >
Epiface implementation for Kobject-based interface implementations . . . 987
L4::Epiface_t0< RPC_IFACE, BASE >
Epiface mixin for generic Kobject-based interfaces . . . 990
L4::Exception
Exception interface . . . 993
L4::Exception_tracer
Back-trace support for exceptions . . . 994
L4::Factory
C++ Factory interface, see Factory for the C interface . . . 996
L4::Factory::Lstr
Special type to add a pascal string into the factory create stream . . . 1006
L4::Factory::Nil
Special type to add a void argument into the factory create stream . . . 1007
L4::Factory::S
Stream class for the create() argument stream . . . 1008
L4::Icu
C++ Icu interface, see Interrupt controller for the C interface . . . 1013
L4::Icu::Info
This class encapsulates information about an ICU . . . 1021
L4::Invalid_capability
Indicates that an invalid object was invoked . . . 1022
L4::Io_pager
Io_pager interface . . . 1025
L4::Iommu
Interface for IO-MMUs used for DMA remapping . . . 1028
L4::IOModifier
Modifier class for the IO stream . . . 1031
L4::Ipc::Array< ELEM_TYPE, LEN_TYPE >
Array data type for dynamically sized arrays in RPCs . . . 1031
L4::Ipc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >
Server-side copy in buffer for Array . . . 1034
L4::Ipc::Array_ref< ELEM_TYPE, LEN_TYPE >
Array reference data type for arrays located in the message . . . 1036
L4::Ipc::Call
RPC attribute for a standard RPC call . . . 1038

L4::Ipc::Call_t< RIGHTS >
RPC attribute for an RPC call with required rights . . . 1039
L4::Ipc::Call_zero_send_timeout
RPC attribute for an RPC call, with zero send timeout . . . 1040
L4::Ipc::Cap< T >
Capability type for RPC interfaces (see L4::Cap<T>) . . . 1041
L4::Ipc::Gen_fpage
Generic RPC base for typed message items . . . 1046
L4::Ipc::In_out< T >
Mark an argument as in-out argument . . . 1048
L4::Ipc::Iostream
Input/Output stream for IPC [un]marshalling . . . 1048
L4::Ipc::Istream
Input stream for IPC unmarshalling . . . 1057
L4::Ipc::Msg::Clnt_noops< T >
Empty client side marshalling code . . . 1068
L4::Ipc::Msg::Clnt_val_ops< MTYPE >
Defines client-side handling of 'MTYPE' as RPC argument . . . 1072
L4::Ipc::Msg::Elem< T >
Helper struct to describe various aspects of an IPC argument . . . 1075
L4::Ipc::Msg::Elem< Array< A, LEN > & >
Array as output argument . . . 1076
L4::Ipc::Msg::Elem< Array< A, LEN > >
Array as input arguments . . . 1078
L4::Ipc::Msg::Elem< Array_ref< A, LEN > & >
Array_ref as output argument . . . 1079
L4::Ipc::Msg::Is_valid_rpc_type< T >
Type trait defining a valid RPC parameter type . . . 1081
L4::Ipc::Msg::Svr_arg_pack< IPC_TYPE >
Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function . . . 1084
L4::Ipc::Msg::Svr_noops< T >
Empty server side marshalling code . . . 1084
L4::Ipc::Msg::Svr_val_ops< MTYPE >
Defines server-side handling of 'MTYPE' as RPC argument . . . 1088
L4::Ipc::Msg_ptr< T >
Pointer to an element of type T in an Ipc::Istream . . . 1091
L4::Ipc::Opt< T >
Attribute for defining an optional RPC argument . . . 1092
L4::Ipc::Ostream
Output stream for IPC marshalling . . . 1094
L4::Ipc::Out< T >
Mark an argument as a output value in an RPC signature . . . 1100
L4::Ipc::Rcv_fpage
Non-small receive item . . . 1100
L4::Ipc::Send_only
RPC attribute for a send-only RPC . . . 1106
L4::Ipc::Small_buf
A receive item for receiving a single object capability . . . 1107
L4::Ipc::Snd_fpage
Send item or return item . . . 1108
L4::Ipc::Str_cp_in< T >
Abstraction for extracting a zero-terminated string from an Ipc::Istream . . . 1117
L4::Ipc::Varg
Variably sized RPC argument . . . 1119
L4::Ipc::Varg_list< MAX >
Self-contained list of variable-sized RPC parameters . . . 1124

L4::Ipc::Varg_list_ref
List of variable-sized RPC parameters as received by the server . . . 1126
L4::Ipc::Varg_list_ref::Iterator
Iterator for Valists . . . 1128
L4::Ipc_gate
The C++ IPC gate interface, see IPC-Gate API for the C interface . . . 1129
L4::Ipc_svr::Br_manager_no_buffers
Empty implementation of Server_iface . . . 1134
L4::Ipc_svr::Compound_reply
Mix in for LOOP_HOOKS to always use compound reply and wait . . . 1138
L4::Ipc_svr::Dbg_dispatch< R, Exc, Printer >
Dispatch helper that, in addition to what Exc_dispatch does, prints exception messages . . . 1140
L4::Ipc_svr::Default_loop_hooks
Default LOOP_HOOKS . . . 1142
L4::Ipc_svr::Default_setup_wait
Mix in for LOOP_HOOKS for setup_wait no op . . . 1144
L4::Ipc_svr::Default_timeout
Mix in for LOOP_HOOKS to use a 0 send and an infinite receive timeout . . . 1145
L4::Ipc_svr::Direct_dispatch< R >
Direct dispatch helper, for forwarding dispatch calls to a registry *R* . . . 1146
L4::Ipc_svr::Direct_dispatch< R * >
Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry *R* . . . 1147
L4::Ipc_svr::Exc_dispatch< R, Exc >
Dispatch helper wrapping try {} catch {} around the dispatch call . . . 1149
L4::Ipc_svr::Ignore_errors
Mix in for LOOP_HOOKS to ignore IPC errors . . . 1151
L4::Ipc_svr::Server_iface
Interface for server-loop related functions . . . 1153
L4::Ipc_svr::Server_iface::Mem_window
Memory receive window . . . 1160
L4::Ipc_svr::Timeout
Callback interface for Timeout_queue . . . 1160
L4::Ipc_svr::Timeout_queue
Timeout queue to be used in l4re server loop . . . 1163
L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >
Loop hooks mixin for integrating a timeout queue into the server loop . . . 1166
L4::Irq
C++ Irq interface, see IRQs for the C interface . . . 1171
L4::Irq_eoi
Interface for sending an unmask message to an object . . . 1180
L4::Irq_handler_object
Server object base class for handling IRQ messages . . . 1182
L4::Irqep_t< Derived, BASE, bool >
Epiface implementation for interrupt handlers . . . 1186
L4::Kip::Mem_desc
Memory descriptors stored in the kernel interface page . . . 1190
L4::Kobject
Base class for all kinds of kernel objects and remote objects, referenced by capabilities . . . 1199
L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >
Helper class to create an L4Re interface class that is derived from two base classes (see `L4::Kobject_t`) . . . 1203
L4::Kobject_3t< Derived, Base1, Base2, Base3, PROTO, S_DEMAND >
Helper class to create an L4Re interface class that is derived from three base classes (see `L4::Kobject_t`) . . . 1206
L4::Kobject_demand< T >
Get the combined server-side resource requirements for all type T.. . . . 1210
L4::Kobject_t< Derived, Base, PROTO, S_DEMAND >
Helper class to create an L4Re interface class that is derived from a single base class . . . 1210

L4::Kobject_typeid< T >
Meta object for handling access to type information of Kobjects . . . 1212
L4::Kobject_typeid< void >
Minimalistic ID for void interface . . . 1215
L4::Kobject_x< Derived, ARGS >
Generic Kobject inheritance template . . . 1218
L4::Lock_guard
Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code . . . 1220
L4::Meta
Meta interface that shall be implemented by each L4Re object and gives access to the dynamic type information for L4Re objects . . . 1222
L4::Out_of_memory
Exception signalling insufficient memory . . . 1227
L4::Pager
Pager interface including the Io_pager interface . . . 1230
L4::Platform_control
L4 C++ interface for controlling platform-wide properties, see Platform Control C API for the C interface . . . 1234
L4::Poll_timeout_counter
Evaluate an expression for a maximum number of times . . . 1240
L4::Poll_timeout_kipclock
A polling timeout based on the L4Re clock . . . 1243
L4::Proto_t< P >
Data type for defining protocol numbers . . . 1245
L4::Rcv_endpoint
Interface for kernel objects that allow to receive IPC from them . . . 1246
L4::Registry_iface
Abstract interface for object registries . . . 1252
L4::Reply_cap
An explicit reply capability . . . 1255
L4::Reply_cap_alloc
Interface to a reply capability allocator . . . 1259
L4::Reply_cap_idx
Value class for optional reply capability index . . . 1261
L4::Runtime_error
Exception for an abstract runtime error . . . 1262
L4::Scheduler
C++ interface of the Scheduler kernel object, see Scheduler for the C interface . . . 1265
L4::Semaphore
C++ Kernel-provided semaphore interface, see Kernel-provided semaphore for the C interface 1273
L4::Server< LOOP_HOOKS >
Basic server loop for handling client requests . . . 1278
L4::Server_object
Abstract server object to be used with L4::Server and L4::Basic_registry . . . 1283
L4::Server_object_t< IFACE, BASE >
Base class (template) for server implementing server objects . . . 1288
L4::Server_object_x< Derived, IFACE, BASE >
Helper class to implement p_dispatch based server objects . . . 1293
L4::Smart_cap< T, SMART >
Smart capability class . . . 1297
L4::String
A null-terminated string container class . . . 1301
L4::Task
C++ interface of the Task kernel object, see Task for the C interface . . . 1302
L4::Thread
C++ L4 kernel thread interface, see Thread for the C interface . . . 1312

L4::Thread::Attr
Thread attributes used for control() . . . 1328
L4::Thread::Modify_senders
Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread . . . 1333
L4::Thread_group
C++ L4 kernel thread group interface, see Thread groups for the C interface . . . 1334
L4::Triggerable
Interface that allows an object to be triggered by some source . . . 1339
L4::Type_info
Dynamic Type Information for L4Re Interfaces . . . 1343
L4::Type_info::Demand
Data type for expressing the needed receive buffers at the server-side of an interface . . . 1344
L4::Type_info::Demand_t< CAPS, FLAGS, MEM, PORTS >
Template type statically describing demand of receive buffers . . . 1346
L4::Type_info::Demand_union_t< D1, D2 >
Template type statically describing the combination of two Demand object . . . 1349
L4::Typeid::Detail::_Rpcs< OPCODE, O, X >
Empty list of RPCs . . . 1352
L4::Typeid::Detail::_Rpcs< OPCODE, O, Default_op< R > >::Rpc< Y >
Find the given RPC in the list . . . 1353
L4::Typeid::Detail::_Rpcs< OPCODE, O, R, X... >
Non-empty list of RPCs . . . 1354
L4::Typeid::Detail::_Rpcs< OPCODE, O, R, X... >::Rpc< Y >
Find the given RPC in the list . . . 1356
L4::Typeid::Detail::Rpcs_end
Internal end-of-list marker . . . 1356
L4::Typeid::P_dispatch< LIST >
Use for protocol based dispatch stage . . . 1357
L4::Typeid::Raw_ipc< CLASS >
RPCs list for passing raw incoming IPC to the server object . . . 1357
L4::Typeid::Rpc_nocode< OPERATION >
List of RPCs of an interface using a single operation without an opcode . . . 1359
L4::Typeid::Rpcs< RPCS >
Standard list of RPCs of an interface . . . 1361
L4::Typeid::Rpcs_code< OPCODE_TYPE >
List of RPCs of an interface using a special opcode type . . . 1362
L4::Typeid::Rpcs_code< OPCODE_TYPE >::F< RPCS > . . . 1363
L4::Typeid::Rpcs_sys< ARG >
List of RPCs typically used for kernel interfaces . . . 1366
L4::Types::__Add_rvalue_reference_helper< T, typename >
Helper template for Add_rvalue_reference . . . 1368
L4::Types::__Add_rvalue_reference_helper< T, Void< T && > >
Helper template for Add_rvalue_reference . . . 1369
L4::Types::__Underlying_type_helper< T, bool >
Helper template for Underlying_type . . . 1370
L4::Types::__Underlying_type_helper< T, false >
Helper template for Underlying_type . . . 1372
L4::Types::Add_rvalue_reference< T >
Create an rvalue reference of the given type . . . 1373
L4::Types::Bool< V >
Boolean meta type . . . 1374
L4::Types::False
False meta value . . . 1375
L4::Types::Flags< BITS_ENUM, UNDERLYING >
Template for defining typical Flags bitmaps . . . 1376
L4::Types::Flags_ops_t< DT >
Mixin class to define a set of friend bitwise operators on DT . . . 1380

L4::Types::Flags_t< DT, T >
Template type to define a flags type with bitwise operations . . . 1382
L4::Types::Int_for_size< SIZE, bool >
Metafunction to get an unsigned integral type for the given size . . . 1386
L4::Types::Int_for_type< T >
Metafunction to get an integral type of the same size as T . . . 1386
L4::Types::Integral_constant< T, Value >
Wrapper for a static constant of the given type . . . 1387
L4::Types::Is_enum< T >
Check whether the given type is an enumeration type . . . 1388
L4::Types::Is_trivially_copyable< T >
Check whether the given type is trivially copyable . . . 1391
L4::Types::Same< A, B >
Compare two data types for equality . . . 1392
L4::Types::Same_template< T, Template >
Check if a type T is an instantiation of a given template . . . 1395
L4::Types::True
True meta value . . . 1397
L4::Types::Underlying_type< T >
Get an underlying type of an enumeration type . . . 1398
L4::Uart
Uart driver abstraction . . . 1400
L4::Uart_apb
Driver for the Advanced Peripheral Bus (APB) UART from the Cortex-M System Design Kit (CMSDK) . . . 1405
L4::Unknown_error
Exception for an unknown condition . . . 1410
L4::Vcon
C++ L4 Vcon interface, see Virtual Console for the C interface . . . 1413
L4::Vm
Virtual machine host address space . . . 1422
l4_buf_regs_t
Encapsulation of the buffer-registers block in the UTCB . . . 1426
l4_exc_regs_t
UTCB structure for exceptions . . . 1427
l4_fpage_t
L4 flexpage type . . . 1430
l4_icu_info_t
Info structure for an ICU . . . 1430
l4_icu_msi_info_t
Info to use for a specific MSI . . . 1432
l4_kernel_info_mem_desc_t
Memory descriptor data structure . . . 1432
l4_kernel_info_t
L4 Kernel Interface Page . . . 1433
l4_msg_regs_t
Encapsulation of the message-register block in the UTCB . . . 1435
l4_msgtag_t
Message tag data structure . . . 1436
l4_pf_trampoline_regs_t
Register state for page fault trampoline handlers . . . 1438
l4_pf_trampoline_t
State for page fault trampoline handler . . . 1439
l4_sched_cpu_set_t
CPU sets . . . 1440
l4_sched_param_t
Scheduler parameter set . . . 1442

l4_snd_fpage_t
Send-flexpage types . . . 1444
l4_thread_regs_t
Encapsulation of the thread-control-register block of the UTCB . . . 1444
l4_timeout_s
Basic timeout specification . . . 1446
l4_timeout_t
Timeout pair . . . 1446
l4_vcon_attr_t
Vcon attribute structure . . . 1447
l4_vcpu_arch_state_t
Architecture-specific vCPU state . . . 1449
l4_vcpu_ipc_regs_t
VCPU message registers . . . 1449
l4_vcpu_regs_t
VCPU registers . . . 1450
l4_vcpu_state_t
State of a vCPU . . . 1453
l4_vm_state_t
L4 extended vCPU state for RISC-V . . . 1456
l4_vm_svm_vmcb_control_area
VMCB structure for SVM VMs . . . 1457
l4_vm_svm_vmcb_state_save_area
State save area structure for SVM VMs . . . 1457
l4_vm_svm_vmcb_state_save_area_seg
State save area segment selector struct . . . 1458
l4_vm_svm_vmcb_t
Control structure for SVM VMs . . . 1459
l4_vm_tz_state
State structure for TrustZone VMs . . . 1460
l4_vm_vmx_vcpu_infos_t
VMX information members . . . 1461
l4_vm_vmx_vcpu_state_t
VMX vCPU state . . . 1462
l4_vm_vmx_vcpu_vmcs_t
VMX software VMCS . . . 1464
l4_vmx_offset_table_t
Software VMCS field offset table . . . 1465
L4drivers::Mmio_register_block< MAX_BITS >
An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order . . . 1466
L4drivers::Register_block< MAX_BITS, BLOCK >
Handles a reference to a register block of the given maximum access width . . . 1468
L4drivers::Register_block_base< MAX_BITS >
Abstract register block interface . . . 1472
L4drivers::Register_block_impl< BASE, MAX_BITS >
Implementation helper for register blocks . . . 1473
L4drivers::Register_block_tmpl< BLOCK >
Helper template that translates to the Register_block_base interface . . . 1475
L4drivers::Register_tmpl< BITS, BLOCK >
Single hardware register inside a Register_block_base interface . . . 1476
L4drivers::Ro_register_block< MAX_BITS, BLOCK >
Handles a reference to a read only register block of the given maximum access width . . . 1481
L4drivers::Ro_register_tmpl< BITS, BLOCK >
Single read only register inside a Register_block_base interface . . . 1483
L4Re::Cap_alloc
Capability allocator interface . . . 1486
L4Re::Console
Console class . . . 1488

L4Re::Core::Ds_file
Implementation for files backed by an L4Re::Dataspace abstraction . . . 1491
L4Re::Core::Ref_ptr< T, CNT >
A reference-counting pointer with automatic cleanup . . . 1494
L4Re::Dataspace
Interface for memory-like objects . . . 1498
L4Re::Dataspace::F
Dataspace flags definitions . . . 1510
L4Re::Dataspace::Stats
Information about the dataspace . . . 1511
L4Re::Debug_obj
Debug interface . . . 1512
L4Re::Default_event_payload
Default event stream payload . . . 1516
L4Re::Dma_space
Managed DMA Address Space . . . 1517
L4Re::Dma_space_mgr
A privileged interface to manage Dma_space associations for the clients . . . 1525
L4Re::Env
C++ interface of the initial environment that is provided to an L4 task . . . 1531
L4Re::Event
Event class . . . 1544
L4Re::Event_buffer_t< PAYLOAD >
Event buffer class . . . 1553
L4Re::Event_buffer_t< PAYLOAD >::Event
Event structure used in buffer . . . 1556
L4Re::Inhibitor
Set of inhibitor locks, which inhibit specific actions when held . . . 1557
L4Re::Itas
Interface to the ITAS . . . 1563
L4Re::Log
Log interface class . . . 1574
L4Re::Mem_alloc
Memory allocation interface . . . 1578
L4Re::Mem_alloc::Stats
Statistics about memory-allocator . . . 1585
L4Re::Mmio_space
Interface for memory-like address space accessible via IPC . . . 1587
L4Re::Namespace
Name-space interface . . . 1592
L4Re::Ned::Cmd_control
Direct control interface for Ned . . . 1601
L4Re::Parent
Parent interface . . . 1603
L4Re::Random
Low-bandwidth interface for random number generators . . . 1607
L4Re::Rm
Region map . . . 1611
L4Re::Rm::Area
An area is a range of virtual addresses which is reserved, see L4Re::Rm::reserve_area() . . . 1633
L4Re::Rm::F
Rm flags definitions . . . 1634
L4Re::Rm::Region
A region is a range of virtual addresses which is backed by content . . . 1635
L4Re::Rm::Unique_region< T >
Unique region . . . 1636
L4Re::Smart_cap_auto< Unmap_flags >
Helper for Unique_cap and Unique_del_cap . . . 1640

L4Re::Smart_count_cap< Unmap_flags >
Helper for Ref_cap and Ref_del_cap . . . 1641
L4Re::Util::_Cap_alloc
Adapter to expose the cap allocator implementation as L4Re::Cap_alloc compatible class . . . 1642
L4Re::Util::Bitmap< BITS >
A static bitmap . . . 1645
L4Re::Util::Bitmap_base
Basic bitmap abstraction . . . 1649
L4Re::Util::Bitmap_base::Bit
A writable bit in a bitmap . . . 1656
L4Re::Util::Bitmap_base::Char< BITS >
Helper abstraction for a byte contained in the bitmap . . . 1657
L4Re::Util::Bitmap_base::Word< BITS >
Helper abstraction for a word contained in the bitmap . . . 1657
L4Re::Util::Br_manager
Buffer-register (BR) manager for L4::Server . . . 1658
L4Re::Util::Br_manager_hooks
Predefined server-loop hooks for a server loop using the Br_manager . . . 1664
L4Re::Util::Br_manager_timeout_hooks
Predefined server-loop hooks for a server with using the Br_manager and a timeout queue . . . 1667
L4Re::Util::Cap_alloc_base
Capability allocator . . . 1671
L4Re::Util::Counter< COUNTER >
Counter for Counting_cap_alloc with variable data width . . . 1671
L4Re::Util::Counter_atomic< COUNTER >
Thread safe version of counter for Counting_cap_alloc . . . 1673
L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >
Internal reference-counting cap allocator . . . 1674
L4Re::Util::Dataspace_svr
Dataspace server class . . . 1679
L4Re::Util::Event_buffer_consumer_t< PAYLOAD >
An event buffer consumer . . . 1684
L4Re::Util::Event_buffer_t< PAYLOAD >
Event_buffer utility class . . . 1688
L4Re::Util::Event_svr< SVR >
Convenience wrapper for implementing an event server . . . 1692
L4Re::Util::Event_t< PAYLOAD >
Convenience wrapper for getting access to an event object . . . 1693
L4Re::Util::Item_alloc_base
Item allocator . . . 1696
L4Re::Util::Names::Name
Name class . . . 1697
L4Re::Util::Names::Name_space
Abstract server-side implementation of the L4::Namespace interface . . . 1700
L4Re::Util::Object_registry
A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread . . . 1704
L4Re::Util::Ref_cap< T >
Automatic capability that implements automatic free and unmap of the capability slot . . . 1709
L4Re::Util::Ref_del_cap< T >
Automatic capability that implements automatic free and unmap+delete of the capability slot . . . 1710
L4Re::Util::Registry_server< LOOP_HOOKS >
A server loop object which has a Object_registry included . . . 1711
L4Re::Util::Smart_cap_auto< Unmap_flags >
Helper for Unique_cap and Unique_del_cap . . . 1718
L4Re::Util::Smart_count_cap< Unmap_flags >
Helper for Ref_cap and Ref_del_cap . . . 1719

L4Re::Util::Vcon_svr< SVR >
Console server template class . . . 1719
L4Re::Util::Video::Goos_svr
Goos server class . . . 1720
L4Re::Vfs::Be_file
Boiler plate class for implementing an open file for L4Re::Vfs . . . 1723
L4Re::Vfs::Be_file_system
Boilerplate class for implementing a L4Re::Vfs::File_system . . . 1728
L4Re::Vfs::Directory
Interface for a POSIX file that is a directory . . . 1730
L4Re::Vfs::File
The basic interface for an open POSIX file . . . 1735
L4Re::Vfs::File_system
Basic interface for an L4Re::Vfs file system . . . 1737
L4Re::Vfs::Fs
POSIX File-system related functionality . . . 1740
L4Re::Vfs::Generic_file
The common interface for an open POSIX file . . . 1745
L4Re::Vfs::Mman
Interface for POSIX memory management . . . 1753
L4Re::Vfs::Ops
Interface for the POSIX backends of an application . . . 1755
L4Re::Vfs::Regular_file
Interface for a POSIX file that provides regular file semantics . . . 1757
L4Re::Vfs::Special_file
Interface for a POSIX file that provides special file semantics . . . 1766
L4Re::Video::Color_component
A color component . . . 1768
L4Re::Video::Goos
Class that abstracts framebuffers . . . 1772
L4Re::Video::Goos::Info
Information structure of a Goos . . . 1782
L4Re::Video::Pixel_info
Pixel information . . . 1784
L4Re::Video::View
View of a framebuffer . . . 1793
L4Re::Video::View::Info
Information structure of a view . . . 1799
l4re_aux_t
Auxiliary descriptor . . . 1801
l4re_ds_stats_t
Information about the data space . . . 1802
l4re_elf_aux_mword_t
Auxiliary vector element for a single unsigned data word . . . 1803
l4re_elf_aux_t
Generic header for each auxiliary vector element . . . 1804
l4re_elf_aux_vma_t
Auxiliary vector element for a reserved virtual memory area . . . 1804
l4re_env_cap_entry_t
Entry in the L4Re environment array for the named initial objects . . . 1804
l4re_env_t
Initial environment data structure . . . 1806
l4re_event_t
Event structure used in buffer . . . 1808
l4re_video_color_component_t
Color component structure . . . 1809
l4re_video_goos_info_t
Goos information structure . . . 1810

l4re_video_pixel_info_t
Pixel_info structure . . . 1812
l4re_video_view_info_t
View information structure . . . 1813
l4re_video_view_t
C representation of a goos view . . . 1814
l4shmc_ringbuf_head_t
Head field of a ring buffer . . . 1814
l4shmc_ringbuf_t
Ring buffer . . . 1815
l4util_l4mod_info
Base module structure . . . 1817
l4util_l4mod_mod
A single module . . . 1818
l4util_mb_addr_range_t
INT-15, AX=E820 style "AddressRangeDescriptor" ...with a "size" parameter on the front which is the structure size - 4, pointing to the next one, up until the full buffer length of the memory map has been reached . . . 1818
l4util_mb_apm_t
APM BIOS info . . . 1819
l4util_mb_drive_t
Drive Info structure . . . 1820
l4util_mb_info_t
MultiBoot Info description . . . 1821
l4util_mb_mod_t
The structure type "mod_list" is used by the multiboot_info structure . . . 1822
l4util_mb_vbe_ctrl_t
VBE controller information . . . 1823
l4util_mb_vbe_mode_t
VBE mode information . . . 1824
L4vbus::Device
Device on a L4vbus::Vbus . . . 1827
L4vbus::Gpio_module
A Gpio_module groups multiple GPIO pins together . . . 1836
L4vbus::Gpio_module::Pin_slice
A slice of the pins provided by this module . . . 1843
L4vbus::Gpio_pin
A GPIO pin . . . 1844
L4vbus::Icu
Vbus Interrupt controller API . . . 1851
L4vbus::Pci_dev
A PCI device . . . 1855
L4vbus::Pci_host_bridge
A Pci host bridge . . . 1860
L4vbus::Pm< DEC >
Power-management API mixin . . . 1865
L4vbus::Vbus
The virtual bus (Vbus) interface . . . 1868
l4vbus_device_t
Detailed information about a vbus device . . . 1877
l4vbus_resource_t
Description of a single vbus resource . . . 1878
L4vcpu::State
C++ implementation of state word in the vCPU area . . . 1879
L4vcpu::Vcpu
C++ implementation of the vCPU save state area . . . 1880
L4virtio::Device
IPC interface for virtio over L4 IPC . . . 1891

L4virtio::Driver::Block_device
Simple class for accessing a virtio block device synchronously . . . 1899
L4virtio::Driver::Block_device::Handle
Handle to an ongoing request . . . 1906
L4virtio::Driver::Device
Client-side implementation for a general virtio device . . . 1907
L4virtio::Driver::Virtio_net_device
Simple class for accessing a virtio net device . . . 1917
L4virtio::Driver::Virtio_net_device::Packet
Structure for a network packet (header including data) with maximum size, assuming that no extra features have been negotiated . . . 1924
L4virtio::Driver::Virtqueue
Driver-side implementation of a Virtqueue . . . 1925
L4virtio::Ptr< T >
Pointer used in virtio descriptors . . . 1933
L4virtio::Svr::Bad_descriptor
Exception used by Queue to indicate descriptor errors . . . 1936
L4virtio::Svr::Block_dev_base< Ds_data >
Base class for virtio block devices . . . 1939
L4virtio::Svr::Block_request< Ds_data >
A request to read or write data . . . 1946
L4virtio::Svr::Console::Control_message
Virtio console control message . . . 1948
L4virtio::Svr::Console::Control_request
Specialised `Virtqueue::Request` providing access to control message payload . . . 1950
L4virtio::Svr::Console::Device
Base class implementing a virtio console device with L4Re-based notification handling . . . 1952
L4virtio::Svr::Console::Device_port
A console port with associated read/write state . . . 1964
L4virtio::Svr::Console::Features
Virtio console specific feature bits . . . 1968
L4virtio::Svr::Console::Port
Representation of a Virtio console port . . . 1971
L4virtio::Svr::Console::Port::Transition
State transition from last report state to current state . . . 1974
L4virtio::Svr::Console::Virtio_con
Base class implementing a virtio console functionality . . . 1975
L4virtio::Svr::Data_buffer
Abstract data buffer . . . 1990
L4virtio::Svr::Dev_config
Abstraction for L4-Virtio device config memory . . . 1994
L4virtio::Svr::Dev_features
Type for device feature bitmap . . . 2004
L4virtio::Svr::Dev_status
Type of the device status register . . . 2007
L4virtio::Svr::Device_t< DATA >
Server-side L4-VIRTIO device stub . . . 2009
L4virtio::Svr::Driver_mem_list_t< DATA >
List of driver memory regions assigned to a single L4-VIRTIO transport instance . . . 2015
L4virtio::Svr::Driver_mem_region_t< DATA >
Region of driver memory, that shall be managed locally . . . 2021
L4virtio::Svr::Request_processor
Encapsulate the state for processing a VIRTIO request . . . 2027
L4virtio::Svr::Scmi::Base_attr_t
SCMI base protocol attributes . . . 2033
L4virtio::Svr::Scmi::Base_proto
Base class for the SCMI base protocol . . . 2034

L4virtio::Svr::Scmi::Perf_proto
Base class for the SCMI performance protocol . . . 2036
L4virtio::Svr::Scmi::Performance_attr_t
SCMI performance protocol attributes . . . 2039
L4virtio::Svr::Scmi::Performance_describe_level_t
SCMI performance describe level . . . 2039
L4virtio::Svr::Scmi::Performance_describe_levels_n_t
SCMI performance describe levels numbers . . . 2040
L4virtio::Svr::Scmi::Performance_domain_attr_t
SCMI performance domain protocol attributes . . . 2041
L4virtio::Svr::Scmi::Proto< OBSERV >
Base class for all protocols . . . 2043
L4virtio::Svr::Scmi::Scmi_dev
A server implementation of the virtio-scmi protocol . . . 2045
L4virtio::Svr::Scmi::Scmi_hdr_t
SCMI header . . . 2048
L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >
A server implementation of the virtio-gpio protocol . . . 2049
L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Host_irq
Handler for the host irq . . . 2054
L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Irq_handler
Handler for an gpio pin irq . . . 2057
L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor
Generic handler for the Virtio requests . . . 2058
L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >
A server implementation of the virtio-i2c protocol . . . 2062
L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Host_irq
Handler for the host irq . . . 2066
L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Request_processor
Handler for the Virtio requests . . . 2068
L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >
A server implementation of the virtio-rng protocol . . . 2071
L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >::Host_irq
Handler for the host irq . . . 2076
L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >::Request_processor
Handler for the Virtio requests . . . 2078
L4virtio::Svr::Virtio_spi< Spi_request_handler, Epiface >
A server implementation of the virtio-spi protocol . . . 2081
L4virtio::Svr::Virtio_spi< Spi_request_handler, Epiface >::Host_irq
Handler for the host IRQ . . . 2085
L4virtio::Svr::Virtio_spi< Spi_request_handler, Epiface >::Request_processor
Handler for the Virtio requests . . . 2087
L4virtio::Svr::Virtqueue
Virtqueue implementation for the device . . . 2090
L4virtio::Svr::Virtqueue::Head_desc
VIRTIO request, essentially a descriptor from the available ring . . . 2102
L4virtio::Virtqueue
Low-level Virtqueue . . . 2104
L4virtio::Virtqueue::Avail
Type of available ring, this is read-only for the host . . . 2118
L4virtio::Virtqueue::Avail::Flags
Flags of the available ring . . . 2119
L4virtio::Virtqueue::Desc
Descriptor in the descriptor table . . . 2121
L4virtio::Virtqueue::Desc::Flags
Type for descriptor flags . . . 2122
L4virtio::Virtqueue::Used
Used ring . . . 2124

L4virtio::Virtqueue::Used::Flags
Flags for the used ring . . . 2125
L4virtio::Virtqueue::Used_elem
Type of an element of the used ring . . . 2127
l4virtio_block_config_t
Device configuration for block devices . . . 2128
l4virtio_block_discard_t
Structure used for the write zeroes and discard commands . . . 2128
l4virtio_block_header_t
Header structure of a request for a block device . . . 2129
l4virtio_config_hdr_t
L4-VIRTIO config header, provided in shared data space . . . 2130
l4virtio_config_queue_t
Queue configuration entry . . . 2131
l4virtio_input_absinfo_t
Information about the absolute axis in the underlying evdev implementation . . . 2132
l4virtio_input_config_t
Device configuration for input devices . . . 2132
l4virtio_input_devids_t
Device ID information for the device . . . 2133
l4virtio_input_event_t
Single event in event or status queue . . . 2134
l4virtio_net_config_t
Device configuration for network devices . . . 2134
l4virtio_net_header_t
Header structure of a request for a network device . . . 2134
L4virtio_port
A Port on the Virtio Net Switch . . . 2135
Mac_addr
A wrapper class around the value of a MAC address . . . 2140
Mac_table< Size >
Mac_table manages a 1:n association between ports and MAC addresses . . . 2141
Net_transfer
A network request to only a single destination . . . 2144
Rm
Region map . . . 2145
Rm::Area
An area is a range of virtual addresses which is reserved, see L4Re::Rm::reserve_area() . . . 2160
Rm::F
Rm flags definitions . . . 2161
Rm::Region
A region is a range of virtual addresses which is backed by content . . . 2163
Rm::Unique_region< T >
Unique region . . . 2163
Switch_factory
The IPC interface for creating ports . . . 2167
utrace::Ring_buffer< SEQUENCE_TYPE >
Ring buffer . . . 2171
utrace::Ring_buffer_consumer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >
Blocking ring buffer consumer . . . 2174
utrace::Ring_buffer_consumer_raw< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >
Polling ring buffer consumer . . . 2180
utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >
Ring buffer producer . . . 2184
utrace::Ring_slot< ITEM_TYPE, GENERATION_PTR >
Ring buffer slot . . . 2187
utrace::Ring_status< SEQUENCE_TYPE >
Ring buffer status area . . . 2189

utrace::Tracebuffer
Tracebuffer abstraction . . . 2192
utrace::Tracebuffer::Index_desc
Mapping of the dynamic tracebuffer log indexes to names . . . 2195
Virtio_net
The Base class of a Port . . . 2196
Virtio_net_request
Abstraction for a network request . . . 2201
Virtio_net_switch::Monitor
Statistics client interface . . . 2203
Virtio_net_switch::Port_statistics
Statistics for one port . . . 2205
Virtio_net_switch::Statistics
Base statistics data structure, resides at the beginning of shared memory . . . 2206
Virtio_net_switch::Statistics_if
IPC interface for the statistics interface . . . 2208
Virtio_switch
The Virtio switch contains all ports and processes network requests . . . 2212
Virtio_vlan_mangle
Class for VLAN packet rewriting . . . 2215

Chapter 12

File Index

12.1 File List

Here is a list of all documented files with brief descriptions:

pkg/drivers-frst/include/asm_access_gen.h . . . 2226
pkg/drivers-frst/include/hw_mmio_register_block . . . 2226
pkg/drivers-frst/include/hw_register_block . . . 2227
pkg/drivers-frst/include/io_regblock.h . . . 2231
pkg/drivers-frst/include/io_regblock_port.h . . . 2233
pkg/drivers-frst/include/Makefile . . . 2280
pkg/drivers-frst/include/poll_timeout_counter.h . . . 2233
pkg/drivers-frst/include/ARCH-amd64/asm_access.h . . . 2221
pkg/drivers-frst/include/ARCH-arm/asm_access.h . . . 2222
pkg/drivers-frst/include/ARCH-arm64/asm_access.h . . . 2223
pkg/drivers-frst/include/ARCH-mips/asm_access.h . . . 2224
pkg/drivers-frst/include/ARCH-riscv/asm_access.h . . . 2224
pkg/drivers-frst/include/ARCH-x86/asm_access.h . . . 2225
pkg/drivers-frst/uart/include/device.h . . . 2234
pkg/drivers-frst/uart/include/Makefile . . . 2280
pkg/drivers-frst/uart/include/uart_16550.h . . . 2235
pkg/drivers-frst/uart/include/uart_16550_dw.h . . . 2237
pkg/drivers-frst/uart/include/uart_apb.h . . . 2237
pkg/drivers-frst/uart/include/uart_base.h . . . 2237
pkg/drivers-frst/uart/include/uart_bcm2835.h . . . 2239
pkg/drivers-frst/uart/include/uart_cadence.h . . . 2240
pkg/drivers-frst/uart/include/uart_dcc-v6.h . . . 2240
pkg/drivers-frst/uart/include/uart_dm.h . . . 2241
pkg/drivers-frst/uart/include/uart_dummy.h . . . 2241
pkg/drivers-frst/uart/include/uart_geni.h . . . 2242
pkg/drivers-frst/uart/include/uart_imx.h . . . 2242
pkg/drivers-frst/uart/include/uart_leon3.h . . . 2243
pkg/drivers-frst/uart/include/uart_linflex.h . . . 2244
pkg/drivers-frst/uart/include/uart_lpuart.h . . . 2244
pkg/drivers-frst/uart/include/uart_mvebu.h . . . 2245
pkg/drivers-frst/uart/include/uart_of.h . . . 2245
pkg/drivers-frst/uart/include/uart_omap35x.h . . . 2246
pkg/drivers-frst/uart/include/uart_pl011.h . . . 2246
pkg/drivers-frst/uart/include/uart_s3c2410.h . . . 2247
pkg/drivers-frst/uart/include/uart_sa1000.h . . . 2248
pkg/drivers-frst/uart/include/uart_sbi.h . . . 2248
pkg/drivers-frst/uart/include/uart_sh.h . . . 2249
pkg/drivers-frst/uart/include/uart_sifive.h . . . 2249
pkg/drivers-frst/uart/include/uart_stm32.h . . . 2250
pkg/drivers-frst/uart/include/uart_tegra-tcu.h . . . 2250

pkg/l4re-core/ned/doc/tutorial.lua . . . 2251
pkg/l4re-core/ned/lib/include/cmd_control . . . 2254
pkg/l4re-core/ned/lib/include/Makefile . . . 2280
pkg/uvmm/configs/vmm.lua . . . 2254
pkg/virtio-net-switch/lib/include/stats.h
Client interface for port statistics . . . 2262
pkg/virtio-net-switch/server/switch/debug.h . . . 2266
pkg/virtio-net-switch/server/switch/filter.cc . . . 2267
pkg/virtio-net-switch/server/switch/filter.h . . . 2268
pkg/virtio-net-switch/server/switch/mac_addr.h . . . 2268
pkg/virtio-net-switch/server/switch/mac_table.h . . . 2270
pkg/virtio-net-switch/server/switch/main.cc . . . 2271
pkg/virtio-net-switch/server/switch/Makefile . . . 2280
pkg/virtio-net-switch/server/switch/options.cc . . . 2280
pkg/virtio-net-switch/server/switch/options.h . . . 2283
pkg/virtio-net-switch/server/switch/port.h . . . 2283
pkg/virtio-net-switch/server/switch/port_ixl.h . . . 2286
pkg/virtio-net-switch/server/switch/port_l4virtio.h . . . 2288
pkg/virtio-net-switch/server/switch/request.h . . . 2291
pkg/virtio-net-switch/server/switch/request_ixl.h . . . 2292
pkg/virtio-net-switch/server/switch/request_l4virtio.h . . . 2294
pkg/virtio-net-switch/server/switch/stats.h . . . 2265
pkg/virtio-net-switch/server/switch/switch.cc . . . 2297
pkg/virtio-net-switch/server/switch/switch.h . . . 2300
pkg/virtio-net-switch/server/switch/virtio_net.h . . . 2301
pkg/virtio-net-switch/server/switch/virtio_net_buffer.h . . . 2305
pkg/virtio-net-switch/server/switch/vlan.h . . . 2305
amd64/l4/sys/__kip-arch.h . . . 2345
amd64/l4/sys/__vcpu-arch.h
AMD64-specific vCPU interface . . . 2346
amd64/l4/sys/ktrace_events.h . . . 2358
amd64/l4/sys/linkage.h
Linkage . . . 2376
amd64/l4/sys/segment.h
Segment handling (AMD64) . . . 2307
amd64/l4/sys/vm.h . . . 2382
amd64/l4/sys/arch/cache.h
Cache functions . . . 2918
amd64/l4/sys/arch/consts.h
Common L4 constants, AMD64 version . . . 2935
amd64/l4/sys/arch/ipc.h . . . 3043
amd64/l4/sys/arch/kip.h . . . 3226
amd64/l4/sys/arch/l4int.h
Fixed sized integer types, AMD64 version . . . 3086
amd64/l4/sys/arch/pf_trampoline.h
Page fault trampoline handler definitions for AMD64 . . . 3101
amd64/l4/sys/arch/platform_control.h . . . 3109
amd64/l4/sys/arch/task.h . . . 3136
amd64/l4/sys/arch/thread.h . . . 2387
amd64/l4/sys/arch/utcb.h
UTCB definitions for AMD64 . . . 3157
amd64/l4/util/bitops_arch.h
Amd64 bit manipulation functions . . . 2406
amd64/l4/util/cpu.h
CPU related functions . . . 2413
amd64/l4/util/irq.h
Some PIC and hardware interrupt related functions . . . 2571

amd64/l4/util/mbi_argv.h
Command line handling . . . 2418
amd64/l4/util/perform.h
Perfomance Monitoring using P5/P6 Measurement Counters . . . 2315
amd64/l4/util/port_io.h
X86 port I/O . . . 2326
amd64/l4/util/rdtsc.h
Timestamp counter related functions . . . 2334
amd64/l4/util/spin.h
Spinning for amd64 . . . 2342
amd64/l4/util/arch/l4_macros.h
Main function . . . 2385
amd64/l4/util/arch/thread.h . . . 2388
arm/l4/sys/__kip-arch.h . . . 2345
arm/l4/sys/__vcpu-arch.h
ARM-specific vCPU interface . . . 2348
arm/l4/sys/atomic.h . . . 3190
arm/l4/sys/ktrace_events.h . . . 2361
arm/l4/sys/linkage.h
Linkage . . . 2377
arm/l4/sys/mem_op.h
Memory access functions (ARM specific) . . . 2379
arm/l4/sys/syscall_defs.h
Syscall entry definitions . . . 2381
arm/l4/sys/vm.h
ARM virtualization interface . . . 2382
arm/l4/sys/arch/cache.h
Cache functions . . . 2919
arm/l4/sys/arch/consts.h
Common L4 constants, arm version . . . 2936
arm/l4/sys/arch/ipc.h . . . 3043
arm/l4/sys/arch/kip.h . . . 3226
arm/l4/sys/arch/l4int.h
Fixed sized integer types, arm version . . . 3086
arm/l4/sys/arch/pf_trampoline.h
Page fault trampoline handler definitions for ARM . . . 3102
arm/l4/sys/arch/platform_control.h . . . 3109
arm/l4/sys/arch/task.h . . . 3137
arm/l4/sys/arch/thread.h
ARM-specific thread related definitions . . . 2388
arm/l4/sys/arch/utcb.h
UTCB definitions for ARM . . . 3160
arm/l4/util/bitops_arch.h
ARM specific implementation of bitops functions . . . 2410
arm/l4/util/cpu.h
CPU related functions . . . 2415
arm/l4/util/irq.h
ARM specific implementation of irq functions . . . 2572
arm/l4/util/mbi_argv.h
Multiboot . . . 2419
arm/l4/util/arch/l4_macros.h
Main function . . . 2385
arm/l4/util/arch/thread.h . . . 2389
arm64/l4/sys/__kip-arch.h . . . 2345
arm64/l4/sys/__vcpu-arch.h
ARM64-specific vCPU interface . . . 2351
arm64/l4/sys/ktrace_events.h . . . 2364
arm64/l4/sys/linkage.h . . . 2377

arm64/l4/sys/vm.h . . . 2384
arm64/l4/sys/arch/cache.h
Cache functions . . . 2921
arm64/l4/sys/arch/consts.h
Common L4 constants, arm version . . . 2937
arm64/l4/sys/arch/ipc.h . . . 3044
arm64/l4/sys/arch/kip.h . . . 3227
arm64/l4/sys/arch/l4int.h
Fixed sized integer types, arm version . . . 3087
arm64/l4/sys/arch/pf_trampoline.h
Page fault trampoline handler definitions for ARM64 . . . 3102
arm64/l4/sys/arch/platform_control.h . . . 3109
arm64/l4/sys/arch/task.h . . . 3137
arm64/l4/sys/arch/thread.h
ARM64-specific thread related definitions . . . 2389
arm64/l4/sys/arch/utcb.h
UTCB definitions for ARM64 . . . 3162
contrib/libio-io/l4/io/io.h . . . 2422
contrib/libio-io/l4/io/types.h . . . 3152
l4/cxx/alloc.h
Alloc list . . . 2425
l4/cxx/arith . . . 2426
l4/cxx/atomic.h
Atomic template . . . 3190
l4/cxx/avl_map
AVL map . . . 2427
l4/cxx/avl_set
AVL set . . . 2429
l4/cxx/avl_tree
AVL tree . . . 2435
l4/cxx/basic_ostream
Basic IO stream . . . 2440
l4/cxx/basic_vector.h
Basic vector . . . 2444
l4/cxx/bitfield . . . 2445
l4/cxx/bitmap . . . 2447

l4/l4virtio/server/virtio-spi-device . . . 2679
l4/libedid/edid.h . . . 2693
l4/re/cap_alloc
Abstract capability-allocator interface . . . 2791
l4/re/console . . . 2731
l4/re/consts
Constants . . . 2949
l4/re/consts.h
Constants . . . 2938
l4/re/dataspace
Dataspace interface . . . 2731
l4/re/dbg_events . . . 2734
l4/re/debug
Debug interface . . . 2806
l4/re/dma_space . . . 2734
l4/re/elf_aux.h
Auxiliary information for binaries . . . 2738
l4/re/env
Environment interface . . . 2740
l4/re/env.h
Environment interface . . . 2742
l4/re/error_helper
Error helper . . . 2746
l4/re/event . . . 2810
l4/re/event.h
Events . . . 2703
l4/re/event_enums.h . . . 2748
l4/re/inhibitor . . . 2763
l4/re/itas . . . 2764
l4/re/l4aux.h
Auxiliary definitions . . . 2765
l4/re/log
Log interface . . . 2766
l4/re/mem_alloc
Memory allocator interface . . . 2767
l4/re/mmio_space
Interface definition to emit MMIO-like accesses via IPC . . . 2770
l4/re/namespace
Namespace interface . . . 2771
l4/re/parent
Parent interface . . . 2774

l4/re/protocols.h
L4Re Protocol Constants (C version) . . . 2775
l4/re/random
Random number generator interface definition . . . 2776
l4/re/remote_access . . . 2778
l4/re/rm
Region mapper interface . . . 2778
l4/re/shared_cap
Shared_cap / Shared_del_cap . . . 2844
l4/re/unique_cap
Unique_cap / Unique_del_cap . . . 2852
l4/re/c/dataspace.h
Data space C interface . . . 2694
l4/re/c/debug.h
Debug C interface . . . 2267
l4/re/c/dma_space.h
DMA space C interface . . . 2697
l4/re/c/event.h
Event C interface . . . 2701
l4/re/c/event_buffer.h . . . 2705
l4/re/c/inhibitor.h
Inhibitor C interface . . . 2706
l4/re/c/itas.h . . . 2708
l4/re/c/log.h
Log C interface . . . 2709
l4/re/c/mem_alloc.h
Memory allocator C interface . . . 2710
l4/re/c/namespace.h
Namespace functions, C interface . . . 2712
l4/re/c/parent.h
Parent C interface . . . 2713
l4/re/c/rm.h
Region map interface, C interface . . . 2715
l4/re/c/util/cap_alloc.h
Capability allocator C interface . . . 2719
l4/re/c/util/kumem_alloc.h
Kumem allocator utility C interface . . . 2720
l4/re/c/util/video/goos_fb.h
Framebuffer utility functionality . . . 2722
l4/re/c/video/colors.h . . . 2724
l4/re/c/video/goos.h . . . 2725
l4/re/c/video/view.h . . . 2728
l4/re/impl/dataspace_impl.h
Dataspace client stub implementation . . . 2755
l4/re/impl/mem_alloc_impl.h
Memory allocator client stub implementation . . . 2757
l4/re/impl/namespace_impl.h
Namespace client stub implementation . . . 2758
l4/re/impl/rm_impl.h
Region map client stub implementation . . . 2761
l4/re/util/bitmap_cap_alloc
Bitmap capability allocator . . . 2784
l4/re/util/br_manager . . . 2786
l4/re/util/cap
Capability utility functions . . . 2789
l4/re/util/cap_alloc
Capability allocator . . . 2793

l4/re/util/cap_alloc_impl.h
Capability allocator implementation . . . 2797
l4/re/util/counting_cap_alloc
Reference-counting capability allocator . . . 2799
l4/re/util/dataspace_svr . . . 2803
l4/re/util/debug . . . 2808
l4/re/util/env_ns . . . 2809
l4/re/util/event . . . 2813
l4/re/util/event_buffer . . . 2816
l4/re/util/event_svr . . . 2817
l4/re/util/icu_svr . . . 2818
l4/re/util/item_alloc
Item allocator . . . 2820
l4/re/util/kumem_alloc
Kumem allocator helper . . . 2823
l4/re/util/meta . . . 3094
l4/re/util/name_space_svr . . . 2824
l4/re/util/object_registry . . . 2829
l4/re/util/poll_timeout_kipclock . . . 2832
l4/re/util/region_mapping
Region handling . . . 2832
l4/re/util/region_mapping_svr . . . 2840
l4/re/util/reply_cap_hooks . . . 2844
l4/re/util/shared_cap
Shared_cap / Shared_del_cap . . . 2848
l4/re/util/unique_cap
Unique_cap / Unique_del_cap . . . 2854
l4/re/util/vcon_svr . . . 2856
l4/re/util/video/goos_fb . . . 2857
l4/re/util/video/goos_svr . . . 2859
l4/re/video/colors . . . 2861
l4/re/video/goos . . . 2862
l4/re/video/goos-sys.h
Goos protocol definition . . . 2865
l4/re/video/view . . . 2866
l4/shmc/ringbuf.h . . . 2866
l4/shmc/shmc.h
Shared memory library header file . . . 2874
l4/sigma0/sigma0.h
Sigma0 interface . . . 2879
l4/sys/__kernel_object_impl.h . . . 2882
l4/sys/__ktrace-impl.h
L4 kernel event tracing . . . 2882
l4/sys/__l4_fpage.h . . . 2885
l4/sys/__platform_control-arm.h . . . 2889
l4/sys/__task-arm.h . . . 2889
l4/sys/__timeout.h . . . 2890
l4/sys/__typeinfo.h
Type information handling . . . 2892
l4/sys/__vcpu-arm.h . . . 2905
l4/sys/__vm-svm.h . . . 2906
l4/sys/__vm-vmx.h . . . 2907
l4/sys/arm_smccc
ARM secure monitor call functions . . . 2913
l4/sys/arm_smccc.h
ARM secure monitor call functions . . . 2915
l4/sys/assert.h
Low-level assert implementation . . . 3185

l4/sys/cache.h
Cache-consistency functions . . . 2924
l4/sys/capability
L4::Cap related definitions . . . 2928
l4/sys/compiler.h
L4 compiler related defines . . . 2931
l4/sys/consts.h
Common constants . . . 2939
l4/sys/debugger
The debugger interface specifies common debugging related definitions . . . 3013
l4/sys/debugger.h
Debugger related definitions . . . 3015
l4/sys/err.h
Error codes . . . 3021
l4/sys/exception
Exception C++ interface . . . 3023
l4/sys/factory
Common factory related definitions . . . 3025
l4/sys/factory.h
Common factory related definitions . . . 3028
l4/sys/icu
Interrupt controller . . . 3035
l4/sys/icu.h
Interrupt controller . . . 3037
l4/sys/iommu . . . 3042
l4/sys/ipc.h
Common IPC interface . . . 3044
l4/sys/ipc_gate
The C++ IPC gate interface . . . 3053
l4/sys/ipc_gate.h
The C IPC gate interface, see L4::Ipc_gate for the C++ interface . . . 3055
l4/sys/irq
C++ Irq interface . . . 3058
l4/sys/irq.h
C Irq interface . . . 2576
l4/sys/kdebug.h
Functionality for invoking the kernel debugger . . . 3061
l4/sys/kdump.h
Functionality for dumping kernel information . . . 3077
l4/sys/kernel_object.h
Kernel object system calls . . . 3079
l4/sys/kip . . . 3081
l4/sys/kip.h
Kernel Info Page access functions . . . 3227
l4/sys/kobject . . . 3083
l4/sys/ktrace.h
L4 kernel event tracing . . . 3084
l4/sys/l4int.h
Fixed sized integer types, generic version . . . 3088
l4/sys/memdesc.h
Memory description functions . . . 3090
l4/sys/meta
Meta interface for getting dynamic type information about objects behind capabilities . . . 3094
l4/sys/obj_info.h
Debugger related functions . . . 3095
l4/sys/pager
Pager and Io_pager C++ interface . . . 3099

l4/sys/pf_trampoline.h
Page fault trampoline handlers . . . 3103
l4/sys/pi_mutex.h
Priority Inheritance Mutex object . . . 3105
l4/sys/platform_control
Platform control object . . . 3107
l4/sys/platform_control.h
Platform control object . . . 3109
l4/sys/rcv_endpoint
The C++ Receive endpoint interface . . . 3113
l4/sys/rcv_endpoint.h
Receive endpoint C interface . . . 3115
l4/sys/scheduler
Scheduler object functions . . . 3117
l4/sys/scheduler.h
Scheduler object functions . . . 3119
l4/sys/semaphore
Semaphore class definition . . . 3124
l4/sys/semaphore.h
C semaphore interface . . . 3126
l4/sys/smart_capability
L4::Capability class . . . 3128
l4/sys/snd_destination
The C++ Sender destination interface . . . 3132
l4/sys/snd_destination.h
Sender destination endpoint C interface . . . 3133
l4/sys/task
Common task related definitions . . . 3134
l4/sys/task.h
Common task related definitions . . . 3137
l4/sys/thread
Common thread related definitions . . . 3143
l4/sys/thread.h
Common thread related definitions . . . 2390
l4/sys/thread_group . . . 3146
l4/sys/thread_group.h . . . 3148
l4/sys/typeinfo_svr
Type information server template . . . 3150
l4/sys/types.h
Common L4 ABI Data Types . . . 3152
l4/sys/utcb.h
UTCB definitions . . . 3164
l4/sys/vcon
C++ Virtual console interface . . . 3173
l4/sys/vcon.h
Virtual console interface . . . 3175
l4/sys/vcpu.h
VCPU API . . . 3282
l4/sys/vcpu_context
Hardware vCPU context interface . . . 3181
l4/sys/vcpu_context.h . . . 3182
l4/sys/vm
Virtualization interface . . . 3182
l4/sys/cxx/capability.h . . . 2945
l4/sys/cxx/consts . . . 2951
l4/sys/cxx/ipc_array . . . 2951
l4/sys/cxx/ipc_basics . . . 2955
l4/sys/cxx/ipc_client . . . 2958

l4/sys/cxx/ipc_epiface . . . 2961
l4/sys/cxx/ipc_iface
Interface Definition Language . . . 2966
l4/sys/cxx/ipc_legacy . . . 2976
l4/sys/cxx/ipc_server . . . 2979
l4/sys/cxx/ipc_server_loop . . . 2984
l4/sys/cxx/ipc_string . . . 2987
l4/sys/cxx/ipc_types . . . 2988
l4/sys/cxx/ipc_varg . . . 2997
l4/sys/cxx/limits . . . 3002
l4/sys/cxx/smart_capability_1x . . . 3004
l4/sys/cxx/types . . . 3007
l4/umalloc/umalloc.h
Public API for the basic next-fit memory allocator . . . 3183
l4/util/assert.h
Some useful assert-style macros . . . 3188
l4/util/atomic.h
Atomic operations header and generic implementations . . . 3192
l4/util/backtrace.h
Backtrace . . . 3198
l4/util/base64.h
Base 64 encoding and decoding functions adapted from Bob Trower 08/04/01 . . . 3200
l4/util/bitops.h
Bit manipulation functions . . . 3202
l4/util/elf.h
ELF definition . . . 3207
l4/util/getopt.h
Getopt . . . 3223
l4/util/keymap.h
Event to ASCII key mapping . . . 3225
l4/util/kip.h . . . 3231
l4/util/kprintf.h
Printf using the kernel debugger . . . 3233
l4/util/l4_macros.h
Some useful generic macros, L4f version . . . 2386
l4/util/l4mod.h
L4mod structures and constants . . . 3234
l4/util/list_alloc.h
Simple list-based allocator . . . 3235
l4/util/lock.h
Simple lock implementation . . . 3238
l4/util/mb_info.h
Multiboot info structure as defined by GRUB . . . 3240
l4/util/parse_cmd.h
Comfortable command-line parsing . . . 3247
l4/util/printf_helpers.h . . . 3249
l4/util/rand.h

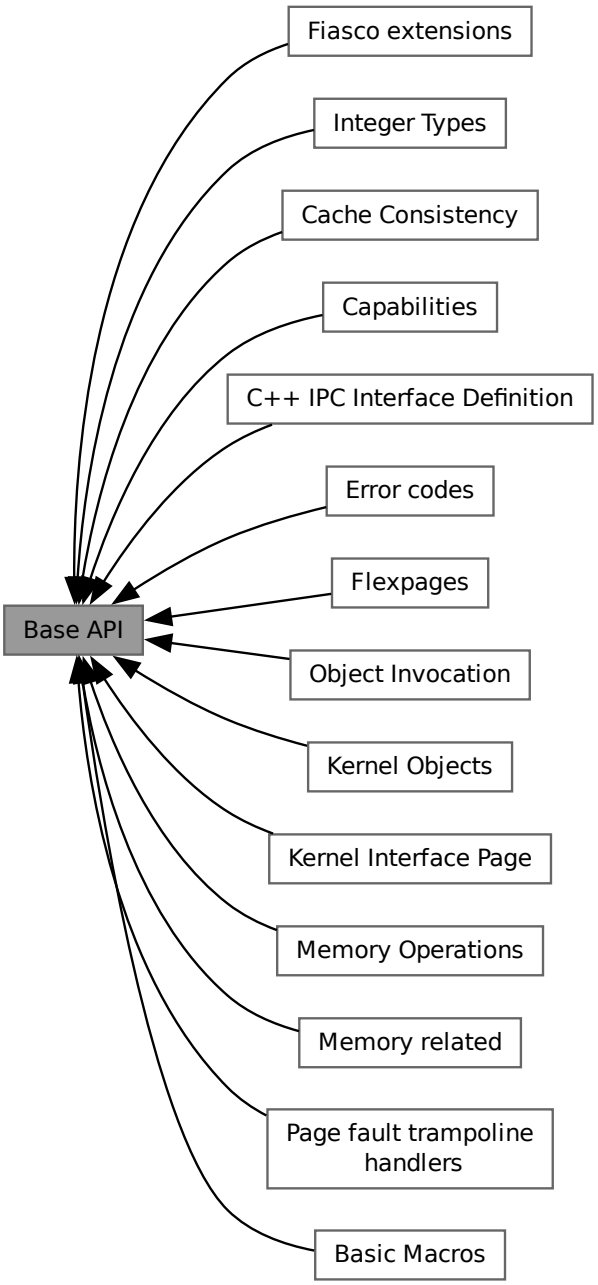
Chapter 13

Topic Documentation

13.1 Base API

Interfaces for all kinds of base functionality.

Collaboration diagram for Base API:



Topics

- Basic Macros 148
  L4 standard macros for header files, function definitions, and public APIs etc.
- Fiasco extensions 153
  Extensions of the Fiasco L4 implementation.

- Flexpages . . . 168
  Flexpage-related API.
- C++ IPC Interface Definition . . . 185
  APIs for defining IPC interfaces using C++ as language.
- Cache Consistency . . . 186
  Various functions for cache consistency.
- Memory related . . . 189
  Memory related constants, data types and functions.
- Error codes . . . 196
  Common error codes.
- Object Invocation . . . 198
  API for L4 object invocation.
- Kernel Objects . . . 258
  API of kernel objects.
- Kernel Interface Page . . . 400
  Kernel Interface Page.
- Page fault trampoline handlers . . . 410
  A page fault trampoline handler is an alternative mechanism to handle page faults.
- Capabilities . . . 414
  C interface for capabilities.
- Memory Operations . . . 418
  Operations for memory access.
- Integer Types . . . 421

Files

- file cache.h
  Cache-consistency functions.
- file compiler.h
  L4 compiler related defines.
- file consts.h
  Common constants.
- file debugger.h
  Debugger related definitions.
- file factory.h
  Common factory related definitions.
- file icu
  Interrupt controller.
- file icu.h

Interrupt controller.

- file ipc.h

  Common IPC interface.
- file irq.h

  C Irq interface.
- file kip
- file kip.h

  Kernel Info Page access functions.
- file memdesc.h

  Memory description functions.
- file semaphore.h

  C semaphore interface.
- file types.h

  Common L4 ABI Data Types.
- file consts.h

  Common L4 constants, arm version.
- file consts.h

  Common L4 constants, arm version.
- file consts.h

  Common L4 constants, AMD64 version.
- file consts.h

  Common L4 constants, x86 version.
- file ipc.h

  L4 IPC System Calls, x86.
- file consts.h

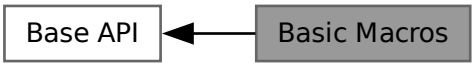
  Common L4 constants, RISC-V version.

13.1.1 Detailed Description

Interfaces for all kinds of base functionality.
Some notes on Inter Process Communication (IPC)
IPC in L4 is always synchronous and unbuffered: a message is transferred from the sender to the recipient if and only if the recipient has invoked a corresponding IPC operation. The sender blocks until this happens or a timeout specified by the sender elapsed without the destination becoming ready to receive.

13.1.2 Basic Macros

L4 standard macros for header files, function definitions, and public APIs etc.
Collaboration diagram for Basic Macros:



Files

- file linkage.h

  Linkage.
- file linkage.h

  Linkage.
- file linkage.h

  Linkage.
- file linkage.h

  Linkage.

Macros

- #define **L4_INLINE**

  L4 Inline function attribute.
- #define **L4_ALWAYS_INLINE**

  Always inline a function.
- #define **L4_BEGIN_DECLS**

  Start section with C types and functions.
- #define **L4_END_DECLS**

  End section with C types and functions.
- #define L4_NOTHROW

  Mark a function declaration and definition as never throwing an exception.
- #define L4_EXPORT

  Attribute to mark functions, variables, and data types as being exported from a library.
- #define L4_HIDDEN

  Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.
- #define **L4_CONSTEXPR**

  Constexpr function attribute.
- #define **L4_NORETURN**

  Noreturn function attribute.
- #define **L4_NOINSTRUMENT**

  No instrumentation function attribute.
- #define **L4_LIKELY**(x)

  Expression is likely to execute.
- #define **L4_UNLIKELY**(x)

  Expression is unlikely to execute.
- #define **L4_STICKY**(x)

  Mark symbol sticky (even not there).
- #define **L4_DEPRECATED**(s)

  Mark symbol deprecated.
- #define **L4_stringify_helper**(x)

  stringify helper.
- #define **L4_stringify**(x)

  stringify.
- #define **L4_CV**

  Define calling convention.
- #define **L4_CV**

  Define calling convention.
- #define **L4_CV**

  Define calling convention.
- #define **L4_CV**

  Define calling convention.
- #define **L4_CV**

  Define calling convention.

Functions

- unsigned long l4_align_stack_for_direct_fncall (unsigned long stack)

  Specify the desired alignment of the stack pointer.
- void **l4_barrier** (void)

  Memory barrier.
- void **l4_mb** (void)

  Memory barrier.
- void **l4_wmb** (void)

  Write memory barrier.
- L4_NORETURN void l4_infinite_loop (void)

  Infinite loop.

13.1.2.1 Detailed Description

L4 standard macros for header files, function definitions, and public APIs etc.

Include File

```
#include <l4/sys/compiler.h>
```

13.1.2.2 Macro Definition Documentation

13.1.2.2.1 L4_EXPORT

```
#define L4_EXPORT
```

Attribute to mark functions, variables, and data types as being exported from a library.
All data types, functions, and global variables that shall be exported from a library shall be marked with this attribute.
The default may become to hide everything that is not marked as L4_EXPORT from the users of a library and provide the possibility for aggressive optimization of all those internal functionality of a library.
Usage:

```
class L4_EXPORT My_class
{
  ...
};

int L4_EXPORT function(void);

int L4_EXPORT global_data; // global data is not recommended
```

Definition at line 220 of file compiler.h.
Referenced by l4io_iterate_devices(), l4io_lookup_device(), l4io_lookup_resource(), l4io_release_iomem(), l4io_release_ioport(), l4io_request_all_ioports(), l4io_request_icu(), l4io_request_iomem(), l4io_request_iomem_region(), l4io_request_ioport(), l4io_request_resource_iomem(), l4re_inhibitor_acquire(), and l4re_inhibitor_release().

13.1.2.2.2 L4_HIDDEN

```
#define L4_HIDDEN
```

Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.
This attribute is intended for functions, data, and data types that shall never be visible outside of a library. In particular, for shared libraries this may result in much faster code within the library and short linking times.

```
class L4_HIDDEN My_class
{
  ...
};

int L4_HIDDEN function(void);

int L4_HIDDEN global_data; // global data is not recommended
```

Definition at line 217 of file compiler.h.

13.1.2.2.3 L4_NOTHROW

```
#define L4_NOTHROW
```

Mark a function declaration and definition as never throwing an exception.
(Also for C code).
This macro shall be used to mark C and C++ functions that never throw any exception. Note that also C functions may throw exceptions according to the compilers ABI and shall be marked with L4_NOTHROW if they never do. In C++ this is equivalent to `throw()`.

```
int foo() L4_NOTHROW;
...
int foo() L4_NOTHROW
{
  ...
  return result;
}
```

Definition at line 167 of file compiler.h.

13.1.2.3 Function Documentation

13.1.2.3.1 l4_align_stack_for_direct_fncall()

```
unsigned long l4_align_stack_for_direct_fncall (
            unsigned long stack)  [inline]
```

Specify the desired alignment of the stack pointer.

BIGGEST_ALIGNMENT provides the largest alignment ever used for any data type on the target machine. This is normally identical to desired stack alignment. Align stack pointer for directly invoked functions.

The stack needs to be aligned to L4_STACK_ALIGN for being able to access certain data on the stack. On x86/↩ AMD64, a function call is performed using the 'call' instruction decrementing the stack pointer and writing the return address onto the stack. The called function considers this when adapting the stack pointer after function entry. If the called function was not invoked by a 'call' instruction, the stack pointer is actually off by a machine word leading to stack alignment issues when executing SSE instructions.

This function fixes the stack pointer for directly invoked functions. For architectures not automatically pushing the stack pointer during a function call, just enforce the L4_STACK_ALIGN alignment.

Definition at line 284 of file compiler.h.

References L4_INLINE.

13.1.2.3.2 l4_infinite_loop()

```
L4_NORETURN void l4_infinite_loop (
            void )  [inline]
```

Infinite loop.

Will never return. Use l4_sleep_forever() if at all possible.

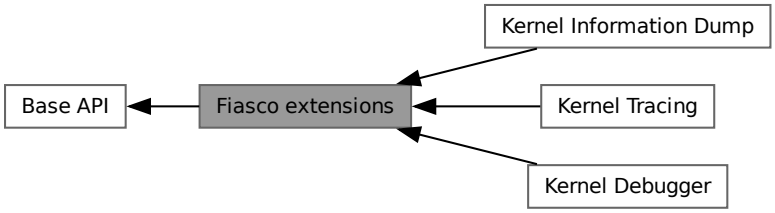
Definition at line 358 of file compiler.h.

References l4_barrier(), L4_INLINE, and L4_NORETURN.

Here is the call graph for this function:

13.1.3 Fiasco extensions

Extensions of the Fiasco L4 implementation.
Collaboration diagram for Fiasco extensions:



Topics

  Segment handling (AMD64).
- file segment.h
  Segment handling (x86).

Functions

- long fiasco_ldt_set (l4_cap_idx_t task, void *ldt, unsigned int num_desc, unsigned int entry_number_start, l4_utcb_t *utcb)

  Set LDT segments descriptors.
- long fiasco_gdt_set (l4_cap_idx_t thread, void *desc, unsigned int size, unsigned int entry_number_start, l4_utcb_t *utcb)

  Set GDT segment descriptors.
- unsigned fiasco_gdt_get_entry_offset (l4_cap_idx_t thread, l4_utcb_t *utcb)

  Return the offset of the entry in the GDT.

13.1.3.1 Detailed Description

Extensions of the Fiasco L4 implementation.

13.1.3.2 Function Documentation

13.1.3.2.1 fiasco_gdt_get_entry_offset()

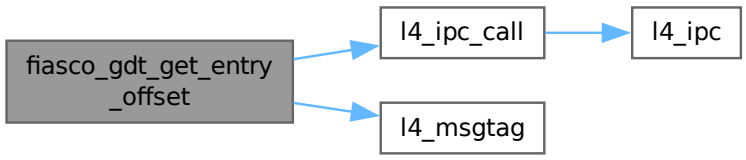
```
unsigned fiasco_gdt_get_entry_offset (
            l4_cap_idx_t thread,
            l4_utcb_t * utcb)  [inline]
```

Return the offset of the entry in the GDT.

Parameters

thread	Thread to get info from.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Definition at line 166 of file segment.h.
References l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_PROTO_THREAD, and L4_THREAD_X86_GDT_OP.
Here is the call graph for this function:



13.1.3.2.2 fiasco_gdt_set()

```
long fiasco_gdt_set (
            l4_cap_idx_t thread,
            void * desc,
            unsigned int size,
            unsigned int entry_number_start,
            l4_utcb_t * utcb)  [inline]
```

Set GDT segment descriptors.
Fiasco supports 4 consecutive entries, starting at the value returned by fiasco_gdt_get_entry_offset().

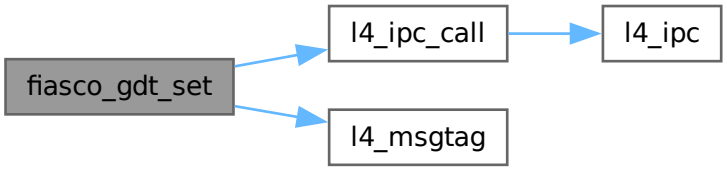
Parameters

thread	Thread to set the GDT entry for.
desc	Pointer to GDT descriptors.
size	Size of the descriptors in bytes (multiple of 8).
entry_number_start	Entry number to start (valid values: 0-3).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

<0	At least one provided GDT descriptor is considered unsafe by the kernel, and not all selected GDT descriptors have been updated.
L4_EOK	Success.

Definition at line 220 of file segment.h.
References l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_PROTO_THREAD, and L4_THREAD_X86_GDT_OP.
Here is the call graph for this function:



13.1.3.2.3 fiasco_ldt_set()

```
long fiasco_ldt_set (
             l4_cap_idx_t task,
             void * ldt,
             unsigned int num_desc,
             unsigned int entry_number_start,
             l4_utcb_t * utcb)  [inline]
```

Set LDT segments descriptors.

Parameters

task	Task to set the segment for.
ldt	Pointer to LDT hardware descriptors.
num_desc	Number of descriptors.
entry_number_start	Entry number to start.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

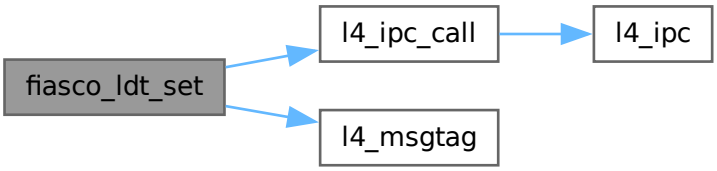
Return values

-L4_ENOSYS	The kernel configuration doesn't support this feature.
-L4_EINVAL	Invalid descriptor or invalid entry number.
L4_EOK	Success.

Note

This feature is not available if the kernel is configured with page table isolation.

Definition at line 153 of file segment.h.
References L4_EINVAL, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_PROTO_TASK, L4_TASK_LDT_SET_X86_OP, L4_TASK_LDT_X86_ENTRY_SIZE, and L4_TASK_LDT_X86_MAX_ENTRIES.
Here is the call graph for this function:



13.1.3.3 Kernel Debugger

Kernel debugger related functionality.
Collaboration diagram for Kernel Debugger:

Files

- file kdebug.h

  Functionality for invoking the kernel debugger.

Functions

- l4_msgtag_t l4_debugger_set_object_name (l4_cap_idx_t cap, const char *name) L4_NOTHROW

  Set the name of a kernel object.
- l4_ret_t l4_debugger_query_object_name (l4_cap_idx_t cap, unsigned id, char *name, unsigned size) L4_NOTHROW

  Get name of the kernel object with Id `id`.
- l4_ret_t l4_debugger_get_object_name (l4_cap_idx_t cap, char *name, unsigned size) L4_NOTHROW

Get name of a kernel object.

- unsigned long l4_debugger_global_id (l4_cap_idx_t cap) L4_NOTHROW

  Get the globally unique ID of the object behind a capability.

- unsigned long l4_debugger_kobj_to_id (l4_cap_idx_t cap, l4_addr_t kobjp) L4_NOTHROW

  Get the globally unique ID of the object behind the kobject pointer.

- l4_ret_t l4_debugger_query_log_typeid (l4_cap_idx_t cap, const char *name, unsigned idx) L4_NOTHROW

  Query the log-id for a log type.

- l4_ret_t l4_debugger_query_log_name (l4_cap_idx_t cap, unsigned idx, char *name, unsigned namelen, char *shortname, unsigned shortnamelen) L4_NOTHROW

  Query the name of a log type given the ID.

- l4_msgtag_t l4_debugger_switch_log (l4_cap_idx_t cap, const char *name, int on_off) L4_NOTHROW

  Set or unset log.

- l4_msgtag_t l4_debugger_add_image_info (l4_cap_idx_t cap, l4_addr_t base, const char *name) L4_NOTHROW

  Add loaded image information for a task.

13.1.3.3.1 Detailed Description

Kernel debugger related functionality.

Attention

This API is subject to change!

This is a debugging facility, any call to any function might be invalid. Do not rely on it in any real code.

Include File

```
#include <l4/sys/debugger.h>
```

13.1.3.3.2 Function Documentation

13.1.3.3.2.1 l4_debugger_add_image_info()

```
l4_msgtag_t l4_debugger_add_image_info (
             l4_cap_idx_t cap,
             l4_addr_t base,
             const char * name)  [inline]
```

Add loaded image information for a task.

Parameters

cap	Capability which refers to the task object.
base	Load base address of image.
name	Image base name.

This is a debugging facility, the call might be invalid.
Definition at line 482 of file debugger.h.
References L4_NOTHROW, and l4_utcb().

Here is the call graph for this function:

13.1.3.3.2.2 l4_debugger_get_object_name()

```
l4_ret_t l4_debugger_get_object_name (
            l4_cap_idx_t cap,
            char * name,
            unsigned size)  [inline]
```

Get name of a kernel object.

Parameters

	cap	Capability which refers to the kernel object.
out	*name*	Buffer to copy the name into. The buffer must be allocated by the caller.
	size	Length of the name buffer.

Return values

0	Success
<0	Error

Definition at line 475 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.3.3.2.3 l4_debugger_global_id()

```
unsigned long l4_debugger_global_id (
            l4_cap_idx_t cap)  [inline]
```

Get the globally unique ID of the object behind a capability.

Parameters

cap	Capability

Return values

~0UL	Capability is not valid.
otherwise	Global debugger id.

This is a debugging facility, the call might be invalid.
Definition at line 433 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.3.3.2.4 l4_debugger_kobj_to_id()

```
unsigned long l4_debugger_kobj_to_id (
             l4_cap_idx_t cap,
             l4_addr_t kobjp)  [inline]
```

Get the globally unique ID of the object behind the kobject pointer.

Parameters

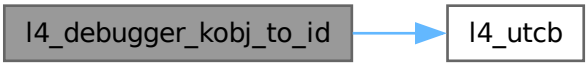
cap	Capability
kobjp	Kobject pointer

Return values

~0UL	The capability or the kobject pointer are invalid.
otherwise	The globally unique id.

This is a debugging facility, the call might be invalid.
Definition at line 439 of file debugger.h.
References L4_NOTHROW, and l4_utcb().

Here is the call graph for this function:



13.1.3.3.2.5 l4_debugger_query_log_name()

```
l4_ret_t l4_debugger_query_log_name (
             l4_cap_idx_t cap,
             unsigned idx,
             char * name,
             unsigned namelen,
             char * shortname,
             unsigned shortnamelen)  [inline]
```

Query the name of a log type given the ID.

Parameters

cap	Debugger capability.
idx	ID to query.
name	Buffer to copy name to.
namelen	Buffer length of name.
shortname	Buffer to copy `shortname` to.
shortnamelen	Buffer length of `shortname`.

Return values

0	Success
<0	Error

This is a debugging facility, the call might be invalid.
Definition at line 452 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.3.3.2.6 l4_debugger_query_log_typeid()

```
l4_ret_t l4_debugger_query_log_typeid (
             l4_cap_idx_t cap,
             const char * name,
             unsigned idx)  [inline]
```

Query the log-id for a log type.

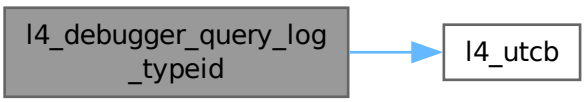
Parameters

cap	Debugger capability
name	Name to query for.
idx	Idx to start searching, start with 0

Returns

positive ID, or negative error code

This is a debugging facility, the call might be invalid.
Definition at line 445 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.3.3.2.7 l4_debugger_query_object_name()

```
l4_ret_t l4_debugger_query_object_name (
             l4_cap_idx_t cap,
             unsigned id,
             char * name,
             unsigned size)  [inline]
```

Get name of the kernel object with Id `id`.

Parameters

	cap	Capability of the debugger object.
	id	Global id of the object whose name is asked.
`out`	*name*	Buffer to copy the name into. The buffer must be allocated by the caller.
	size	Length of the `name` buffer.

Return values

0	Success
<0	Error

Definition at line 468 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.3.3.2.8 l4_debugger_set_object_name()

```
l4_msgtag_t l4_debugger_set_object_name (
            l4_cap_idx_t cap,
            const char * name)  [inline]
```

Set the name of a kernel object.

Parameters

cap	Capability which refers to the kernel object.
name	Name of the kernel object that is e.g. displayed in the kernel debugger.

This is a debugging facility, the call might be invalid.

Examples

examples/libs/shmc/prodcons.c, and examples/sys/aliens/main.c.

Definition at line 426 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.3.3.2.9 l4_debugger_switch_log()

```
l4_msgtag_t l4_debugger_switch_log (
            l4_cap_idx_t cap,
            const char * name,
            int on_off)  [inline]
```

Set or unset log.

Parameters

cap	Debugger object.
name	Name of the log type.
on_off	1: turn log on, 0: turn log off

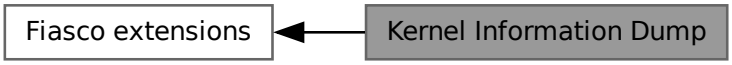
Returns

Syscall return tag

Definition at line 461 of file debugger.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.3.4 Kernel Information Dump

Kernel information dumping related functionality.
Collaboration diagram for Kernel Information Dump:



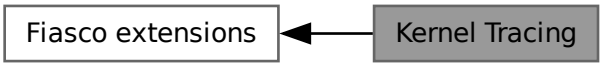
Kernel information dumping related functionality.
Functions that dump various kernel internal information to the console. Probably only present in kernel debug builds.

Include File

```
#include <l4/sys/kdump.h>
```

13.1.3.5 Kernel Tracing

Kernel tracing related functionality.
Collaboration diagram for Kernel Tracing:



Functions

- l4_msgtag_t fiasco_tbuf_validate (void)

  Validate the kernel base debugger capability.
- l4_umword_t fiasco_tbuf_log (const char *text)

  Create new trace-buffer entry with describing <text>.
- l4_umword_t fiasco_tbuf_log_3val (const char *text, l4_umword_t v1, l4_umword_t v2, l4_umword_t v3)

  Create new trace-buffer entry with describing <text> and three additional values.
- l4_umword_t fiasco_tbuf_log_binary (const unsigned char *data)

  Create new trace-buffer entry with binary data.
- void **fiasco_tbuf_clear** (void)

  Clear trace-buffer.
- void **fiasco_tbuf_dump** (void)

  Dump trace-buffer to kernel console.
- l4_msgtag_t fiasco_tbuf_map_status (l4_fpage_t *ku_mem)

  Map kernel trace-buffer status page.
- l4_msgtag_t fiasco_tbuf_map_slots (l4_fpage_t *ku_mem)

  Map kernel trace-buffer slots.

13.1.3.5.1 Detailed Description

Kernel tracing related functionality.

Attention

This API is subject to change!

This is a tracing facility for the Fiasco kernel trace buffer. Any call to any function might be invalid. Do not rely on it in any real code.

Include File

```
#include <l4/sys/ktrace.h>
```

13.1.3.5.2 Function Documentation

13.1.3.5.2.1 fiasco_tbuf_log()

```
l4_umword_t fiasco_tbuf_log (
             const char * text)  [inline]
```

Create new trace-buffer entry with describing <text>.

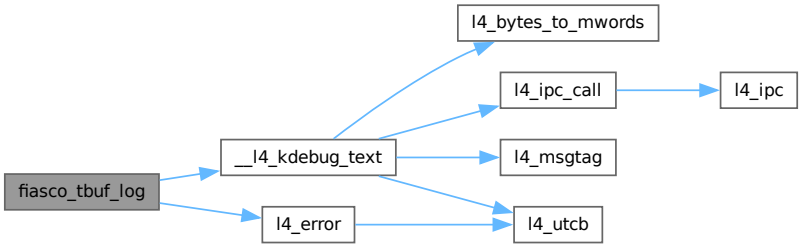
Parameters

text	Logging text

Returns

Pointer to trace-buffer entry

Definition at line 29 of file __ktrace-impl.h.
References __l4_kdebug_text(), and l4_error().
Here is the call graph for this function:



13.1.3.5.2.2 fiasco_tbuf_log_3val()

```
l4_umword_t fiasco_tbuf_log_3val (
             const char * text,
             l4_umword_t v1,
             l4_umword_t v2,
             l4_umword_t v3)  [inline]
```

Create new trace-buffer entry with describing <text> and three additional values.

Parameters

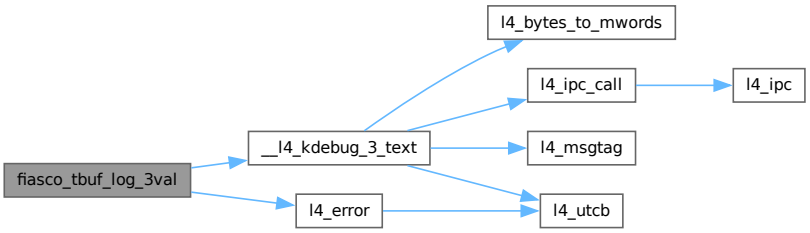
text	Logging text
v1	first value
v2	second value
v3	third value

Returns

Pointer to trace-buffer entry

Definition at line 36 of file __ktrace-impl.h.
References __l4_kdebug_3_text(), and l4_error().

Here is the call graph for this function:



13.1.3.5.2.3 fiasco_tbuf_log_binary()

```
l4_umword_t fiasco_tbuf_log_binary (
            const unsigned char * data)  [inline]
```

Create new trace-buffer entry with binary data.

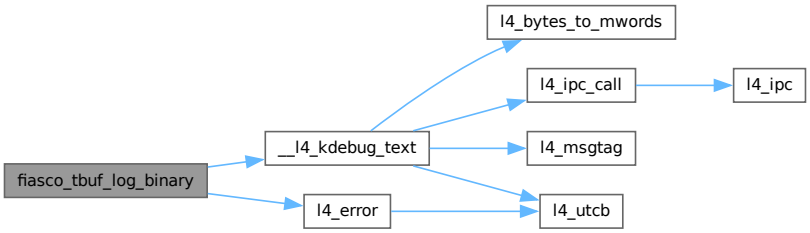
Parameters

data	binary data

Returns

Pointer to trace-buffer entry

Definition at line 59 of file __ktrace-impl.h.
References __l4_kdebug_text(), and l4_error().
Here is the call graph for this function:



13.1.3.5.2.4 fiasco_tbuf_map_slots()

```
l4_msgtag_t fiasco_tbuf_map_slots (
            l4_fpage_t * ku_mem)  [inline]
```

Map kernel trace-buffer slots.

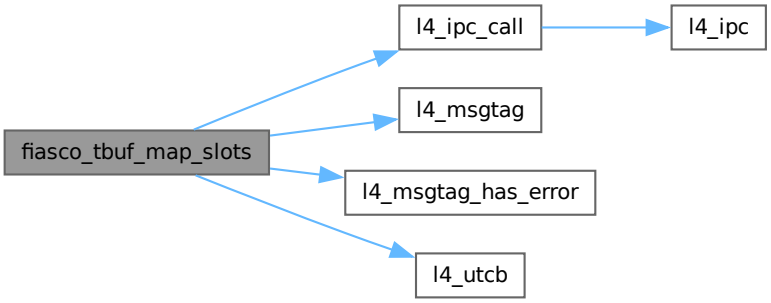
Parameters

ku_mem	Flexpage where to map the trace-buffer slots. Expected to be the exact size as defined by the status page.

Returns

IPC message tag.

Definition at line 85 of file __ktrace-impl.h.
References L4_BASE_DEBUGGER_CAP, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), l4_msgtag_has_error(), L4_PROTO_DEBUGGER, l4_utcb(), l4_msg_regs_t::mr, and l4_fpage_t::raw.
Here is the call graph for this function:



13.1.3.5.2.5 fiasco_tbuf_map_status()

```
l4_msgtag_t fiasco_tbuf_map_status (
            l4_fpage_t * ku_mem)  [inline]
```

Map kernel trace-buffer status page.

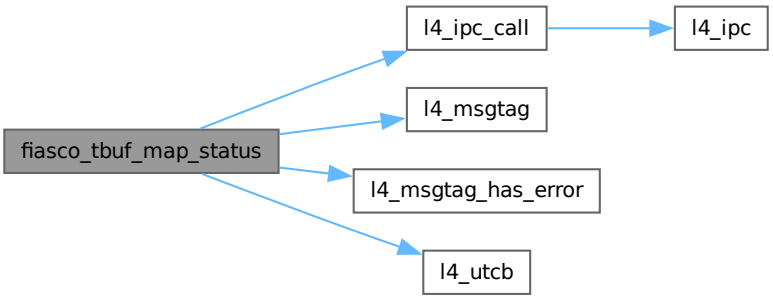
Parameters

ku_mem	Flexpage where to map the trace-buffer status page. Expected to be exactly one page in size.

Returns

IPC message tag.

Definition at line 66 of file __ktrace-impl.h.
References L4_BASE_DEBUGGER_CAP, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), l4_msgtag_has_error(), L4_PROTO_DEBUGGER, l4_utcb(), l4_msg_regs_t::mr, and l4_fpage_t::raw.
Here is the call graph for this function:



13.1.3.5.2.6 fiasco_tbuf_validate()

```
l4_msgtag_t fiasco_tbuf_validate (
            void ) [inline]
```

Validate the kernel base debugger capability.

Return values

true	The base debugger capability is valid and accessible.
false	The base debugger capability is not valid or not accessible.

Definition at line 25 of file __ktrace-impl.h.
References L4_BASE_DEBUGGER_CAP, L4_BASE_TASK_CAP, and l4_task_cap_valid().
Here is the call graph for this function:

13.1.4 Flexpages

Flexpage-related API.

Collaboration diagram for Flexpages:

Data Structures

- union l4_fpage_t

  L4 flexpage type.

Enumerations

- enum L4_fpage_consts {
  L4_FPAGE_RIGHTS_SHIFT = 0 , L4_FPAGE_TYPE_SHIFT = 4 , L4_FPAGE_SIZE_SHIFT = 6 , L4_FPAGE_ADDR_SHIFT = 12 ,
  L4_FPAGE_RIGHTS_BITS = 4 , L4_FPAGE_TYPE_BITS = 2 , L4_FPAGE_SIZE_BITS = 6 , L4_FPAGE_ADDR_BITS = L4_MWORD_BITS - L4_FPAGE_ADDR_SHIFT ,
  L4_FPAGE_RIGHTS_MASK , **L4_FPAGE_TYPE_MASK** , **L4_FPAGE_SIZE_MASK** , **L4_FPAGE_ADDR_MASK** = ~0UL << L4_FPAGE_ADDR_SHIFT ,
  L4_FPAGE_RIGHTS_ALL = L4_FPAGE_RIGHTS_MASK }

  L4 flexpage structure.
- enum { L4_WHOLE_ADDRESS_SPACE = 63 }

  Constants for flexpages.
- enum L4_fpage_rights {
  L4_FPAGE_X = 1 , L4_FPAGE_W = 2 , L4_FPAGE_RO = 4 , L4_FPAGE_RW = L4_FPAGE_RO | L4_FPAGE_W ,
  L4_FPAGE_RX = L4_FPAGE_RO | L4_FPAGE_X , L4_FPAGE_RWX = L4_FPAGE_RW | L4_FPAGE_X }

  Memory and IO port flexpage rights.
- enum L4_cap_fpage_rights {
  L4_CAP_FPAGE_W = 0x1 , L4_CAP_FPAGE_S = 0x2 , L4_CAP_FPAGE_R = 0x4 , L4_CAP_FPAGE_RO = 0x4 ,
  L4_CAP_FPAGE_D = 0x8 , L4_CAP_FPAGE_RW = L4_CAP_FPAGE_R | L4_CAP_FPAGE_W ,
  L4_CAP_FPAGE_RS = L4_CAP_FPAGE_R | L4_CAP_FPAGE_S , L4_CAP_FPAGE_RWS = L4_CAP_FPAGE_RW | L4_CAP_FPAGE_S ,
  L4_CAP_FPAGE_RWSD = L4_CAP_FPAGE_RWS | L4_CAP_FPAGE_D , L4_CAP_FPAGE_RWD = L4_CAP_FPAGE_RW | L4_CAP_FPAGE_D , L4_CAP_FPAGE_RSD = L4_CAP_FPAGE_RS | L4_CAP_FPAGE_D }

  Object flexpage rights.
- enum L4_fpage_type { L4_FPAGE_SPECIAL = 0 , L4_FPAGE_MEMORY = 1 , L4_FPAGE_IO = 2 , L4_FPAGE_OBJ = 3 }

  Flexpage type.
- enum L4_fpage_control { L4_FPAGE_CONTROL_OFFSET_SHIFT = 12 , L4_FPAGE_CONTROL_MASK = ~0UL << L4_FPAGE_CONTROL_OFFSET_SHIFT }

  Flexpage map control flags.
- enum { L4_WHOLE_IOADDRESS_SPACE = 16 , L4_IOPORT_MAX = (1L << L4_WHOLE_IOADDRESS_SPACE) }

  Special constants for IO flexpages.

Functions

- L4_CONSTEXPR l4_fpage_t l4_fpage (l4_addr_t address, unsigned int order, unsigned char rights) L4_NOTHROW

  Create a memory flexpage.
- L4_CONSTEXPR l4_fpage_t l4_fpage_all (void) L4_NOTHROW

  Get a flexpage, describing all address spaces at once.
- L4_CONSTEXPR l4_fpage_t l4_fpage_invalid (void) L4_NOTHROW

  Get an invalid flexpage.
- L4_CONSTEXPR l4_fpage_t l4_iofpage (unsigned long port, unsigned int order) L4_NOTHROW

  Create an IO-port flexpage.
- L4_CONSTEXPR l4_fpage_t l4_obj_fpage (l4_cap_idx_t obj, unsigned int order, unsigned char rights) L4_NOTHROW

  Create a kernel-object flexpage.
- L4_CONSTEXPR int l4_is_fpage_writable (l4_fpage_t fp) L4_NOTHROW

  Test if the flexpage is writable.
- L4_CONSTEXPR unsigned l4_fpage_rights (l4_fpage_t f) L4_NOTHROW

  Return rights from a flexpage.
- L4_CONSTEXPR unsigned l4_fpage_type (l4_fpage_t f) L4_NOTHROW

  Return type from a flexpage.
- L4_CONSTEXPR unsigned l4_fpage_size (l4_fpage_t f) L4_NOTHROW

  Return size (log2) from a flexpage.
- L4_CONSTEXPR unsigned l4_fpage_order (l4_fpage_t f) L4_NOTHROW

  Return order (log2(size)) from a flexpage.
- L4_CONSTEXPR unsigned long l4_fpage_page (l4_fpage_t f) L4_NOTHROW

  Return the page part from a flexpage.
- L4_CONSTEXPR l4_addr_t l4_fpage_memaddr (l4_fpage_t f) L4_NOTHROW

  Return the memory address from the memory flexpage.
- L4_CONSTEXPR l4_cap_idx_t l4_fpage_obj (l4_fpage_t f) L4_NOTHROW

  Return the capability index from the object flexpage.
- L4_CONSTEXPR unsigned long l4_fpage_ioport (l4_fpage_t f) L4_NOTHROW

  Return the IO port number from the IO flexpage.
- L4_CONSTEXPR l4_fpage_t l4_fpage_set_rights (l4_fpage_t src, unsigned char new_rights) L4_NOTHROW

  Set new right in a flexpage.
- L4_CONSTEXPR int l4_fpage_contains (l4_fpage_t fpage, l4_addr_t addr, unsigned order) L4_NOTHROW

  Test whether a given range is completely within an fpage.
- L4_CONSTEXPR unsigned char l4_fpage_max_order (unsigned char order, l4_addr_t addr, l4_addr_t min↩ _addr, l4_addr_t max_addr, l4_addr_t hotspot=0)

  Determine maximum flexpage size of a region.
- L4_CONSTEXPR int l4_is_fpage_valid (l4_fpage_t fp) L4_NOTHROW

  Test if the flexpage is valid.

13.1.4.1 Detailed Description

Flexpage-related API.
A flexpage is a page with a variable size, that can describe memory, IO-Ports (IA32 only), and sets of kernel objects. A flexpage describes an always size aligned region of an address space. The size is given in a log2 scale. This means the size in elements (bytes for memory, ports for IO-Ports, and capabilities for kernel objects) is always a power of two.
A flexpage also carries type and access right information for the described region. The type information selects the address space in which the flexpage is valid. Access rights have a meaning depending on the specific address space (type).
There exists a special type for defining *receive windows* or for the l4_task_unmap() method, that can be used to describe all address spaces (all types) with a single flexpage.

Include File

```
#include <l4/sys/types.h>
```

13.1.4.2 Enumeration Type Documentation

13.1.4.2.1 anonymous enum

`anonymous enum`
Constants for flexpages.

Enumerator

L4_WHOLE_ADDRESS_SPACE	Whole address space size. This value does not only specify the log2 size of the biggest possible memory flexpage. It can be also used as size for a special flexpage to define a flexpage which completely covers all spaces.

Definition at line 84 of file __l4_fpage.h.

13.1.4.2.2 anonymous enum

`anonymous enum`
Special constants for IO flexpages.

Enumerator

L4_WHOLE_IOADDRESS_SPACE	Whole I/O address space size. In contrast to L4_WHOLE_ADDRESS_SPACE, this value forms the log2 size of the biggest possible I/O flexpage.
L4_IOPORT_MAX	Maximum I/O port address plus 1.

Definition at line 326 of file __l4_fpage.h.

13.1.4.2.3 L4_cap_fpage_rights

`enum L4_cap_fpage_rights`
Object flexpage rights.
Capabilities are modified or transferred with map and unmap operations. For that, capabilities are wrapped into flexpage objects. The flexpage carries a set of rights the sender wants to hand over to the receiver along with the capability.
For the user only the 'S' and the 'W' right are visible. Other rights such as the 'D' right are internal to the corresponding kernel object and cannot be evaluated by the receiver.
Note that additional object attributes and permissions can be specified in a send item, see Attributes and additional permissions for obj

Note

A thread can also map a capability from its task's capability table with a reduced set of rights into another slot of its own capability table.

Enumerator

L4_CAP_FPAGE_W	Interface specific 'W' right for capability flexpages. The semantics of the 'W' right is defined by the protocol. For example in case of a dataspace cap, the 'W' right is needed to get a writable dataspace.

L4_CAP_FPAGE_S	Interface specific 'S' right for capability flexpages. The semantics of the 'S' right is defined by the interface. When transferring object capabilities via IPC, the kernel masks this right with the 'S' right of the capability used to address the IPC partner. Thus, the 'S' right of sent capabilities is only transferred if both the flexpage and the IPC gate or thread capability specifying the IPC partner have the 'S' right. For L4::Task::map(), the 'S' right is only transferred if the flexpage, the source and destination task capabilities have the 'S' right.
L4_CAP_FPAGE_R	Read right for capability flexpages. This is always required, otherwise no capability is mapped.
L4_CAP_FPAGE_RO	Read right for capability flexpages. This is always required, otherwise no capability is mapped.
L4_CAP_FPAGE_D	Delete right for capability flexpages. This allows the receiver to delete the corresponding kernel object using unmap() regardless of other tasks still holding a capability to the kernel object. Such capabilities are set to an empty capability if the object is deleted.
L4_CAP_FPAGE_RW	Read and interface specific 'W' right for capability flexpages. The semantics of the 'W' right is defined by the interface. **See also** L4_CAP_FPAGE_W
L4_CAP_FPAGE_RS	Read and interface specific 'S' right for capability flexpages. The semantics of the 'S' right is defined by the interface. **See also** L4_CAP_FPAGE_S
L4_CAP_FPAGE_RWS	Read, interface specific 'W', and 'S' rights for capability flexpages. The semantics of the 'W' and 'S' right are defined by the interface. **See also** L4_CAP_FPAGE_R, L4_CAP_FPAGE_W, and L4_CAP_FPAGE_S
L4_CAP_FPAGE_RWSD	Full rights for capability flexpages. **See also** L4_CAP_FPAGE_R, L4_CAP_FPAGE_W, L4_CAP_FPAGE_S, and L4_CAP_FPAGE_D
L4_CAP_FPAGE_RWD	Read, write, and delete right for capability flexpages. **See also** L4_CAP_FPAGE_R, L4_CAP_FPAGE_W, and L4_CAP_FPAGE_D
L4_CAP_FPAGE_RSD	Read, 'S', and delete right for capability flexpages. **See also** L4_CAP_FPAGE_R, L4_CAP_FPAGE_S, and L4_CAP_FPAGE_D

Definition at line 148 of file __l4_fpage.h.

13.1.4.2.4 L4_fpage_consts

enum L4_fpage_consts
L4 flexpage structure.

Enumerator

L4_FPAGE_RIGHTS_SHIFT	Access permissions shift.
L4_FPAGE_TYPE_SHIFT	Flexpage type shift (memory, IO port, obj...).
L4_FPAGE_SIZE_SHIFT	Flexpage size shift (log2-based).
L4_FPAGE_ADDR_SHIFT	Page address shift.
L4_FPAGE_RIGHTS_BITS	Access permissions size.
L4_FPAGE_TYPE_BITS	Flexpage type size (memory, IO port, obj...).
L4_FPAGE_SIZE_BITS	Flexpage size size (log2-based).
L4_FPAGE_ADDR_BITS	Page address size.
L4_FPAGE_RIGHTS_MASK	Mask to get the flexpage rights.
L4_FPAGE_RIGHTS_ALL	Specify as flexpage rights during grant.

Definition at line 48 of file __l4_fpage.h.

13.1.4.2.5 L4_fpage_control

enum L4_fpage_control
Flexpage map control flags.

Enumerator

L4_FPAGE_CONTROL_OFFSET_SHIFT	Number of bits an index must be shifted or an address must be aligned to in the control word.
L4_FPAGE_CONTROL_MASK	Mask for truncating the lower bits of the send base or the index of the control word.

Definition at line 243 of file __l4_fpage.h.

13.1.4.2.6 L4_fpage_rights

enum L4_fpage_rights
Memory and IO port flexpage rights.
For IO flexpages, bit 1 and bit 2 are a combined read/write right. In a map operation, the receiver receives the IO port capability when the sender possesses it and at least one of these bits is present. For an unmap operation, the absence of one of those bits is sufficient to unmap the IO port capability.
Note that more memory attributes can be specified in a send item, see l4_fpage_cacheability_opt_t.

Enumerator

L4_FPAGE_X	Executable flexpage.
L4_FPAGE_W	Writable flexpage.
L4_FPAGE_RO	Read-only flexpage.
L4_FPAGE_RW	Read-write flexpage.
L4_FPAGE_RX	Read-execute flexpage.

L4_FPAGE_RWX	Read-write-execute flexpage.

Definition at line 118 of file __l4_fpage.h.

13.1.4.2.7 L4_fpage_type

```
enum L4_fpage_type
```
Flexpage type.

Enumerator

L4_FPAGE_SPECIAL	Special flexpage, either l4_fpage_invalid() or l4_fpage_all(); only supported by selected interfaces.
L4_FPAGE_MEMORY	Flexpage for memory spaces.
L4_FPAGE_IO	Flexpage for I/O port spaces.
L4_FPAGE_OBJ	Flexpage for object spaces.

Definition at line 230 of file __l4_fpage.h.

13.1.4.3 Function Documentation

13.1.4.3.1 l4_fpage()

```
L4_CONSTEXPR l4_fpage_t l4_fpage (
             l4_addr_t address,
             unsigned int order,
             unsigned char rights)  [inline]
```
Create a memory flexpage.

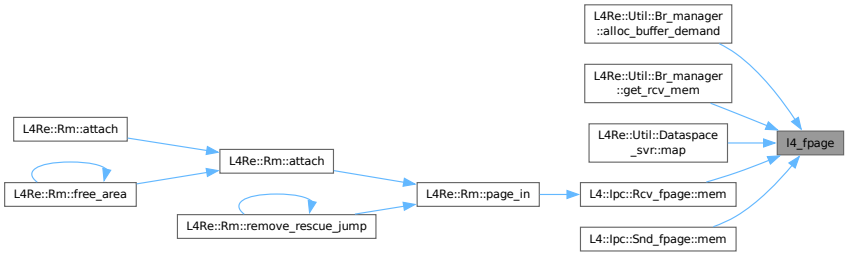
Parameters

address	Flexpage start address
order	Flexpage size (log2), L4_WHOLE_ADDRESS_SPACE to specify the whole address space (with `address` 0). The minimum log2 size of a memory flexpage is defined by L4_LOG2_PAGESIZE according to the size of the smallest virtual page supported by the MMU.
rights	Access rights, see L4_fpage_rights

Returns

Memory flexpage

Definition at line 740 of file __l4_fpage.h.
References L4_FPAGE_MEMORY, and L4_NOTHROW.
Referenced by L4Re::Util::Br_manager::alloc_buffer_demand(), L4Re::Util::Br_manager::get_rcv_mem(), L4Re::Util::Dataspace_svr::
L4::Ipc::Rcv_fpage::mem(), and L4::Ipc::Snd_fpage::mem().
Here is the caller graph for this function:



13.1.4.3.2 l4_fpage_all()

```
L4_CONSTEXPR l4_fpage_t l4_fpage_all (
             void )  [inline]
```

Get a flexpage, describing all address spaces at once.

Returns

Special *all-spaces* flexpage.

Note

This flexpage can be used to define a receive window where the sender can send objects of any type, or for an unmap item completely covering all spaces of the target task. It does not make sense to use this flexpage as send item.

Definition at line 760 of file __l4_fpage.h.
References L4_FPAGE_SPECIAL, L4_NOTHROW, and L4_WHOLE_ADDRESS_SPACE.

13.1.4.3.3 l4_fpage_contains()

```
L4_CONSTEXPR int l4_fpage_contains (
             l4_fpage_t fpage,
             l4_addr_t addr,
             unsigned order)  [inline]
```

Test whether a given range is completely within an fpage.

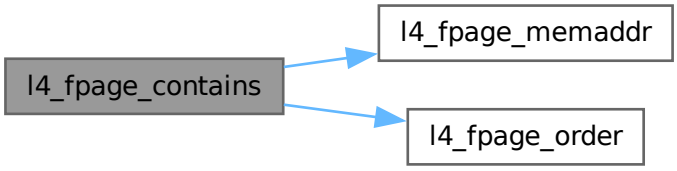
Parameters

fpage	Flexpage
addr	Address
order	Size of range in log2.

Return values

==0	The range is not completely in the fpage.
!=0	The range is within the fpage.

Definition at line 792 of file __l4_fpage.h.
References l4_fpage_memaddr(), l4_fpage_order(), and L4_NOTHROW.
Here is the call graph for this function:



13.1.4.3.4 l4_fpage_invalid()

```
L4_CONSTEXPR l4_fpage_t l4_fpage_invalid (
             void )  [inline]
```

Get an invalid flexpage.

Returns

Special *invalid* flexpage.

Definition at line 766 of file __l4_fpage.h.
References L4_FPAGE_SPECIAL, and L4_NOTHROW.

13.1.4.3.5 l4_fpage_ioport()

```
L4_CONSTEXPR unsigned long l4_fpage_ioport (
             l4_fpage_t f)  [inline]
```

Return the IO port number from the IO flexpage.

Parameters

f	Flexpage

Returns

IO port number from the given IO flexpage.

Precondition

`f` must be an IO flexpage (`l4_fpage_type(f) == L4_FPAGE_IO`) and

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.
Definition at line 692 of file __l4_fpage.h.
References L4_FPAGE_ADDR_SHIFT, and L4_NOTHROW.

13.1.4.3.6 l4_fpage_max_order()

```
L4_CONSTEXPR unsigned char l4_fpage_max_order (
             unsigned char order,
             l4_addr_t addr,
             l4_addr_t min_addr,
             l4_addr_t max_addr,
             l4_addr_t hotspot = 0)  [inline]
```

Determine maximum flexpage size of a region.

Parameters

order	Order value to start with (e.g. for memory L4_LOG2_PAGESIZE would be used)
addr	Address to be covered by the flexpage.
min_addr	Start of region / minimal address (including).
max_addr	End of region / maximal address (excluding).
hotspot	(Optional) hot spot.

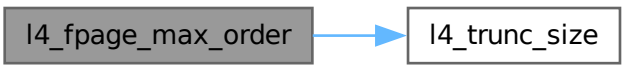
Returns

Maximum order (log2-size) possible.

Note

The start address of the flexpage can be determined with l4_trunc_size(addr, returnvalue)

Definition at line 800 of file __l4_fpage.h.
References l4_trunc_size().
Here is the call graph for this function:



13.1.4.3.7 l4_fpage_memaddr()

```
L4_CONSTEXPR l4_addr_t l4_fpage_memaddr (
             l4_fpage_t f)  [inline]
```

Return the memory address from the memory flexpage.

Parameters

f	Flexpage

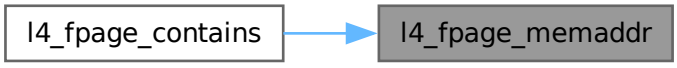
Returns

Page address from the given memory flexpage.

Precondition

`f` must be a memory flexpage (`l4_fpage_type(f) == L4_FPAGE_MEMORY`).

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.
Definition at line 698 of file __l4_fpage.h.
References L4_NOTHROW.
Referenced by l4_fpage_contains().
Here is the caller graph for this function:



13.1.4.3.8 l4_fpage_obj()

```
L4_CONSTEXPR l4_cap_idx_t l4_fpage_obj (
             l4_fpage_t f)  [inline]
```

Return the capability index from the object flexpage.

Parameters

f	Flexpage

Returns

Capability index from the given object flexpage.

Precondition

`f` must be an object flexpage (`l4_fpage_type(f) == L4_FPAGE_OBJ`)

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.
Definition at line 704 of file __l4_fpage.h.
References L4_NOTHROW.

13.1.4.3.9 l4_fpage_order()

```
L4_CONSTEXPR unsigned l4_fpage_order (
             l4_fpage_t f)  [inline]
```

Return order (log2(size)) from a flexpage.

Parameters

f	Flexpage

Returns

Order part of the given flexpage.

See also

l4_fpage_memaddr(), l4_fpage_obj(), l4_fpage_ioport()

Definition at line 680 of file __l4_fpage.h.

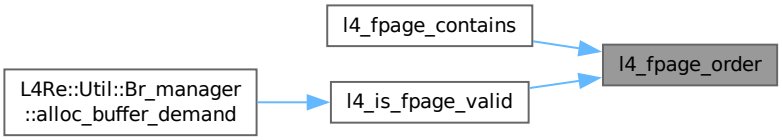
Referenced by l4_fpage_contains(), and l4_is_fpage_valid().
Here is the caller graph for this function:



13.1.4.3.10 l4_fpage_page()

```
L4_CONSTEXPR unsigned long l4_fpage_page (
             l4_fpage_t f)  [inline]
```

Return the page part from a flexpage.

Parameters

f	Flexpage

Returns

Page part of the given flexpage.

Note

The meaning of the page part depends on the flexpage type.

Definition at line 686 of file __l4_fpage.h.
References L4_FPAGE_ADDR_SHIFT, and L4_NOTHROW.

13.1.4.3.11 l4_fpage_rights()

```
L4_CONSTEXPR unsigned l4_fpage_rights (
             l4_fpage_t f)  [inline]
```

Return rights from a flexpage.

Parameters

f	Flexpage

Returns

Size part of the given flexpage.

Definition at line 662 of file __l4_fpage.h.
References L4_FPAGE_RIGHTS_MASK, L4_FPAGE_RIGHTS_SHIFT, and L4_NOTHROW.
Referenced by l4_is_fpage_writable().
Here is the caller graph for this function:

13.1.4.3.12 l4_fpage_set_rights()

```
L4_CONSTEXPR l4_fpage_t l4_fpage_set_rights (
             l4_fpage_t src,
             unsigned char new_rights)  [inline]
```

Set new right in a flexpage.

Parameters

src	Flexpage
new_rights	New rights

Returns

Modified flexpage with new rights.

Definition at line 729 of file __l4_fpage.h.
References L4_FPAGE_RIGHTS_MASK, L4_FPAGE_RIGHTS_SHIFT, and L4_NOTHROW.
Referenced by L4::Ipc::Snd_fpage::io().

13.1.4.3.15 l4_iofpage()

```
L4_CONSTEXPR l4_fpage_t l4_iofpage (
            unsigned long port,
            unsigned int order)  [inline]
```

Create an IO-port flexpage.

Parameters

port	I/O-flexpage port base

order	I/O-flexpage size (log2), L4_WHOLE_IOADDRESS_SPACE to specify the whole I/O address space (with `port` 0)

Returns

I/O flexpage

Definition at line 746 of file __l4_fpage.h.
References L4_FPAGE_ADDR_SHIFT, L4_FPAGE_IO, L4_FPAGE_RW, and L4_NOTHROW.

Here is the caller graph for this function:

13.1.4.3.17 l4_is_fpage_writable()

```
L4_CONSTEXPR int l4_is_fpage_writable (
             l4_fpage_t fp)  [inline]
```

Test if the flexpage is writable.

Parameters

fp	Flexpage.

Return values

!=0	if flexpage is writable.
==0	if flexpage is not writable.

Definition at line 773 of file __l4_fpage.h.
References l4_fpage_rights(), L4_FPAGE_W, and L4_NOTHROW.

Here is the call graph for this function:

13.1.4.3.18 l4_obj_fpage()

```
L4_CONSTEXPR l4_fpage_t l4_obj_fpage (
             l4_cap_idx_t obj,
             unsigned int order,
             unsigned char rights)  [inline]
```

Create a kernel-object flexpage.

Parameters

obj	Base capability index.
order	Log2 size (number of capabilities).
rights	Access rights, see L4_cap_fpage_rights

Returns

Flexpage for a set of kernel objects.

Note

L4_CAP_FPAGE_R is always required, otherwise no capability is mapped.

Examples

examples/sys/utcb-ipc/main.c.

Definition at line 752 of file __l4_fpage.h.
References L4_CAP_SHIFT, L4_FPAGE_ADDR_SHIFT, L4_FPAGE_OBJ, and L4_NOTHROW.

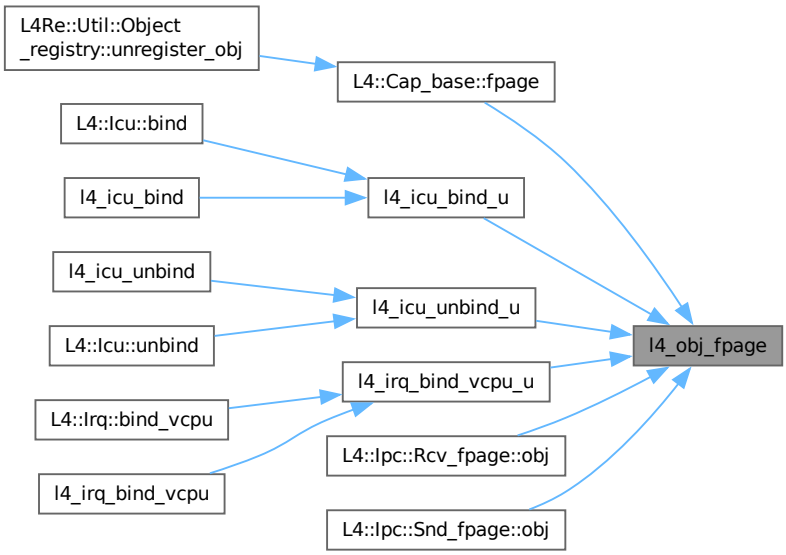
Here is the caller graph for this function:



13.1.5 C++ IPC Interface Definition

APIs for defining IPC interfaces using C++ as language.
Collaboration diagram for C++ IPC Interface Definition:

Topics

- Internal•Helpers 186

Namespaces

- namespace L4::Typeid

  Definition of interface data-type helpers.

13.1.5.1 Detailed Description

APIs for defining IPC interfaces using C++ as language.

13.1.5.2 Internal Helpers

Collaboration diagram for Internal Helpers:

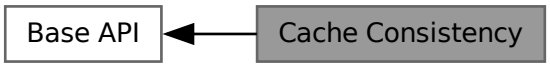
Data Structures

- struct L4::Types::Bool< V >
  Boolean meta type.
- struct L4::Types::False
  False meta value.
- struct L4::Types::True
  True meta value.
- struct L4::Types::Same< A, B >
  Compare two data types for equality.

13.1.5.2.1 Detailed Description

13.1.6 Cache Consistency

Various functions for cache consistency.
Collaboration diagram for Cache Consistency:



Functions

- L4_BEGIN_DECLS int l4_cache_clean_data (unsigned long start, unsigned long end) L4_NOTHROW
  Cache clean a range in D-cache; writes back to PoC.
- int l4_cache_flush_data (unsigned long start, unsigned long end) L4_NOTHROW
  Cache flush a range; writes back to PoC.
- int l4_cache_inv_data (unsigned long start, unsigned long end) L4_NOTHROW
  Cache invalidate a range; might write back to PoC.
- int l4_cache_coherent (unsigned long start, unsigned long end) L4_NOTHROW
  Make memory coherent between I-cache and D-cache; writes back to PoU.
- int l4_cache_dma_coherent (unsigned long start, unsigned long end) L4_NOTHROW
  Make memory coherent for use with external memory; writes back to PoC.
- int **l4_cache_dma_coherent_full** (void) L4_NOTHROW
  Make memory coherent for use with external memory; writes back to PoC.

13.1.6.1 Detailed Description

Various functions for cache consistency.
These functions shall be used to ensure that

- all blocks (e.g. CPU cores, devices, DMA engines) are guaranteed to see the same copy of a memory location (Point of Coherency – PoC),
- instruction and data caches of a core are guaranteed to see the same copy of a memory location (Point of Unification – PoU).

Certain functions are NOPs on certain architectures, for example on Intel it's not necessary to explicitly make caches coherent to PoU.

13.1.6.2 Function Documentation

13.1.6.2.1 l4_cache_clean_data()

```
L4_BEGIN_DECLS int l4_cache_clean_data (
             unsigned long start,
             unsigned long end)  [inline]
```

Cache clean a range in D-cache; writes back to PoC.

Parameters

start	Start of range (inclusive)
end	End of range (exclusive)

Return values

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Writes back any dirty cache lines in the range but leaves them in the cache and marks the cached copies clean.

Examples

examples/libs/l4re/c++/shared_ds/ds_clnt.cc.

Definition at line 68 of file cache.h.
References L4_NOTHROW.

13.1.6.2.2 l4_cache_coherent()

```
int l4_cache_coherent (
             unsigned long start,
             unsigned long end)  [inline]
```

Make memory coherent between I-cache and D-cache; writes back to PoU.

Parameters

start	Start of range (inclusive)
end	End of range (exclusive)

Return values

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Definition at line 92 of file cache.h.
References L4_NOTHROW.

13.1.6.2.3 l4_cache_dma_coherent()

```
int l4_cache_dma_coherent (
             unsigned long start,
             unsigned long end)  [inline]
```

Make memory coherent for use with external memory; writes back to PoC.

Parameters

start	Start of range (inclusive)
end	End of range (exclusive)

Return values

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Definition at line 100 of file cache.h.
References L4_NOTHROW.

13.1.6.2.4 l4_cache_flush_data()

```
int l4_cache_flush_data (
             unsigned long start,
             unsigned long end)  [inline]
```

Cache flush a range; writes back to PoC.

Parameters

start	Start of range (inclusive)
end	End of range (exclusive)

Return values

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Writes back any dirty cache lines and invalidates all cache entries in the range.
Definition at line 76 of file cache.h.
References L4_NOTHROW.

13.1.6.2.5 l4_cache_inv_data()

```
int l4_cache_inv_data (
            unsigned long start,
            unsigned long end)  [inline]
```

Cache invalidate a range; might write back to PoC.

Parameters

start	Start of range (inclusive)
end	End of range (exclusive)

Return values

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Invalidates all cache entries in the range but does not necessarily write back dirty cache lines.

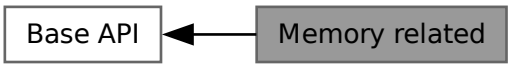
Note

Implementations may choose to write back dirty lines nonetheless if this is more efficient.

Definition at line 84 of file cache.h.
References L4_NOTHROW.

13.1.7 Memory related

Memory related constants, data types and functions.
Collaboration diagram for Memory related:



Macros

- #define **L4_PAGESIZE**

  Minimal page size (in bytes).
- #define L4_PAGEMASK

  Mask for the page number.
- #define L4_LOG2_PAGESIZE

  Number of bits used for page offset.
- #define L4_SUPERPAGESIZE

  Size of a large page.
- #define L4_SUPERPAGEMASK

  Mask for the number of a large page.
- #define L4_LOG2_SUPERPAGESIZE

Number of bits used as offset for a large page.

- #define **L4_INVALID_PTR** ((void *)L4_INVALID_ADDR)

  Invalid address as pointer type.
- #define L4_PAGESHIFT 12

  Size of a page, log2-based.
- #define L4_SUPERPAGESHIFT 21

  Size of a large page, log2-based.
- #define L4_PAGESHIFT 12

  Size of a page, log2-based.
- #define L4_SUPERPAGESHIFT 21

  Size of a large page, log2-based.
- #define L4_PAGESHIFT 12

  Size of a page, log2-based.
- #define L4_SUPERPAGESHIFT 21

  Size of a large page, log2-based.
- #define L4_PAGESHIFT 12

  Size of a page log2-based.
- #define L4_SUPERPAGESHIFT 22

  Size of a large page log2-based.
- #define **L4_PAGESHIFT** 12

  Sizeof a page in log2.
- #define **L4_SUPERPAGESHIFT** 21

  Sizeof a large page in log2.

Enumerations

- enum l4_addr_consts_t { L4_INVALID_ADDR = ~0UL }

  Address related constants.

Functions

- l4_addr_t l4_trunc_page (l4_addr_t address) L4_NOTHROW

  Round an address down to the next lower page boundary.
- l4_addr_t l4_trunc_size (l4_addr_t address, unsigned char bits) L4_NOTHROW

  Round an address down to the next lower flexpage with size bits.
- l4_addr_t l4_round_page (l4_addr_t address) L4_NOTHROW

  Round address up to the next page.
- l4_addr_t l4_round_size (l4_addr_t value, unsigned char bits) L4_NOTHROW

  Round value up to the next alignment with bits size.
- unsigned l4_bytes_to_mwords (unsigned size) L4_NOTHROW

  Determine how many machine words (l4_umword_t) are required to store a buffer of 'size' bytes.

13.1.7.1 Detailed Description

Memory related constants, data types and functions.

13.1.7.2 Macro Definition Documentation

13.1.7.2.1 L4_LOG2_PAGESIZE

```
#define L4_LOG2_PAGESIZE
```

Number of bits used for page offset.
Size of page in log2.
Definition at line 426 of file consts.h.
Referenced by L4Re::Dataspace::map(), L4Re::Dataspace::map_region(), and L4Re::Util::Dataspace_svr::page_shift().

13.1.7.2.2 L4_LOG2_SUPERPAGESIZE

```
#define L4_LOG2_SUPERPAGESIZE
```

Number of bits used as offset for a large page.
Size of large page in log2
Definition at line 452 of file consts.h.

13.1.7.2.3 L4_PAGEMASK

```
#define L4_PAGEMASK
```

Mask for the page number.

Note

The most significant bits are set.

Definition at line 417 of file consts.h.
Referenced by L4virtio::Driver::Device::driver_connect(), l4_round_page(), and l4_trunc_page().

13.1.7.2.4 L4_PAGESHIFT [1/4]

```
#define L4_PAGESHIFT 12
```

Size of a page, log2-based.
Sizeof a page in log2.
Size of a page log2-based.
Definition at line 24 of file consts.h.

13.1.7.2.5 L4_PAGESHIFT [2/4]

```
#define L4_PAGESHIFT 12
```

Size of a page, log2-based.
Sizeof a page in log2.
Size of a page log2-based.

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, examples/libs/l4re/c/ma+rm.c, examples/libs/l4re/streammap/client.cc, and examples/libs/l4re/streammap/server.cc.

Definition at line 26 of file consts.h.
Referenced by L4Re::Rm::attach(), L4virtio::Driver::Device::driver_connect(), L4Re::Rm::free_area(), L4Re::Util::Dataspace_svr::map L4Re::Rm::reserve_area(), and L4Re::Rm::reserve_area().

13.1.7.2.6 L4_PAGESHIFT [3/4]

```
#define L4_PAGESHIFT 12
```

Size of a page, log2-based.
Sizeof a page in log2.
Size of a page log2-based.
Definition at line 26 of file consts.h.

13.1.7.2.7 L4_PAGESHIFT [4/4]

```
#define L4_PAGESHIFT 12
```

Size of a page log2-based.
Sizeof a page in log2.
Definition at line 24 of file consts.h.

13.1.7.2.8 L4_SUPERPAGEMASK

```
#define L4_SUPERPAGEMASK
```

Mask for the number of a large page.

Note

The most significant bits are set.

Definition at line 444 of file consts.h.

13.1.7.2.9 L4_SUPERPAGESHIFT [1/4]

```
#define L4_SUPERPAGESHIFT 21
```

Size of a large page, log2-based.
Sizeof a large page in log2.
Size of a large page log2-based.
Definition at line 30 of file consts.h.

13.1.7.2.10 L4_SUPERPAGESHIFT [2/4]

```
#define L4_SUPERPAGESHIFT 21
```

Size of a large page, log2-based.
Sizeof a large page in log2.
Size of a large page log2-based.

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, and examples/libs/l4re/c/ma+rm.c.

Definition at line 31 of file consts.h.
Referenced by L4Re::Dma_space_mgr::block_area(), L4virtio::Svr::Driver_mem_region_t< No_custom_data >::Driver_mem_region_
and L4Re::Dma_space::map().

13.1.7.2.11 L4_SUPERPAGESHIFT [3/4]

```
#define L4_SUPERPAGESHIFT 21
```

Size of a large page, log2-based.
Sizeof a large page in log2.
Size of a large page log2-based.
Definition at line 31 of file consts.h.

13.1.7.2.12 L4_SUPERPAGESHIFT [4/4]

```
#define L4_SUPERPAGESHIFT 22
```

Size of a large page log2-based.
Sizeof a large page in log2.
Definition at line 30 of file consts.h.

13.1.7.2.13 L4_SUPERPAGESIZE

```
#define L4_SUPERPAGESIZE
```

Size of a large page.
A large page is a *super page* on IA32 or a *section* on ARM.
Definition at line 435 of file consts.h.
Referenced by L4virtio::Driver::Device::driver_connect().

13.1.7.3 Enumeration Type Documentation

13.1.7.3.1 l4_addr_consts_t

```
enum l4_addr_consts_t
```

Address related constants.

Enumerator

L4_INVALID_ADDR	Invalid address.

Definition at line 520 of file consts.h.

13.1.7.4 Function Documentation

13.1.7.4.1 l4_bytes_to_mwords()

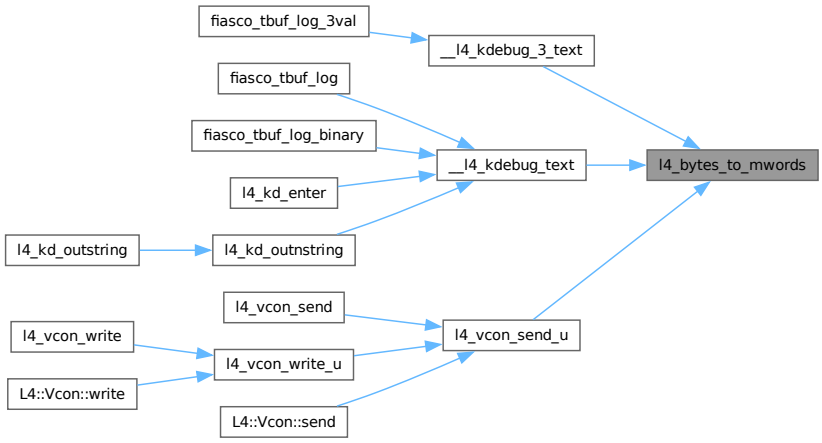
```
unsigned l4_bytes_to_mwords (
            unsigned size)  [inline]
```

Determine how many machine words (l4_umword_t) are required to store a buffer of 'size' bytes.

Parameters

size	The number of bytes to be translated into machine words.

Definition at line 513 of file consts.h.
References L4_INLINE, and L4_NOTHROW.
Referenced by __l4_kdebug_3_text(), __l4_kdebug_text(), and l4_vcon_send_u().
Here is the caller graph for this function:



13.1.7.4.2 l4_round_page()

```
l4_addr_t l4_round_page (
            l4_addr_t address)  [inline]
```

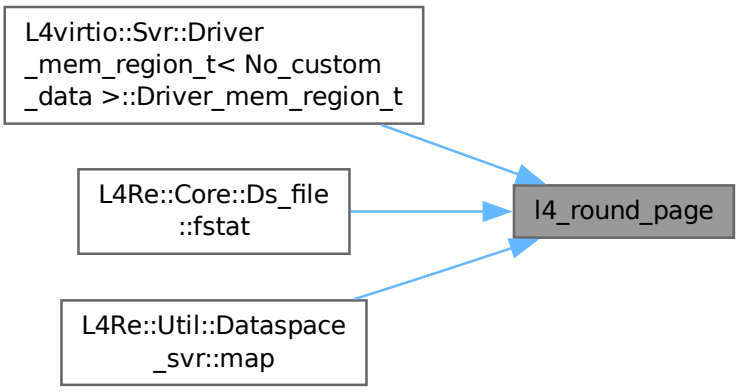
Round address up to the next page.
The address is rounded up to the next minimal page boundary. On most architectures this is a 4k page. Check L4_PAGESIZE for the minimal page size.

Parameters

address	The address to round up.

Definition at line 490 of file consts.h.
References L4_INLINE, L4_NOTHROW, L4_PAGEMASK, and L4_PAGESIZE.
Referenced by L4virtio::Svr::Driver_mem_region_t< No_custom_data >::Driver_mem_region_t(), L4Re::Core::Ds_file::fstat(), and L4Re::Util::Dataspace_svr::map().

Here is the caller graph for this function:



13.1.7.4.3 l4_round_size()

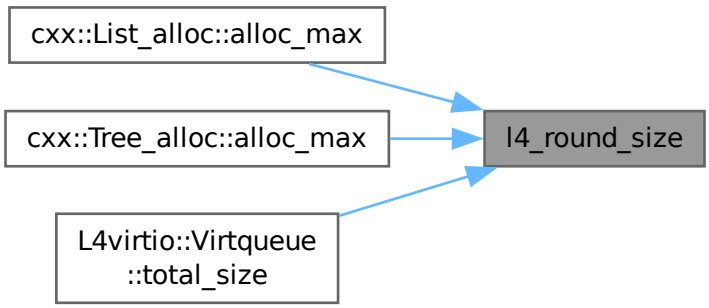
```
l4_addr_t l4_round_size (
             l4_addr_t value,
             unsigned char bits)  [inline]
```

Round value up to the next alignment with *bits* size.

Parameters

value	The value to round up to the next size-alignment.
bits	The size of the alignment (log2).

Definition at line 501 of file consts.h.
References L4_INLINE, and L4_NOTHROW.
Referenced by cxx::List_alloc::alloc_max(), cxx::Tree_alloc::alloc_max(), and L4virtio::Virtqueue::total_size().
Here is the caller graph for this function:



13.1.7.4.4 l4_trunc_page()

```
l4_addr_t l4_trunc_page (
            l4_addr_t address)  [inline]
```

Round an address down to the next lower page boundary.
The address is rounded down to the next lower minimal page boundary. On most architectures this is a 4k page. Check L4_PAGESIZE for the minimal page size.

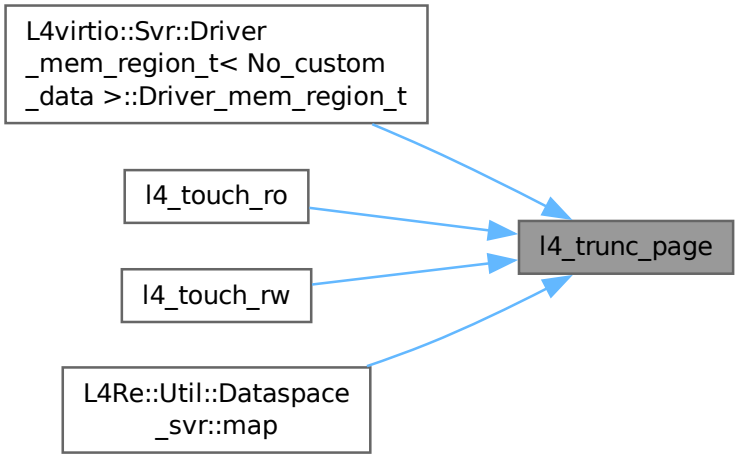
Parameters

address	The address to round.

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, and examples/libs/l4re/c/ma+rm.c.

Definition at line 465 of file consts.h.
References L4_INLINE, L4_NOTHROW, and L4_PAGEMASK.
Referenced by L4virtio::Svr::Driver_mem_region_t< No_custom_data >::Driver_mem_region_t(), l4_touch_ro(), l4_touch_rw(), and L4Re::Util::Dataspace_svr::map().
Here is the caller graph for this function:



13.1.7.4.5 l4_trunc_size()

```
l4_addr_t l4_trunc_size (
            l4_addr_t address,
            unsigned char bits)  [inline]
```

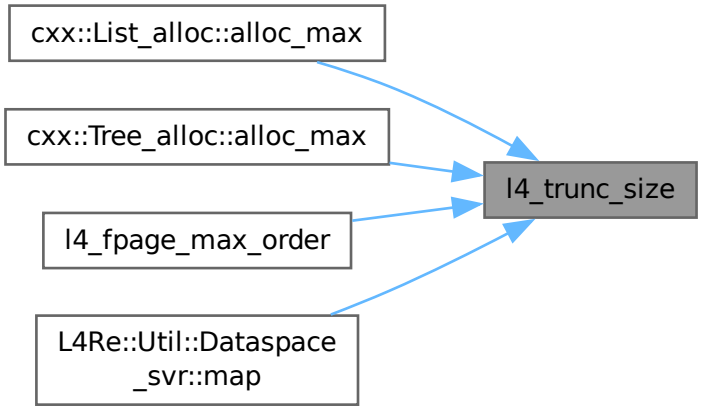
Round an address down to the next lower flexpage with size *bits*.

Parameters

address	The address to round.
bits	The size of the flexpage (log2).

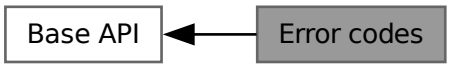
Definition at line 476 of file consts.h.

References L4_INLINE, and L4_NOTHROW.
Referenced by cxx::List_alloc::alloc_max(), cxx::Tree_alloc::alloc_max(), l4_fpage_max_order(), and L4Re::Util::Dataspace_svr::map(
Here is the caller graph for this function:



13.1.8 Error codes

Common error codes.
Collaboration diagram for Error codes:



Enumerations

- enum l4_error_code_t {
  L4_EOK = 0 , L4_EPERM = 1 , L4_ENOENT = 2 , L4_EIO = 5 ,
  L4_ENXIO = 6 , L4_E2BIG = 7 , L4_EAGAIN = 11 , L4_ENOMEM = 12 ,
  L4_EACCESS = 13 , L4_EFAULT = 14 , L4_EBUSY = 16 , L4_EEXIST = 17 ,
  L4_ENODEV = 19 , L4_ENOTDIR = 20 , L4_EINVAL = 22 , L4_ENOSPC = 28 ,
  L4_ERANGE = 34 , L4_EDEADLK = 35 , L4_ENAMETOOLONG = 36 , L4_ENOSYS = 38 ,
  L4_EBADPROTO = 39 , L4_EADDRNOTAVAIL = 99 , L4_ERRNOMAX = 100 , L4_ENOREPLY = 1000 ,
  L4_EMSGTOOSHORT = 1001 , L4_EMSGTOOLONG = 1002 , L4_EMSGMISSARG = 1003 ,
  L4_EMSGERRRANGE = 1004 ,
  L4_EDROPREPLY = 1005 , L4_EIPC_LO = 2000 , L4_EIPC_HI = 2000 + 0x1f }

  L4 error codes.

13.1.8.1 Detailed Description

Common error codes.

Include File

```
#include <l4/sys/err.h>
```

13.1.8.2 Enumeration Type Documentation

13.1.8.2.1 l4_error_code_t

`enum l4_error_code_t`

L4 error codes.

Those error codes are used by both the kernel and the user programs.

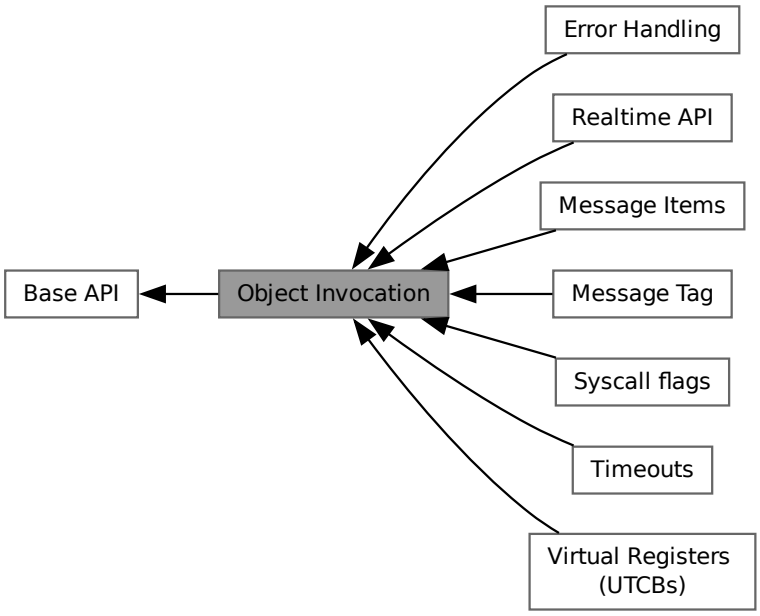
Enumerator

L4_EOK	Ok.
L4_EPERM	No permission.
L4_ENOENT	No such entity.
L4_EIO	I/O error.
L4_ENXIO	No such device or address.
L4_E2BIG	Argument value too big.
L4_EAGAIN	Try again.
L4_ENOMEM	No memory.
L4_EACCESS	Permission denied.
L4_EFAULT	Invalid memory address.
L4_EBUSY	Object currently busy, try later.
L4_EEXIST	Already exists.
L4_ENODEV	No such thing.
L4_ENOTDIR	Not a directory.
L4_EINVAL	Invalid argument.
L4_ENOSPC	No space left on device.
L4_ERANGE	Range error.
L4_EDEADLK	Deadlock would occur.
L4_ENAMETOOLONG	Name too long.
L4_ENOSYS	No sys.
L4_EBADPROTO	Unsupported protocol.
L4_EADDRNOTAVAIL	Address not available.
L4_ERRNOMAX	Maximum error value.
L4_ENOREPLY	No reply.
L4_EMSGTOOSHORT	Message too short.
L4_EMSGTOOLONG	Message too long.
L4_EMSGMISSARG	Message has invalid capability.
L4_EMSGERRRANGE	Error code range error.
L4_EDROPREPLY	Server dropped reply capability.
L4_EIPC_LO	Communication error-range low.
L4_EIPC_HI	Communication error-range high.

Definition at line 31 of file err.h.

13.1.9 Object Invocation

API for L4 object invocation.
Collaboration diagram for Object Invocation:



Topics

- Message Items . . . 213
  Message-item-related functionality.
- Timeouts . . . 220
  All kinds of timeouts and time related functions.
- Syscall flags . . . 228
  These flags determine the concrete operation when a kernel object is invoked.
- Error Handling . . . 230
  Error handling for L4 object invocation.
- Realtime API . . . 235
- Message Tag . . . 235
  API related to the message tag data type.
- Virtual Registers (UTCBs) . . . 246
  L4 Virtual Registers (UTCB).

Files

- file utcb.h

  UTCB definitions.

Functions

- l4_msgtag_t l4_ipc_send (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW

  *Send a message to an object (do **not** wait for a reply).*
- l4_msgtag_t l4_ipc_wait_ext (l4_cap_idx_t reply_cap, l4_utcb_t *utcb, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Wait for an incoming message from any possible sender.
- l4_msgtag_t **l4_ipc_wait** (l4_utcb_t *utcb, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Same as l4_ipc_wait_ext() with `reply_cap` set to L4_INVALID_CAP to specify the implicit reply capability.
- l4_msgtag_t l4_ipc_receive (l4_cap_idx_t object, l4_utcb_t *utcb, l4_timeout_t timeout) L4_NOTHROW

  Wait for a message from a specific source.
- l4_msgtag_t l4_ipc_call (l4_cap_idx_t object, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW

  Object call (usual invocation).
- l4_msgtag_t l4_ipc_reply (l4_cap_idx_t reply_cap, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW

  Reply operation (uses a reply capability).
- l4_msgtag_t l4_ipc_reply_and_wait_ext (l4_cap_idx_t reply_cap, l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Reply and wait operation (uses the reply capability).
- l4_msgtag_t **l4_ipc_reply_and_wait** (l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Same as l4_ipc_reply_and_wait_ext() with `reply_cap` set to L4_INVALID_CAP to specify the implicit reply capability.
- l4_msgtag_t l4_ipc_send_and_wait (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Send a message and do an open wait.
- l4_msgtag_t l4_ipc (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_umword_t flags, l4_umword_t slabel, l4_msgtag_t tag, l4_umword_t *rlabel, l4_timeout_t timeout) L4_NOTHROW

  Generic L4 object invocation.
- l4_msgtag_t l4_ipc_sleep (l4_timeout_t timeout) L4_NOTHROW

  Sleep for an amount of time.
- l4_msgtag_t l4_ipc_sleep_ms (l4_uint32_t ms) L4_NOTHROW

  Sleep for a certain amount of milliseconds.
- l4_msgtag_t l4_ipc_sleep_us (l4_uint64_t us) L4_NOTHROW

  Sleep for a certain amount of microseconds.
- int l4_sndfpage_add (l4_fpage_t const snd_fpage, unsigned long snd_base, l4_msgtag_t *tag) L4_NOTHROW

  Add a flexpage to be sent to the UTCB.

13.1.9.1 Detailed Description

API for L4 object invocation.

Include File

```
#include <l4/sys/ipc.h>
```

General abstractions for L4 object invocation. The basic principle is that all objects are denoted by a capability that is accessed via a capability selector (see Capabilities).
This set of functions is common to all kinds of objects provided by the L4 micro kernel. The concrete semantics of an invocation depends on the object that shall be invoked.
Objects may be invoked in various ways, the most common way is to use a *call* operation (l4_ipc_call()). However, there are a lot more flavours available that have a semantics depending on the object.

See also

IPC-Gate API

L4 Inter-Process Communication (IPC)

13.1.9.2 Timeouts during IPC

IPC operation between two communication partners may consist of up to two phases (send phase and receive phase). For both phases, a timeout may be specified (send timeout and receive timeout).

Note

When IPC communication happens across CPU cores and a timeout is specified, then the counting of the timeout only begins after the target thread has been scheduled at least once. In particular, this means that an IPC timeout, including a timeout of zero, may be delayed depending on the scheduling on the target CPU core. If a higher priority thread on the target core is executing a busy loop, that delay may even be indefinitely.

See also

Timeouts

13.1.9.3 Function Documentation

13.1.9.3.1 l4_ipc()

```
l4_msgtag_t l4_ipc (
             l4_cap_idx_t dest,
             l4_utcb_t * utcb,
             l4_umword_t flags,
             l4_umword_t slabel,
             l4_msgtag_t tag,
             l4_umword_t * rlabel,
             l4_timeout_t timeout)  [inline]
```

Generic L4 object invocation.

Parameters

	dest	Destination object. L4_INVALID_CAP denotes the current thread. An IPC to the current thread will always abort after the specified timeout and can be used for sleeping without busy waiting.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
	flags	Invocation flags (see L4_SYSF_NONE).
	slabel	Send label if applicable (may be seen by the receiver).
	tag	Sending message tag.
out	*rlabel*	Receiving label.
	timeout	Timeout pair (see l4_timeout_t).

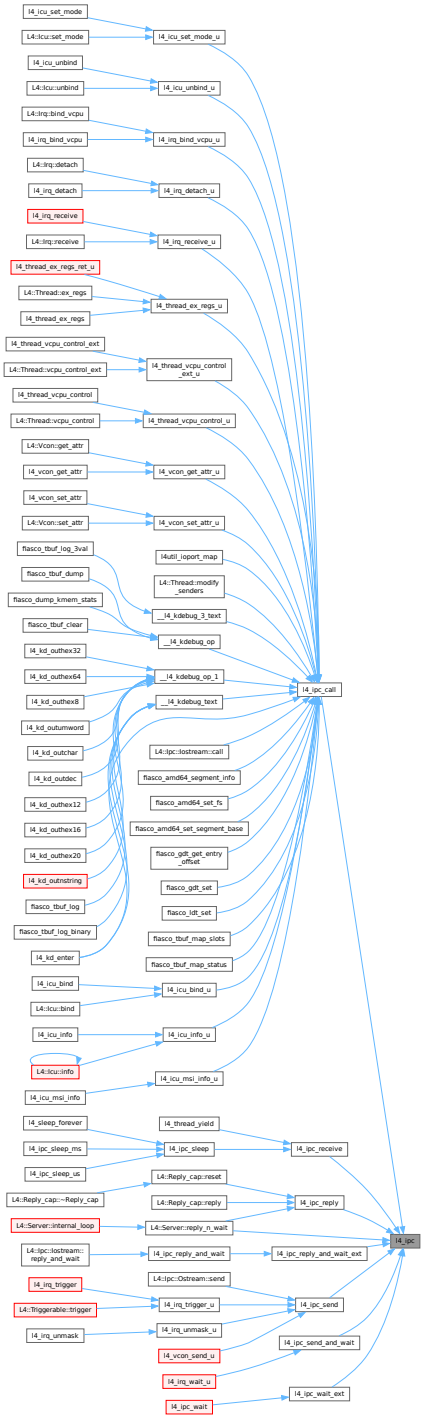
Returns

return tag

See also

L4 Inter-Process Communication (IPC)

Definition at line 19 of file ipc.h.
References L4_NOTHROW.
Referenced by l4_ipc_call(), l4_ipc_receive(), l4_ipc_reply(), l4_ipc_reply_and_wait_ext(), l4_ipc_send(), l4_ipc_send_and_wait(), l4_ipc_wait_ext(), and L4::Server< LOOP_HOOKS >::reply_n_wait().
Here is the caller graph for this function:



13.1.9.3.2 l4_ipc_call()

```
l4_msgtag_t l4_ipc_call (
             l4_cap_idx_t object,
             l4_utcb_t * utcb,
             l4_msgtag_t tag,
             l4_timeout_t timeout)  [inline]
```

Object call (usual invocation).

Parameters

object	Capability selector for the object to call. A value of L4_INVALID_CAP denotes the current thread and will abort the IPC after the time specified in the `snd` part of the `timeout` parameter has expired.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
tag	Message tag to describe the message to be sent.
timeout	Timeout pair for send and receive phase (see l4_timeout_t).

Returns

result tag

A message is sent to the object and the invoker waits for a reply from the object. Messages from other sources are not accepted.

Note

The send-to-receive transition needs no time, the object can reply with a send timeout of zero.

If a finite receive timeout is specified, the IPC receive operation could abort before the partner was able to send the reply message. Under certain circumstances the partner may still have the temporary reply capability to the calling thread and may use this capability to reply to the caller at a later, unexpected time specifying an arbitrary IPC label. This case is relevant for servers which call another, possibly untrusted, server while serving a client request.

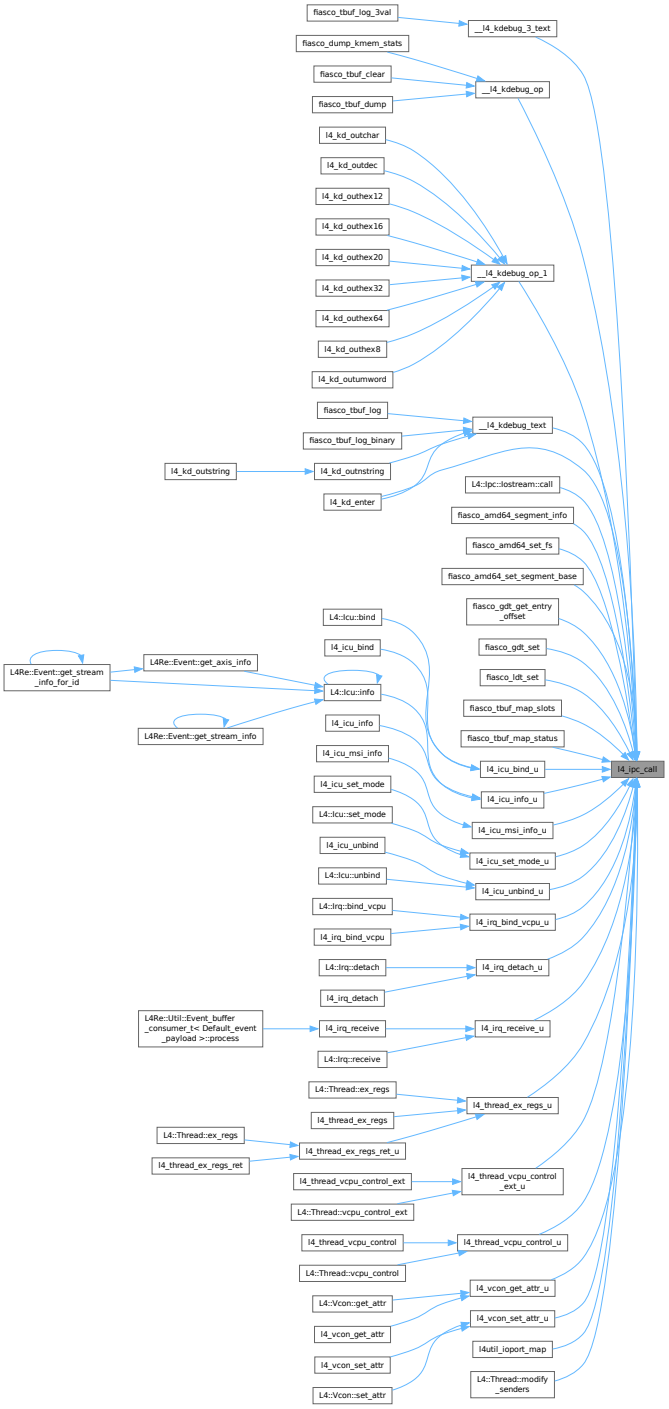
Examples

examples/sys/aliens/main.c, examples/sys/ipc/ipc_example.c, and examples/sys/singlestep/main.c.

Definition at line 625 of file ipc.h.
References l4_ipc(), L4_NOTHROW, and L4_SYSF_CALL.
Referenced by __l4_kdebug_3_text(), __l4_kdebug_op(), __l4_kdebug_op_1(), __l4_kdebug_text(), L4::Ipc::Iostream::call(), fiasco_amd64_segment_info(), fiasco_amd64_set_fs(), fiasco_amd64_set_segment_base(), fiasco_gdt_get_entry_offset(), fiasco_gdt_set(), fiasco_ldt_set(), fiasco_tbuf_map_slots(), fiasco_tbuf_map_status(), l4_icu_bind_u(), l4_icu_info_u(), l4_icu_msi_info_u(), l4_icu_set_mode_u(), l4_icu_unbind_u(), l4_irq_bind_vcpu_u(), l4_irq_detach_u(), l4_irq_receive_u(), l4_kd_enter(), l4_thread_ex_regs_u(), l4_thread_vcpu_control_ext_u(), l4_thread_vcpu_control_u(), l4_vcon_get_attr_u(), l4_vcon_set_attr_u(), l4util_ioport_map(), and L4::Thread::modify_senders().
Here is the call graph for this function:

Here is the caller graph for this function:



13.1.9.3.3 l4_ipc_receive()

```
l4_msgtag_t l4_ipc_receive (
            l4_cap_idx_t object,
            l4_utcb_t * utcb,
            l4_timeout_t timeout)  [inline]
```

Wait for a message from a specific source.

Parameters

object	Thread or IRQ object to receive a message from. A value of L4_INVALID_CAP denotes the current thread. This can be used for sleeping without busy waiting for the time specified in the `rcv` part of the `timeout` parameter.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
timeout	Timeout pair (see l4_timeout_t, only the receive part matters).

Returns

result tag.

This operation waits for a message from the specified object. Messages from other sources are not accepted by this operation. The operation does not include a send phase, this means no message is sent to the object. See l4_ipc_wait() for general message receiving.

Note

This operation is used to receive messages from a specific IRQ or thread. Receiving from IPC gates or any other objects does not work. It is not common to use the receive-only IPC operation for normal client/server communication.

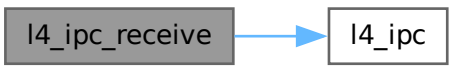
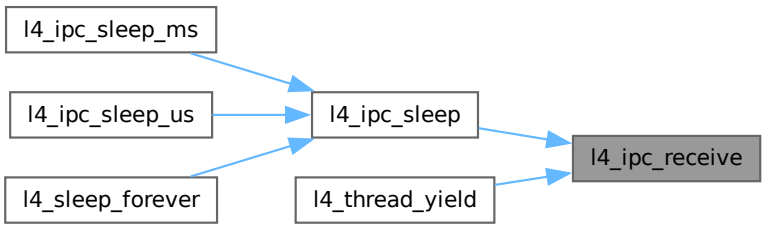
Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 686 of file ipc.h.
References l4_ipc(), L4_NOTHROW, L4_SYSF_RECV, and l4_msgtag_t::raw.
Referenced by l4_ipc_sleep(), and l4_thread_yield().
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.9.3.4 l4_ipc_reply()

```
l4_msgtag_t l4_ipc_reply (
            l4_cap_idx_t reply_cap,
            l4_utcb_t * utcb,
            l4_msgtag_t tag,
            l4_timeout_t timeout)  [inline]
```

Reply operation (uses a *reply* capability).

Parameters

reply_cap	Reply capability selector. A value of L4_INVALID_CAP denotes the implicit reply capability of the current thread.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
tag	Describes the message to be sent as reply.
timeout	Timeout pair (see l4_timeout_t).

Returns

result tag

A message is sent to a previous caller using the given reply capability. The reply capability is always invalidated by the call, even if the IPC operation fails.

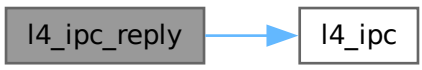
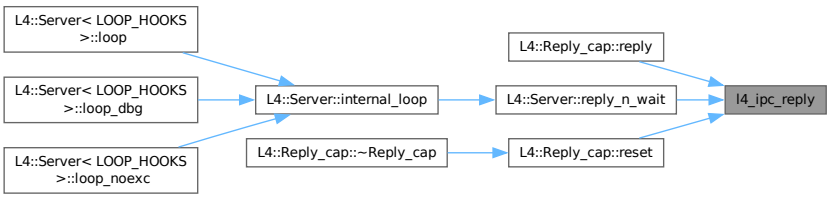
L4 Inter-Process Communication (IPC)

Definition at line 632 of file ipc.h.
References l4_ipc(), L4_NOTHROW, L4_SYSF_REPLY, and L4_SYSF_SEND.
Referenced by L4::Reply_cap::reply(), L4::Server< LOOP_HOOKS >::reply_n_wait(), and L4::Reply_cap::reset().
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.9.3.5 l4_ipc_reply_and_wait_ext()

```
l4_msgtag_t l4_ipc_reply_and_wait_ext (
             l4_cap_idx_t reply_cap,
             l4_utcb_t * utcb,
             l4_msgtag_t tag,
             l4_umword_t * label,
             l4_timeout_t timeout)  [inline]
```

Reply and wait operation (uses the *reply* capability).

Parameters

	reply_cap	Reply capability selector. A value of L4_INVALID_CAP denotes the implicit reply capability of the current thread.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
	tag	Describes the message to be sent as reply.
out	*label*	Label assigned to the source object of the received message.
	timeout	Timeout pair (see l4_timeout_t).

Returns

result tag

A message is sent to the previous caller using the implicit reply capability. Afterwards the invoking thread waits for a message from any source.

Note

This is the standard server operation: it sends a reply to the actual client and waits for the next incoming request, which may come from any other client.

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

              l4_cap_idx_t dest,
              l4_utcb_t * utcb,
              l4_msgtag_t tag,
              l4_timeout_t timeout)  [inline]
```

Send a message to an object (do **not** wait for a reply).

Parameters

dest	Capability selector for the destination object. A value of L4_INVALID_CAP denotes the current thread and could be used for sleeping without busy waiting for the time specified in the `snd` part of the `timeout` parameter.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
tag	Descriptor for the message to be sent.
timeout	Timeout pair (see l4_timeout_t) only send part is relevant.

Returns

Syscall return tag for the send-only operation, this means there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. Use l4_ipc_error() to check for errors and **do not** use l4_error().

A message is sent to the destination object. There is no receive phase included. The invoker continues working after sending the message.

Note

This is a special-purpose message transfer. Objects usually support only invocation via l4_ipc_call() consisting of a send phase and a receive phase for returning the result of the object invocation. For example, l4_icu_unmask(), l4_icu_mask() and l4_irq_trigger() use send-only IPC operations for object invocation.

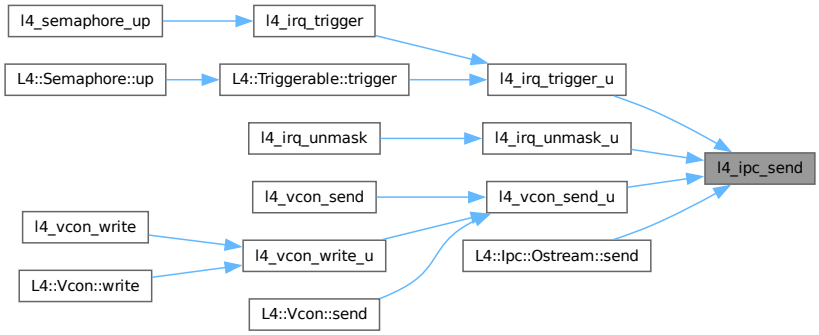
Here is the caller graph for this function:



13.1.9.3.7 l4_ipc_send_and_wait()

```
l4_msgtag_t l4_ipc_send_and_wait (
              l4_cap_idx_t dest,
              l4_utcb_t * utcb,
              l4_msgtag_t tag,
              l4_umword_t * label,
              l4_timeout_t timeout)  [inline]
```

Send a message and do an open wait.

Parameters

	dest	Object to send a message to. A value of L4_INVALID_CAP denotes the current thread and will abort the IPC after the time specified in the `snd` part of the `timeout` parameter has expired.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
	tag	Describes the message that shall be sent.
`out`	*label*	Label assigned to the source object of the receive phase.
	timeout	Timeout pair (see l4_timeout_t).

Returns

result tag

A message is sent to the destination object and the invoking thread waits for a reply from any source.

Note

This is a special-purpose operation and shall not be used in general applications.

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

```
l4_msgtag_t l4_ipc_sleep (
             l4_timeout_t timeout)  [inline]
```

Sleep for an amount of time.

Parameters

timeout	Timeout pair (see l4_timeout_t, the receive part matters).

Returns

error code:

- L4_IPC_RETIMEOUT: success
- L4_IPC_RECANCELED woken up by a different thread (l4_thread_ex_regs()).

The invoking thread waits until the timeout is expired or the wait was aborted by another thread by l4_thread_ex_regs().

```
l4_msgtag_t l4_ipc_sleep_ms (
            l4_uint32_t ms)  [inline]
```

Sleep for a certain amount of milliseconds.

Parameters

ms	Number of milliseconds to wait.

Returns

error code:

- L4_IPC_RETIMEOUT: success
- L4_IPC_RECANCELED woken up by a different thread (l4_thread_ex_regs()).

The invoking thread waits until the timeout is expired or the wait was aborted by another thread by l4_thread_ex_regs().

```
l4_msgtag_t l4_ipc_sleep_us (
            l4_uint64_t us)  [inline]
```

Sleep for a certain amount of microseconds.

Parameters

us	Number of microseconds to wait.

Returns

error code:

- L4_IPC_RETIMEOUT: success
- L4_IPC_RECANCELED woken up by a different thread (l4_thread_ex_regs()).

The invoking thread waits until the timeout is expired or the wait was aborted by another thread by l4_thread_ex_regs().

13.1.9.3.11 l4_ipc_wait_ext()

```
l4_msgtag_t l4_ipc_wait_ext (
             l4_cap_idx_t reply_cap,
             l4_utcb_t * utcb,
             l4_umword_t * label,
             l4_timeout_t timeout)  [inline]
```

Wait for an incoming message from any possible sender.

Parameters

	reply_cap	Reply capability selector. A value of L4_INVALID_CAP denotes the implicit reply capability of the current thread.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.
out	*label*	Label assigned to the source object (IPC gate or IRQ).
	timeout	Timeout pair (see l4_timeout_t, only the receive part is used).

Returns

return tag

This operation does an open wait, and therefore needs no capability to denote the possible source of a message. This means the calling thread waits for an incoming message from any possible source. There is no send phase included in this operation.
The usual usage of this function is to call that function when entering a server loop in a user-level server that implements user-level objects, see also l4_ipc_reply_and_wait().

Note

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

```
int l4_sndfpage_add (
            l4_fpage_t const snd_fpage,
            unsigned long snd_base,
            l4_msgtag_t * tag)  [inline]
```

Add a flexpage to be sent to the UTCB.

Parameters

	snd_fpage	Flexpage.
	snd_base	Send base.
in,out	*tag*	Tag to be updated. Only the number of items is incremented in the updated tag, all other members remain unmodified.

Returns

0 on success, negative error code otherwise

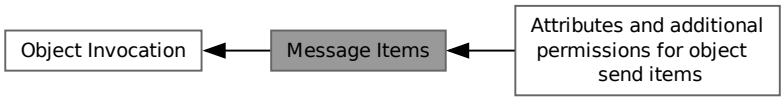
13.1.9.4 Message Items

Message-item-related functionality.

Collaboration diagram for Message Items:



Topics

- Attributes and additional permissions for object send items 219

  These rights need to be added to the snd_base when mapping and control internal behavior.

Data Structures

- struct l4_snd_fpage_t

  Send-flexpage types.

Enumerations

- enum l4_fpage_cacheability_opt_t { L4_FPAGE_CACHE_OPT = 0x1 , L4_FPAGE_CACHEABLE = 0x3 , L4_FPAGE_BUFFERABLE = 0x5 , L4_FPAGE_UNCACHEABLE = 0x1 }

  Cacheability options for memory send items.
- enum l4_msg_item_consts_t { L4_ITEM_MAP = 8 , L4_ITEM_CONT = 1 , L4_MAP_ITEM_GRANT = 2 , L4_MAP_ITEM_MAP = 0 , L4_RCV_ITEM_FORWARD_MAPPINGS = 1 , L4_RCV_ITEM_SINGLE_CAP = L4_ITEM_MAP | 2 , L4_RCV_ITEM_LOCAL_ID = 4 }

  Constants for message items.

Functions

- L4_CONSTEXPR l4_umword_t l4_map_control (l4_umword_t spot, unsigned char cache, unsigned grant) L4_NOTHROW

  Create the first word for a map item that is a send item for the memory space.
- L4_CONSTEXPR l4_umword_t l4_map_obj_control (l4_umword_t spot, unsigned grant) L4_NOTHROW

  Create the first word for a map item that is a send item for the object space.

13.1.9.4.1 Detailed Description

Message-item-related functionality.
Message items are typed items that are used for transferring capabilities during IPC. There are three sub-types of typed message items with variations in the layout:

1. Typed message items set by the sender in its message registers (MRs) of the UTCB for specifying what shall be sent.
2. Typed message items set by the receiver in its buffer registers (BRs) of the UTCB for specifying which types of capabilities may be received at which addresses.
3. Typed message items set by the kernel in the receiver's message registers (MRs) of the UTCB for providing information about the transfer to the receiver.

They are abbreviated by *send item*, *receive item*, and *return item*, respectively.
A typed message item in the message registers (case 1 and case 3) always consists of two words (even if it is a void item). The size of a typed message item in the buffer registers (case 2) is determined by its first word. The size is up to three words (see L4_RCV_ITEM_SINGLE_CAP and L4_RCV_ITEM_FORWARD_MAPPINGS). A void item in the buffer registers consists of a single word.

Include File

```
#include <l4/sys/types.h>
```

13.1.9.4.2 Enumeration Type Documentation

13.1.9.4.2.1 l4_fpage_cacheability_opt_t

`enum l4_fpage_cacheability_opt_t`
Cacheability options for memory send items.
Only the IPC sender and the thread performing the map operation can specify the caching mode of the target mapping. By default, the caching mode of the sender is used as caching mode for the target mapping. If L4_↩ FPAGE_CACHE_OPT is set in the send item, the caching mode is overridden by the respective mode from below.

Enumerator

L4_FPAGE_CACHE_OPT	Enable the cacheability option in a memory send item. Without this flag, the options are copied from the sender.
L4_FPAGE_CACHEABLE	Cacheability option to enable caches for the mapping. Implies L4_FPAGE_CACHE_OPT.
L4_FPAGE_BUFFERABLE	Cacheability option to enable buffered writes for the mapping. Implies L4_FPAGE_CACHE_OPT.
L4_FPAGE_UNCACHEABLE	Cacheability option to disable caching for the mapping. Implies L4_FPAGE_CACHE_OPT.

Definition at line 303 of file __l4_fpage.h.

13.1.9.4.2.2 l4_msg_item_consts_t

`enum l4_msg_item_consts_t`
Constants for message items.

Enumerator

L4_ITEM_MAP	Identify a message item as *map item*.
L4_ITEM_CONT	Denote that the following item shall be put into the same receive item as this one.

L4_MAP_ITEM_GRANT	Flag as *grant* instead of *map* operation. This means, the sender delegates access to the receiver and the kernel removes the rights from the sender (basically a move operation). The mapping in the receiver gets the new parent of any child mappings of the mapping of the sender. Rights revocation via send item/flexpage is *not* guaranteed to be applied to descendant mappings in case of grant. See Spaces and Mappings for more details on map/grant. **Note** The grant operation is not performed if the resulting rights of the receiver mapping would not contain the L4_CAP_FPAGE_R bit (for object capabilities) or none of the L4_FPAGE_RWX bits (memory and IO ports). In that case, the mapping is not created in the receiver space and not removed from the sender space. If the removal of the whole mapping from the sender is not possible because the size of the mapped frame at the sender exceeds the size defined by the send or receive flexpage, the grant operation is turned into a regular map operation and the mapping is *not* removed from the sender. This would happen if, for example, a smaller part of an L4 superpage mapping shall be granted.
L4_MAP_ITEM_MAP	Flag as usual *map* operation.
L4_RCV_ITEM_FORWARD_MAPPINGS	This flag specifies if received capabilities shall be mapped to a particular task instead of the invoking task. This flag may be used only if L4_RCV_ITEM_LOCAL_ID is unset. Setting this flag increases the size of the buffer item by one word. This word is used to specify a capability index for the task that shall receive the mappings.
L4_RCV_ITEM_SINGLE_CAP	Mark the receive buffer to be a small receive item that describes a buffer for a single object capability. A receive item needs to specify a *receive window*. The receive window determines which kind of capabilities (object, memory, I/O ports) may be received where in the respective space. If this flag is unset, the receive window is specified in the second word of the receive item via a flexpage. If this flag is set, the receive window consists of a single capability index in the object space and the capability index is specified in the most significant bits of the first word of the receive item (see L4_CAP_SHIFT).

L4_RCV_ITEM_LOCAL_ID	The receiver requests to receive a local ID instead of a mapping whenever possible. This flag may be used only if L4_RCV_ITEM_SINGLE_CAP is set and L4_RCV_ITEM_FORWARD_MAPPINGS is unset. When this flag is set, then, • when sender and receiver are bound to the same task, then no mapping is done for this item and just the raw flexpage (l4_fpage_t) is transferred, • otherwise, when the sender specified an IPC gate for transfer that is bound to a thread that is bound to the same task as the receiving thread, then no mapping is done for this item and just the bitwise OR (|) of the label and the L4_CAP_FPAGE_W and L4_CAP_FPAGE_S permissions that would have been mapped is transferred, • otherwise a regular mapping is done for this item.

Definition at line 229 of file consts.h.

13.1.9.4.3 Function Documentation

13.1.9.4.3.1 l4_map_control()

```
L4_CONSTEXPR l4_umword_t l4_map_control (
             l4_umword_t spot,
             unsigned char cache,
             unsigned grant)  [inline]
```

Create the first word for a map item that is a send item for the memory space.

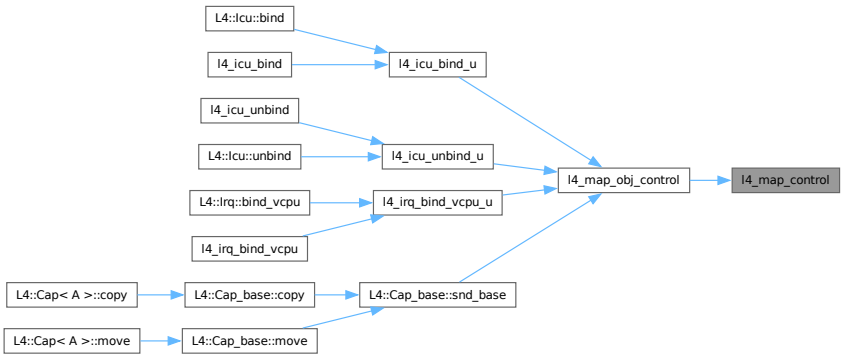
Parameters

spot	Hot spot address, used to determine what is actually mapped when send and receive flexpage have differing sizes.
cache	Cacheability hints for memory flexpages. See Cacheability options.
grant	Indicates if it is a map or a grant item. Allowed values: L4_MAP_ITEM_MAP, L4_MAP_ITEM_GRANT.

Returns

The value to be used as first word in a send item for memory.

Definition at line 779 of file __l4_fpage.h.
References L4_FPAGE_CONTROL_MASK, L4_ITEM_MAP, and L4_NOTHROW.
Referenced by l4_map_obj_control().
Here is the caller graph for this function:



13.1.9.4.3.2 l4_map_obj_control()

```
L4_CONSTEXPR l4_umword_t l4_map_obj_control (
             l4_umword_t spot,
             unsigned grant)  [inline]
```

Create the first word for a map item that is a send item for the object space.

Parameters

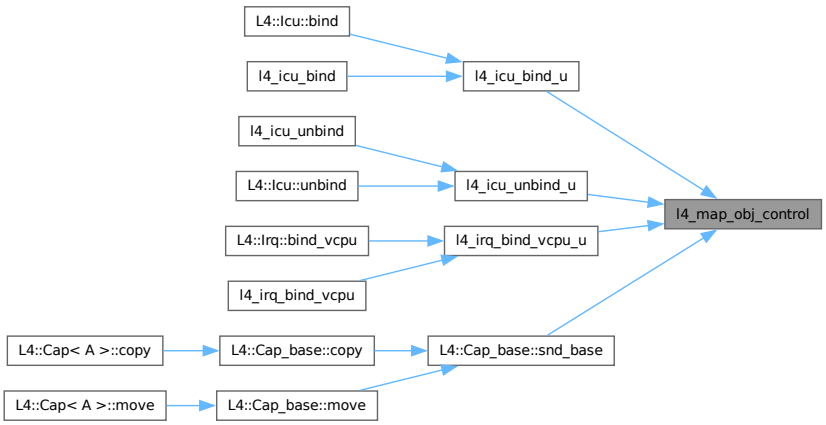
spot	Hot spot address, used to determine what is actually mapped when send and receive flexpages have different size.
grant	Indicates if it is a map item or a grant item. Allowed values: L4_MAP_ITEM_MAP, L4_MAP_ITEM_GRANT.

Returns

The value to be used as first word in a send item for kernel objects or IO-ports.

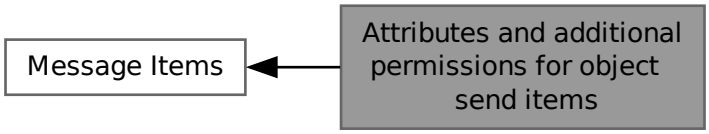
Definition at line 786 of file __l4_fpage.h.
References l4_map_control(), and L4_NOTHROW.
Referenced by l4_icu_bind_u(), l4_icu_unbind_u(), l4_irq_bind_vcpu_u(), and L4::Cap_base::snd_base().
Here is the call graph for this function:

Here is the caller graph for this function:



13.1.9.4.4 Attributes and additional permissions for object send items

These rights need to be added to the snd_base when mapping and control internal behavior.
Collaboration diagram for Attributes and additional permissions for object send items:



Macros

- #define **L4_FPAGE_C_REF_CNT** 0x00

  Mapping is reference-counted (default).
- #define **L4_FPAGE_C_NO_REF_CNT** 0x10

  Don't increase the reference counter.
- #define **L4_FPAGE_C_OBJ_RIGHT1** 0x20

  Object-type specific right.
- #define **L4_FPAGE_C_OBJ_RIGHT2** 0x40

  Object-type specific right.
- #define **L4_FPAGE_C_OBJ_RIGHT3** 0x80

  Object-type specific right.
- #define **L4_FPAGE_C_OBJ_RIGHTS** 0xe0

  All Object-type specific right bits.
- #define L4_FPAGE_C_IPCGATE_SVR L4_FPAGE_C_OBJ_RIGHT1

  The receiver may invoke IPC-gate-specific functions on the capability, for example, bind a thread to the gate and modify the label.

13.1.9.4.4.1 Detailed Description

These rights need to be added to the snd_base when mapping and control internal behavior.
The exact meaning depends on the type of capability (currently used only with IPC gates).

13.1.9.4.4.2 Macro Definition Documentation

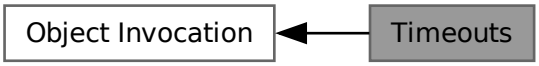
L4_FPAGE_C_IPCGATE_SVR

```
#define L4_FPAGE_C_IPCGATE_SVR L4_FPAGE_C_OBJ_RIGHT1
```

The receiver may invoke IPC-gate-specific functions on the capability, for example, bind a thread to the gate and modify the label.
Needed if the receiver implements the server side of an IPC gate.
Definition at line 288 of file __l4_fpage.h.

13.1.9.5 Timeouts

All kinds of timeouts and time related functions.
Collaboration diagram for Timeouts:



Data Structures

- struct l4_timeout_s
  Basic timeout specification.
- union l4_timeout_t
  Timeout pair.

Macros

- #define L4_IPC_TIMEOUT_0 ((l4_timeout_s){0x0400})
  Timeout constants.
- #define **L4_IPC_TIMEOUT_NEVER** ((l4_timeout_s){0})
  never timeout
- #define **L4_IPC_NEVER_INITIALIZER** {0}
  never timeout, initializer
- #define **L4_IPC_NEVER** ((l4_timeout_t){0})
  never timeout
- #define **L4_IPC_RECV_TIMEOUT_0** ((l4_timeout_t){0x00000400})
  0 receive timeout
- #define **L4_IPC_SEND_TIMEOUT_0** ((l4_timeout_t){0x04000000})
  0 send timeout
- #define **L4_IPC_BOTH_TIMEOUT_0** ((l4_timeout_t){0x04000400})
  0 receive and send timeout
- #define **L4_TIMEOUT_US_NEVER** (~0ULL)
  The waiting period in microseconds which is interpreted as "never" by l4_timeout_from_us().
- #define L4_TIMEOUT_US_MAX ((1ULL << 41) - 1)
  The longest waiting period in microseconds accepted by l4_timeout_from_us().

Typedefs

- typedef struct l4_timeout_s l4_timeout_s

  Basic timeout specification.
- typedef union l4_timeout_t l4_timeout_t

  Timeout pair.

Functions

- L4_CONSTEXPR l4_timeout_s l4_timeout_rel (unsigned man, unsigned exp) L4_NOTHROW

  Get relative timeout consisting of mantissa and exponent.
- L4_CONSTEXPR l4_timeout_t l4_ipc_timeout (unsigned snd_man, unsigned snd_exp, unsigned rcv_man, unsigned rcv_exp) L4_NOTHROW

  Convert explicit timeout values to l4_timeout_t type.
- L4_CONSTEXPR l4_timeout_t l4_timeout (l4_timeout_s snd, l4_timeout_s rcv) L4_NOTHROW

  Combine send and receive timeout in a timeout.
- L4_CONSTEXPR void l4_snd_timeout (l4_timeout_s snd, l4_timeout_t *to) L4_NOTHROW

  Set send timeout in given to timeout.
- L4_CONSTEXPR void l4_rcv_timeout (l4_timeout_s rcv, l4_timeout_t *to) L4_NOTHROW

  Set receive timeout in given to timeout.
- L4_CONSTEXPR l4_kernel_clock_t l4_timeout_rel_get (l4_timeout_s to) L4_NOTHROW

  Get clock value of out timeout.
- L4_CONSTEXPR unsigned l4_timeout_is_absolute (l4_timeout_s to) L4_NOTHROW

  Return whether the given timeout is absolute or not.
- L4_CONSTEXPR l4_kernel_clock_t l4_timeout_get (l4_kernel_clock_t cur, l4_timeout_s to) L4_NOTHROW

  Get clock value for a clock + a timeout.
- l4_timeout_s l4_timeout_abs (l4_kernel_clock_t pint, int br) L4_NOTHROW

  Set an absolute timeout.
- unsigned l4_utcb_mr64_idx (unsigned idx) L4_NOTHROW

  Get index into 64bit message registers alias from native-sized index.

13.1.9.5.1 Detailed Description

All kinds of timeouts and time related functions.

13.1.9.5.2 Macro Definition Documentation

13.1.9.5.2.1 L4_IPC_TIMEOUT_0

```
#define L4_IPC_TIMEOUT_0 ((l4_timeout_s){0x0400})
```

Timeout constants.
0 timeout
Definition at line 73 of file __timeout.h.
Referenced by L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::timeout().

13.1.9.5.2.2 L4_TIMEOUT_US_MAX

```
#define L4_TIMEOUT_US_MAX ((1ULL << 41) - 1)
```

The longest waiting period in microseconds accepted by l4_timeout_from_us().
See l4_timeout_from_us() for an explanation.
Definition at line 91 of file __timeout.h.

13.1.9.5.3 Typedef Documentation

13.1.9.5.3.1 l4_timeout_s

```
typedef struct l4_timeout_s l4_timeout_s
```

Basic timeout specification.
If bit 15 == 0, basically a floating point number with 10 bits mantissa and 5 bits exponent (t = m∗2^e).
If the mantissa is zero, the exponent encodes special values, see L4_IPC_TIMEOUT_0 and L4_IPC_TIMEOUT_NEVER.
If bit 15 == 1 the timeout is absolute and the lower 6 bits encode the index of the UTCB buffer register(s) holding the absolute 64-bit timeout value. On 32-bit systems, two consecutive UTCB buffer registers are used.

13.1.9.5.3.2 l4_timeout_t

```
typedef union l4_timeout_t l4_timeout_t
```

Timeout pair.
For IPC there are usually a send and a receive timeout. So this structure contains a pair of timeouts.

13.1.9.5.4 Function Documentation

13.1.9.5.4.1 l4_ipc_timeout()

```
L4_CONSTEXPR l4_timeout_t l4_ipc_timeout (
             unsigned snd_man,
             unsigned snd_exp,
             unsigned rcv_man,
             unsigned rcv_exp)  [inline]
```

Convert explicit timeout values to l4_timeout_t type.

Parameters

snd_man	Mantissa of send timeout.
snd_exp	Exponent of send timeout.
rcv_man	Mantissa of receive timeout.
rcv_exp	Exponent of receive timeout.

Definition at line 207 of file __timeout.h.
References L4_NOTHROW, and l4_timeout().
Here is the call graph for this function:

13.1.9.5.4.2 l4_rcv_timeout()

```
L4_CONSTEXPR void l4_rcv_timeout (
             l4_timeout_s rcv,
             l4_timeout_t * to)  [inline]
```

Set receive timeout in given to timeout.

Parameters

	rcv	Receive timeout
out	*to*	L4 timeout

Definition at line 231 of file __timeout.h.
References L4_NOTHROW.

13.1.9.5.4.3 l4_snd_timeout()

```
L4_CONSTEXPR void l4_snd_timeout (
              l4_timeout_s snd,
              l4_timeout_t * to)  [inline]
```

Set send timeout in given to timeout.

Parameters

	snd	Send timeout
out	*to*	L4 timeout

Definition at line 224 of file __timeout.h.
References L4_NOTHROW.

13.1.9.5.4.4 l4_timeout()

```
L4_CONSTEXPR l4_timeout_t l4_timeout (
              l4_timeout_s snd,
              l4_timeout_s rcv)  [inline]
```

Combine send and receive timeout in a timeout.

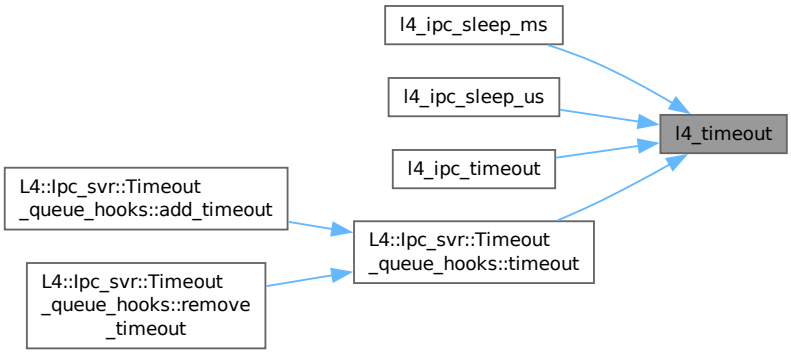
Parameters

snd	Send timeout
rcv	Receive timeout

Returns

L4 timeout

Definition at line 217 of file __timeout.h.
References L4_NOTHROW.
Referenced by l4_ipc_sleep_ms(), l4_ipc_sleep_us(), l4_ipc_timeout(), and L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN
Here is the caller graph for this function:



13.1.9.5.4.5 l4_timeout_abs()

```
l4_timeout_s l4_timeout_abs (
             l4_kernel_clock_t pint,
             int br)  [inline]
```

Set an absolute timeout.

Parameters

pint	Point in time in clocks
br	The buffer register the timeout shall be placed in. (

Note

On 32bit architectures the timeout needs two consecutive buffers.)

The absolute timeout value will be placed into the buffer register *br* of the current thread.

Returns

timeout value

Definition at line 412 of file utcb.h.
References L4_NOTHROW, and l4_utcb().

```
L4_CONSTEXPR l4_kernel_clock_t l4_timeout_get (
             l4_kernel_clock_t cur,
             l4_timeout_s to)  [inline]
```

Get clock value for a clock + a timeout.

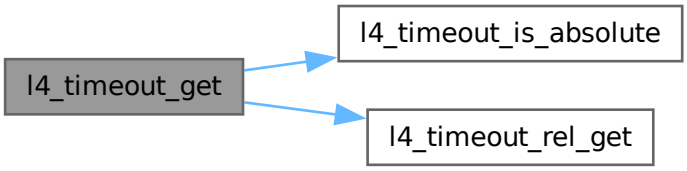
Parameters

cur	Clock value
to	L4 timeout

Returns

Clock sum

Definition at line 261 of file __timeout.h.
References L4_NOTHROW, l4_timeout_is_absolute(), and l4_timeout_rel_get().
Here is the call graph for this function:



13.1.9.5.4.7 l4_timeout_is_absolute()

```
L4_CONSTEXPR unsigned l4_timeout_is_absolute (
            l4_timeout_s to)  [inline]
```

Return whether the given timeout is absolute or not.

Parameters

to	L4 timeout

Returns

!= 0 if absolute, 0 if relative

Definition at line 254 of file __timeout.h.
References L4_NOTHROW.
Referenced by l4_timeout_get().
Here is the caller graph for this function:

13.1.9.5.4.8 l4_timeout_rel()

```
L4_CONSTEXPR l4_timeout_s l4_timeout_rel (
            unsigned man,
            unsigned exp)  [inline]
```

Get relative timeout consisting of mantissa and exponent.

Parameters

man	Mantissa of timeout
exp	Exponent of timeout

Returns

timeout value

Definition at line 238 of file __timeout.h.
References L4_NOTHROW.

13.1.9.5.4.9 l4_timeout_rel_get()

```
L4_CONSTEXPR l4_kernel_clock_t l4_timeout_rel_get (
            l4_timeout_s to)  [inline]
```

Get clock value of out timeout.

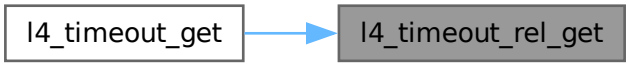
Parameters

to	L4 timeout

Returns

Clock value

Definition at line 245 of file __timeout.h.
References L4_NOTHROW.
Referenced by l4_timeout_get().
Here is the caller graph for this function:



13.1.9.5.4.10 l4_utcb_mr64_idx()

```
unsigned l4_utcb_mr64_idx (
            unsigned idx)  [inline]
```

Get index into 64bit message registers alias from native-sized index.

Parameters

idx	Index to native-sized message register

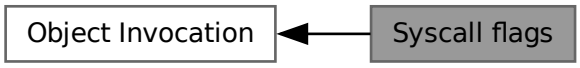
Returns

Index to 64bit message register alias

Definition at line 415 of file utcb.h.
References L4_INLINE, and L4_NOTHROW.
Referenced by l4_icu_msi_info_u().
Here is the caller graph for this function:

13.1.9.6 Syscall flags

These flags determine the concrete operation when a kernel object is invoked.
Collaboration diagram for Syscall flags:



Macros

- #define **L4_SYSF_NONE**

  Empty set of flags.
- #define L4_SYSF_SEND

  Send-phase flag.
- #define L4_SYSF_RECV

  Receive-phase flag.
- #define L4_SYSF_OPEN_WAIT

  Open-wait flag.
- #define L4_SYSF_REPLY

  Reply flag.
- #define L4_SYSF_CALL

  Call flags (combines send and receive).
- #define L4_SYSF_WAIT

  Wait flags (combines receive and open wait).
- #define L4_SYSF_SEND_AND_WAIT

  Send-and-wait flags.
- #define L4_SYSF_REPLY_AND_WAIT

  Reply-and-wait flags.

13.1.9.6.1 Detailed Description

These flags determine the concrete operation when a kernel object is invoked.
The following combinations of flags are supported when invoking IPC (see l4_ipc()); with other combinations, behavior is undefined:

- L4_SYSF_SEND: send to specified partner
- L4_SYSF_RECV: receive from specified partner
- L4_SYSF_RECV | L4_SYSF_OPEN_WAIT: receive from any sending partner; see L4_SYSF_WAIT
- L4_SYSF_SEND | L4_SYSF_RECV: call specified partner; see L4_SYSF_CALL
- L4_SYSF_SEND | L4_SYSF_RECV | L4_SYSF_OPEN_WAIT: send to specified partner and receive from any sending partner; see L4_SYSF_SEND_AND_WAIT
- L4_SYSF_REPLY | L4_SYSF_SEND: reply to caller
- L4_SYSF_REPLY | L4_SYSF_SEND | L4_SYSF_RECV: call the caller
- L4_SYSF_REPLY | L4_SYSF_SEND | L4_SYSF_RECV | L4_SYSF_OPEN_WAIT: reply to caller and receive from any sending partner; see L4_SYSF_REPLY_AND_WAIT

13.1.9.6.2 Macro Definition Documentation

13.1.9.6.2.1 L4_SYSF_CALL

```
#define L4_SYSF_CALL
```

Call flags (combines send and receive).
Combines L4_SYSF_SEND and L4_SYSF_RECV.
Definition at line 110 of file consts.h.
Referenced by l4_ipc_call().

13.1.9.6.2.2 L4_SYSF_OPEN_WAIT

```
#define L4_SYSF_OPEN_WAIT
```

Open-wait flag.
This flag indicates that the receive operation (see L4_SYSF_RECV) shall be an *open wait*. *Open wait* means that the invoking thread shall wait for a message from any possible sender and *not* from the sender denoted by the capability.
Definition at line 93 of file consts.h.

13.1.9.6.2.3 L4_SYSF_RECV

```
#define L4_SYSF_RECV
```

Receive-phase flag.
Setting this flag induces a receive phase, this means the invoking thread waits for a message from the object denoted by the capability. For a send phase see L4_SYSF_SEND.
Definition at line 82 of file consts.h.
Referenced by l4_ipc_receive().

13.1.9.6.2.4 L4_SYSF_REPLY

```
#define L4_SYSF_REPLY
```

Reply flag.
This flag indicates that the send phase shall use the in-kernel reply capability instead of the capability denoted by the selector index.
Definition at line 102 of file consts.h.
Referenced by l4_ipc_reply().

13.1.9.6.2.5 L4_SYSF_REPLY_AND_WAIT

```
#define L4_SYSF_REPLY_AND_WAIT
```

Reply-and-wait flags.
Combines L4_SYSF_SEND, L4_SYSF_REPLY, and L4_SYSF_WAIT.
Definition at line 134 of file consts.h.
Referenced by l4_ipc_reply_and_wait_ext(), and L4::Server< LOOP_HOOKS >::reply_n_wait().

13.1.9.6.2.6 L4_SYSF_SEND

```
#define L4_SYSF_SEND
```

Send-phase flag.
Setting this flag induces a send phase, this means a message is sent to the object denoted by the capability. For receive phase see L4_SYSF_RECV.
In l4_vcpu_state_t::user_task this flag means that the kernel has cached the user task capability internally, see l4_thread_vcpu_resume_commit().
Definition at line 71 of file consts.h.
Referenced by l4_ipc_reply(), and l4_ipc_send().

13.1.9.6.2.7 L4_SYSF_SEND_AND_WAIT

```
#define L4_SYSF_SEND_AND_WAIT
```

Send-and-wait flags.
Combines L4_SYSF_SEND and L4_SYSF_WAIT.
Definition at line 126 of file consts.h.
Referenced by l4_ipc_send_and_wait().

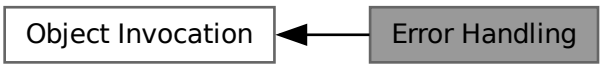
13.1.9.6.2.8 L4_SYSF_WAIT

```
#define L4_SYSF_WAIT
```

Wait flags (combines receive and open wait).
Combines L4_SYSF_RECV and L4_SYSF_OPEN_WAIT.
Definition at line 118 of file consts.h.
Referenced by l4_ipc_wait_ext(), and L4::Server< LOOP_HOOKS >::reply_n_wait().

13.1.9.7 Error Handling

Error handling for L4 object invocation.
Collaboration diagram for Error Handling:



Enumerations

- enum l4_ipc_tcr_error_t {
  L4_IPC_ERROR_MASK = 0x1F , L4_IPC_SND_ERR_MASK = 0x01 , L4_IPC_ENOT_EXISTENT = 0x04 , L4_IPC_RETIMEOUT = 0x03 ,
  L4_IPC_SETIMEOUT = 0x02 , L4_IPC_RECANCELED = 0x07 , L4_IPC_SECANCELED = 0x06 , L4_IPC_REMAPFAILED = 0x11 ,
  L4_IPC_SEMAPFAILED = 0x10 , L4_IPC_RESNDPFTO = 0x0b , L4_IPC_SESNDPFTO = 0x0a , L4_IPC_RERCVPFTO = 0x0d ,

L4_IPC_SERCVPFTO = 0x0c , L4_IPC_REABORTED = 0x0f , L4_IPC_SEABORTED = 0x0e , L4_IPC_REMSGCUT = 0x09 ,
L4_IPC_SEMSGCUT = 0x08 , L4_IPC_NO_REPLY_CAP = 0x13 }

Error codes in the error TCR.

Functions

- l4_umword_t l4_ipc_error (l4_msgtag_t tag, l4_utcb_t *utcb) L4_NOTHROW

  Get the IPC error code for an IPC operation.
- l4_ret_t l4_error (l4_msgtag_t tag) L4_NOTHROW

  Get IPC error code if any or message tag label otherwise for an IPC call.
- int l4_ipc_is_snd_error (l4_utcb_t *utcb) L4_NOTHROW

  Returns whether an error occurred in send phase of an invocation.
- int l4_ipc_is_rcv_error (l4_utcb_t *utcb) L4_NOTHROW

  Returns whether an error occurred in receive phase of an invocation.
- int l4_ipc_error_code (l4_utcb_t *utcb) L4_NOTHROW

  Get the error condition of the last invocation from the TCR.

13.1.9.7.1 Detailed Description

Error handling for L4 object invocation.

Include File

```
#include <l4/sys/ipc.h>
```

13.1.9.7.2 Enumeration Type Documentation

13.1.9.7.2.1 l4_ipc_tcr_error_t

```
enum l4_ipc_tcr_error_t
```

Error codes in the *error* TCR.
The error codes are accessible via the *error* TCR, see l4_thread_regs_t.error.

Enumerator

L4_IPC_ERROR_MASK	Mask for error bits.
L4_IPC_SND_ERR_MASK	Send error mask.
L4_IPC_ENOT_EXISTENT	Non-existing destination or source.
L4_IPC_RETIMEOUT	Timeout during receive operation.
L4_IPC_SETIMEOUT	Timeout during send operation.
L4_IPC_RECANCELED	Receive operation canceled.
L4_IPC_SECANCELED	Send operation canceled.
L4_IPC_REMAPFAILED	Map flexpage failed in receive operation.
L4_IPC_SEMAPFAILED	Map flexpage failed in send operation.
L4_IPC_RESNDPFTO	Send-pagefault timeout in receive operation.
L4_IPC_SESNDPFTO	Send-pagefault timeout in send operation.
L4_IPC_RERCVPFTO	Receive-pagefault timeout in receive operation.
L4_IPC_SERCVPFTO	Receive-pagefault timeout in send operation.
L4_IPC_REABORTED	Receive operation aborted.
L4_IPC_SEABORTED	Send operation aborted.

L4_IPC_REMSGCUT	Received message truncated. Usually returned when the typed items to be sent by the IPC partner exceed the buffer registers of the respective types.
L4_IPC_SEMSGCUT	Sent message truncated. Usually returned when the typed items to be sent exceed the IPC partner's buffer registers of the respective types.
L4_IPC_NO_REPLY_CAP	Receive operation using explicit reply capability failed. Either the reply capability index was too large or the callers memory quota was exhausted.

Definition at line 81 of file ipc.h.

13.1.9.7.3 Function Documentation

13.1.9.7.3.1 l4_error()

```
l4_ret_t l4_error (
            l4_msgtag_t tag)  [inline]
```

Get IPC error code if any or message tag label otherwise for an IPC call.
This function shall only be used if the IPC operation includes a receive phase (usually a call operation), otherwise no tag label is received and the return value of this function is undefined.

Parameters

tag	Message tag returned by the IPC call.

Returns

In case of an IPC error, a negative error code in the range of L4_EIPC_LO to L4_EIPC_HI (see l4_ipc_to_errno() and l4_ipc_tcr_error_t), otherwise the tag label. By convention, the callee can signal errors via a negative tag label (negated value from l4_error_code_t) and success via a non-negative value.

Examples

examples/libs/l4re/streammap/client.cc, examples/sys/aliens/main.c, examples/sys/isr/main.c, examples/sys/migrate/thread_mig examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

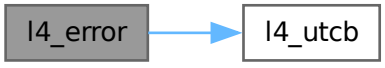
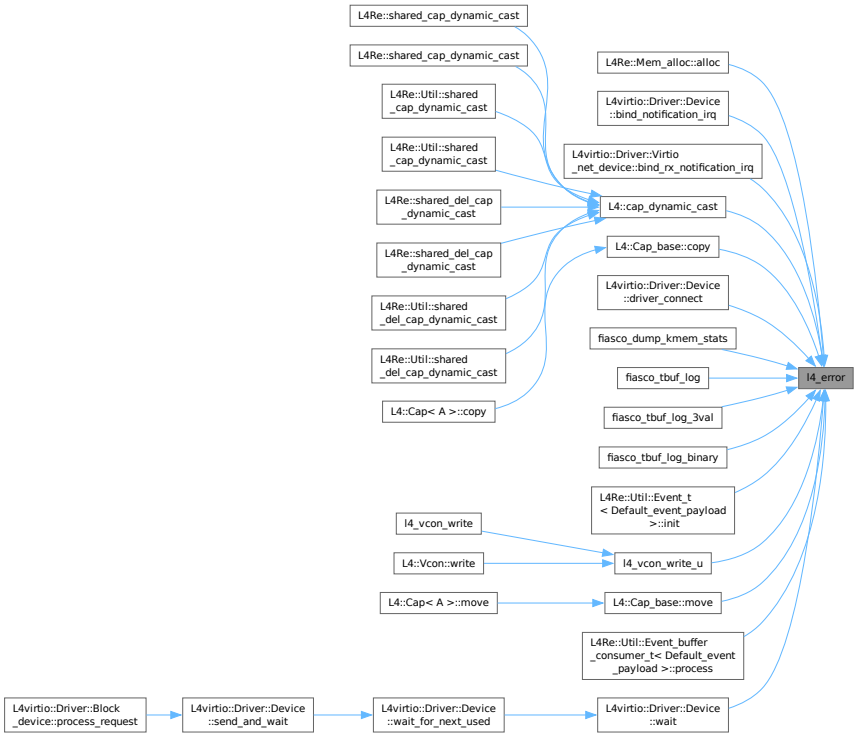
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.9.7.3.2 l4_ipc_error()

```
l4_umword_t l4_ipc_error (
            l4_msgtag_t tag,
            l4_utcb_t * utcb)  [inline]
```

Get the IPC error code for an IPC operation.

Parameters

tag	Message tag returned by the IPC operation.
utcb	UTCB that was used for the IPC operation.

Returns

0 if no error condition is set, error code otherwise (see l4_ipc_tcr_error_t).

Examples

examples/sys/ipc/ipc_example.c, and examples/sys/start-with-exc/main.c.

Definition at line 713 of file ipc.h.
References L4_IPC_ERROR_MASK, L4_LIKELY, l4_msgtag_has_error(), and L4_NOTHROW.

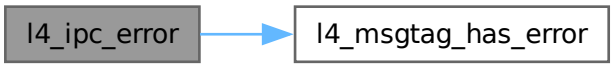
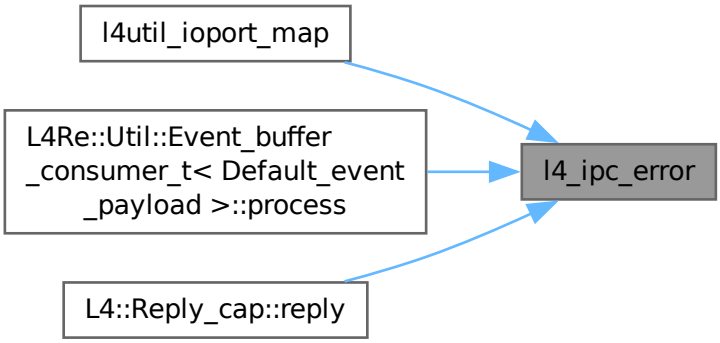
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.9.7.3.3 l4_ipc_error_code()

```
int l4_ipc_error_code (
            l4_utcb_t * utcb)  [inline]
```

Get the error condition of the last invocation from the TCR.

Precondition

l4_msgtag_has_error(tag) == true

Parameters

utcb	UTCB to check.

Returns

Error condition of type l4_ipc_tcr_error_t.

Definition at line 742 of file ipc.h.
References L4_INLINE, L4_IPC_ERROR_MASK, and L4_NOTHROW.

13.1.9.7.3.4 l4_ipc_is_rcv_error()

```
int l4_ipc_is_rcv_error (
            l4_utcb_t * utcb)  [inline]
```

Returns whether an error occurred in receive phase of an invocation.

Precondition

l4_msgtag_has_error(tag) == true

Parameters

utcb	UTCB to check.

Returns

Boolean value.

Definition at line 739 of file ipc.h.
References L4_INLINE, and L4_NOTHROW.

13.1.9.7.3.5 l4_ipc_is_snd_error()

```
int l4_ipc_is_snd_error (
            l4_utcb_t * utcb)  [inline]
```

Returns whether an error occurred in send phase of an invocation.

Precondition

l4_msgtag_has_error(tag) == true

Parameters

utcb	UTCB to check.

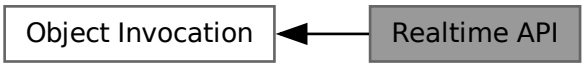
Returns

Boolean value.

Definition at line 736 of file ipc.h.
References L4_INLINE, and L4_NOTHROW.

13.1.9.8 Realtime API

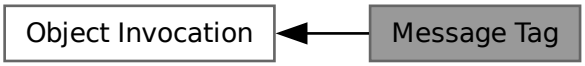
Collaboration diagram for Realtime API:



13.1.9.9 Message Tag

API related to the message tag data type.

Collaboration diagram for Message Tag:



Data Structures

- struct l4_msgtag_t

  Message tag data structure.

Enumerations

- enum L4_msgtag_protocol {
  L4_PROTO_NONE = 0 , L4_PROTO_ALLOW_SYSCALL = 1 , L4_PROTO_PF_EXCEPTION = 1 ,
  L4_PROTO_PLATFORM_CTL = 0L ,
  L4_PROTO_IRQ = -1L , L4_PROTO_PAGE_FAULT = -2L , L4_PROTO_EXCEPTION = -5L , L4_PROTO_SIGMA0 = -6L ,
  L4_PROTO_IO_PAGE_FAULT = -8L , L4_PROTO_THREAD_GROUP = -9L , L4_PROTO_KOBJECT = -10L , L4_PROTO_TASK = -11L ,
  L4_PROTO_THREAD = -12L , L4_PROTO_LOG = -13L , L4_PROTO_SCHEDULER = -14L , L4_PROTO_FACTORY = -15L ,

  L4_PROTO_VCPU_CONTEXT = -25L , L4_PROTO_PI_MUTEX = -26L }

  Message tag for IPC operations.
- enum L4_msgtag_flags { L4_MSGTAG_ERROR , L4_MSGTAG_TRANSFER_FPU , L4_MSGTAG_SCHEDULE , **L4_MSGTAG_PROPAGATE** = 0x4000 , L4_MSGTAG_FLAGS }

  Flags for message tags.

Functions

- long l4_msgtag_label (l4_msgtag_t t) L4_NOTHROW

  Get the protocol of tag.
- unsigned l4_msgtag_words (l4_msgtag_t t) L4_NOTHROW

  Get the number of untyped words.
- unsigned l4_msgtag_items (l4_msgtag_t t) L4_NOTHROW

  Get the number of typed items.
- unsigned l4_msgtag_flags (l4_msgtag_t t) L4_NOTHROW

  Get the flags.
- unsigned l4_msgtag_has_error (l4_msgtag_t t) L4_NOTHROW

  Test for error indicator flag.
- unsigned l4_msgtag_is_page_fault (l4_msgtag_t t) L4_NOTHROW

  Test for page-fault protocol.
- unsigned l4_msgtag_is_exception (l4_msgtag_t t) L4_NOTHROW

  Test for exception protocol.
- unsigned l4_msgtag_is_sigma0 (l4_msgtag_t t) L4_NOTHROW

Test for sigma0 protocol.

- unsigned l4_msgtag_is_io_page_fault (l4_msgtag_t t) L4_NOTHROW

  Test for IO-page-fault protocol.

- l4_msgtag_t l4_msgtag (long label, unsigned words, unsigned items, unsigned flags) L4_NOTHROW

  Create a message tag from the specified values.

13.1.9.9.1 Detailed Description

API related to the message tag data type.

Include File

```
#include <l4/sys/types.h>
```

13.1.9.9.2 Enumeration Type Documentation

13.1.9.9.2.1 L4_msgtag_flags

enum L4_msgtag_flags
Flags for message tags.

Enumerator

L4_MSGTAG_ERROR	Error indicator flag.
L4_MSGTAG_TRANSFER_FPU	Enable FPU transfer flag for IPC. By enabling this flag when sending IPC, the sender indicates that the contents of the FPU shall be transferred to the receiving thread. However, the receiver has to indicate its willingness to receive FPU context in its buffer descriptor register (BDR).
L4_MSGTAG_SCHEDULE	Enable schedule in IPC flag. Usually IPC operations donate the remaining time slice of a thread to the called thread. Enabling this flag when sending IPC does a real scheduling decision. However, this flag decreases IPC performance.
L4_MSGTAG_FLAGS	Mask for all flags.

Definition at line 103 of file types.h.

13.1.9.9.2.2 L4_msgtag_protocol

enum L4_msgtag_protocol
Message tag for IPC operations.
All predefined protocols used by the kernel.

Enumerator

L4_PROTO_NONE	Default protocol tag to reply to kernel.
L4_PROTO_ALLOW_SYSCALL	Allow an alien the system call.
L4_PROTO_PF_EXCEPTION	Make an exception out of a page fault.
L4_PROTO_PLATFORM_CTL	Platform control.
L4_PROTO_IRQ	IRQ message.
L4_PROTO_PAGE_FAULT	Page fault message.
L4_PROTO_EXCEPTION	Exception.
L4_PROTO_SIGMA0	Sigma0 protocol.
L4_PROTO_IO_PAGE_FAULT	I/O page fault message.

L4_PROTO_THREAD_GROUP	Protocol for messages to a thread group obj.
L4_PROTO_KOBJECT	Protocol for messages to a generic kobject.
L4_PROTO_TASK	Protocol for messages to a task object.
L4_PROTO_THREAD	Protocol for messages to a thread object.
L4_PROTO_LOG	Protocol for messages to a log object.
L4_PROTO_SCHEDULER	Protocol for messages to a scheduler object.
L4_PROTO_FACTORY	Protocol for messages to a factory object.
L4_PROTO_VM	Protocol for messages to a virtual machine object.
L4_PROTO_DMA_SPACE	Protocol for (creating) kernel DMA space objects.
L4_PROTO_IRQ_SENDER	Protocol for IRQ senders (IRQ -> IPC).
L4_PROTO_SEMAPHORE	Protocol for semaphore objects.
L4_PROTO_META	Meta information protocol.
L4_PROTO_IOMMU	Protocol ID for IO-MMUs.
L4_PROTO_DEBUGGER	Protocol ID for the debugger.
L4_PROTO_SMCCC	Protocol ID for ARM SMCCC calls.
L4_PROTO_VCPU_CONTEXT	Protocol for hardware vCPU contexts.
L4_PROTO_PI_MUTEX	Protocol for priority inheritance mutex.

Definition at line 53 of file types.h.

13.1.9.9.3 Function Documentation

13.1.9.9.3.1 l4_msgtag()

```
l4_msgtag_t l4_msgtag (
             long label,
             unsigned words,
             unsigned items,
             unsigned flags)  [inline]
```

Create a message tag from the specified values.
Message tag functions.

Parameters

label	The user-defined label
words	The number of untyped words within the UTCB
items	The number of typed items (e.g., flexpages) within the UTCB
flags	The IPC flags for realtime and FPU extensions

Returns

Message tag

Examples

examples/sys/aliens/main.c, examples/sys/ipc/ipc_example.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/mai
and examples/sys/utcb-ipc/main.c.

Typedefs

- typedef struct l4_utcb_t l4_utcb_t

  Opaque type for the UTCB.

Functions

- l4_utcb_t * **l4_utcb** (void) L4_NOTHROW L4_PURE

  Get the UTCB address.

- l4_msg_regs_t * l4_utcb_mr (void) L4_NOTHROW L4_PURE

  Get the message-register block of a UTCB.

- l4_buf_regs_t * l4_utcb_br (void) L4_NOTHROW L4_PURE

  Get the buffer-register block of a UTCB.

- l4_thread_regs_t * l4_utcb_tcr (void) L4_NOTHROW L4_PURE

  Get the thread-control-register block of a UTCB.

13.1.9.10.1 Detailed Description

L4 Virtual Registers (UTCB).

Include File

```
#include <l4/sys/utcb.h>
```

The virtual registers are part of the micro-kernel API and are located in the user-level thread control block (UTCB). The UTCB is a data structure defined by the micro kernel and located on kernel-provided memory. Each L4 thread gets a unique UTCB assigned when it is bound to a task (see Thread Control , l4_thread_control_bind() for more information).
The UTCB is arranged in three blocks of virtual registers.

- Thread Control Registers (TCRs)
- Message Registers (MRs)
- Buffer Registers (BRs)

To access the contents of the virtual registers the l4_utcb_mr(), l4_utcb_tcr(), and l4_utcb_br() functions must be used.

13.1.9.10.2 Typedef Documentation

13.1.9.10.2.1 l4_utcb_t

```
typedef struct l4_utcb_t l4_utcb_t
```

Opaque type for the UTCB.
To access the contents of the virtual registers the l4_utcb_mr(), l4_utcb_tcr(), and l4_utcb_br() functions must be used.

13.1.9.10.4 Message Registers (MRs)

Collaboration diagram for Message Registers (MRs):

Topics

- Exception registers 251
  Overlay definition of the MRs for exception messages.

Data Structures

- union l4_msg_regs_t
  Encapsulation of the message-register block in the UTCB.

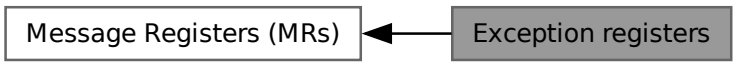
Typedefs

- typedef union l4_msg_regs_t **l4_msg_regs_t**
  Encapsulation of the message-register block in the UTCB.

13.1.9.10.4.1 Detailed Description

13.1.9.10.4.2 Exception registers

Overlay definition of the MRs for exception messages.
Collaboration diagram for Exception registers:



Functions

- l4_umword_t l4_utcb_exc_pc (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE
  Access function to get the program counter of the exception state.
- void l4_utcb_exc_pc_set (l4_exc_regs_t *u, l4_addr_t pc) L4_NOTHROW
  Set the program counter register in the exception state.
- unsigned long **l4_utcb_exc_typeval** (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE
  Get the value out of an exception UTCB that describes the type of exception.
- int l4_utcb_exc_is_pf (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE
  Check whether an exception IPC is a page fault.
- l4_addr_t **l4_utcb_exc_pfa** (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE
  Function to get the L4 style page fault address out of an exception.

- int l4_utcb_exc_is_ex_regs_exception (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE

  Check whether an exception IPC was triggered via l4_thread_ex_regs().
- l4_exc_regs_t * l4_utcb_exc (void) L4_NOTHROW L4_PURE

  Get the message-register block of a UTCB (for an exception IPC).

Detailed Description

Overlay definition of the MRs for exception messages.

Function Documentation

l4_utcb_exc()

```
l4_exc_regs_t * l4_utcb_exc (
             void )  [inline]
```

Get the message-register block of a UTCB (for an exception IPC).

Returns

A pointer to the exception message in `u`.

Examples

examples/sys/aliens/main.c, and examples/sys/singlestep/main.c.

Definition at line 390 of file utcb.h.
References L4_INLINE, L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

l4_utcb_exc_is_ex_regs_exception()

```
int l4_utcb_exc_is_ex_regs_exception (
             l4_exc_regs_t const * u)  [inline]
```

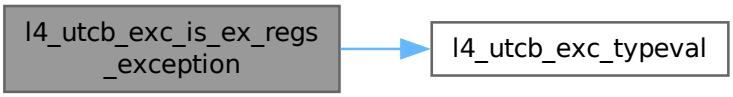
Check whether an exception IPC was triggered via l4_thread_ex_regs().

Return values

0	Exception was not triggered through ex_regs.
!=0	Exception was triggered through ex_regs.

This function checks if the exception was emitted by using the L4_THREAD_EX_REGS_TRIGGER_EXCEPTION flag in an l4_thread_ex_regs() call.
Definition at line 100 of file utcb.h.
References L4_INLINE, L4_NOTHROW, and l4_utcb_exc_typeval().

Here is the call graph for this function:



l4_utcb_exc_is_pf()

```
int l4_utcb_exc_is_pf (
            l4_exc_regs_t const * u)  [inline]
```

Check whether an exception IPC is a page fault.

Returns

0 if not, != 0 if yes

Function to check whether an exception IPC is a page fault, also applies to I/O pagefaults.
Definition at line 90 of file utcb.h.
References L4_INLINE, and L4_NOTHROW.

l4_utcb_exc_pc()

```
l4_umword_t l4_utcb_exc_pc (
            l4_exc_regs_t const * u)  [inline]
```

Access function to get the program counter of the exception state.

Parameters

u	UTCB

Returns

The program counter register out of the exception state.

Examples

examples/sys/aliens/main.c, and examples/sys/singlestep/main.c.

Definition at line 75 of file utcb.h.
References L4_INLINE, and L4_NOTHROW.

l4_utcb_exc_pc_set()

```
void l4_utcb_exc_pc_set (
            l4_exc_regs_t * u,
            l4_addr_t pc)  [inline]
```

Set the program counter register in the exception state.

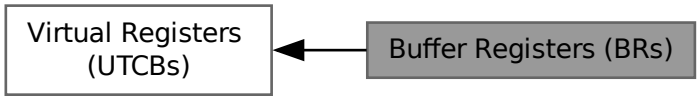
Parameters

u	UTCB
pc	The program counter to set.

Definition at line 80 of file utcb.h.
References L4_INLINE, and L4_NOTHROW.

13.1.9.10.5 Buffer Registers (BRs)

Collaboration diagram for Buffer Registers (BRs):



Data Structures

- struct l4_buf_regs_t

  Encapsulation of the buffer-registers block in the UTCB.

Typedefs

- typedef struct l4_buf_regs_t **l4_buf_regs_t**

  Encapsulation of the buffer-registers block in the UTCB.

Enumerations

- enum l4_buffer_desc_consts_t { L4_BDR_MEM_SHIFT = 0 , L4_BDR_IO_SHIFT = 5 , L4_BDR_OBJ_SHIFT = 10 , **L4_BDR_OFFSET_MASK** = (1UL << 20) - 1 }

  Constants for buffer descriptors.

Functions

- void **l4_utcb_inherit_fpu** (int switch_on) L4_NOTHROW

  Enable or disable inheritance of FPU state to receiver.
- l4_umword_t l4_bdr (l4_umword_t mem, l4_umword_t io, l4_umword_t obj, l4_umword_t flags) L4_NOTHROW

  Create a buffer descriptor.

13.1.9.10.5.1 Detailed Description

13.1.9.10.5.2 Enumeration Type Documentation

l4_buffer_desc_consts_t

`enum l4_buffer_desc_consts_t`
Constants for buffer descriptors.

Enumerator

L4_BDR_MEM_SHIFT	Bit offset for the memory-buffer index.
L4_BDR_IO_SHIFT	Bit offset for the IO-buffer index.
L4_BDR_OBJ_SHIFT	Bit offset for the capability-buffer index.

Definition at line 320 of file consts.h.

13.1.9.10.5.3 Function Documentation

l4_bdr()

```
l4_umword_t l4_bdr (
             l4_umword_t mem,
             l4_umword_t io,
             l4_umword_t obj,
             l4_umword_t flags)  [inline]
```

Create a buffer descriptor.

Parameters

mem	Index of the first memory receive buffer.
io	Index of the first IO-port receive buffer.
obj	Index of the first object receive buffer.
flags	Flags (only L4_UTCB_INHERIT_FPU so far).

Definition at line 362 of file utcb.h.
References L4_INLINE, and L4_NOTHROW.
Referenced by L4Re::Util::Br_manager::setup_wait().

  C Virtual console interface for simple character based input and output, see L4::Vcon for the C++ interface.

Data Structures

- class L4::Kobject
  Base class for all kinds of kernel objects and remote objects, referenced by capabilities.
- class L4::Vm
  Virtual machine host address space.

13.1.10.1 Detailed Description

API of kernel objects.

Include File

```
#include <l4/sys/kernel_object.h>
```

13.1.10.2 IPC-Gate API

The C IPC gate interface, see L4::Ipc_gate for the C++ interface.
Collaboration diagram for IPC-Gate API:

Functions

- l4_msgtag_t l4_ipc_gate_get_infos (l4_cap_idx_t gate, l4_umword_t *label)

  Get information about the IPC-gate.
- l4_msgtag_t l4_rcv_ep_bind_thread (l4_cap_idx_t ep, l4_cap_idx_t thread, l4_umword_t label)

  Bind the IPC receive endpoint to a thread.
- l4_msgtag_t l4_rcv_ep_bind_snd_destination (l4_cap_idx_t ep, l4_cap_idx_t snd_dst, l4_umword_t label)

  Bind the IPC receive endpoint to a send destination (a thread).

13.1.10.2.1 Detailed Description

The C IPC gate interface, see L4::Ipc_gate for the C++ interface.
IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the Factory interface.
Depending on the permissions of the capability used, an IPC gate forwards IPC to the Thread the IPC gate is *bound* to (cf. l4_rcv_ep_bind_thread() and l4_rcv_ep_bind_snd_destination()). If the capability has the L4_FPAGE_C_IPCGATE_SVR permission, only IPC using a protocol different from the L4_PROTO_KOBJECT protocol is forwarded. Without the L4_FPAGE_C_IPCGATE_SVR permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.
Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the Thread interface of that thread is not accessible via an IPC gate. The IPC-Gate API of an IPC gate is only accessible if the capability used has the L4_FPAGE_C_IPCGATE_SVR permission (cf. previous paragraph). Conversely that means, if the capability used lacks the L4_FPAGE_C_IPCGATE_SVR permission, IPC-Gate API calls are forwarded to the thread or thread group the IPC gate is bound to instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without L4_FPAGE_C_IPCGATE_SVR permission so the client cannot tamper with the IPC gate.
When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. l4_rcv_ep_bind_thread() and l4_rcv_ep_bind_snd_destination()). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the L4_CAP_FPAGE_S and L4_CAP_FPAGE_W permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to upon receive (or to the selected thread from the thread group the IPC gate is bound to). However, the configured label of an IPC gate can also be queried via l4_ipc_gate_get_infos() if the capability used has the L4_FPAGE_C_IPCGATE_SVR permission.
When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, l4_thread_modify_sender_start() shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.
When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

Include File

```
#include <l4/sys/ipc_gate.h>
```

For the C++ interface refer to the L4::Ipc_gate documentation.

See also

Object Invocation

13.1.10.2.2 Function Documentation

13.1.10.2.2.1 l4_ipc_gate_get_infos()

```
l4_msgtag_t l4_ipc_gate_get_infos (
             l4_cap_idx_t gate,
             l4_umword_t * label)  [inline]
```

Get information about the IPC-gate.

Parameters

	gate	The IPC gate object to get information about.
out	*label*	The label of the IPC gate is returned here.

Returns

System call return tag.

Precondition

If `gate` does not possess the L4_FPAGE_C_IPCGATE_SVR right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the thread or thread group the IPC gate is bound to, blocking the caller if the IPC gate is not bound yet.

Definition at line 166 of file ipc_gate.h.
References l4_utcb().
Here is the call graph for this function:

13.1.10.2.2.2 l4_rcv_ep_bind_snd_destination()

```
l4_msgtag_t l4_rcv_ep_bind_snd_destination (
             l4_cap_idx_t ep,
             l4_cap_idx_t snd_dst,
             l4_umword_t label)  [inline]
```

Bind the IPC receive endpoint to a send destination (a thread).

Parameters

ep	The IPC receive endpoint object.
snd_dst	The send destination (thread) object `ep` shall be bound to.
label	Label to assign to `ep`. For IPC gates, the two least significant bits must be set to zero.

Returns

Syscall return tag containing one of the following return codes.

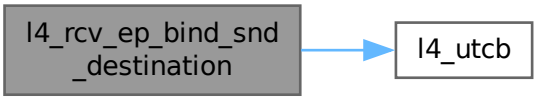
Return values

L4_EOK	Operation successful.
-L4_EINVAL	`snd_dst` is not a thread object or other arguments were malformed.
-L4_EPERM	No L4_CAP_FPAGE_S right on `ep` or `snd_dst`.

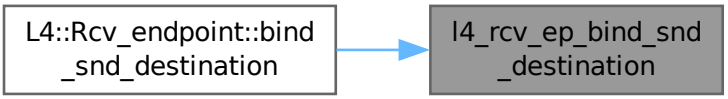
Precondition

If `ep` is an IPC gate capability without the L4_FPAGE_C_IPCGATE_SVR right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the send destination the IPC gate is bound to, blocking the caller if the IPC gate was not bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different send destination. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless l4_thread_modify_sender_start() is used to change these labels.
Definition at line 138 of file rcv_endpoint.h.
References l4_utcb().
Referenced by L4::Rcv_endpoint::bind_snd_destination().
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.10.2.2.3 l4_rcv_ep_bind_thread()

```
l4_msgtag_t l4_rcv_ep_bind_thread (
             l4_cap_idx_t ep,
             l4_cap_idx_t thread,
             l4_umword_t label)  [inline]
```

Bind the IPC receive endpoint to a thread.

Parameters

ep	The IPC receive endpoint object.
thread	The thread object `ep` shall be bound to.
label	Label to assign to `ep`. For IPC gates, the two least significant bits must be set to zero.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	Operation successful.
-L4_EINVAL	`thread` is not a thread object or other arguments were malformed.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capabilities `ep` and `thread` both must have the permission L4_CAP_FPAGE_S.

If `ep` is an IPC gate capability without the L4_FPAGE_C_IPCGATE_SVR right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the thread the IPC gate is bound to, blocking the caller if the IPC gate was not bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless l4_thread_modify_sender_start() is used to change these labels.

Examples

examples/sys/isr/main.c.

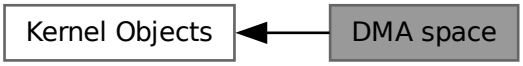
13.1.10.3 DMA space

A DMA space represents a device memory address space managed by an IOMMU.

Collaboration diagram for DMA space:



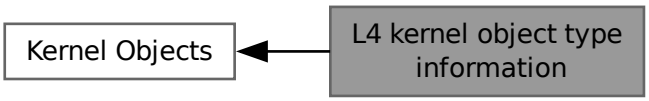
A DMA space represents a device memory address space managed by an IOMMU.
That is, it manages the translation of virtual addresses used by devices to physical addresses. It is accessed via the L4::Task interface, but with the following caveats:

- No threads can be bound to it.
- No objects (and IO ports on IA32) can be mapped to it.
- No kernel-user memory can be added to it.
- It must be constructed by passing the L4_PROTO_DMA_SPACE protocol constant to the kernel factory's L4::Factory.create() call.

A DMA space must be bound to an L4::Iommu to enable the address translation for specific devices.
The kernel factory allows to create DMA spaces only if the kernel has been configured with IOMMU support and if an IOMMU was detected.

13.1.10.4 L4 kernel object type information

Type information for L4 server objects that can be called via IPC.
Collaboration diagram for L4 kernel object type information:



Data Structures

- struct L4::Type_info

  Dynamic Type Information for L4Re Interfaces.
- struct L4::Kobject_typeid< T >

  Meta object for handling access to type information of Kobjects.
- class L4::Kobject_t< Derived, Base, PROTO, S_DEMAND >

  Helper class to create an L4Re interface class that is derived from a single base class.
- class L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >

  Helper class to create an L4Re interface class that is derived from two base classes (see `L4::Kobject_t`).
- struct L4::Kobject_3t< Derived, Base1, Base2, Base3, PROTO, S_DEMAND >

  Helper class to create an L4Re interface class that is derived from three base classes (see `L4::Kobject_t`).
- struct L4::Kobject_x< Derived, ARGS >

  Generic Kobject inheritance template.

Functions

- template<typename T>
  Type_info const * L4::kobject_typeid () noexcept

  Get the L4::Type_info for the L4Re interface given in `T`.

13.1.10.4.1 Detailed Description

Type information for L4 server objects that can be called via IPC.
This type information consists of inheritance information, the protocol number assigned to an interface as well as the demand on server-side resources.

13.1.10.4.2 Function Documentation

13.1.10.4.2.1 kobject_typeid()

```
template<typename T>
Type_info const * L4::kobject_typeid ()  [inline], [noexcept]
```

Get the L4::Type_info for the L4Re interface given in `T`.

Template Parameters

T	The type (L4Re interface) for which the information shall be returned.

Returns

A pointer to the L4::Type_info structure for `T`.

Definition at line 682 of file __typeinfo.h.
References L4::Kobject_typeid< T >::id().

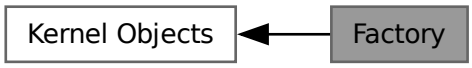
13.1.10.5 Factory

C factory interface to create objects, see L4::Factory for the C++ interface.
Collaboration diagram for Factory:



Functions

- l4_msgtag_t l4_factory_create_task (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_fpage_t *utcb_area) L4_NOTHROW

  Create a new task.
- l4_msgtag_t l4_factory_create_thread (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

  Create a new thread.
- l4_msgtag_t l4_factory_create_factory (l4_cap_idx_t factory, l4_cap_idx_t target_cap, unsigned long limit) L4_NOTHROW

  Create a new factory.
- l4_msgtag_t l4_factory_create_gate (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_cap_idx_t snd_dst_↩ cap, l4_umword_t label) L4_NOTHROW

  Create a new IPC gate, optionally bound to a send destination (a thread or thread group).
- l4_msgtag_t l4_factory_create_irq (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

Create a new IRQ sender.

- l4_msgtag_t l4_factory_create_vm (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

  Create a new virtual machine.

- l4_msgtag_t l4_factory_create_vcpu_context (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

  Create a new vCPU context.

- l4_msgtag_t l4_factory_create_thread_group (l4_cap_idx_t factory, l4_cap_idx_t target_cap, unsigned policy) L4_NOTHROW

  Create a new thread group.

- l4_msgtag_t l4_factory_create_pi_mutex (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_addr_t ku_status, l4_cap_idx_t task_cap) L4_NOTHROW

  Create a new priority inheritance mutex.

- l4_msgtag_t l4_factory_create (l4_cap_idx_t factory, long obj, l4_cap_idx_t target) L4_NOTHROW

  Create a new object.

13.1.10.5.1 Detailed Description

C factory interface to create objects, see L4::Factory for the C++ interface.
A factory is used to create all kinds of kernel objects:

- Task
- Thread
- Factory
- IPC-Gate API
- IRQs
- Virtual Machines

To create a new kernel object the caller has to specify the factory to use for creation. The caller has to allocate a capability slot where the kernel stores the new object's capability.
The factory is equipped with a limit that limits the amount of kernel memory available for that factory.

Note

The limit does not give any guarantee for the amount of available kernel memory.

Include File

```
#include <l4/sys/factory.h>
```

For the C++ interface refer to L4::Factory.

13.1.10.5.2 Function Documentation

13.1.10.5.2.1 l4_factory_create()

```
l4_msgtag_t l4_factory_create (
             l4_cap_idx_t factory,
             long obj,
             l4_cap_idx_t target)  [inline]
```

Create a new object.

Parameters

	factory	Factory to use for creation.
	obj	Protocol ID to describe the type of the object to create.

out	*target*	The kernel stores the new object's capability into this slot.

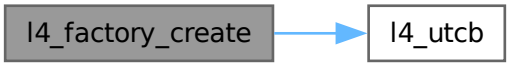
Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

The capability `factory` must have the permission L4_CAP_FPAGE_S.

Definition at line 769 of file factory.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.5.2.2 l4_factory_create_factory()

```
l4_msgtag_t l4_factory_create_factory (
             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap,
             unsigned long limit)  [inline]
```

Create a new factory.

Parameters

	factory	Capability index for factory to use for creation.
out	*target_cap*	The kernel stores the new factory's capability into this slot.
	limit	Limit for the new factory in bytes.

Returns

Syscall return tag

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

The capability `factory` must have the permission L4_CAP_FPAGE_S.

Note

The limit of the new factory is subtracted from the available amount of the factory used for creation.

This method is only guaranteed to work with the Kernel Factory. For other services, use the generic L4::Factory::create() method and consult the service documentation for information on the arguments that need to be passed to the create stream.

Definition at line 599 of file factory.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.5.2.3 l4_factory_create_gate()

```
l4_msgtag_t l4_factory_create_gate (
             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap,
             l4_cap_idx_t snd_dst_cap,
             l4_umword_t label)  [inline]
```

Create a new IPC gate, optionally bound to a send destination (a thread or thread group).

Parameters

	factory	Capability index for factory to use for creation.
`out`	*target_cap*	The kernel stores the new IPC gate's capability into this slot.
	snd_dst_cap	Optional capability index of a thread or thread group to bind the gate to. Use L4_INVALID_CAP to create an unbound IPC gate.
	label	Optional label of the gate (precisely used if `snd_dst_cap` is valid). If `snd_dst_cap` is valid, `label` must be present.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	No error occurred.
-L4_ENOMEM	Out-of-memory during allocation of the lpc_gate object.
-L4_EINVAL	`snd_dst_cap` is void or points to something that is not a thread or thread group.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `factory` must have the permission L4_CAP_FPAGE_S. Also `snd_dst_cap` (if not L4_INVALID_CAP) must have the permission L4_CAP_FPAGE_S.

An unbound IPC gate can be bound to a thread using l4_rcv_ep_bind_thread().

13.1.10.5.2.4 l4_factory_create_irq()

```
l4_msgtag_t l4_factory_create_irq (
             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap)  [inline]
```

Create a new IRQ sender.

Parameters

	factory	Factory to use for creation.
`out`	*target_cap*	The kernel stores the new IRQ's capability into this slot.

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

The capability `factory` must have the permission L4_CAP_FPAGE_S.

13.1.10.5.2.5 l4_factory_create_pi_mutex()

```
l4_msgtag_t l4_factory_create_pi_mutex (
             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap,
             l4_addr_t ku_status,
             l4_cap_idx_t task_cap)  [inline]
```

Create a new priority inheritance mutex.
The priority inheritance mutex is bound to the specified task.

Parameters

	factory	Capability index for factory to use for creation.
out	*target_cap*	The kernel stores the new mutex's capability into this slot.
	ku_status	Address of mutex status field in kernel-user memory of specified task.
	task_cap	Task the mutex gets bound to.

Returns

Syscall return tag

Return values

L4_EOK	No error occurred.
-L4_ENOMEM	Out-of-memory during allocation of the mutex object.
-L4_EINVAL	Invalid ku_status or task_cap parameter.
-L4_EPERM	Insufficient permissions; see precondition.
-L4_ENODEV	Priority inheritance mutexes not supported.

Precondition

The capabilities `factory` and `task_cap` must have the permission L4_CAP_FPAGE_S.

See also

Priority Inheritance Mutex C API

13.1.10.5.2.6 l4_factory_create_task()

```
l4_msgtag_t l4_factory_create_task (
             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap,
             l4_fpage_t * utcb_area)  [inline]
```

Create a new task.

Parameters

	factory	Capability index for factory to use for creation.
out	*target_cap*	The kernel stores the new task's capability into this slot.
in,out	*utcb_area*	Pointer to flexpage that describes an area of kernel-user memory that can be used for UTCBs and vCPU state-save-areas of the new task.

On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

Returns

Syscall return tag.

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

The capability `factory` must have the permission L4_CAP_FPAGE_S.

Note

The size of the UTCB area specifies indirectly the number of UTCBs available for this task. Refer to l4_task_add_ku_mem() for adding more of this type of memory.

13.1.10.5.2.8 l4_factory_create_thread_group()

```
l4_msgtag_t l4_factory_create_thread_group (
             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap,
             unsigned policy)  [inline]
```

Create a new thread group.

An IPC endpoint can be bound to a thread group. When a message arrives at the IPC endpoint, a specific thread of the thread group is selected to actually receive the message. A thread group is a send destination for an IPC endpoint.

Parameters

	factory	Capability index for factory to use for creation.
out	*target_cap*	The kernel stores the new thread group's capability into this slot.
	policy	Policy parameter for the thread group. See L4_thread_group_policy for a list of supported values.

Returns

Syscall return tag

Return values

L4_EOK	No error occurred.
-L4_ENOMEM	Out-of-memory during allocation of the thread group object.
-L4_EINVAL	Invalid policy parameter.
-L4_EPERM	The factory instance requires L4_CAP_FPAGE_S rights on `factory` and L4_CAP_FPAGE_S is not present.
<0	Error code.

             l4_cap_idx_t factory,
             l4_cap_idx_t target_cap)  [inline]
```

Create a new vCPU context.
A vCPU context typically represents a hardware structure that captures the state of a vCPU on a CPU (e.g. VMX VMCS).

Parameters

	factory	Capability index for factory to use for creation.
out	*target_cap*	The kernel stores the new vCPU context's capability into this slot.

Returns

Syscall return tag

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

The capability `factory` must have the permission L4_CAP_FPAGE_S.

Functions

- l4_uint64_t l4_vm_vmx_get_caps (l4_vm_vmx_vcpu_state_t const *vcpu_state, enum L4_vm_vmx_caps_regs caps_reg) L4_NOTHROW

  Get a capability register for VMX.
- l4_uint32_t l4_vm_vmx_get_caps_default1 (l4_vm_vmx_vcpu_state_t const *vcpu_state, enum L4_vm_vmx_dfl1_regs dfl1_reg) L4_NOTHROW

  Get a default to one capability register for VMX.
- unsigned l4_vm_vmx_field_len (unsigned field) L4_NOTHROW

  Return length in bytes of a VMCS field.
- unsigned l4_vm_vmx_field_order (unsigned field) L4_NOTHROW

  Return length in power of two (bytes) of a VMCS field.
- void l4_vm_vmx_clear (l4_vm_vmx_vcpu_vmcs_t *vmcs, l4_vm_vmx_vcpu_vmcs_t *dest_vmcs) L4_NOTHROW

  Save the content from the software VMCS to a different software VMCS.
- void l4_vm_vmx_ptr_load (l4_vm_vmx_vcpu_vmcs_t *vmcs, l4_vm_vmx_vcpu_vmcs_t *src_vmcs) L4_NOTHROW

  Load the content from a different software VMCS to the software VMCS.
- l4_uint32_t l4_vm_vmx_get_cr2_index (l4_vm_vmx_vcpu_vmcs_t const *vmcs) L4_NOTHROW

  Get the software VMCS field index of the virtual CR2 register.
- l4_umword_t l4_vm_vmx_read_nat (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field) L4_NOTHROW

  Read a natural-width software VMCS field.
- l4_uint16_t l4_vm_vmx_read_16 (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field) L4_NOTHROW

  Read a 16-bit software VMCS field.
- l4_uint32_t l4_vm_vmx_read_32 (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field) L4_NOTHROW

  Read a 32-bit software VMCS field.
- l4_uint64_t l4_vm_vmx_read_64 (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field) L4_NOTHROW

  Read a 64-bit software VMCS field.
- l4_uint64_t l4_vm_vmx_read (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field) L4_NOTHROW

  Read any software VMCS field.
- void l4_vm_vmx_write_nat (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field, l4_umword_t val) L4_NOTHROW

  Write to a natural-width software VMCS field.
- void l4_vm_vmx_write_16 (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field, l4_uint16_t val) L4_NOTHROW

  Write to a 16-bit software VMCS field.
- void l4_vm_vmx_write_32 (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field, l4_uint32_t val) L4_NOTHROW

  Write to a 32-bit software VMCS field.
- void l4_vm_vmx_write_64 (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field, l4_uint64_t val) L4_NOTHROW

  Write to a 64-bit software VMCS field.
- void l4_vm_vmx_write (l4_vm_vmx_vcpu_vmcs_t *vmcs, unsigned field, l4_uint64_t val) L4_NOTHROW

  Write to an arbitrary software VMCS field.
- void l4_vm_vmx_set_hw_vmcs (l4_vm_vmx_vcpu_vmcs_t *vmcs, l4_cap_idx_t vmcs_cap) L4_NOTHROW

  Associate the software VMCS with a vCPU context, i.e.
- l4_cap_idx_t l4_vm_vmx_get_hw_vmcs (l4_vm_vmx_vcpu_vmcs_t *vmcs) L4_NOTHROW

  Get the vCPU context (i.e.

13.1.10.6.3.1 Detailed Description

Virtual machine API for VMX.

13.1.10.6.3.2 Typedef Documentation

l4_vm_vmx_vcpu_state_t

```
typedef struct l4_vm_vmx_vcpu_state_t l4_vm_vmx_vcpu_state_t
```

VMX vCPU state.
This is a specialization of the generic vCPU state for VMX. This data structure represents the following memory layout:

- 0x000 - 0x1ff: Standard vCPU state (with padding). See l4_vcpu_state_t.
- 0x200 - 0x3ff: VMX information members (with padding). See l4_vm_vmx_vcpu_infos_t.
- 0x400 - 0xfff: VMX software VMCS. See l4_vm_vmx_vcpu_vmcs_t.

Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

l4_vm_vmx_vcpu_vmcs_t

```
typedef struct l4_vm_vmx_vcpu_vmcs_t l4_vm_vmx_vcpu_vmcs_t
```

VMX software VMCS.
This data structure represents the following memory layout:

- 0x000 - 0x007: Reserved (ignored by the kernel). In the hardware VMCS, the revision identifier and the abort indicator are stored in this area. Hereby we simply ignore these two entries.
- 0x008 - 0x00f: User space data (ignored by the kernel). This currently stores the pointer to a different software VMCS whose content has been loaded to this software VMCS.
- 0x010 - 0x013: VMCS field index of the software-defined CR2 field in the software VMCS.
- 0x014 - 0x017: Reserved.
- 0x018 - 0x01f: Capability of the vCPU context, i.e. the hardware VMCS object (with padding).
- 0x020 - 0x047: Software VMCS field offset table. See l4_vmx_offset_table_t.
- 0x048 - 0x0bf: Reserved.
- 0x0c0 - 0xabf: Software VMCS fields (with padding).
- 0xac0 - 0xbff: Software VMCS fields dirty bitmap (with padding).

Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

l4_vmx_offset_table_t

```
typedef struct l4_vmx_offset_table_t l4_vmx_offset_table_t
```

Software VMCS field offset table.
This data structure represents the following memory layout:

- 0x00 - 0x02: 3 offsets for 16-bit fields.
- 0x03: Reserved.
- 0x04 - 0x06: 3 offsets for 64-bit fields.

- 0x07: Reserved.
- 0x08 - 0x0a: 3 offsets for 32-bit fields.
- 0x0b: Reserved.
- 0x0c - 0x0e: 3 offsets for natural-width fields.
- 0x0f: Reserved.
- 0x10 - 0x12: 3 limits for 16-bit fields.
- 0x13: Reserved.
- 0x14 - 0x16: 3 limits for 64-bit fields.
- 0x17: Reserved.
- 0x18 - 0x1a: 3 limits for 32-bit fields.
- 0x1b: Reserved.
- 0x1c - 0x1e: 3 limits for natural-width fields.
- 0x1f: Reserved.
- 0x20 - 0x23: 4 index shifts.
- 0x24: Offset of the first software VMCS field.
- 0x25: Size of the software VMCS fields.
- 0x26 - 0x27: Reserved.

The offsets/limits in each size category are in the following order:

- Control fields.
- Read-only fields.
- Guest fields.

The index shifts are in the following order:

- 16-bit.
- 64-bit.
- 32-bit.
- Natural-width.

All offsets/limits/sizes are represented in a 64-byte granule.
The offsets (after being multiplied by 64) are indexes in the values array in l4_vm_vmx_vcpu_vmcs_t and bit indexes in the dirty_bitmap array in l4_vm_vmx_vcpu_vmcs_t.
The limits (after being multiplied by 64) represent the range of the available indexes.

Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

13.1.10.6.3.3 Enumeration Type Documentation

L4_vm_vmx_caps_regs

enum L4_vm_vmx_caps_regs
Exported VMX capability registers.

Enumerator

L4_VM_VMX_BASIC_REG	Basic VMX capabilities.
L4_VM_VMX_TRUE_PINBASED_CTLS_REG	True pin-based control caps.
L4_VM_VMX_TRUE_PROCBASED_CTLS_REG	True processor based control caps.
L4_VM_VMX_TRUE_EXIT_CTLS_REG	True exit control caps.
L4_VM_VMX_TRUE_ENTRY_CTLS_REG	True entry control caps.
L4_VM_VMX_MISC_REG	Misc caps.
L4_VM_VMX_CR0_FIXED0_REG	Fixed to 0 bits of CR0.
L4_VM_VMX_CR0_FIXED1_REG	Fixed to 1 bits of CR0.
L4_VM_VMX_CR4_FIXED0_REG	Fixed to 0 bits of CR4.
L4_VM_VMX_CR4_FIXED1_REG	Fixed to 1 bits of CR4.
L4_VM_VMX_VMCS_ENUM_REG	VMCS enumeration info.
L4_VM_VMX_PROCBASED_CTLS2_REG	Processor based control 2 caps.
L4_VM_VMX_EPT_VPID_CAP_REG	EPT and VPID caps.
L4_VM_VMX_NESTED_REVISION	Nested VMCS revision.
L4_VM_VMX_NUM_CAPS_REGS	Total number of VMX capability registers.

Definition at line 28 of file __vm-vmx.h.

L4_vm_vmx_dfl1_regs

enum L4_vm_vmx_dfl1_regs
Exported VMX capability registers (default to 1 bits).

Enumerator

L4_VM_VMX_PINBASED_CTLS_DFL1_REG	Default 1 bits in pin-based controls.
L4_VM_VMX_PROCBASED_CTLS_DFL1_REG	Default 1 bits in processor-based controls.
L4_VM_VMX_EXIT_CTLS_DFL1_REG	Default 1 bits in exit controls.
L4_VM_VMX_ENTRY_CTLS_DFL1_REG	Default 1 bits in entry controls.
L4_VM_VMX_NUM_DFL1_REGS	Total number of default on registers.

Definition at line 51 of file __vm-vmx.h.

L4_vm_vmx_sw_fields

enum L4_vm_vmx_sw_fields
Additional (software-defined) VMCS fields.
The VMCS offsets defined here are actually not in the hardware VMCS. However our VMMs run in user mode and need to have access to certain registers available in kernel mode only. So we put them into our software VMCS.

Enumerator

L4_VM_VMX_VMCS_CR2	Software VMCS offset for CR2. **Note** You usually need to check this value against the value you get from l4_vm_vmx_get_cr2_index() to make sure you are running on a compatible kernel.
L4_VM_VMX_VMCS_NAT_ARG0	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_NAT_ARG1	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_NAT_ARG2	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_NAT_ARG3	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_XCR0	VMCS offset of extended control register XCR0.
L4_VM_VMX_VMCS_MSR_SYSCALL_MASK	VMCS offset of system call flag mask MSR.
L4_VM_VMX_VMCS_MSR_LSTAR	VMCS offset of IA32e mode system call target address MSR.
L4_VM_VMX_VMCS_MSR_CSTAR	VMCS offset of IA32 mode system call target address MSR.
L4_VM_VMX_VMCS_MSR_TSC_AUX	VMCS offset of auxiliary TSC signature MSR.
L4_VM_VMX_VMCS_MSR_STAR	VMCS offset of system call target address MSR.
L4_VM_VMX_VMCS_MSR_KERNEL_GS_BASE	VMCS offset of GS base address swap target MSR.

Definition at line 69 of file __vm-vmx.h.

L4_vm_vmx_vmcs_sizes

```
enum L4_vm_vmx_vmcs_sizes
```

Sizes of software VMCS members.

Enumerator

L4_VM_VMX_VMCS_SIZE_VALUES	Size of the software VMCS values member.
L4_VM_VMX_VMCS_SIZE_DIRTY_BITMAP	Size of the software VMCS dirty bitmap member.

Definition at line 170 of file __vm-vmx.h.

13.1.10.6.3.4 Function Documentation

l4_vm_vmx_clear()

```
void l4_vm_vmx_clear (
            l4_vm_vmx_vcpu_vmcs_t * vmcs,
            l4_vm_vmx_vcpu_vmcs_t * dest_vmcs)  [inline]
```

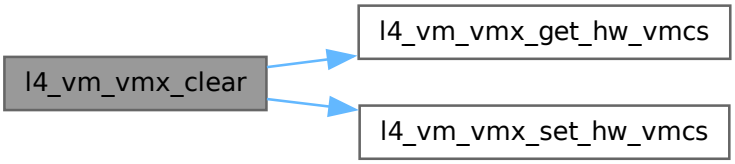
Save the content from the software VMCS to a different software VMCS.

Parameters

vmcs	Pointer to the source software VMCS.
dest_vmcs	Pointer to the destination software VMCS.

This function is comparable to the VMX VMCLEAR instruction.
Definition at line 698 of file __vm-vmx.h.
References L4_NOTHROW, l4_vm_vmx_get_hw_vmcs(), l4_vm_vmx_set_hw_vmcs(), and L4_VM_VMX_VMCS_SIZE_DIRTY_BITM

Referenced by l4_vm_vmx_ptr_load().
Here is the call graph for this function:



Here is the caller graph for this function:

l4_vm_vmx_field_len()

```
unsigned l4_vm_vmx_field_len (
             unsigned field)  [inline]
```

Return length in bytes of a VMCS field.

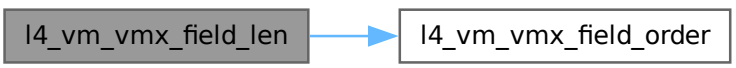
Parameters

field	Field number.

Returns

Width of field in bytes.

Definition at line 593 of file __vm-vmx.h.
References L4_NOTHROW, and l4_vm_vmx_field_order().
Here is the call graph for this function:



l4_vm_vmx_field_order()

```
unsigned l4_vm_vmx_field_order (
             unsigned field)  [inline]
```

Return length in power of two (bytes) of a VMCS field.

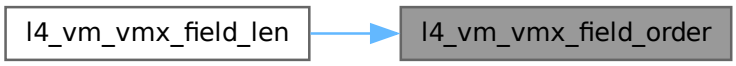
Parameters

field	Field number.

Returns

Width of field in power of two (bytes).

Definition at line 600 of file __vm-vmx.h.
References L4_NOTHROW.
Referenced by l4_vm_vmx_field_len().
Here is the caller graph for this function:



l4_vm_vmx_get_caps()

```
l4_uint64_t l4_vm_vmx_get_caps (
             l4_vm_vmx_vcpu_state_t const * vcpu_state,
             enum L4_vm_vmx_caps_regs caps_reg)  [inline]
```

Get a capability register for VMX.

Parameters

vcpu_state	Pointer to the vCPU state.
caps_reg	Capability register index (see L4_vm_vmx_caps_regs).

Returns

The value of the capability register.

Definition at line 884 of file __vm-vmx.h.
References L4_NOTHROW.

l4_vm_vmx_get_caps_default1()

```
l4_uint32_t l4_vm_vmx_get_caps_default1 (
             l4_vm_vmx_vcpu_state_t const * vcpu_state,
             enum L4_vm_vmx_dfl1_regs dfl1_reg)  [inline]
```

Get a default to one capability register for VMX.

Parameters

vcpu_state	Pointer to the vCPU state.
dfl1_reg	Default to 1 capability register index (see L4_vm_vmx_dfl1_regs).

Returns

The value of the capability register.

Definition at line 892 of file __vm-vmx.h.
References L4_NOTHROW.

l4_vm_vmx_get_cr2_index()

```
l4_uint32_t l4_vm_vmx_get_cr2_index (
            l4_vm_vmx_vcpu_vmcs_t const * vmcs)  [inline]
```

Get the software VMCS field index of the virtual CR2 register.

Parameters

vmcs	Pointer to the software VMCS.

Returns

The field index used for the virtual CR2 register as used by the current Fiasco interface.

The CR2 register is actually not in the hardware VMCS, however our VMMs run in user mode and need to have access to this register so we put it into our software VMCS.

l4_vm_vmx_get_hw_vmcs()

```
l4_cap_idx_t l4_vm_vmx_get_hw_vmcs (
             l4_vm_vmx_vcpu_vmcs_t * vmcs)  [inline]
```

Get the vCPU context (i.e.
the hardware VMCS object) associated with the software VMCS.

Parameters

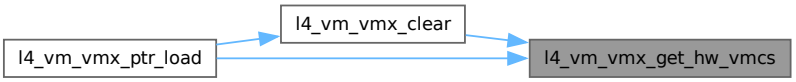
vmcs	Pointer to the software VMCS.

Returns

vCPU context (hardware VMCS object) capability.

Definition at line 915 of file __vm-vmx.h.
References L4_CAP_MASK, and L4_NOTHROW.
Referenced by l4_vm_vmx_clear(), and l4_vm_vmx_ptr_load().

Here is the caller graph for this function:



l4_vm_vmx_ptr_load()

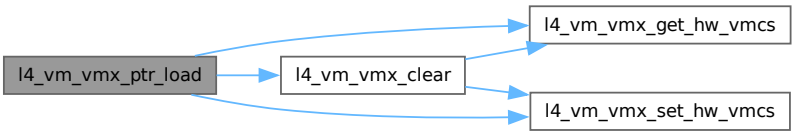
```
void l4_vm_vmx_ptr_load (
            l4_vm_vmx_vcpu_vmcs_t * vmcs,
            l4_vm_vmx_vcpu_vmcs_t * src_vmcs)  [inline]
```

Load the content from a different software VMCS to the software VMCS.

Parameters

vmcs	Pointer to the destination software VMCS.
src_vmcs	Pointer to the source software VMCS.

This function is comparable to the VMX VMPTRLD instruction.
Definition at line 719 of file __vm-vmx.h.
References L4_NOTHROW, l4_vm_vmx_clear(), l4_vm_vmx_get_hw_vmcs(), l4_vm_vmx_set_hw_vmcs(), and L4_VM_VMX_VMCS_SIZE_DIRTY_BITMAP.
Here is the call graph for this function:



l4_vm_vmx_read()

```
l4_uint64_t l4_vm_vmx_read (
            l4_vm_vmx_vcpu_vmcs_t * vmcs,
            unsigned field)  [inline]
```

Read any software VMCS field.

Parameters

vmcs	Pointer to the software VMCS.
field	The VMCS field index as used on VMX hardware.

Returns

The value of the software VMCS field with the given index.

Definition at line 787 of file __vm-vmx.h.
References L4_NOTHROW, l4_vm_vmx_read_16(), l4_vm_vmx_read_32(), l4_vm_vmx_read_64(), and l4_vm_vmx_read_nat().

            l4_vm_vmx_vcpu_vmcs_t * vmcs,
            unsigned field)  [inline]
```

Read a natural-width software VMCS field.

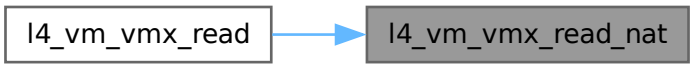
Parameters

vmcs	Pointer to the software VMCS.
field	The VMCS field index as used on VMX hardware.

Returns

The value of the software VMCS field with the given index.

Definition at line 743 of file __vm-vmx.h.
References L4_NOTHROW.
Referenced by l4_vm_vmx_read().
Here is the caller graph for this function:



l4_vm_vmx_set_hw_vmcs()

```
void l4_vm_vmx_set_hw_vmcs (
            l4_vm_vmx_vcpu_vmcs_t * vmcs,
            l4_cap_idx_t vmcs_cap)  [inline]
```

Associate the software VMCS with a vCPU context, i.e.
a hardware VMCS object.
The VMX extended vCPU state is unable to be resumed unless it is associated with a vCPU context, i.e. a hardware VMCS object: An L4::Vcpu_context from the user space point of view with its kernel counterpart `Vmx_vmcs`.

Note

When replacing the vCPU context, the dirty bitmap of the software VMCS is not touched, neither by the kernel nor by the API functions. This is on purpose, to enable efficient switching between separate VMs in the common case. If there is a logical discrepancy between the content of the software VMCS and the replaced vCPU context, the user is responsible for explicitly setting the relevant software VMCS fields and/or the relevant software VMCS dirty bitmap bits to ensure that the discrepancy is rectified on the next vCPU resume. This needs to be done regardless of using the API functions (the preferred way) or accessing the data structures directly (the discouraged way).

Replacing the vCPU context while the vCPU is currently running has no immediate effect until the next v↩ CPU resume. In addition to that, the kernel might cache the vCPU context internally (in other words, the capability is not looked up on every vCPU resume). To remove the association of the current vCPU context, simply replace it by an another vCPU context. The reference count of the previous vCPU context will be decremented accordingly on the next vCPU resume.

To remove the association of the current vCPU context without replacing it by an another vCPU context, pass an invalid capability with the bit 3 set and trigger a vCPU resume. The vCPU resume will fail in this case (due to the missing vCPU context), but the reference count of the previous vCPU context will be decremented accordingly.

There is no need to explicitly remove the association of the current vCPU context before deleting the software VMCS. Deleting the software VMCS automatically disassociates it from the vCPU context and a vCPU context with a reference count of 0 will be eventually deleted as well.

If the hardware limitations on the usage of the vCPU context are not observed (i.e. no hardware VMCS being active on more than one physical CPU), the vCPU will fail to resume.

Parameters

vmcs	Pointer to the software VMCS.
vmcs_cap	vCPU context (hardware VMCS object) capability.

Definition at line 907 of file __vm-vmx.h.
References L4_NOTHROW.
Referenced by l4_vm_vmx_clear(), and l4_vm_vmx_ptr_load().

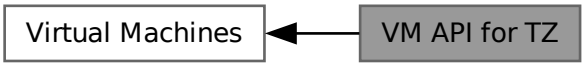
13.1.10.6.4 VM API for TZ

Virtual Machine API for ARM TrustZone.

Collaboration diagram for VM API for TZ:



Data Structures

- struct l4_vm_tz_state

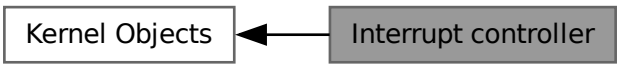
  state structure for TrustZone VMs

13.1.10.6.4.1 Detailed Description

Virtual Machine API for ARM TrustZone.

13.1.10.7 Interrupt controller

The C Icu interface, see L4::Icu for the C++ interface.
Collaboration diagram for Interrupt controller:



Data Structures

- struct l4_icu_info_t

  Info structure for an ICU.

Typedefs

- typedef struct l4_icu_info_t l4_icu_info_t

  Info structure for an ICU.

Enumerations

- enum L4_icu_flags { L4_ICU_FLAG_MSI }

  Flags for IRQ numbers used for the ICU.

Functions

- l4_msgtag_t l4_icu_bind (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq) L4_NOTHROW

  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t l4_icu_bind_u (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

Bind an interrupt line of an interrupt controller to an interrupt object.

- l4_msgtag_t l4_icu_unbind (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq) L4_NOTHROW

  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t l4_icu_unbind_u (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t l4_icu_set_mode (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t mode) L4_NOTHROW

  Set interrupt mode.
- l4_msgtag_t l4_icu_set_mode_u (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb) L4_NOTHROW

  Set interrupt mode.
- l4_msgtag_t l4_icu_info (l4_cap_idx_t icu, l4_icu_info_t *info) L4_NOTHROW

  Get information about the ICU features.
- l4_msgtag_t l4_icu_info_u (l4_cap_idx_t icu, l4_icu_info_t *info, l4_utcb_t *utcb) L4_NOTHROW

  Get information about the ICU features.
- l4_msgtag_t l4_icu_msi_info (l4_cap_idx_t icu, unsigned irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info) L4_NOTHROW

  Get MSI info about IRQ.
- l4_msgtag_t l4_icu_msi_info_u (l4_cap_idx_t icu, unsigned irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info, l4_utcb_t *utcb) L4_NOTHROW

  Get MSI info about IRQ.
- l4_msgtag_t l4_icu_unmask (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to) L4_NOTHROW

  Unmask an IRQ line.
- l4_msgtag_t l4_icu_unmask_u (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to, l4_utcb_t *utcb) L4_NOTHROW

  Unmask the given interrupt line.
- l4_msgtag_t l4_icu_mask (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to) L4_NOTHROW

  Mask an IRQ line.
- l4_msgtag_t l4_icu_mask_u (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to, l4_utcb_t *utcb) L4_NOTHROW

  Mask an IRQ line.

13.1.10.7.1 Detailed Description

The C Icu interface, see L4::Icu for the C++ interface.

Note

"ICU" is short for "interrupt control unit".

These functions define the interface for interrupt controllers, for binding IRQ objects to interrupt lines and other interrupt sources, as well as functions for masking and unmasking of interrupts.
To setup an IRQ line the following steps are required:

1. l4_icu_set_mode() (optional if IRQ has a default mode)
2. l4_rcv_ep_bind_thread() or l4_rcv_ep_bind_snd_destination() to attach the IRQ object to a thread object.
3. l4_icu_bind()
4. l4_icu_unmask() to receive the first IRQ

For certain interrupt sources only some of these steps are necessary and supported, see Scheduler and Virtual Console.
At most one IRQs object can be bound to a certain interrupt source and a certain IRQs object can be bound to at most one interrupt source.

Include File

```
#include <l4/sys/icu.h>
```

13.1.10.7.2 Typedef Documentation

13.1.10.7.2.1 l4_icu_info_t

`typedef struct l4_icu_info_t l4_icu_info_t`

Info structure for an ICU.
This structure contains information about the features of an ICU.

See also

l4_icu_info().

13.1.10.7.3 Enumeration Type Documentation

13.1.10.7.3.1 L4_icu_flags

`enum L4_icu_flags`

Flags for IRQ numbers used for the ICU.

Enumerator

L4_ICU_FLAG_MSI	Flag to denote that the IRQ is actually an MSI. This flag may be used for l4_icu_bind() and l4_icu_unbind() functions to denote that the IRQ number is meant to be an MSI.

Definition at line 53 of file icu.h.

13.1.10.7.4 Function Documentation

13.1.10.7.4.1 l4_icu_bind()

```
l4_msgtag_t l4_icu_bind (
             l4_cap_idx_t icu,
             unsigned irqnum,
             l4_cap_idx_t irq)  [inline]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

Parameters

icu	ICU object to bind `irq` to.
irqnum	IRQ line at the ICU.
irq	IRQ object to bind to this ICU.

Returns

Syscall return tag. The caller should check the return value using l4_error() to check for errors and to identify the correct method for unmasking the interrupt. Return values < 0 indicate an error. A return value of 0 means a direct unmask via the IRQ object using l4_irq_unmask(). A return value of 1 means that the interrupt has to be unmasked via the ICU using l4_icu_unmask().

Return values

-L4_EINVAL	`irq` is bound to an interrupt source.

-L4_EPERM	Insufficient permissions; see precondition.

Precondition

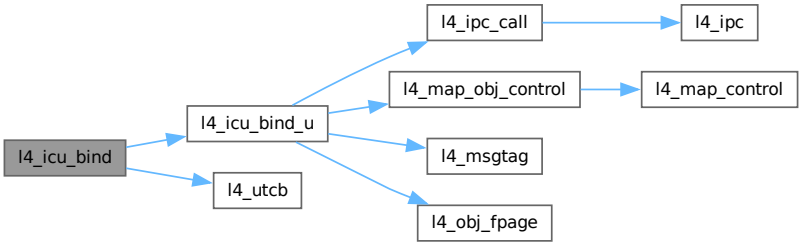
The capability `irq` must have the permission L4_CAP_FPAGE_W.

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different IRQ object, only the unbinding happens. An IRQ object that is bound to an interrupt source will get unbound if the IRQ object is deleted.

Examples

examples/sys/isr/main.c.

Definition at line 496 of file icu.h.
References l4_icu_bind_u(), L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.7.4.2 l4_icu_bind_u()

```
l4_msgtag_t l4_icu_bind_u (
             l4_cap_idx_t icu,
             unsigned irqnum,
             l4_cap_idx_t irq,
             l4_utcb_t * utcb)  [inline]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

Parameters

icu	The ICU object to bind `irq` to.
irqnum	IRQ line at the ICU.
irq	IRQ object for the given IRQ line to bind to this ICU.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. The caller should check the return value using l4_error() to check for errors and to identify the correct method for unmasking the interrupt. Return values < 0 indicate an error. A return value of `0` means a direct unmask via the IRQ object using L4::Irq::unmask. A return value of `1` means that the interrupt has to be unmasked via the ICU using L4::Icu::unmask.

Return values

-L4_EINVAL	`irq` is bound to an interrupt source.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_W.

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different L4::Irq object, only the unbinding happens. An L4::Irq object that is bound to an interrupt source will get unbound if the L4::Irq object is deleted.

13.1.10.7.4.5 l4_icu_mask()

```
l4_msgtag_t l4_icu_mask (
            l4_cap_idx_t icu,
            unsigned irqnum,
            l4_umword_t * label,
            l4_timeout_t to)  [inline]
```

Mask an IRQ line.

Parameters

icu	The ICU object where the IRQ line shall be masked.
irqnum	IRQ line at the ICU.
label	If non-NULL, the function also performs an open wait IPC operation waiting for the next message, and the received label is returned here.
to	IPC timeout, if unsure use L4_IPC_NEVER.

Returns

Syscall return tag. If `label` is NULL, this function performs an IPC send-only operation and there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. In this case use l4_ipc_error() to check for errors and **do not** use l4_error().

Definition at line 518 of file icu.h.
References L4_NOTHROW, and l4_utcb().

             l4_timeout_t to,
             l4_utcb_t * utcb)  [inline]
```

Mask an IRQ line.

Parameters

icu	The ICU object where the IRQ line shall be masked.
irqnum	IRQ line at the ICU.
label	If NULL, this function is a send-only message to the ICU. If not NULL, this function will enter an open wait after sending the mask message and the received label is returned here.
to	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL `label` only.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. If `label` is NULL, this function performs an IPC send-only operation and there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. In this case use l4_ipc_error() to check for errors and **do not** use l4_error().

              unsigned irqnum,
              l4_uint64_t source,
              l4_icu_msi_info_t * msi_info)  [inline]
```

Get MSI info about IRQ.

Parameters

	icu	The ICU object from which MSI information shall be retrieved.
	irqnum	IRQ line at the ICU.
	source	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	*msi_info*	A l4_icu_msi_info_t structure receiving the address and the data value to trigger this MSI.

Returns

Syscall return tag

Definition at line 508 of file icu.h.
References l4_icu_msi_info_u(), L4_NOTHROW, and l4_utcb().

                l4_umword_t * label,
                l4_timeout_t to)  [inline]
```

Unmask an IRQ line.

Parameters

icu	The ICU object where the IRQ line shall be unmasked.
irqnum	IRQ line at the ICU.
label	If non-NULL, the function also performs an open wait IPC operation waiting for the next message, and the received label is returned here.
to	IPC timeout, if unsure use L4_IPC_NEVER.

Returns

Syscall return tag. If `label` is NULL, this function performs an IPC send-only operation and there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. In this case use l4_ipc_error() to check for errors and **do not** use l4_error().

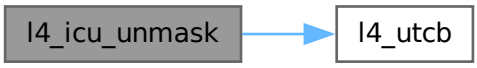
Here is the call graph for this function:



13.1.10.7.4.14 l4_icu_unmask_u()

```
l4_msgtag_t l4_icu_unmask_u (
                l4_cap_idx_t icu,
                unsigned irqnum,
                l4_umword_t * label,
                l4_timeout_t to,
                l4_utcb_t * utcb)  [inline]
```

Unmask the given interrupt line.

Parameters

icu	The ICU object where the IRQ line shall be unmasked. When the object is an IRQ, the given interrupt line is ignored and instead the line which the IRQ is bound to (if any) is unmasked.

Its counterpart for explicitly masking an interrupt line is L4::Icu::mask().

Parameters

	irqnum	The interrupt line that shall be unmasked. Ignored if the object is an IRQ.
`out`	*label*	If NULL, this is a send-only unmask. If not NULL, this operation enters an open wait and the *protected label* shall be received here.
	to	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL `label` only.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. If `label` is NULL, this function performs an IPC send-only operation and there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. In this case use l4_ipc_error() to check for errors and **do not** use l4_error().

  Interrupt attributes.

Functions

- l4_msgtag_t l4_irq_detach (l4_cap_idx_t irq) L4_NOTHROW

  Detach from an interrupt source.
- l4_msgtag_t l4_irq_detach_u (l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Detach from this interrupt.
- l4_msgtag_t l4_irq_bind_vcpu (l4_cap_idx_t irq, l4_cap_idx_t thread, l4_umword_t cfg) L4_NOTHROW

  Bind a thread to this Irq for vCPU interrupt forwarding.
- l4_msgtag_t l4_irq_bind_vcpu_u (l4_cap_idx_t irq, l4_cap_idx_t thread, l4_umword_t cfg, l4_utcb_t *utcb) L4_NOTHROW

  Bind a thread to this Irq for vCPU interrupt forwarding.

- l4_msgtag_t l4_irq_trigger (l4_cap_idx_t irq) L4_NOTHROW

  Trigger an IRQ.
- l4_msgtag_t l4_irq_trigger_u (l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Trigger the object.
- l4_msgtag_t l4_irq_receive (l4_cap_idx_t irq, l4_timeout_t to) L4_NOTHROW

  Unmask and wait for specified IRQ.
- l4_msgtag_t l4_irq_receive_u (l4_cap_idx_t irq, l4_timeout_t timeout, l4_utcb_t *utcb) L4_NOTHROW

  Unmask and wait for this IRQ.
- l4_msgtag_t l4_irq_wait (l4_cap_idx_t irq, l4_umword_t *label, l4_timeout_t to) L4_NOTHROW

  Unmask IRQ and wait for any message.
- l4_msgtag_t l4_irq_wait_u (l4_cap_idx_t irq, l4_umword_t *label, l4_timeout_t timeout, l4_utcb_t *utcb) L4_NOTHROW

  Unmask IRQ and (open) wait for any message.
- l4_msgtag_t l4_irq_unmask (l4_cap_idx_t irq) L4_NOTHROW

  Unmask IRQ.
- l4_msgtag_t l4_irq_unmask_u (l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Unmask this IRQ.

13.1.10.8.1 Detailed Description

C IRQ interface, see L4::Irq for the C++ interface.
The IRQ interface provides access to abstract interrupts provided by the microkernel. Interrupts may be

- hardware interrupts provided by the platform interrupt controller,
- virtual device interrupts provided by the microkernel's virtual devices (virtual serial or trace buffer) or
- virtual interrupts that can be triggered by user programs (IRQs) via l4_irq_trigger().

For hardware and virtual device interrupts the Irq object must be bound to an interrupt source, see Interrupt controller. To receive interrupts, the Irq object must be bound to a thread, see l4_rcv_ep_bind_thread() and l4_rcv_ep_bind_snd_destination().
IRQ objects can be created using a factory, see the Factory API (use l4_factory_create_irq()).

Include File

```
#include <l4/sys/irq.h>
```

For the C++ interface refer to the L4::Irq API for an overview.

13.1.10.8.2 Enumeration Type Documentation

13.1.10.8.2.1 L4_irq_mode

`enum L4_irq_mode`
Interrupt attributes.

Enumerator

L4_IRQ_F_NONE	Flow types. None
L4_IRQ_F_SET_MODE	Valid flag, if not set, the set_mode operation does nothing.
L4_IRQ_F_LEVEL	Level triggered.
L4_IRQ_F_EDGE	Edge triggered.

13.1.10.8.3 Function Documentation

13.1.10.8.3.1 l4_irq_bind_vcpu()

```
l4_msgtag_t l4_irq_bind_vcpu (
              l4_cap_idx_t irq,
              l4_cap_idx_t thread,
              l4_umword_t cfg)  [inline]
```

Bind a thread to this Irq for vCPU interrupt forwarding.
If the interrupt is triggered, the kernel will directly inject the interrupt into the guest. This requires that the thread is currently in extended vCPU user mode. Otherwise the interrupt will stay pending and gets injected on the next vCPU user mode transition. Optionally a doorbell Irq can be registered on the thread (see Thread::register_doorbell_irq()) that is triggered in this case.
If a guest has acknowledged the interrupt but has not yet issued an EOI (i.e. the interrupt is in "active" state), it is not possible to bind the Irq to a new thread object. Either wait for the guest to issue the EOI or detach() from the current thread. In this case the interrupt will stay active in the guest and it is the responsibility of the VMM to handle the eventual EOI of the guest.

Parameters

irq	The IRQ object that shall be bound.
thread	Thread object this Irq shall be bound to.
cfg	Architecture specific interrupt configuration.

Returns

Syscall return tag

Return values

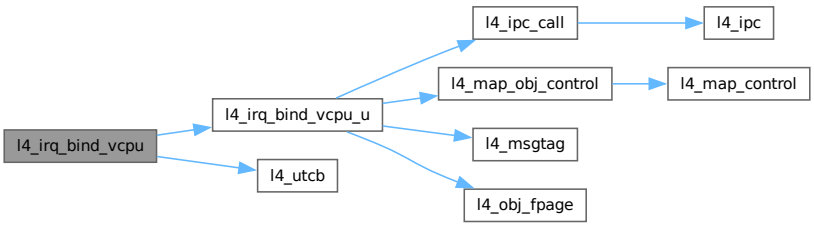
-L4_EPERM	Insufficient permissions; see precondition.
-L4_EBUSY	Cannot bind to new thread because interrupt is active on previous thread and guest has to issue end-of-interrupt first.
-L4_ENOSYS	The kernel does not support direct interrupt forwarding.

Precondition

The capabilities `irq` and `thread` both must have the permission L4_CAP_FPAGE_S.

Definition at line 300 of file irq.h.
References l4_irq_bind_vcpu_u(), L4_NOTHROW, and l4_utcb().

Here is the call graph for this function:



13.1.10.8.3.2 l4_irq_bind_vcpu_u()

```
l4_msgtag_t l4_irq_bind_vcpu_u (
             l4_cap_idx_t irq,
             l4_cap_idx_t thread,
             l4_umword_t cfg,
             l4_utcb_t * utcb)  [inline]
```

Bind a thread to this Irq for vCPU interrupt forwarding.

Parameters

irq	The IRQ object that shall be bound. If the interrupt is triggered, the kernel will directly inject the interrupt into the guest. This requires that the thread is currently in extended vCPU user mode. Otherwise the interrupt will stay pending and gets injected on the next vCPU user mode transition. Optionally a doorbell Irq can be registered on the thread (see Thread::register_doorbell_irq()) that is triggered in this case.

If a guest has acknowledged the interrupt but has not yet issued an EOI (i.e. the interrupt is in "active" state), it is not possible to bind the Irq to a new thread object. Either wait for the guest to issue the EOI or detach() from the current thread. In this case the interrupt will stay active in the guest and it is the responsibility of the VMM to handle the eventual EOI of the guest.

Parameters

thread	Thread object this Irq shall be bound to.
cfg	Architecture specific interrupt configuration.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Return values

-L4_EPERM	Insufficient permissions; see precondition.
-L4_EBUSY	Cannot bind to the new thread because interrupt is active on previous thread and guest has to issue end-of-interrupt first.
-L4_ENOSYS	The kernel does not support direct interrupt forwarding.

Precondition

The invoked Irq capability and the capability `thread` both must have the permission L4_CAP_FPAGE_S.

Definition at line 250 of file irq.h.
References L4_CAP_FPAGE_RWS, l4_ipc_call(), L4_IPC_NEVER, l4_map_obj_control(), l4_msgtag(), L4_NOTHROW, l4_obj_fpage(), L4_PROTO_IRQ_SENDER, l4_msg_regs_t::mr, and l4_fpage_t::raw.

```
l4_msgtag_t l4_irq_detach (
            l4_cap_idx_t irq)  [inline]
```

Detach from an interrupt source.

Parameters

irq	The IRQ object that shall be detached.

Returns

Syscall return tag

Return values

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
2	Successfully detached, an active vIRQ was abandoned.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_S.

Examples

examples/sys/isr/main.c.

Definition at line 294 of file irq.h.

```
l4_msgtag_t l4_irq_detach_u (
             l4_cap_idx_t irq,
             l4_utcb_t * utcb)  [inline]
```

Detach from this interrupt.

Parameters

irq	The IRQ object that shall be detached.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Return values

0	Successfully detached, there was no interrupt pending.

1	Successfully detached, there was an interrupt pending.
2	Successfully detached, an active vIRQ was abandoned.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The invoked Irq capability must have the permission L4_CAP_FPAGE_S.

13.1.10.8.3.6 l4_irq_receive_u()

```
l4_msgtag_t l4_irq_receive_u (
              l4_cap_idx_t irq,
              l4_timeout_t timeout,
              l4_utcb_t * utcb)  [inline]
```

Unmask and wait for this IRQ.

Parameters

irq	The IRQ object that shall be unmasked.
timeout	Timeout.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Note

If this is the function normally used for your IRQs consider using L4::Semaphore instead of L4::Irq.

Definition at line 270 of file irq.h.
References l4_ipc_call(), l4_msgtag(), L4_NOTHROW, and L4_PROTO_IRQ.
Referenced by l4_irq_receive(), and L4::Irq::receive().

13.1.10.8.3.8 l4_irq_trigger_u()

```
l4_msgtag_t l4_irq_trigger_u (
             l4_cap_idx_t irq,
             l4_utcb_t * utcb)  [inline]
```

Trigger the object.

Parameters

irq	The IRQ object that shall be triggered.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag for a send-only operation, this means there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. Use l4_ipc_error() to check for errors and **do not** use l4_error().

Definition at line 263 of file irq.h.
References L4_IPC_BOTH_TIMEOUT_0, l4_ipc_send(), l4_msgtag(), L4_NOTHROW, and L4_PROTO_IRQ.
Referenced by l4_irq_trigger(), and L4::Triggerable::trigger().

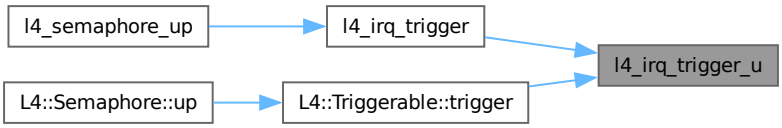
Here is the caller graph for this function:



13.1.10.8.3.9 l4_irq_unmask()

```
l4_msgtag_t l4_irq_unmask (
            l4_cap_idx_t irq)  [inline]
```

Unmask IRQ.

Parameters

irq	The IRQ object that shall be unmasked.

Returns

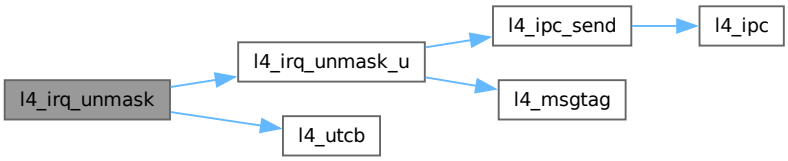
Syscall return tag

Note

l4_irq_wait() and l4_irq_receive() are doing the unmask themselves.

Definition at line 326 of file irq.h.
References l4_irq_unmask_u(), L4_NOTHROW, and l4_utcb().

Here is the call graph for this function:



13.1.10.8.3.10 l4_irq_unmask_u()

```
l4_msgtag_t l4_irq_unmask_u (
             l4_cap_idx_t irq,
             l4_utcb_t * utcb)  [inline]
```

Unmask this IRQ.

Parameters

irq	The IRQ object that shall be unmasked.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag for a send-only operation, this means there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. Use l4_ipc_error() to check for errors and **do not** use l4_error().

Irq::wait() and Irq::receive() operations already include an unmask(), do not use an extra unmask() in these cases.
Definition at line 286 of file irq.h.

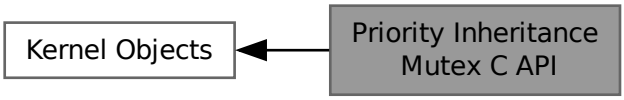
13.1.10.9 Priority Inheritance Mutex C API

C interface for controlling priority inheritance mutexes.
Collaboration diagram for Priority Inheritance Mutex C API:



Functions

- l4_msgtag_t l4_pi_mutex_lock (l4_cap_idx_t mutex, l4_timeout_t timeout) L4_NOTHROW

  Lock contended priority inheritance mutex on slow path.
- l4_msgtag_t l4_pi_mutex_unlock (l4_cap_idx_t mutex) L4_NOTHROW

  Unlock contended priority inheritance mutex from fast path or slow path.

13.1.10.9.1 Detailed Description

C interface for controlling priority inheritance mutexes.
A priority inheritance mutex (PI mutex) object provides the slow path for a priority-inheritance-aware mutex. User-space implements the fast-path using a compare-and-swap atomic operation, with acquire/release semantics, on a `status` machine-word in kernel-user memory.

[63/31 .. L4_CAP_SHIFT]	...	0
thread cap slot		waiter flag

When a thread wants to acquire a PI mutex, it first tries to do so via the fast path: `cas(&status, 0, self_thread_cap())` If the mutex is uncontended the cas succeeds and the thread becomes the owner of mutex. Otherwise, the thread needs to enter the slow path via `l4_pi_mutex_lock()` and the kernel takes over.
When a thread wants to release a PI mutex, it first tries to do so via the fast path: `cas(&status, self_thread_cap(), 0)` If the mutex is uncontended, i.e. the waiter flag is not set, the cas succeeds. Otherwise, the thread needs to enter the slow path via `l4_pi_mutex_unlock()` and the kernel takes over.

Include File

```
#include <l4/sys/pi_mutex.h>
```

13.1.10.9.2 Function Documentation

13.1.10.9.2.1 l4_pi_mutex_lock()

```
l4_msgtag_t l4_pi_mutex_lock (
             l4_cap_idx_t mutex,
             l4_timeout_t timeout)  [inline]
```

Lock contended priority inheritance mutex on slow path.

Parameters

mutex	Priority inheritance mutex object.
timeout	Timeout for blocking the mutex lock operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.

Returns

Syscall return tag. Use l4_error() to check for errors.

Return values

0	Success.
-L4_EAGAIN	Lock operation in kernel failed, can happen under certain circumstances, try again.
-L4_EDEADLK	Deadlock condition was detected or the calling thread already owns the mutex.
-L4_EINVAL	Invalid parameter or ku_status in invalid state.

L4_IPC_RETIMEOUT	Timeout expired before mutex could be locked.
L4_IPC_RECANCELED	Thread was cancelled while waiting on the mutex.

Definition at line 145 of file pi_mutex.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.9.2.2 l4_pi_mutex_unlock()

```
l4_msgtag_t l4_pi_mutex_unlock (
            l4_cap_idx_t mutex)  [inline]
```

Unlock contended priority inheritance mutex from fast path or slow path.

Parameters

mutex	Priority inheritance mutex object.

Returns

Syscall return tag. Use l4_error() to check for errors.

Return values

0	Success.
-L4_EINVAL	Invalid parameter or ku_status in invalid state.
-L4_EPERM	Calling thread was not the owner of the mutex.

Definition at line 151 of file pi_mutex.h.
References L4_NOTHROW, and l4_utcb().

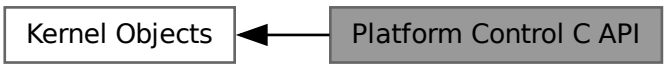
13.1.10.10 Platform Control C API

C interface for controlling platform-wide properties, see L4::Platform_control for the C++ interface.
Collaboration diagram for Platform Control C API:



Functions

- l4_msgtag_t l4_platform_ctl_set_task_asid (l4_cap_idx_t pfc, l4_cap_idx_t task, l4_umword_t asid) L4_NOTHROW

  Set ASID of task.
- l4_msgtag_t l4_platform_ctl_system_suspend (l4_cap_idx_t pfc, l4_umword_t extras) L4_NOTHROW

  Enter suspend to RAM.
- l4_msgtag_t l4_platform_ctl_system_shutdown (l4_cap_idx_t pfc, l4_umword_t reboot) L4_NOTHROW

  Shutdown or reboot the system.
- l4_msgtag_t l4_platform_ctl_cpu_allow_shutdown (l4_cap_idx_t pfc, l4_umword_t phys_id, l4_umword_t enable) L4_NOTHROW

  Allow a CPU to be shut down.
- l4_msgtag_t l4_platform_ctl_cpu_enable (l4_cap_idx_t pfc, l4_umword_t phys_id) L4_NOTHROW

  Enable an offline CPU.
- l4_msgtag_t l4_platform_ctl_cpu_disable (l4_cap_idx_t pfc, l4_umword_t phys_id) L4_NOTHROW

  Disable an online CPU.

13.1.10.10.1 Detailed Description

C interface for controlling platform-wide properties, see L4::Platform_control for the C++ interface.

Include File

```
#include <l4/sys/platform_control.h>
```

The API allows a client to suspend, reboot or shutdown the system.
For the C++ interface refer to L4::Platform_control

13.1.10.10.2 Function Documentation

13.1.10.10.2.1 l4_platform_ctl_cpu_allow_shutdown()

```
l4_msgtag_t l4_platform_ctl_cpu_allow_shutdown (
             l4_cap_idx_t pfc,
             l4_umword_t phys_id,
             l4_umword_t enable)  [inline]
```

Allow a CPU to be shut down.

Parameters

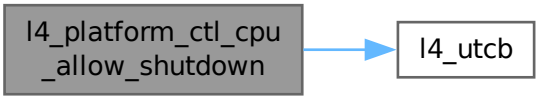
pfc	Capability index for the platform-control object.

phys↩ _id	Physical CPU id of CPU (e.g. local APIC id) to enable.
enable	Allow shutdown when 1, disallow when 0.

Returns

Syscall return tag

Definition at line 228 of file platform_control.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.10.2.2 l4_platform_ctl_cpu_disable()

```
l4_msgtag_t l4_platform_ctl_cpu_disable (
             l4_cap_idx_t pfc,
             l4_umword_t phys_id)  [inline]
```

Disable an online CPU.

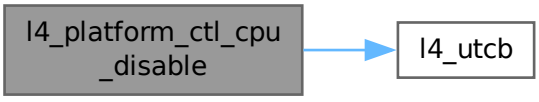
Parameters

pfc	Capability to the platform control object.
phys↩ _id	Physical CPU id of CPU (e.g. local APIC id) to disable.

Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.
Definition at line 267 of file platform_control.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.10.2.3 l4_platform_ctl_cpu_enable()

```
l4_msgtag_t l4_platform_ctl_cpu_enable (
            l4_cap_idx_t pfc,
            l4_umword_t phys_id)  [inline]
```

Enable an offline CPU.

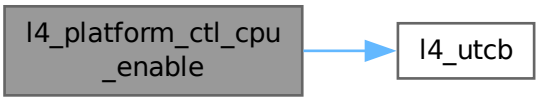
Parameters

pfc	Capability to the platform control object.
phys↩ _id	Physical CPU id of CPU (e.g. local APIC id) to enable.

Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.
Definition at line 260 of file platform_control.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.10.2.4 l4_platform_ctl_set_task_asid()

```
l4_msgtag_t l4_platform_ctl_set_task_asid (
            l4_cap_idx_t pfc,
            l4_cap_idx_t task,
            l4_umword_t asid)  [inline]
```

Set ASID of task.
On Cortex-R52 platforms, it might be necessary to control the VMID of a task or virtual machine explicitly. The IOMPU on such platforms will use it for further access control of device memory accesses. A privileged component can use this call to control the value.
The caller must have write permissions to the destination task.

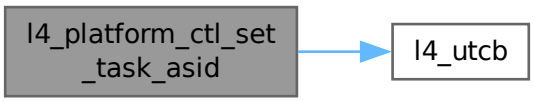
Parameters

pfc	Capability index for the platform-control object.
task	Capability index of destination task
asid	New ASID value

Returns

Syscall return tag

Definition at line 62 of file __platform_control-arm.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.10.2.5 l4_platform_ctl_system_shutdown()

```
l4_msgtag_t l4_platform_ctl_system_shutdown (
             l4_cap_idx_t pfc,
             l4_umword_t reboot)  [inline]
```

Shutdown or reboot the system.

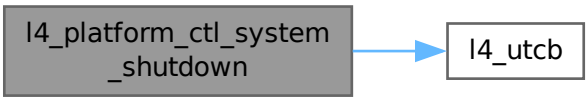
Parameters

pfc	Capability index for the platform-control object.
reboot	Shutdown when 0, or reboot when 1.

Returns

Syscall return tag

Definition at line 207 of file platform_control.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.10.2.6 l4_platform_ctl_system_suspend()

```
l4_msgtag_t l4_platform_ctl_system_suspend (
             l4_cap_idx_t pfc,
             l4_umword_t extras)  [inline]
```

Enter suspend to RAM.

Precondition

Must only be invoked on the boot CPU. Furthermore it must be ensured that the invoking thread is not migrated to a different CPU during the suspend.

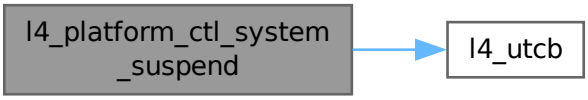
Parameters

pfc	Capability index for the platform-control object.
extras	Some extra platform-specific information needed to enter suspend to RAM. On x86 platforms and when using the Platform_control object provided by Fiasco, the value defines the sleep state. The sleep states are defined in the ACPI table. Other platforms as well as Io's Platform_control object don't make use of this value at the moment.

Returns

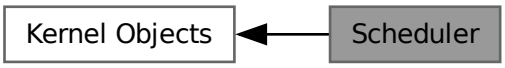
Syscall return tag

Definition at line 200 of file platform_control.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.11 Scheduler

C interface of the Scheduler kernel object, see L4::Scheduler for the C++ interface.
Collaboration diagram for Scheduler:



Data Structures

- struct l4_sched_cpu_set_t

  CPU sets.
- struct l4_sched_param_t

  Scheduler parameter set.

Typedefs

- typedef struct l4_sched_cpu_set_t **l4_sched_cpu_set_t**

  CPU sets.
- typedef struct l4_sched_param_t **l4_sched_param_t**

  Scheduler parameter set.

Enumerations

- enum L4_scheduler_classes { L4_SCHEDULER_CLASS_FIXED_PRIO = 1UL << 1 , L4_SCHEDULER_CLASS_WFQ = 1UL << 2 }

  Supported scheduler classes.
- enum L4_scheduler_ops { L4_SCHEDULER_INFO_OP = 0UL , L4_SCHEDULER_RUN_THREAD_OP = 1UL , L4_SCHEDULER_IDLE_TIME_OP = 2UL }

  Operations on the Scheduler object.

Functions

- l4_sched_cpu_set_t l4_sched_cpu_set (l4_umword_t offset, unsigned char granularity, l4_umword_t map=1) L4_NOTHROW
- l4_msgtag_t l4_scheduler_info (l4_cap_idx_t scheduler, l4_umword_t *cpu_max, l4_sched_cpu_set_t *cpus) L4_NOTHROW))

  Get scheduler information.
- l4_msgtag_t l4_scheduler_info_with_classes (l4_cap_idx_t scheduler, l4_umword_t *cpu_max, l4_sched_cpu_set_t *cpus, l4_umword_t *sched_classes) L4_NOTHROW))

  Get scheduler information.
- l4_sched_param_t l4_sched_param (unsigned prio, l4_umword_t quantum=0) L4_NOTHROW

  Construct scheduler parameter.
- l4_msgtag_t l4_scheduler_run_thread (l4_cap_idx_t scheduler, l4_cap_idx_t thread, l4_sched_param_t const *sp) L4_NOTHROW)

  Run a thread on a Scheduler.
- l4_msgtag_t l4_scheduler_idle_time (l4_cap_idx_t scheduler, l4_sched_cpu_set_t const *cpus, l4_kernel_clock_t *us) L4_NOTHROW)

  Query the idle time (in µs) of a CPU.
- int l4_scheduler_is_online (l4_cap_idx_t scheduler, l4_umword_t cpu) L4_NOTHROW

  Query if a CPU is online.

13.1.10.11.1 Detailed Description

C interface of the Scheduler kernel object, see L4::Scheduler for the C++ interface.
The Scheduler interface allows a client to manage CPU resources. The API provides functions to query scheduler information, check the online state of CPUs, query CPU idle time and to start threads on defined CPU sets.
The scheduler offers a virtual device IRQ which triggers when the number of online cores changes, e.g. due to hotplug events. In contrast to hardware IRQs, this IRQ implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

It depends on the platform, which hotplug events actually trigger the IRQ. Many platforms only support triggering the IRQ when a CPU core different from the boot CPU goes online.

Include File

```
#include <l4/sys/scheduler.h>
```

13.1.10.11.2 Enumeration Type Documentation

13.1.10.11.2.1 L4_scheduler_classes

```
enum L4_scheduler_classes
```
Supported scheduler classes.

Enumerator

L4_SCHEDULER_CLASS_FIXED_PRIO	Fixed-priority scheduler.
L4_SCHEDULER_CLASS_WFQ	Weighted fair queuing scheduler.

Definition at line 46 of file scheduler.h.

13.1.10.11.2.2 L4_scheduler_ops

```
enum L4_scheduler_ops
```
Operations on the Scheduler object.

Enumerator

L4_SCHEDULER_INFO_OP	Query infos about the scheduler.
L4_SCHEDULER_RUN_THREAD_OP	Run a thread on this scheduler.
L4_SCHEDULER_IDLE_TIME_OP	Query idle time for the scheduler.

Definition at line 269 of file scheduler.h.

13.1.10.11.3 Function Documentation

13.1.10.11.3.1 l4_sched_cpu_set()

```
l4_sched_cpu_set_t l4_sched_cpu_set (
            l4_umword_t offset,
            unsigned char granularity,
            l4_umword_t map = 1)  [inline]
```

Parameters

offset	Offset. Must be a multiple of 2^granularity.
granularity	Granularity in log2 notation.
map	Bitmap of CPUs, defaults to 1 in C++.

Returns

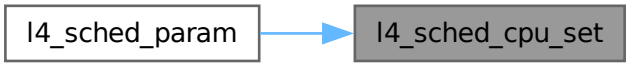
CPU set.

Examples

examples/sys/migrate/thread_migrate.cc.

Definition at line 279 of file scheduler.h.
References l4_sched_cpu_set_t::gran_offset, L4_NOTHROW, and l4_sched_cpu_set_t::map.
Referenced by l4_sched_param().

Here is the caller graph for this function:



13.1.10.11.3.2 l4_sched_param()

```
l4_sched_param_t l4_sched_param (
            unsigned prio,
            l4_umword_t quantum = 0)  [inline]
```

Construct scheduler parameter.

Parameters

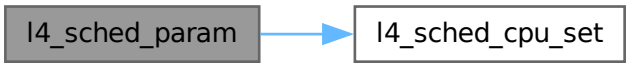
prio	Thread priority (1-255).
quantum	Timeslice in micro seconds.

The l4_sched_param_t::affinity of the returned value contains all CPUs.

Examples

examples/sys/aliens/main.c, examples/sys/migrate/thread_migrate.cc, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 289 of file scheduler.h.
References l4_sched_param_t::affinity, L4_NOTHROW, l4_sched_cpu_set(), l4_sched_param_t::prio, and l4_sched_param_t::quantum.
Here is the call graph for this function:



13.1.10.11.3.3 l4_scheduler_idle_time()

```
l4_msgtag_t l4_scheduler_idle_time (
            l4_cap_idx_t scheduler,
            l4_sched_cpu_set_t const * cpus,
            l4_kernel_clock_t * us)  [inline]
```

Query the idle time (in µs) of a CPU.

Parameters

	scheduler	Scheduler object.
	cpus	Set of CPUs to query. Only the idle time of the first selected CPU in `cpus.map` is queried.
`out`	*us*	Idle time of queried CPU in µs.

Return values

0	Success.
-L4_EINVAL	Invalid CPU requested in cpu set.

This function retrieves the idle time in µs of the first selected CPU in `cpus.map`. The idle time is the accumulated time a CPU has spent in the idle thread since its last reset. To calculate a load estimate `l` one has to retrieve the idle time at the beginning (`i1`) and the end (`i2`) of a known time interval `t`. The load is then calculated as l = 1 - (i2 - i1)/t.
The idle time is only defined for online CPUs. Reading the idle time from offline CPUs is undefined and may result in either getting -L4_EINVAL or calculating an estimated (incorrect) load of 1.

Note

The idle time statistics of remote CPUs is updated on context switch events only, hence may not be up-to-date when requested cross-CPU. To get up-to-date idle time you should use a thread running on the same CPU of which the idle time is requested.

Definition at line 403 of file scheduler.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.11.3.4 l4_scheduler_info()

```
l4_msgtag_t l4_scheduler_info (
             l4_cap_idx_t scheduler,
             l4_umword_t * cpu_max,
             l4_sched_cpu_set_t * cpus)  [inline]
```

Get scheduler information.

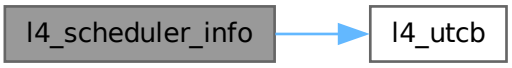
Parameters

	scheduler	Scheduler object.
`out`	*cpu_max*	Maximum number of CPUs ever available. Optional, can be NULL.
`in,out`	*cpus*	*cpus.offset* is first CPU of interest. *cpus.granularity* (see l4_sched_cpu_set_t). *cpus.map* Bitmap of online CPUs. Must not be NULL.

Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

Definition at line 381 of file scheduler.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.11.3.5 l4_scheduler_info_with_classes()

```
l4_msgtag_t l4_scheduler_info_with_classes (
             l4_cap_idx_t scheduler,
             l4_umword_t * cpu_max,
             l4_sched_cpu_set_t * cpus,
             l4_umword_t * sched_classes)  [inline]
```

Get scheduler information.

Parameters

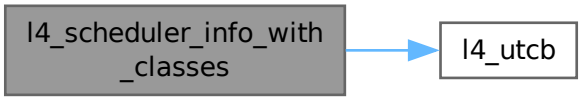
	scheduler	Scheduler object.
out	*cpu_max*	Maximum number of CPUs ever available. Optional, can be NULL.
in,out	*cpus*	*cpus.offset* is first CPU of interest. *cpus.granularity* (see l4_sched_cpu_set_t). *cpus.map* Bitmap of online CPUs. Must not be NULL.
out	*sched_classes*	A bitmap of available scheduling classes (see L4_scheduler_classes). Optional, can be NULL.

Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

This function delivers the same information as l4_scheduler_info plus the available scheduler classes (see L4_scheduler_classes).
Definition at line 388 of file scheduler.h.
References L4_NOTHROW, and l4_utcb().

Here is the call graph for this function:



13.1.10.11.3.6 l4_scheduler_is_online()

```
int l4_scheduler_is_online (
            l4_cap_idx_t scheduler,
            l4_umword_t cpu)  [inline]
```

Query if a CPU is online.

Parameters

scheduler	Scheduler object.
cpu	CPU number whose online status should be queried.

Return values

true	The CPU is online.
false	The CPU is offline

Definition at line 410 of file scheduler.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.11.3.7 l4_scheduler_run_thread()

```
l4_msgtag_t l4_scheduler_run_thread (
            l4_cap_idx_t scheduler,
            l4_cap_idx_t thread,
            l4_sched_param_t const * sp)  [inline]
```

Run a thread on a Scheduler.

Parameters

scheduler	Scheduler object.
thread	Capability of the thread to run.
sp	Scheduling parameters.

Return values

0	Success.
-L4_EINVAL	Invalid size of the scheduling parameter.

This function launches a thread on a CPU determined by the scheduling parameter `sp.affinity`. A thread can be intentionally stopped by migrating it on an offline or an invalid CPU. The thread is only guaranteed to run if the CPU it is migrated to is currently online.

Note

If the target CPU is currently not online, there is no guarantee that the thread will ever run, even if the CPU comes online later on.

A scheduler may impose a policy with regard to selecting CPUs. However the scheduler is required to ensure the following two properties:

- Two threads with disjoint CPU sets must be scheduled to different CPUs.
- Two threads with identical CPU sets selecting only a single CPU must be scheduled to the same CPU.

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 396 of file scheduler.h.

Here is the call graph for this function:

13.1.10.12 Kernel-provided semaphore

C semaphore interface, see L4::Semaphore for the C++ interface.

Collaboration diagram for Kernel-provided semaphore:

Functions

- l4_msgtag_t l4_semaphore_up (l4_cap_idx_t sem) L4_NOTHROW

  Semaphore up operation (wrapper for trigger()).
- l4_msgtag_t l4_semaphore_down (l4_cap_idx_t sem, l4_timeout_t timeout) L4_NOTHROW

  Semaphore down operation.

13.1.10.12.1 Detailed Description

C semaphore interface, see L4::Semaphore for the C++ interface.

Include File

```
#include <l4/sys/semaphore.h>
```

13.1.10.12.2 Function Documentation

13.1.10.12.2.1 l4_semaphore_down()

```
l4_msgtag_t l4_semaphore_down (
            l4_cap_idx_t sem,
            l4_timeout_t timeout)  [inline]
```

Semaphore down operation.

Parameters

sem	Semaphore object.
timeout	Timeout for blocking the semaphore down operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.

Returns

Syscall return tag. Use l4_error() to check for errors.

Return values

-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `sem` must have the permission L4_CAP_FPAGE_S.

This method decrements the semaphore counter by one, or blocks if the counter is already zero, until either a timeout or cancel condition hits or the counter is increased by an `up()` operation.
Definition at line 100 of file semaphore.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.12.2.2 l4_semaphore_up()

```
l4_msgtag_t l4_semaphore_up (
            l4_cap_idx_t sem)  [inline]
```

Semaphore up operation (wrapper for trigger()).

Parameters

sem	Semaphore object.

Returns

Send-only IPC message return tag. Use l4_ipc_error() to check for errors, do **not** use l4_error().

Increases the semaphore counter by one if it is smaller than an unspecified limit. The unspecified limit is guaranteed to be at least 2^31-1.
Definition at line 45 of file semaphore.h.
References l4_irq_trigger(), and L4_NOTHROW.

13.1.10.13 Task

C interface of the Task kernel object, see L4::Task for the C++ interface.

Collaboration diagram for Task:

Enumerations

- enum l4_unmap_flags_t { L4_FP_ALL_SPACES , L4_FP_DELETE_OBJ , L4_FP_OTHER_SPACES }

  Flags for the unmap operation.

Functions

- l4_msgtag_t l4_task_vgicc_map (l4_cap_idx_t task, l4_fpage_t vgicc_fpage) L4_NOTHROW

  Map the GIC virtual CPU interface page to the task in case Fiasco detected a GIC version 2.
- l4_msgtag_t l4_task_map (l4_cap_idx_t dst_task, l4_cap_idx_t src_task, l4_fpage_t snd_fpage, l4_umword_t snd_base) L4_NOTHROW

  Map resources available in the source task to a destination task.
- l4_msgtag_t l4_task_unmap (l4_cap_idx_t task, l4_fpage_t fpage, l4_umword_t map_mask) L4_NOTHROW

  Revoke rights from the task.
- l4_msgtag_t l4_task_unmap_batch (l4_cap_idx_t task, l4_fpage_t const *fpages, unsigned num_fpages, l4_umword_t map_mask) L4_NOTHROW

  Revoke rights from a task.
- l4_msgtag_t l4_task_delete_obj (l4_cap_idx_t task, l4_cap_idx_t obj) L4_NOTHROW

  Release capability and delete object.
- l4_msgtag_t l4_task_release_cap (l4_cap_idx_t task, l4_cap_idx_t cap) L4_NOTHROW

  Release object capability.
- l4_msgtag_t l4_task_cap_valid (l4_cap_idx_t task, l4_cap_idx_t cap) L4_NOTHROW

  Check whether a capability is present (refers to an object).
- l4_msgtag_t l4_task_cap_equal (l4_cap_idx_t task, l4_cap_idx_t cap_a, l4_cap_idx_t cap_b) L4_NOTHROW

  Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).
- l4_msgtag_t l4_task_add_ku_mem (l4_cap_idx_t task, l4_fpage_t *ku_mem) L4_NOTHROW

  Add kernel-user memory.

13.1.10.13.1 Detailed Description

C interface of the Task kernel object, see L4::Task for the C++ interface.
A task represents a combination of the address spaces provided by the L4Re micro kernel. A task consists of at least a memory address space and an object address space. On IA32 there is also an IO-port address space.
Task objects are created using the Factory interface.

Include File

```
#include <l4/sys/task.h>
```

13.1.10.13.2 Enumeration Type Documentation

13.1.10.13.2.1 l4_unmap_flags_t

enum l4_unmap_flags_t

Flags for the unmap operation.

See also

L4::Task::unmap() and l4_task_unmap()

Enumerator

L4_FP_ALL_SPACES	Flag to tell the unmap operation to revoke permissions from all child mappings including the mapping in the invoked task. **Note** Object capabilities are not hierarchical – they have no children. The result of the map operation on an object capability is a copy of that capability in the object space of the destination task. An unmap operation on object capabilities is a no-op if this flag is not specified. **See also** L4::Task::unmap() l4_task_unmap()
L4_FP_DELETE_OBJ	Flag that indicates that an unmap operation on object capabilities shall try to delete the corresponding objects immediately. This flag implies the L4_FP_ALL_SPACES flag. The concept of deletion is only applicable to kernel objects. Therefore, for memory and I/O port capabilities, this flag has the same effect as L4_FP_ALL_SPACES alone. **See also** L4::Task::unmap() l4_task_unmap() **Note** Specifying L4_FP_DELETE_OBJ ^ L4_FP_ALL_SPACES is treated as L4_FP_OTHER_SPACES.
L4_FP_OTHER_SPACES	Counterpart to L4_FP_ALL_SPACES; revoke permissions from child mappings only. **See also** L4::Task::unmap() l4_task_unmap()

Definition at line 186 of file consts.h.

13.1.10.13.3 Function Documentation

13.1.10.13.3.1 l4_task_add_ku_mem()

```
l4_msgtag_t l4_task_add_ku_mem (
            l4_cap_idx_t task,
            l4_fpage_t * ku_mem)  [inline]
```

Add kernel-user memory.

Parameters

	task	Capability index of the task to add the memory to.
in,out	*ku_mem*	Flexpage describing the virtual area the memory goes to. On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

Returns

Syscall return tag

Kernel-user memory (ku_mem) is memory that is shared between the kernel and user-space. It is needed for the UTCB area of threads (see l4_thread_control_bind()) and for (extended) vCPU state. Note that existing kernel-user memory cannot be unmapped or mapped somewhere else.

Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page (L4_PAGESIZE). A portable implementation should not depend on allocations greater than 16KiB to succeed.

This function is only guaranteed to work on L4::Task objects. It might or might not work on L4::Vm objects or on L4Re::Dma_space objects but there is no practical use for adding kernel-user memory to L4::Vm objects or to L4Re::Dma_space objects.

Definition at line 497 of file task.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.13.3.2 l4_task_cap_equal()

```
l4_msgtag_t l4_task_cap_equal (
             l4_cap_idx_t task,
             l4_cap_idx_t cap_a,
             l4_cap_idx_t cap_b)  [inline]
```

Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).

Parameters

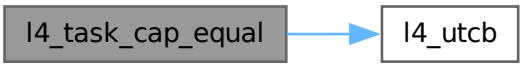
task	Capability index for the destination task to do the lookup in.
cap_a	Capability selector for the first capability to compare.
cap_b	Capability selector for the second capability to compare.

Return values

l4_msgtag_t::label() = 1	The compared capabilities point to the same object with same considered permission.
l4_msgtag_t::label() = 0	The compared capabilities do **not** point to the same object or differ in the considered permission.

- For L4::Ipc_gate objects, only the permissions L4_CAP_FPAGE_W, L4_CAP_FPAGE_S, and L4_FPAGE_C_OBJ_RIGHT1 are considered for the comparison. Differences in other permissions are ignored.
- For other objects, only the permissions L4_CAP_FPAGE_W and L4_CAP_FPAGE_S are considered for the comparison. Differences in other permissions are ignored.

Note that having the L4_CAP_FPAGE_R permission is implicit in possessing the capability.
Definition at line 490 of file task.h.
References L4_NOTHROW, and l4_utcb().
Referenced by L4::Cap_base::is_equal().
Here is the call graph for this function:



Here is the caller graph for this function:

13.1.10.13.3.3 l4_task_cap_valid()

```
l4_msgtag_t l4_task_cap_valid (
             l4_cap_idx_t task,
             l4_cap_idx_t cap)  [inline]
```

Check whether a capability is present (refers to an object).

Parameters

task	Task to check the capability in.
cap	Valid capability to check for presence.

Return values

l4_msgtag_t::label() > 0	Capability is present (refers to an object).

l4_msgtag_t::label() == 0	No capability present (void object).

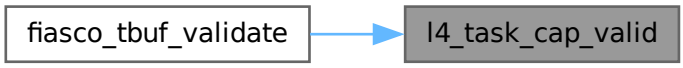
A capability is considered present when it refers to an existing kernel object.

Precondition

`cap` must be a valid capability index (i.e. not L4_INVALID_CAP or the like).

Definition at line 484 of file task.h.
References L4_NOTHROW, and l4_utcb().
Referenced by fiasco_tbuf_validate().
Here is the call graph for this function:

Here is the caller graph for this function:



13.1.10.13.3.4 l4_task_delete_obj()

```
l4_msgtag_t l4_task_delete_obj (
             l4_cap_idx_t task,
             l4_cap_idx_t obj)  [inline]
```

Release capability and delete object.

Parameters

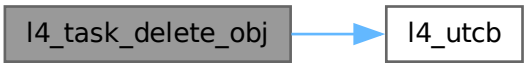
task	Capability index of destination task.
obj	Capability index of the object to delete.

Returns

Syscall return tag

If `obj` has the delete permission, initiates the deletion of the object. This implies that all capabilities for that object are gone afterwards. However, kernel-internally, objects are not destroyed until all other kernel objects holding a reference to it drop the reference. Hence, quota used by that object might not be freed immediately.
If `obj` does not have the delete permission, no error will be reported and only the capability `obj` is removed. (Note that, depending on the object's reference counter, this might still imply initiation of deletion.)

This operation is equivalent to l4_task_unmap() with L4_FP_DELETE_OBJ flag.
Definition at line 463 of file task.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.13.3.5 l4_task_map()

```
l4_msgtag_t l4_task_map (
             l4_cap_idx_t dst_task,
             l4_cap_idx_t src_task,
             l4_fpage_t snd_fpage,
             l4_umword_t snd_base)  [inline]
```

Map resources available in the source task to a destination task.

Parameters

dst_task	Capability index of the destination task.
src_task	Capability index of the source task.
snd_fpage	Send flexpage that describes an area in the address space or object space of the source task.
snd_base	Send base that describes an offset in the receive window of the destination task. The lower bits contain additional map control flags (see l4_fpage_cacheability_opt_t for memory mappings, Attributes and additional permissions for object send items for object mappings, and L4_MAP_ITEM_GRANT; also see l4_map_control() and l4_map_obj_control()).

Returns

Syscall return tag. The function l4_error() shall be used to test if the map operation was successful.

Return values

L4_EOK	Operation successful (but see notes below).
-L4_EPERM	Insufficient permissions; see precondition.
-L4_EINVAL	Invalid source task capability.
-L4_IPC_SEMAPFAILED	The map operation failed due to limited quota.

Precondition

The capability `dst_task` must have the permission L4_CAP_FPAGE_W.

This method allows for asynchronous transfer of capabilities, memory mappings, and IO-port mappings (on IA32) from one task to another. The receive window is the whole address space of `dst_task`. By specifying proper rights in `snd_fpage` and `snd_base`, it is possible to remove rights during transfer.

Note

If the send flexpage is of type L4_FPAGE_OBJ, the L4_CAP_FPAGE_S right is removed from the transferred capability unless both the source and destination task capabilities possess the L4_CAP_FPAGE_S right themselves.

Even with l4_error() returning L4_EOK there might be cases where not all pages of the send flexpage were mapped respectively granted to the destination task, for instance, if the corresponding mapping in the destination task does already exist.

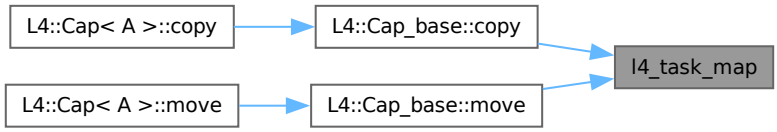
For more information on spaces and mappings, see Spaces and Mappings. The flexpage API is described in more detail at Flexpages.

Note

For peculiarities when using grant, see L4_MAP_ITEM_GRANT.

Definition at line 433 of file task.h.
References L4_NOTHROW, and l4_utcb().
Referenced by L4::Cap_base::copy(), and L4::Cap_base::move().
Here is the call graph for this function:

Here is the caller graph for this function:



13.1.10.13.3.6 l4_task_release_cap()

```
l4_msgtag_t l4_task_release_cap (
             l4_cap_idx_t task,
             l4_cap_idx_t cap)  [inline]
```

Release object capability.

Parameters

task	Capability index of destination task
cap	Capability index of object to release

Returns

Syscall return tag

This operation unmaps the capability from the specified task. This operation is equivalent to unmapping a single object capability by specifying all object rights as unmap mask.

Note

If the reference counter of the kernel object referenced by `cap` goes down to zero, deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 478 of file task.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.13.3.7 l4_task_unmap()

```
l4_msgtag_t l4_task_unmap (
             l4_cap_idx_t task,
             l4_fpage_t fpage,
             l4_umword_t map_mask)  [inline]
```

Revoke rights from the task.

Parameters

task	Capability index of destination task
fpage	Flexpage that describes an area in one capability space of the destination task and the rights to revoke.
map_mask	Unmap mask, see l4_unmap_flags_t

Returns

Syscall return tag

This method allows to revoke rights from the destination task. The rights to revoke are specified in the flexpage, see l4_fpage_rights(). For a flexpage describing IO ports or memory, it also revokes rights from all the tasks that got the rights delegated from the destination task (i.e., this operation does a recursive rights revocation). The capability is unmapped if certain rights are specified, see below for details. It is guaranteed that the rights revocation is completed before this function returns.
Note that this function cannot be used to revoke the reference counting permission (see L4_FPAGE_C_REF_CNT) or the IPC-gate server permission (see L4_FPAGE_C_IPCGATE_SVR) from object capabilities.
It depends on the platform and the object type which rights need to be specified in the `rights` field of `fpage` to unmap a capability:

- An object capability is unmapped if and only if the L4_CAP_FPAGE_R right bit is set.
- An IO port is unmapped if and only if any right bit is set.
- Memory is unmapped if and only if the L4_FPAGE_RO right bit is set.

Note

Depending on the page-table features supported by the hardware, revocation of certain rights from a memory capability can be a no-op (i.e., the rights are not revoked). Further, revocation of certain rights may grant other rights which were not present before. For instance, on an architecture without support for NX, revoking X does nothing. For another example, revoking only X from an execute-only page grants read permission (because the mapping remains present in the page table).

If the reference counter of a kernel object referenced in `fpage` goes down to zero (as a result of deleting capabilities), the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

13.1.10.13.3.8 l4_task_unmap_batch()

```
l4_msgtag_t l4_task_unmap_batch (
             l4_cap_idx_t task,
             l4_fpage_t const * fpages,
```

```
            unsigned num_fpages,
            l4_umword_t map_mask)  [inline]
```

Revoke rights from a task.

Parameters

task	Capability index of destination task
fpages	An array of flexpages. Each item describes an area in one capability space of the destination task.
num_fpages	The size of the fpages array in elements (number of fpages sent).
map_mask	Unmap mask, see l4_unmap_flags_t

Returns

Syscall return tag

Revoke rights specified in an array of flexpages, see l4_task_unmap for details.

Precondition

The caller needs to take care that num_fpages is not bigger than L4_UTCB_GENERIC_DATA_SIZE - 2.

Definition at line 447 of file task.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.13.3.9 l4_task_vgicc_map()

```
l4_msgtag_t l4_task_vgicc_map (
            l4_cap_idx_t task,
            l4_fpage_t vgicc_fpage)  [inline]
```

Map the GIC virtual CPU interface page to the task in case Fiasco detected a GIC version 2.

Parameters

task	Capability index of destination task
vgicc_fpage	Flexpage that describes an area in the address space of the destination task to map the vGICC page to

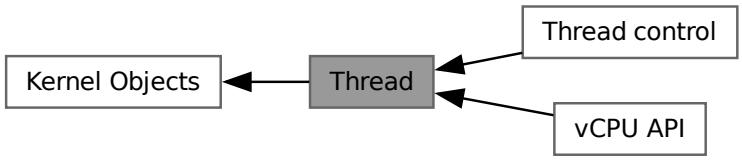
Returns

Syscall return tag

Definition at line 46 of file __task-arm.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.14 Thread

C Thread object interface, see L4::Thread for the C++ interface.
Collaboration diagram for Thread:



Topics

- Thread control 375
  API for Thread Control method.
- vCPU API 380
  vCPU API.

Enumerations

- enum L4_thread_control_flags { L4_THREAD_CONTROL_SET_PAGER = 0x0010000 , L4_THREAD_CONTROL_BIND_TASK = 0x0200000 , L4_THREAD_CONTROL_ALIEN = 0x0400000 , L4_THREAD_CONTROL_SET_EXC_HANDLER = 0x1000000 }
  Flags for the thread control operation.
- enum L4_thread_control_mr_indices { L4_THREAD_CONTROL_MR_IDX_FLAGS = 0 , L4_THREAD_CONTROL_MR_IDX_PAGER = 1 , L4_THREAD_CONTROL_MR_IDX_EXC_HANDLER = 2 , L4_THREAD_CONTROL_MR_IDX_FLAG_VALS = 4 , L4_THREAD_CONTROL_MR_IDX_BIND_UTCB = 5 , L4_THREAD_CONTROL_MR_IDX_BIND_TASK = 6 }
  Indices for the values in the message register for thread control.

- enum L4_thread_ex_regs_flags { L4_THREAD_EX_REGS_CANCEL = 0x10000UL , L4_THREAD_EX_REGS_TRIGGER_EXC = 0x20000UL , L4_THREAD_EX_REGS_ARCH_MASK = 0xff000000UL }

  Flags for the thread ex-regs operation.
- enum L4_pf_tramp_control_op { L4_THREAD_PF_TRAMP_CONTROL_OP_SETUP = (L4_THREAD_PF_TRAMP_CONTROL_OP | 0x00000UL) , L4_THREAD_PF_TRAMP_CONTROL_OP_RESUME = (L4_THREAD_PF_TRAMP_↩ CONTROL_OP | 0x10000UL) , L4_THREAD_PF_TRAMP_CONTROL_OP_REFLECT = (L4_THREAD_↩ PF_TRAMP_CONTROL_OP | 0x20000UL) , L4_THREAD_PF_TRAMP_CONTROL_OP_DISABLE = (L4↩ _THREAD_PF_TRAMP_CONTROL_OP | 0x30000UL) , L4_THREAD_PF_TRAMP_CONTROL_OP_ENABLE = (L4_THREAD_PF_TRAMP_CONTROL_OP | 0x40000UL) }

  Sub-opcodes for L4_THREAD_PF_TRAMP_CONTROL_OP.
- enum L4_thread_ex_regs_flags_arm { L4_THREAD_EX_REGS_ARM_SET_EL_MASK = 0x3 << 24 , L4_THREAD_EX_REGS_ARM_SET_EL_KEEP = 0x0 << 24 , L4_THREAD_EX_REGS_ARM_SET_EL_EL0 = 0x1 << 24 , L4_THREAD_EX_REGS_ARM_SET_EL_EL1 = 0x2 << 24 }

  Arm specific L4::Thread::ex_regs() flags.
- enum L4_thread_ex_regs_flags_arm64 { L4_THREAD_EX_REGS_ARM64_SET_EL_MASK = 0x3 << 24 , L4_THREAD_EX_REGS_ARM64_SET_EL_KEEP = 0x0 << 24 , L4_THREAD_EX_REGS_ARM64_SET_EL_EL0 = 0x1 << 24 , L4_THREAD_EX_REGS_ARM64_SET_EL_EL1 = 0x2 << 24 }

  Arm64 specific L4::Thread::ex_regs() flags.

Functions

- l4_msgtag_t l4_thread_ex_regs (l4_cap_idx_t thread, l4_addr_t ip, l4_addr_t sp, l4_umword_t flags) L4_NOTHROW

  Exchange basic thread registers.
- l4_msgtag_t l4_thread_ex_regs_u (l4_cap_idx_t thread, l4_addr_t ip, l4_addr_t sp, l4_umword_t flags, l4_utcb_t *utcb) L4_NOTHROW

  Exchange basic thread registers.
- l4_msgtag_t l4_thread_ex_regs_ret (l4_cap_idx_t thread, l4_addr_t *ip, l4_addr_t *sp, l4_umword_t *flags) L4_NOTHROW

  Exchange basic thread registers and return previous values.
- l4_msgtag_t l4_thread_ex_regs_ret_u (l4_cap_idx_t thread, l4_addr_t *ip, l4_addr_t *sp, l4_umword_t *flags, l4_utcb_t *utcb) L4_NOTHROW

  Exchange basic thread registers and return previous values.
- l4_msgtag_t l4_thread_yield (void) L4_NOTHROW

  Yield current time slice.
- l4_msgtag_t l4_thread_switch (l4_cap_idx_t to_thread) L4_NOTHROW

  Switch to another thread (and donate the remaining time slice).
- l4_msgtag_t l4_thread_stats_time (l4_cap_idx_t thread, l4_kernel_clock_t *us) L4_NOTHROW

  Get consumed time of thread in µs.
- l4_msgtag_t l4_thread_vcpu_resume_start (void) L4_NOTHROW

  vCPU return from event handler.
- l4_msgtag_t l4_thread_vcpu_resume_commit (l4_cap_idx_t thread, l4_msgtag_t tag) L4_NOTHROW

  Commit vCPU resume.
- l4_msgtag_t l4_thread_vcpu_control (l4_cap_idx_t thread, l4_addr_t vcpu_state) L4_NOTHROW

  Enable the vCPU feature for the thread.
- l4_msgtag_t l4_thread_vcpu_control_u (l4_cap_idx_t thread, l4_addr_t vcpu_state, l4_utcb_t *utcb) L4_NOTHROW

  Enable the vCPU feature for the thread.
- l4_msgtag_t l4_thread_vcpu_control_ext (l4_cap_idx_t thread, l4_addr_t ext_vcpu_state) L4_NOTHROW

  Enable the extended vCPU feature for the thread.
- l4_msgtag_t l4_thread_vcpu_control_ext_u (l4_cap_idx_t thread, l4_addr_t ext_vcpu_state, l4_utcb_t *utcb) L4_NOTHROW

Enable the extended vCPU feature for the thread.

- l4_msgtag_t l4_thread_register_del_irq (l4_cap_idx_t thread, l4_cap_idx_t irq) L4_NOTHROW

  Register an IRQ that will trigger upon deletion events.
- l4_msgtag_t l4_thread_modify_sender_start (void) L4_NOTHROW

  Start a thread sender modification sequence.
- int l4_thread_modify_sender_add (l4_umword_t match_mask, l4_umword_t match, l4_umword_t del_bits, l4_umword_t add_bits, l4_msgtag_t *tag) L4_NOTHROW

  Add a modification pattern to a sender modification sequence.
- l4_msgtag_t l4_thread_modify_sender_commit (l4_cap_idx_t thread, l4_msgtag_t tag) L4_NOTHROW

  Apply (commit) a sender modification sequence.
- l4_msgtag_t l4_thread_register_doorbell_irq (l4_cap_idx_t thread, l4_cap_idx_t irq) L4_NOTHROW

  Register an IRQ that will trigger when a forwarded virtual interrupt is pending.
- l4_msgtag_t l4_thread_pf_trampoline_setup (l4_cap_idx_t thread, l4_addr_t pf_tramp_state) L4_NOTHROW

  Setup page fault trampoline handler.
- l4_msgtag_t l4_thread_pf_trampoline_resume (l4_cap_idx_t thread) L4_NOTHROW

  Resume from page fault trampoline handler.
- l4_msgtag_t l4_thread_pf_trampoline_reflect (l4_cap_idx_t thread) L4_NOTHROW

  Page fault trampoline handler reflects page fault to exception handler.
- l4_msgtag_t l4_thread_pf_trampoline_disable (l4_cap_idx_t thread, int *was_enabled) L4_NOTHROW

  Disable the page fault trampoline handling for this thread.
- l4_msgtag_t l4_thread_pf_trampoline_enable (l4_cap_idx_t thread) L4_NOTHROW

  Re-enable the page fault trampoline handling for this thread.
- l4_msgtag_t l4_thread_arm_set_tpidruro (l4_cap_idx_t thread, l4_addr_t tpidruro) L4_NOTHROW

  Set the TPIDRURO thread specific register.

13.1.10.14.1 Detailed Description

C Thread object interface, see L4::Thread for the C++ interface.
An L4 thread is a thread of execution in the L4 context. Usually user-level and kernel threads are mapped 1:1 to each other. Thread kernel objects are created using a factory, see Factory (l4_factory_create_thread()).
Amongst other things an L4 thread encapsulates:

- CPU state
  - General-purpose registers
  - Program counter
  - Stack pointer
- FPU state
- Scheduling parameters, see the Scheduler API
- Execution state
  - Blocked, Runnable, Running

Thread objects provide an API for

- Thread configuration and manipulation
- Thread switching.

The thread control functions are used to control various aspects of a thread. See l4_thread_control_start() for more information.
On ARM newly created threads run in EL0 by default and the exception level can be changed there with ex_regs().

Include File

```
#include <l4/sys/thread.h>
```

For the C++ interface refer to L4::Thread.

13.1.10.14.2 Enumeration Type Documentation

13.1.10.14.2.1 L4_pf_tramp_control_op

enum L4_pf_tramp_control_op
Sub-opcodes for L4_THREAD_PF_TRAMP_CONTROL_OP.

Enumerator

L4_THREAD_PF_TRAMP_CONTROL_OP_SETUP	Setup PF trampoline handler.
L4_THREAD_PF_TRAMP_CONTROL_OP_RESUME	Normal resume from PF trampoline handler to user-land.
L4_THREAD_PF_TRAMP_CONTROL_OP_REFLECT	Resume from PF trampoline handler – trigger exception.
L4_THREAD_PF_TRAMP_CONTROL_OP_DISABLE	Disable PF trampoline handler. The ITAS will usually enable PF trampoline handling for all threads. A thread can decide to install its own pager and will disable the PF trampoline handling in that case.
L4_THREAD_PF_TRAMP_CONTROL_OP_ENABLE	Re-enable PF trampoline handler. Re-enable the PF trampoline handling for a thread where the handling was explicitly disabled before.

Definition at line 925 of file thread.h.

13.1.10.14.2.2 L4_thread_control_flags

enum L4_thread_control_flags
Flags for the thread control operation.

Enumerator

L4_THREAD_CONTROL_SET_PAGER	The pager will be given.
L4_THREAD_CONTROL_BIND_TASK	The task to bind the thread to will be given.
L4_THREAD_CONTROL_ALIEN	Alien state of the thread is set.
L4_THREAD_CONTROL_SET_EXC_HANDLER	The exception handler of the thread will be given.

Definition at line 876 of file thread.h.

13.1.10.14.2.3 L4_thread_control_mr_indices

enum L4_thread_control_mr_indices
Indices for the values in the message register for thread control.

Enumerator

L4_THREAD_CONTROL_MR_IDX_FLAGS	**See also** L4_thread_control_flags.
L4_THREAD_CONTROL_MR_IDX_PAGER	Index for pager cap.
L4_THREAD_CONTROL_MR_IDX_EXC_HANDLER	Index for exception handler.
L4_THREAD_CONTROL_MR_IDX_FLAG_VALS	Index for feature values.

L4_THREAD_CONTROL_MR_IDX_BIND_UTCB	Index for UTCB address for bind.
L4_THREAD_CONTROL_MR_IDX_BIND_TASK	Index for task flexpage for bind.

Definition at line 897 of file thread.h.

13.1.10.14.2.4 L4_thread_ex_regs_flags

enum L4_thread_ex_regs_flags
Flags for the thread ex-regs operation.

Enumerator

L4_THREAD_EX_REGS_CANCEL	Cancel ongoing IPC in the thread.
L4_THREAD_EX_REGS_TRIGGER_EXCEPTION	Trigger artificial exception in thread.
L4_THREAD_EX_REGS_ARCH_MASK	Arch specific flags.

Definition at line 912 of file thread.h.

13.1.10.14.2.5 L4_thread_ex_regs_flags_arm

enum L4_thread_ex_regs_flags_arm
Arm specific L4::Thread::ex_regs() flags.
Only one option must be used in calls to L4::Thread::ex_regs(). Using more than one option results in undefined behaviour.

Enumerator

L4_THREAD_EX_REGS_ARM_SET_EL_MASK	Exception level set mask.
L4_THREAD_EX_REGS_ARM_SET_EL_KEEP	Keep current exception level of thread (default).
L4_THREAD_EX_REGS_ARM_SET_EL_EL0	Set exception level of thread to EL0 (usr mode).
L4_THREAD_EX_REGS_ARM_SET_EL_EL1	Set exception level of thread to EL1 (sys mode).

Definition at line 37 of file thread.h.

13.1.10.14.2.6 L4_thread_ex_regs_flags_arm64

enum L4_thread_ex_regs_flags_arm64
Arm64 specific L4::Thread::ex_regs() flags.
Only one option must be used in calls to L4::Thread::ex_regs(). Using more than one option results in undefined behaviour.

Enumerator

L4_THREAD_EX_REGS_ARM64_SET_EL_MASK	Exception level set mask.
L4_THREAD_EX_REGS_ARM64_SET_EL_KEEP	Keep current exception level of thread (default).
L4_THREAD_EX_REGS_ARM64_SET_EL_EL0	Set exception level of thread to EL0.
L4_THREAD_EX_REGS_ARM64_SET_EL_EL1	Set exception level of thread to EL1t.

Definition at line 44 of file thread.h.

13.1.10.14.3 Function Documentation

13.1.10.14.3.1 l4_thread_arm_set_tpidruro()

```
l4_msgtag_t l4_thread_arm_set_tpidruro (
             l4_cap_idx_t thread,
             l4_addr_t tpidruro)  [inline]
```

Set the TPIDRURO thread specific register.

Parameters

thread	Thread to manipulate
tpidruro	The value to be set

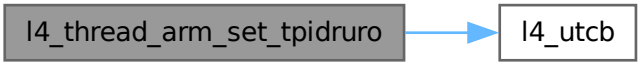
Returns

System call return tag

Note

When this function is invoked for a thread currently executing on a different core, then the changed register content will not be visible to that thread until a thread switch happens on that core.

Definition at line 70 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.14.3.2 l4_thread_ex_regs()

```
l4_msgtag_t l4_thread_ex_regs (
             l4_cap_idx_t thread,
             l4_addr_t ip,
             l4_addr_t sp,
             l4_umword_t flags)  [inline]
```

Exchange basic thread registers.

Parameters

thread	Capability selector of the thread to manipulate.
ip	New instruction pointer, use ~0UL to leave the instruction pointer unchanged.
sp	New stack pointer, use ~0UL to leave the stack pointer unchanged.
flags	Ex-regs flags, see L4_thread_ex_regs_flags.

Returns

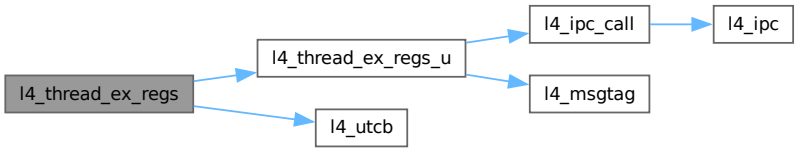
System call return tag

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if L4_THREAD_EX_REGS_TRIGGER_EXCEPTION forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see L4_thread_ex_regs_flags_arm and L4_thread_ex_regs_flags_arm64.
The thread is started using l4_scheduler_run_thread(). However, if at the time l4_scheduler_run_thread() is called, the instruction pointer of the thread is invalid, a later call to l4_thread_ex_regs() with a valid instruction pointer might start the thread.

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 1086 of file thread.h.
References L4_NOTHROW, l4_thread_ex_regs_u(), and l4_utcb().
Here is the call graph for this function:



13.1.10.14.3.3 l4_thread_ex_regs_ret()

```
l4_msgtag_t l4_thread_ex_regs_ret (
            l4_cap_idx_t thread,
            l4_addr_t * ip,
            l4_addr_t * sp,
            l4_umword_t * flags)  [inline]
```

Exchange basic thread registers and return previous values.

Parameters

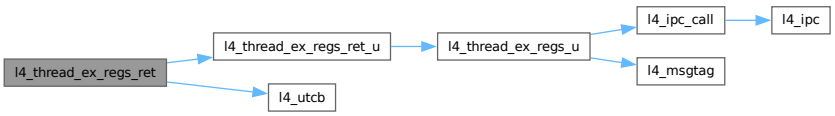
	thread	Capability selector of the thread to manipulate.
`in,out`	*ip*	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
`in,out`	*sp*	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
`in,out`	*flags*	Ex-regs flags, see L4_thread_ex_regs_flags, return previous CPU flags of the thread.

Returns

System call return tag

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations

and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if L4_THREAD_EX_REGS_TRIGGER_EXCEPTION forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see L4_thread_ex_regs_flags_arm and L4_thread_ex_regs_flags_arm64.
The thread is started using l4_scheduler_run_thread(). However, if at the time l4_scheduler_run_thread() is called, the instruction pointer of the thread is invalid, a later call to l4_thread_ex_regs() with a valid instruction pointer might start the thread.
Returned values are valid only if function returns successfully.
Definition at line 1093 of file thread.h.
References L4_NOTHROW, l4_thread_ex_regs_ret_u(), and l4_utcb().
Here is the call graph for this function:



13.1.10.14.3.4 l4_thread_ex_regs_ret_u()

```
l4_msgtag_t l4_thread_ex_regs_ret_u (
             l4_cap_idx_t thread,
             l4_addr_t * ip,
             l4_addr_t * sp,
             l4_umword_t * flags,
             l4_utcb_t * utcb)  [inline]
```

Exchange basic thread registers and return previous values.

Parameters

	thread	Capability selector of the thread to manipulate.
in,out	*ip*	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
in,out	*sp*	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
in,out	*flags*	Ex-regs flags, see L4_thread_ex_regs_flags, return previous CPU flags of the thread.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag. [out] parameters are only valid if the function returns successfully. Use l4_error() to check.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if L4_THREAD_EX_REGS_TRIGGER_EXCEPTION forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see L4_thread_ex_regs_flags_arm and L4_thread_ex_regs_flags_arm64.
The thread is started using L4::Scheduler::run_thread(). However, if at the time L4::Scheduler::run_thread() is called, the instruction pointer of the thread is invalid, a later call to ex_regs() with a valid instruction pointer might start the thread.

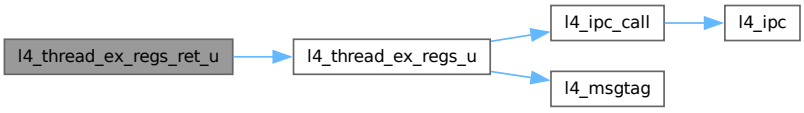
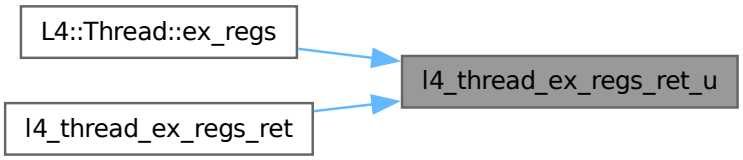
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.10.14.3.5 l4_thread_ex_regs_u()

```
l4_msgtag_t l4_thread_ex_regs_u (
             l4_cap_idx_t thread,
             l4_addr_t ip,
             l4_addr_t sp,
             l4_umword_t flags,
             l4_utcb_t * utcb)  [inline]
```

Exchange basic thread registers.

Parameters

thread	Capability selector of the thread to manipulate.
ip	New instruction pointer, use ~0UL to leave the instruction pointer unchanged.
sp	New stack pointer, use ~0UL to leave the stack pointer unchanged.
flags	Ex-regs flags, see L4_thread_ex_regs_flags.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if L4_THREAD_EX_REGS_TRIGGER_EXCEPTION forces an IPC then changes in IP and SP take ef-

fect directly after returning from this IPC. On ARM this method allows to change the exception level, see L4_thread_ex_regs_flags_arm and L4_thread_ex_regs_flags_arm64.
The thread is started using L4::Scheduler::run_thread(). However, if at the time L4::Scheduler::run_thread() is called, the instruction pointer of the thread is invalid, a later call to ex_regs() with a valid instruction pointer might start the thread.

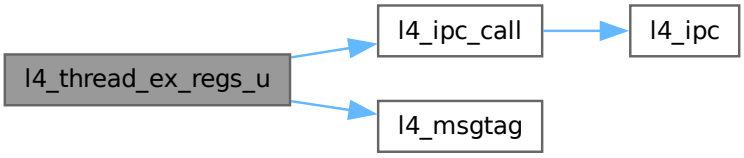
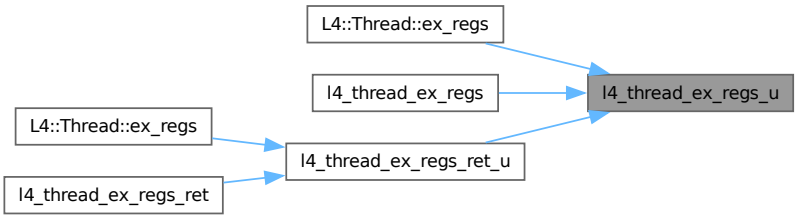
Referenced by L4::Thread::ex_regs(), l4_thread_ex_regs(), and l4_thread_ex_regs_ret_u().
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.10.14.3.6 l4_thread_modify_sender_add()

```
int l4_thread_modify_sender_add (
             l4_umword_t match_mask,
             l4_umword_t match,
             l4_umword_t del_bits,
             l4_umword_t add_bits,
             l4_msgtag_t * tag)  [inline]
```

Add a modification pattern to a sender modification sequence.

Parameters

tag	Tag received from l4_thread_modify_sender_start() or previous l4_thread_modify_sender_add() calls from the same sequence.
match_mask	Bitmask of bits to match the label.
match	Bitmask that must be equal to the label after applying match_mask.
del_bits	Bits to be deleted from the label.

add_bits	Bits to be added to the label.

Returns

0 on success, <0 on error

In pseudo code: if ((sender_label & match_mask) == match) { sender_label = (sender_label & ~del_bits) | add_bits; }
Only the first match is applied.

l4_thread_modify_sender_start

l4_thread_modify_sender_commit

Definition at line 1260 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.14.3.7 l4_thread_modify_sender_commit()

```
l4_msgtag_t l4_thread_modify_sender_commit (
             l4_cap_idx_t thread,
             l4_msgtag_t tag)  [inline]
```

Apply (commit) a sender modification sequence.
The modification rules are applied to all IPCs to the thread (whether directly or by IPC gate) that are already in flight, that is that the sender is already blocking on.

Note

Modifying the senders of a thread running on a different CPU core is not supported.

To ensure that no in-flight senders are missed, either the thread itself must execute modify_senders, or the thread executing the modify_senders must synchronize with the target thread. This synchronization must ensure the following:

1. Before modify_senders is executed the target thread must execute at least shortly (so that pending DRQs are handled).
2. The target thread must pause its IPC dispatch, until modify_senders is completed. In other words, the target thread must not be receive ready, because otherwise an IPC message with an unmodified label can be transferred to its UTCB or vCPU state.

13.1.10.14.3.8 l4_thread_modify_sender_start()

```
l4_msgtag_t l4_thread_modify_sender_start (
            void )  [inline]
```

Start a thread sender modification sequence.
Add modification rules with l4_thread_modify_sender_add() and commit with l4_thread_modify_sender_commit().
Do not touch the UTCB between l4_thread_modify_sender_start() and l4_thread_modify_sender_commit().
This mechanism shall be used to change the source object labels of every pending IPC of an IPC gate or an IRQ if the labels in such pending IPC become invalid for the receiving thread, potentially because:

- an IPC gate / IRQ was unbound from a thread, or
- an IPC gate / IRQ was removed, or
- the label of an IPC gate /IRQ bound to a thread was changed.

It is not required to perform the modify_sender mechanism after an IPC gate or an IRQ was bound to a thread for the first time.

Here is the call graph for this function:

13.1.10.14.3.11 l4_thread_pf_trampoline_reflect()

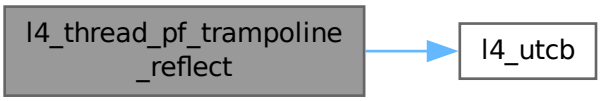
```
l4_msgtag_t l4_thread_pf_trampoline_reflect (
            l4_cap_idx_t thread)  [inline]
```

Page fault trampoline handler reflects page fault to exception handler.

Parameters

thread	Thread to reflect page fault to exception handler.

Called by the trampoline page fault handler in case a page fault could not be resolved. The kernel will reflect the page fault as exception IPC to the exception handler of the faulting thread.
Definition at line 1331 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



13.1.10.14.3.12 l4_thread_pf_trampoline_resume()

```
l4_msgtag_t l4_thread_pf_trampoline_resume (
            l4_cap_idx_t thread)  [inline]
```

Resume from page fault trampoline handler.

Parameters

thread	Thread to resume after handling page fault.

Called by the trampoline page fault handler after successfully resolving the page fault.
Definition at line 1316 of file thread.h.

            l4_cap_idx_t thread,
            l4_addr_t pf_tramp_state)  [inline]
```

Setup page fault trampoline handler.

Parameters

thread	Thread to setup page fault trampoline for.
pf_tramp_state	State of the faulting thread at entry of page fault handler, see l4_pf_trampoline_t. Instead of sending a page fault IPC to the pager, the kernel makes a single attempt to handle the page fault in the context of the faulting thread. For that purpose, the kernel saves the state of the faulting thread to the preallocated kernel-user memory `pf_tramp_state` and returns directly to the address of the page fault trampoline handler which is specified in l4_pf_trampoline_t::handler_ip. The page fault trampoline handler uses the stack and the stack pointer of the preempted context.

If the handler was able to resolve the page fault, it finishes using pf_trampoline_resume to resume to the preempted context.
If the page fault couldn't be resolved, the handler calls pf_trampoline_reflect which reflects the page fault to the exception handler of the thread.
If any page fault is triggered while the trampoline page fault handler is executed, a page fault IPC to the pager is generated.

13.1.10.14.3.14 l4_thread_register_del_irq()

```
l4_msgtag_t l4_thread_register_del_irq (
             l4_cap_idx_t thread,
             l4_cap_idx_t irq)  [inline]
```

Register an IRQ that will trigger upon deletion events.

Parameters

thread	Thread to register IRQ for.
irq	Capability index for the IRQ object to be triggered.

Returns

System call return tag containing the return code.

Return values

-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_W.

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion Irq can only be deregistered by deleting the Irq or the thread.
List of deletion events:

- deletion of one or several IPC gates bound to this thread.

When the deletion event is delivered, there is no indication about which IPC gate was deleted.
Definition at line 1181 of file thread.h.

13.1.10.14.3.15 l4_thread_register_doorbell_irq()

```
l4_msgtag_t l4_thread_register_doorbell_irq (
             l4_cap_idx_t thread,
             l4_cap_idx_t irq)  [inline]
```

Register an IRQ that will trigger when a forwarded virtual interrupt is pending.

Parameters

thread	Thread to register IRQ for.
irq	Capability index for the IRQ object to be triggered.

Returns

System call return tag containing the return code.

Return values

-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_W.

See l4_irq_bind_vcpu() for more details about how interrupts can be forwarded directly by the kernel to extended vCPU user mode.
In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion Irq can only be deregistered by deleting the Irq or the thread.

13.1.10.14.3.18 l4_thread_vcpu_control()

```
l4_msgtag_t l4_thread_vcpu_control (
             l4_cap_idx_t thread,
             l4_addr_t vcpu_state)  [inline]
```

Enable the vCPU feature for the thread.

Parameters

thread	Capability selector of the thread for which the vCPU feature shall be enabled.
vcpu_state	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see l4_task_add_ku_mem()).

Returns

Syscall return tag.

This function enables the vCPU feature of the `thread`.
The kernel-user memory area starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of l4_vcpu_state_t.

Note

Disabling of the vCPU feature is optional and currently not supported.

```
l4_msgtag_t l4_thread_vcpu_control_ext (
            l4_cap_idx_t thread,
            l4_addr_t ext_vcpu_state)  [inline]
```

Enable the extended vCPU feature for the thread.

Parameters

thread	Capability selector of the thread for which the extended vCPU feature shall be enabled.
ext_vcpu_state	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see l4_task_add_ku_mem()).

Returns

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT or AMD's SVM. This function enables the extended vCPU feature of the `thread`. Enabling the extended vCPU feature also enables the vCPU feature.
The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of L4_PAGESIZE. It includes the data of l4_vcpu_state_t at offset 0, the extended vCPU state at offset L4_VCPU↩ _OFFSET_EXT_STATE, and, on some platforms, the extended vCPU information at offset L4_VCPU_OFFSET_↩ EXT_INFOS.

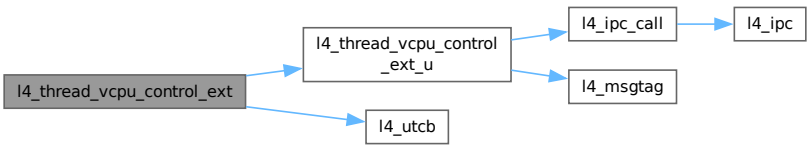
Note

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

Definition at line 1213 of file thread.h.
References L4_NOTHROW, l4_thread_vcpu_control_ext_u(), and l4_utcb().
Here is the call graph for this function:



13.1.10.14.3.20 l4_thread_vcpu_control_ext_u()

```
l4_msgtag_t l4_thread_vcpu_control_ext_u (
            l4_cap_idx_t thread,
            l4_addr_t ext_vcpu_state,
            l4_utcb_t * utcb)  [inline]
```

Enable the extended vCPU feature for the thread.

Parameters

thread	Capability selector of the thread for which the extended vCPU feature shall be enabled.

ext_vcpu_state	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see L4::Task::add_ku_mem()).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT-x (VMX) or AMD's AMD-V (SVM).
This function enables the extended vCPU feature of `this` thread. Enabling the extended vCPU feature also enables the vCPU feature.
The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of L4_PAGESIZE. It includes the data of l4_vcpu_state_t at offset 0, the extended vCPU state at offset L4_VCPU↩_OFFSET_EXT_STATE, and, on some platforms, the extended vCPU information at offset L4_VCPU_OFFSET_↩EXT_INFOS.
On Intel's VT-x (VMX), the extended vCPU state is l4_vm_vmx_vcpu_vmcs_t and the extended vCPU information is l4_vm_vmx_vcpu_infos_t. Furthermore, the extended vCPU state needs to be associated with a vCPU context (see l4_vm_vmx_set_hw_vmcs()).
On AMD's AMD-V (SVM), the extended vCPU state is l4_vm_svm_vmcb_t.

Note

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

             l4_addr_t vcpu_state,
             l4_utcb_t * utcb)  [inline]
```

Enable the vCPU feature for the thread.

Parameters

thread	Capability selector of the thread for which the vCPU feature shall be enabled.
vcpu_state	A virtual address pointing to a l4_vcpu_state_t. It must be a valid kernel-user-memory address (see L4::Task::add_ku_mem()).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

This function enables the vCPU feature of `this` thread
The kernel-user memory starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of l4_vcpu_state_t.
The asynchronous IPC handling is described at vCPU API.

Note

Disabling of the vCPU feature is optional and currently not supported.

13.1.10.14.3.22 l4_thread_vcpu_resume_commit()

```
l4_msgtag_t l4_thread_vcpu_resume_commit (
             l4_cap_idx_t thread,
             l4_msgtag_t tag)  [inline]
```

Commit vCPU resume.

Parameters

thread	Thread to be resumed, the invalid cap can be used for the current thread.
tag	Tag to use, returned by l4_thread_vcpu_resume_start()

Returns

Syscall return tag containing one of the following return codes.

Return values

0	Indicates a VM exit, provided that `thread` is in extended vCPU mode with virtual interrupts cleared.
1	Indicates an incoming IPC message, provided that the `thread` is in extended vCPU mode with virtual interrupts cleared.
-L4_EPERM	The user task capability set in the vCPU state is missing the L4_CAP_FPAGE_S right. On Intel's VT-x (VMX): The vCPU context capability set in the extended vCPU state is missing the L4_CAP_FPAGE_S right.
-L4_ENOENT	The user task capability set in the vCPU state is invalid.
-L4_EINVAL	`thread` is not the current running thread, or does not have the vCPU feature enabled. On Intel's VT-x (VMX): No vCPU context associated with the extended vCPU state.
-L4_EBUSY	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state is already active on a different CPU.
-L4_ENODEV	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state cannot be initialized or activated.
<0	A supplied mapping failed.

All flexpages in the UTCB (added with l4_sndfpage_add() after l4_thread_vcpu_resume_start()) are unconditionally mapped into the user task configured in the vCPU state.
To resume into another address space, the capability to the target Task (or L4::Vm) must be set in l4_vcpu_state_t::user_task together with L4_VCPU_F_USER_MODE. The capability selector must have all lower bits clear (see L4_CAP_MASK). The kernel adds the L4_SYSF_SEND flag there to indicate that the capability has been referenced in the kernel. Consecutive resumes will not reference the task capability again until all lower bits are cleared again. To release a task use a different task capability or use an invalid capability with the L4_SYSF_REPLY flag set.

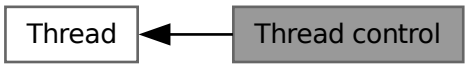
13.1.10.14.4 Thread control

API for Thread Control method.
Collaboration diagram for Thread control:



Functions

- void l4_thread_control_start (void) L4_NOTHROW

  Start a thread control API sequence.
- void l4_thread_control_pager (l4_cap_idx_t pager) L4_NOTHROW

  Set the pager.
- void l4_thread_control_exc_handler (l4_cap_idx_t exc_handler) L4_NOTHROW

  Set the exception handler.
- void l4_thread_control_bind (l4_utcb_t *thread_utcb, l4_cap_idx_t task) L4_NOTHROW

  Bind the thread to a task.
- void l4_thread_control_alien (int on) L4_NOTHROW

  Enable alien mode.
- l4_msgtag_t l4_thread_control_commit (l4_cap_idx_t thread) L4_NOTHROW

  Commit the thread control parameters.

13.1.10.14.4.1 Detailed Description

API for Thread Control method.
The thread control API provides access to almost any parameter of a thread object. The API is based on a single invocation of the thread object. However, because of the huge amount of parameters, the API provides a set of functions to set specific parameters of a thread and a commit function to commit the thread control call (see l4_thread_control_commit()).
A thread control operation must always start with l4_thread_control_start() and be committed with l4_thread_control_commit(). All other thread control parameter setter functions must be called between these two functions.
An example for a sequence of thread control API calls can be found below.
l4_thread_control_start();
l4_thread_control_pager(pager_cap);

l4_thread_control_bind (thread_utcb, task);
l4_thread_control_commit(thread_cap);

13.1.10.14.4.2 Function Documentation

l4_thread_control_alien()

```
void l4_thread_control_alien (
             int on)  [inline]
```

Enable alien mode.

Parameters

on	Boolean value defining the state of the feature.

For a thread in alien mode the kernel produces just an exception IPC for each IPC and exception caused by the alien thread instead of handling these events regularly. (Page faults of alien threads and interrupts occurring while the alien thread is running are always handled regularly.) While the alien thread is blocking, the exception handler can inspect and modify the state of the alien thread and potentially also the system call arguments. If the exception handler replies with L4_PROTO_ALLOW_SYSCALL as message tag, the kernel handles the next IPC or exception of the alien thread in a regular way. If the exception handler leaves certain thread state unchanged (in particular the instruction pointer), this will be the IPC or exception that caused the call of the exception handler. For a regularly processed IPC or exception of the alien thread the kernel also performs an exception IPC on kernel exit.
This feature can be used to attach a debugger to a thread and trace all object invocations and their results. It could also be used to handle other systems that use the same syscall instruction as L4Re.

Examples

examples/sys/aliens/main.c, and examples/sys/singlestep/main.c.

Definition at line 1125 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

l4_thread_control_bind()

```
void l4_thread_control_bind (
             l4_utcb_t * thread_utcb,
             l4_cap_idx_t task)  [inline]
```

Bind the thread to a task.

Parameters

thread_utcb	The thread's UTCB address within the task it shall be bound to. The address must be aligned (architecture dependent; at least word aligned) and it must point to at least L4_UTCB_OFFSET bytes of kernel-user memory.

task	The task the thread shall be bound to.

Precondition

The thread must not be bound to a task yet.

The capability `task` must have the permission L4_CAP_FPAGE_S, otherwise the later call to l4_thread_control_commit() will fail with L4_EPERM.

A thread may execute code in the context of a task if and only if the thread is bound to the task. To actually start execution, l4_thread_ex_regs() needs to be used. Execution in the context of the task means that the code has access to all the task's resources (and only those). The executed code itself must be one of those resources. A thread can be bound at most once to a task.

Note

The UTCBs of different threads in the same task should not overlap in order to prevent data corruption.

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 1119 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

l4_thread_control_commit()

```
l4_msgtag_t l4_thread_control_commit (
             l4_cap_idx_t thread)  [inline]
```

Commit the thread control parameters.

Parameters

thread	Capability selector of target thread to commit to.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	Operation successful.
-L4_EPERM	Insufficient permissions; see precondition.

-L4_EINVAL	Malformed thread control parameters.

Precondition

The capability `thread` must have the permission L4_CAP_FPAGE_S. When using l4_thread_control_bind(), also the respective task capability must have the permission L4_CAP_FPAGE_S.

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 1131 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

l4_thread_control_exc_handler()

```
void l4_thread_control_exc_handler (
             l4_cap_idx_t exc_handler)  [inline]
```

Set the exception handler.

Parameters

exc_handler	Capability index invoked to send an exception IPC.

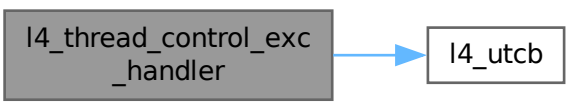
Note

The exception-handler capability index is interpreted in the task the thread is bound to (executes in).

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 1112 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:



l4_thread_control_pager()

```
void l4_thread_control_pager (
             l4_cap_idx_t pager)  [inline]
```

Set the pager.

Parameters

pager	Capability index invoked to send a page-fault IPC.

Note

The pager capability index is interpreted in the task the thread is bound to (executes in).

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 1106 of file thread.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

l4_thread_control_start()

```
void l4_thread_control_start (
             void )  [inline]
```

Start a thread control API sequence.
This function starts a sequence of thread control API functions. After this functions any of following functions may be called in any order.

- l4_thread_control_pager()
- l4_thread_control_exc_handler()
- l4_thread_control_bind()
- l4_thread_control_alien()

To commit the changes to the thread l4_thread_control_commit() must be called in the end.

Note

The thread control API calls store the parameters for the thread in the UTCB of the caller (see l4_utcb()), this means between l4_thread_control_start() and l4_thread_control_commit() no functions that modify the UTCB contents must be called.

Examples

examples/sys/aliens/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

  Offsets for vCPU state layouts.

- enum L4_vcpu_state_offset { L4_VCPU_OFFSET_EXT_STATE = 0x400 , L4_VCPU_OFFSET_EXT_INFOS = 0x200 }

  Offsets for vCPU state layouts.

13.1.10.14.5.1 Detailed Description

vCPU API.
The vCPU API in L4Re implements virtual processors (vCPUs) on top of L4::Thread. This API can be used for user level threading, operating system rehosting (see L4Linux) and virtualization.
You switch a thread into `vCPU` operation with L4::Thread::vcpu_control.
In vCPU mode, incoming IPC can be redirected to a handler function. If an IPC is sent to the vCPU, the thread's normal execution is interrupted and the handler called. Which kind of IPC is redirected is specified by the L4_vcpu_state_flags set in the l4_vcpu_state_t::state field of `vcpu_state`. All events enabled in the `vcpu_state` field are redirected to the handler. The handler is set via l4_vcpu_state_t::entry_ip and l4_vcpu_state_t::entry_sp. IPC redirection works independent of "kernel" and "user" mode, but see l4_vcpu_state_t::entry_sp. When the entry handler is called, the UTCB contains the result of the IPC and content normally found in CPU registers is in l4_vcpu_state_t::i.
Furthermore, the thread can execute in the context of different tasks, called the "kernel" and the "user" mode. The kernel task is the one to which the thread was originally bound via L4::Thread::control(). Execution starts in the kernel task and it is always switched to when the asynchronous IPC handler is invoked. When returning from the handler via l4_thread_vcpu_resume_start() and l4_thread_vcpu_resume_commit(), a different user task can be specified by setting l4_vcpu_state_t::user_task and enabling the L4_VCPU_F_USER_MODE flag in l4_vcpu_state_t::state. Note that the kernel may cache the user task internally, see l4_thread_vcpu_resume_commit().
If the L4_VCPU_F_USER_MODE flag is enabled, the following flags will be automatically enabled in l4_vcpu_state_t::state on L4::Thread::vcpu_resume_commit():

- L4_VCPU_F_IRQ

- L4_VCPU_F_PAGE_FAULTS
- L4_VCPU_F_EXCEPTIONS

When the kernel mode is entered, the following flags will be automatically disabled in l4_vcpu_state_t::state:

- L4_VCPU_F_IRQ
- L4_VCPU_F_PAGE_FAULTS
- L4_VCPU_F_USER_MODE

Extended vCPU operation is used for hardware CPU virtualization. It can be enabled with L4::Thread::vcpu_control_ext(). vCPU Support Library defines a convenience API for working with vCPUs.

vCPU Support Library

13.1.10.14.5.2 Enumeration Type Documentation

L4_vcpu_state_flags

`enum L4_vcpu_state_flags`
State flags of a vCPU.

Enumerator

L4_VCPU_F_IRQ	Receiving of IRQs and IPC enabled. While this flag is not set, the corresponding vCPU thread will not receive any IPC and threads attempting to send an IPC to this thread will block (according to the selected send timeout). **Note** On L4::Thread::vcpu_resume_commit() this flag is automatically enabled in l4_vcpu_state_t::state if L4_VCPU_F_USER_MODE is enabled. When the kernel mode is entered, this flag is automatically disabled in l4_vcpu_state_t::state.
L4_VCPU_F_PAGE_FAULTS	Page faults enabled. If this flag is set, a page fault switches to kernel mode (potentially causing a VM exit) and calls the entry handler. If this flag is not set, a page fault generates a page fault IPC to the pager of the vCPU thread. **Note** IPC redirection for page faults controlled by this flag works independent of "kernel" and "user" mode. On L4::Thread::vcpu_resume_commit() this flag is automatically enabled in l4_vcpu_state_t::state if L4_VCPU_F_USER_MODE is enabled. When the kernel mode is entered, this flag is automatically disabled in l4_vcpu_state_t::state.

L4_VCPU_F_EXCEPTIONS	Exceptions enabled. If this flag is set, then, on the event of an exception, the vCPU switches to kernel mode (potentially causing a VM exit) and calls the entry handler. If this flag is not set, an exception generates an exception IPC to the exception handler of the vCPU thread. **Note** IPC redirection for exceptions controlled by this flag works independent of "kernel" and "user" mode. On L4::Thread::vcpu_resume_commit() this flag is automatically enabled in l4_vcpu_state_t::state if L4_VCPU_F_USER_MODE is enabled.
L4_VCPU_F_USER_MODE	User task will be used. If set, the vCPU switches to user mode on next L4::Thread::vcpu_resume_commit(). If clear, the vCPU stays in "kernel" mode. **Note** When the kernel mode is entered, this flag is automatically disabled in l4_vcpu_state_t::state.
L4_VCPU_F_FPU_ENABLED	FPU enabled. This flag is only relevant if L4_VCPU_F_USER_MODE is set. Setting this flag allows code in vCPU mode to use the FPU. If this flag is not set, any FPU operation will trigger a corresponding exception (FPU fault).

Definition at line 101 of file vcpu.h.

L4_vcpu_state_offset [1/5]

enum L4_vcpu_state_offset
Offsets for vCPU state layouts.

Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 34 of file __vcpu-arch.h.

L4_vcpu_state_offset [2/5]

enum L4_vcpu_state_offset
Offsets for vCPU state layouts.

Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 35 of file __vcpu-arch.h.

L4_vcpu_state_offset [3/5]

enum L4_vcpu_state_offset
Offsets for vCPU state layouts.

Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 36 of file __vcpu-arch.h.

L4_vcpu_state_offset [4/5]

enum L4_vcpu_state_offset
Offsets for vCPU state layouts.

Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 34 of file __vcpu-arch.h.

L4_vcpu_state_offset [5/5]

enum L4_vcpu_state_offset
Offsets for vCPU state layouts.

Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 34 of file __vcpu-arch.h.

L4_vcpu_sticky_flags

enum L4_vcpu_sticky_flags
Sticky flags of a vCPU.

Enumerator

L4_VCPU_SF_IRQ_PENDING	An event is pending: Either an IRQ or another thread attempts to send an IPC to this vCPU thread.

Definition at line 167 of file vcpu.h.

13.1.10.15 Thread groups

C thread group interface, see L4::Thread_group for the C++ interface.

Collaboration diagram for Thread groups:

Enumerations

- enum L4_thread_group_ops { L4_THREAD_GROUP_ADD_OP = 2UL , L4_THREAD_GROUP_REMOVE_OP = 3UL }

  Operations on the Thread_group object.
- enum L4_thread_group_policy { L4_THREAD_GROUP_POLICY_STRICT_CORE_LOCAL = 0 , L4_THREAD_GROUP_POLIC = 1 }

  Thread group policy.

Functions

- l4_msgtag_t l4_thread_group_add (l4_cap_idx_t tg, l4_cap_idx_t thread) L4_NOTHROW

  Add thread to a thread group.
- l4_msgtag_t l4_thread_group_remove (l4_cap_idx_t tg, l4_cap_idx_t thread) L4_NOTHROW

  Remove thread from a thread group.

13.1.10.15.1 Detailed Description

C thread group interface, see L4::Thread_group for the C++ interface.
An L4 thread group is a collection of threads used as indirection for IPC gate and IRQ objects such that these objects can have multiple receivers, from which the kernel selects one according to a policy.
The primary use case for thread groups are multi-threaded servers and CPU core local IRQ / IPC delivery.
A thread can be bound to at most one thread group. Before binding a thread to a thread group, the thread must be bound to a task. All threads bound to the same thread group must belong to the same task.

13.1.10.15.2 Enumeration Type Documentation

13.1.10.15.2.1 L4_thread_group_ops

`enum L4_thread_group_ops`
Operations on the Thread_group object.

Enumerator

L4_THREAD_GROUP_ADD_OP	Add thread to thread group.
L4_THREAD_GROUP_REMOVE_OP	Remove thread from thread group.

Definition at line 40 of file thread_group.h.

13.1.10.15.2.2 L4_thread_group_policy

`enum L4_thread_group_policy`
Thread group policy.
Define how to select a suitable thread from the thread group.

Enumerator

L4_THREAD_GROUP_POLICY_STRICT_CORE_LOCAL	Use a thread on the same CPU core. Fail if no such thread is available.
L4_THREAD_GROUP_POLICY_SOFT_CORE_LOCAL	Prefer a thread on the same CPU core. Fall-back to another thread of the group if no such thread is available.

Definition at line 52 of file thread_group.h.

13.1.10.15.3 Function Documentation

13.1.10.15.3.1 l4_thread_group_add()

```
l4_msgtag_t l4_thread_group_add (
             l4_cap_idx_t tg,
             l4_cap_idx_t thread)  [inline]
```

Add thread to a thread group.

Parameters

tg	Thread group object.
thread	Thread to add to the thread group.

Definition at line 135 of file thread_group.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.15.3.2 l4_thread_group_remove()

```
l4_msgtag_t l4_thread_group_remove (
             l4_cap_idx_t tg,
             l4_cap_idx_t thread)  [inline]
```

Remove thread from a thread group.

Parameters

tg	Thread group object.
thread	Thread to remove from the thread group.

Definition at line 142 of file thread_group.h.
References L4_NOTHROW, and l4_utcb().

Here is the call graph for this function:

13.1.10.16 Virtual Console

C Virtual console interface for simple character based input and output, see L4::Vcon for the C++ interface.
Collaboration diagram for Virtual Console:

Data Structures

- struct l4_vcon_attr_t

  Vcon attribute structure.

Typedefs

- typedef struct l4_vcon_attr_t l4_vcon_attr_t

  Vcon attribute structure.

Enumerations

- enum L4_vcon_size_consts { L4_VCON_WRITE_SIZE = (L4_UTCB_GENERIC_DATA_SIZE - 2) * sizeof(l4_umword_t) , L4_VCON_READ_SIZE = (L4_UTCB_GENERIC_DATA_SIZE - 1) * sizeof(l4_↩ umword_t) }

  Size constants.
- enum L4_vcon_i_flags { L4_VCON_INLCR = 000100 , L4_VCON_IGNCR = 000200 , L4_VCON_ICRNL = 000400 }

  Input flags.
- enum L4_vcon_o_flags { L4_VCON_ONLCR = 000004 , L4_VCON_OCRNL = 000010 , L4_VCON_ONLRET = 000040 }

  Output flags.
- enum L4_vcon_l_flags { L4_VCON_ICANON = 000002 , L4_VCON_ECHO = 000010 }

  Local flags.

Functions

- l4_msgtag_t l4_vcon_send (l4_cap_idx_t vcon, char const *buf, unsigned size) L4_NOTHROW

  Send data to virtual console.

- l4_msgtag_t l4_vcon_send_u (l4_cap_idx_t vcon, char const *buf, unsigned size, l4_utcb_t *utcb) L4_NOTHROW

  Send data to `this` virtual console.
- long l4_vcon_write (l4_cap_idx_t vcon, char const *buf, unsigned size) L4_NOTHROW

  Write data to virtual console.
- long l4_vcon_write_u (l4_cap_idx_t vcon, char const *buf, unsigned size, l4_utcb_t *utcb) L4_NOTHROW

  Write data to `this` virtual console.
- int l4_vcon_read (l4_cap_idx_t vcon, char *buf, unsigned size) L4_NOTHROW

  Read data from virtual console.
- int l4_vcon_read_u (l4_cap_idx_t vcon, char *buf, unsigned size, l4_utcb_t *utcb) L4_NOTHROW

  Read data from `this` virtual console.
- int l4_vcon_read_with_flags (l4_cap_idx_t vcon, char *buf, unsigned size) L4_NOTHROW

  Read data from virtual console, extended version including flags.
- l4_msgtag_t l4_vcon_set_attr (l4_cap_idx_t vcon, l4_vcon_attr_t const *attr) L4_NOTHROW

  Set attributes of a Vcon.
- l4_msgtag_t l4_vcon_set_attr_u (l4_cap_idx_t vcon, l4_vcon_attr_t const *attr, l4_utcb_t *utcb) L4_NOTHROW

  Set the attributes of `this` virtual console.
- l4_msgtag_t l4_vcon_get_attr (l4_cap_idx_t vcon, l4_vcon_attr_t *attr) L4_NOTHROW

  Get attributes of a Vcon.
- l4_msgtag_t l4_vcon_get_attr_u (l4_cap_idx_t vcon, l4_vcon_attr_t *attr, l4_utcb_t *utcb) L4_NOTHROW

  Get attributes of `this` virtual console.
- void l4_vcon_set_attr_raw (l4_vcon_attr_t *attr) L4_NOTHROW

  Set terminal attributes to disable all special processing.

13.1.10.16.1 Detailed Description

C Virtual console interface for simple character based input and output, see L4::Vcon for the C++ interface.
The interrupt for read events is provided by the virtual key interrupt which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

A server implementing the virtual console protocol has a queue for input events. When the first input event is added to the empty queue, the virtual key interrupt is triggered. Further events are added to the queue without generating further interrupts. The queue is emptied when a client reads all queued input events.

Include File

```
#include <l4/sys/vcon.h>
```

See L4::Vcon for the C++ interface.

13.1.10.16.2 Typedef Documentation

13.1.10.16.2.1 l4_vcon_attr_t

`typedef struct l4_vcon_attr_t l4_vcon_attr_t`

Vcon attribute structure.
The flags members can be a combination of their respective enums.

See also

L4_vcon_i_flags
L4_vcon_o_flags
L4_vcon_l_flags

13.1.10.16.3 Enumeration Type Documentation

13.1.10.16.3.1 L4_vcon_i_flags

`enum L4_vcon_i_flags`
Input flags.

Enumerator

L4_VCON_INLCR	Translate NL to CR.
L4_VCON_IGNCR	Ignore CR.
L4_VCON_ICRNL	Translate CR to NL if L4_VCON_IGNCR is not set.

Definition at line 208 of file vcon.h.

13.1.10.16.3.2 L4_vcon_l_flags

`enum L4_vcon_l_flags`
Local flags.

Enumerator

L4_VCON_ICANON	Canonical mode.
L4_VCON_ECHO	Echo input.

Definition at line 230 of file vcon.h.

13.1.10.16.3.3 L4_vcon_o_flags

`enum L4_vcon_o_flags`
Output flags.

Enumerator

L4_VCON_ONLCR	Translate NL to CR-NL.
L4_VCON_OCRNL	Translate CR to NL.
L4_VCON_ONLRET	Do not output CR.

Definition at line 219 of file vcon.h.

13.1.10.16.3.4 L4_vcon_size_consts

`enum L4_vcon_size_consts`
Size constants.

Enumerator

L4_VCON_WRITE_SIZE	Maximum size that can be written with one l4_vcon_write call.
L4_VCON_READ_SIZE	Maximum size that can be read with one l4_vcon_read* call.

Definition at line 95 of file vcon.h.

13.1.10.16.4 Function Documentation

13.1.10.16.4.1 l4_vcon_get_attr()

```
l4_msgtag_t l4_vcon_get_attr (
             l4_cap_idx_t vcon,
             l4_vcon_attr_t * attr)  [inline]
```

Get attributes of a Vcon.

Parameters

	vcon	Vcon object.
out	*attr*	Attribute structure.

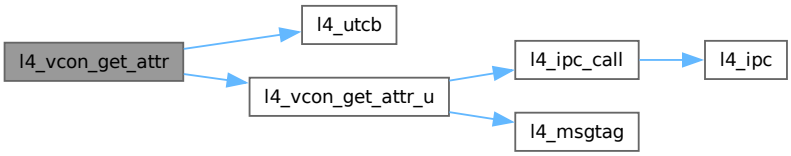
Returns

Syscall return tag

Examples

examples/sys/isr/main.c.

Definition at line 435 of file vcon.h.
References L4_NOTHROW, l4_utcb(), and l4_vcon_get_attr_u().
Here is the call graph for this function:



13.1.10.16.4.2 l4_vcon_get_attr_u()

```
l4_msgtag_t l4_vcon_get_attr_u (
             l4_cap_idx_t vcon,
             l4_vcon_attr_t * attr,
             l4_utcb_t * utcb)  [inline]
```

Get attributes of `this` virtual console.

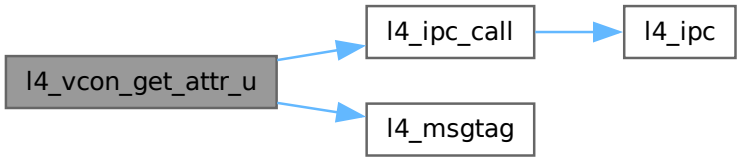
Parameters

	vcon	Capability index of the vcon object.
out	*attr*	Attribute structure. Contains the attributes after a successful call of this function.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

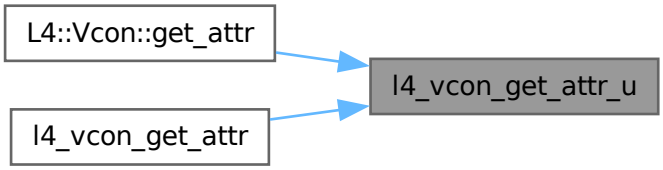
Returns

Syscall return tag.

Definition at line 417 of file vcon.h.
References l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_NOTHROW, L4_PROTO_LOG, L4_VCON_GET_ATTR_OP, and l4_msg_regs_t::mr.
Referenced by L4::Vcon::get_attr(), and l4_vcon_get_attr().
Here is the call graph for this function:



Here is the caller graph for this function:



13.1.10.16.4.3 l4_vcon_read()

```
int l4_vcon_read (
              l4_cap_idx_t vcon,
              char * buf,
              unsigned size)  [inline]
```

Read data from virtual console.

Parameters

	vcon	Vcon object.
out	*buf*	Pointer to data buffer.
	size	Size of buffer in bytes.

Return values

-L4_EPERM	Insufficient permissions; see precondition.
>size	More bytes to read, `size` bytes are in the buffer `buf`.
<=size	Number of bytes read.

Precondition

The capability `vcon` must have the permission L4_CAP_FPAGE_W.

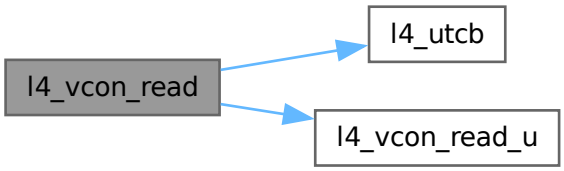
Note

Size must not exceed L4_VCON_READ_SIZE.

Examples

examples/sys/isr/main.c.

Definition at line 391 of file vcon.h.
References L4_NOTHROW, l4_utcb(), and l4_vcon_read_u().
Here is the call graph for this function:



13.1.10.16.4.4 l4_vcon_read_u()

```
int l4_vcon_read_u (
            l4_cap_idx_t vcon,
            char * buf,
            unsigned size,
            l4_utcb_t * utcb)  [inline]
```

Read data from `this` virtual console.

Parameters

	vcon	Capability index of the vcon object.
`out`	*buf*	Pointer to data buffer.
	size	Size of the data buffer in bytes.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

-L4_EPERM	Insufficient permissions; see precondition.

>*size*	More bytes to read, `size` bytes are in the buffer `buf`.
<=*size*	Number of bytes read.

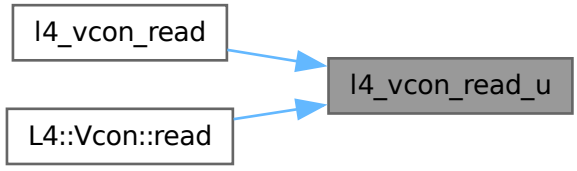
Precondition

The invoked Vcon capability must have the permission L4_CAP_FPAGE_W.

Note

Size must not exceed L4_VCON_READ_SIZE.

Definition at line 381 of file vcon.h.
References L4_NOTHROW, and L4_VCON_READ_SIZE_MASK.
Referenced by l4_vcon_read(), and L4::Vcon::read().
Here is the caller graph for this function:



13.1.10.16.4.5 l4_vcon_read_with_flags()

```
int l4_vcon_read_with_flags (
            l4_cap_idx_t vcon,
            char * buf,
            unsigned size)  [inline]
```

Read data from virtual console, extended version including flags.

Parameters

	vcon	Vcon object.
out	*buf*	Pointer to data buffer.
	size	Size of buffer in bytes.

If this function returns a positive value the caller can check the L4_VCON_READ_STAT_BREAK flag bit for a break condition. The bytes read can be obtained by masking the return value with L4_VCON_READ_SIZE_MASK.
If a break condition is signaled, it is always the first event in the transmitted content, i.e. all characters supplied by this read call follow the break condition.
`buf` might be a `NULL`, in this case the input data will be dropped.

Note

Size must not exceed L4_VCON_READ_SIZE.

Return values

-L4_EPERM	Insufficient permissions; see precondition.
>size	More bytes to read, `size` bytes are in the buffer `buf`.
<=size	Number of bytes read.

Precondition

The capability `vcon` must have the permission L4_CAP_FPAGE_W.

Definition at line 375 of file vcon.h.
References L4_NOTHROW, and l4_utcb().
Here is the call graph for this function:

13.1.10.16.4.6 l4_vcon_send()

```
l4_msgtag_t l4_vcon_send (
             l4_cap_idx_t vcon,
             char const * buf,
             unsigned size)  [inline]
```

Send data to virtual console.

Parameters

vcon	Vcon object.
buf	Pointer to data buffer.
size	Size of buffer in bytes.

Returns

Syscall return tag

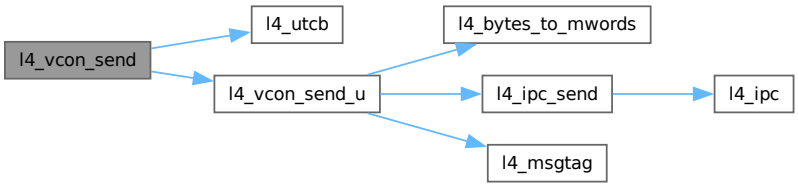
Note

Size must not exceed L4_VCON_WRITE_SIZE, a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use l4_ipc_error() to check for send errors, and **do not** use l4_error().

Examples

examples/sys/utcb-ipc/main.c.

Definition at line 315 of file vcon.h.
References L4_NOTHROW, l4_utcb(), and l4_vcon_send_u().
Here is the call graph for this function:



13.1.10.16.4.7 l4_vcon_send_u()

```
l4_msgtag_t l4_vcon_send_u (
            l4_cap_idx_t vcon,
            char const * buf,
            unsigned size,
            l4_utcb_t * utcb)  [inline]
```

Send data to `this` virtual console.

Parameters

vcon	Capability index of the Vcon object.
buf	Pointer to the data buffer.
size	Size of the data buffer in bytes.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag

Note

Size must not exceed L4_VCON_WRITE_SIZE, a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use l4_ipc_error() to check for send errors, do not use l4_error(), as l4_error() will always return an error.

13.1.10.16.4.8 l4_vcon_set_attr()

```
l4_msgtag_t l4_vcon_set_attr (
            l4_cap_idx_t vcon,
            l4_vcon_attr_t const * attr)  [inline]
```

Set attributes of a Vcon.

Parameters

vcon	Vcon object.
attr	Attribute structure.

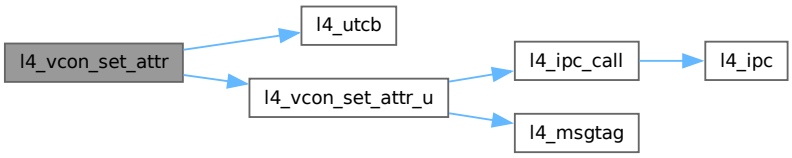
Returns

Syscall return tag

Examples

examples/sys/isr/main.c.

Definition at line 411 of file vcon.h.
References L4_NOTHROW, l4_utcb(), and l4_vcon_set_attr_u().
Here is the call graph for this function:



13.1.10.16.4.9 l4_vcon_set_attr_raw()

```
void l4_vcon_set_attr_raw (
            l4_vcon_attr_t * attr)  [inline]
```

Set terminal attributes to disable all special processing.
Removes all flags that would mangle the read or written characters. Also disables echoing and any special processing of characters.

Parameters

in,out	*attr*	Attribute structure to update.

Definition at line 441 of file vcon.h.
References L4_NOTHROW.
Referenced by l4_vcon_attr_t::set_raw().

            l4_cap_idx_t vcon,
            l4_vcon_attr_t const * attr,
            l4_utcb_t * utcb)  [inline]
```

Set the attributes of `this` virtual console.

Parameters

vcon	Capability index of the vcon object.
attr	Attribute structure with the attributes for the virtual console.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

Definition at line 397 of file vcon.h.

13.1.11 Kernel Interface Page

Kernel Interface Page.
Collaboration diagram for Kernel Interface Page:

Topics

- Memory descriptors (C version) 406
  C Interface for KIP memory descriptors.

Data Structures

- class L4::Kip::Mem_desc
  Memory descriptors stored in the kernel interface page.
- struct l4_kernel_info_t
  L4 Kernel Interface Page.

Macros

- #define **L4_KERNEL_INFO_MAGIC** (0x4BE6344CL) /* "L4µK" */

  Kernel Info Page identifier ("L4µK").

Typedefs

- typedef struct l4_kernel_info_t l4_kernel_info_t

  L4 Kernel Interface Page.

Enumerations

- enum { L4_KIP_OFFS_READ_US = 0x900 , L4_KIP_OFFS_READ_NS = 0x980 }

Functions

- l4_kernel_info_t const * l4_kip (void) L4_NOTHROW

  Get Kernel Info Page.
- l4_umword_t l4_kip_version (l4_kernel_info_t const *kip) L4_NOTHROW

  Get the kernel version.
- const char * l4_kip_version_string (l4_kernel_info_t const *kip) L4_NOTHROW

  Get the kernel version string.
- int l4_kernel_info_version_offset (l4_kernel_info_t const *kip) L4_NOTHROW

  Return offset in bytes of version_strings relative to the KIP base.
- l4_cpu_time_t l4_kip_clock (l4_kernel_info_t const *kip) L4_NOTHROW

  Return clock value from the KIP.
- l4_umword_t l4_kip_clock_lw (l4_kernel_info_t const *kip) L4_NOTHROW

  Return least significant machine word of clock value from the KIP.
- l4_uint64_t l4_kip_clock_ns (l4_kernel_info_t const *kip) L4_NOTHROW

  Return current clock using the KIP in nanoseconds.

13.1.11.1 Detailed Description

Kernel Interface Page.
C interface for the Kernel Interface Page:

C++ interface for the Kernel Interface Page:

Include File

```
#include <l4/sys/kip>
```

Include File

```
#include <l4/sys/kip.h>
```

13.1.11.2 Typedef Documentation

13.1.11.2.1 l4_kernel_info_t

```
typedef struct l4_kernel_info_t l4_kernel_info_t
```

L4 Kernel Interface Page.
32-bit architecture may assume that the upper 32 bits of addresses is 0

13.1.11.3 Enumeration Type Documentation

13.1.11.3.1 anonymous enum

```
anonymous enum
```

Enumerator

L4_KIP_OFFS_READ_US	Offset of KIP code (provided by the kernel) for reading the KIP clock in microseconds. If the kernel is configured for a fine-grained KIP clock (CONFIG_SYNC_↩ TSC enabled for IA32, ARM_SYNC_CLOCK for ARM), this code provides the KIP clock with microseconds granularity and accuracy by reading the hardware clock used by the kernel and transforming this value into microseconds. Otherwise this code just reads the KIP clock value.
L4_KIP_OFFS_READ_NS	Offset of KIP code (provided by the kernel) for reading the time stamp counter and transforming this value into nanoseconds. If the kernel is configured for fine-grained KIP clock (CONFIG_SYNC enabled for IA32, ARM_SYNC_CLOCK for ARM), this code provides the KIP clock with nanoseconds granularity and accuracy by reading the hardware clock used by the kernel and transforming this value into nanoseconds. Otherwise this code just reads the KIP clock value and multiplies it by 1000.

Definition at line 95 of file kip.h.

13.1.11.4 Function Documentation

13.1.11.4.1 l4_kernel_info_version_offset()

```
int l4_kernel_info_version_offset (
            l4_kernel_info_t const * kip)  [inline]
```

Return offset in bytes of version_strings relative to the KIP base.

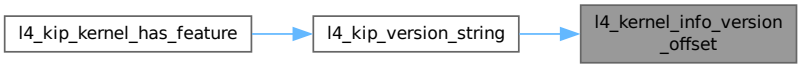
Parameters

kip	Pointer to the kernel info page (KIP).

Returns

offset of version_strings relative to the KIP base address, in bytes.

Definition at line 238 of file kip.h.
References L4_NOTHROW.
Referenced by l4_kip_version_string().
Here is the caller graph for this function:



13.1.11.4.2 l4_kip()

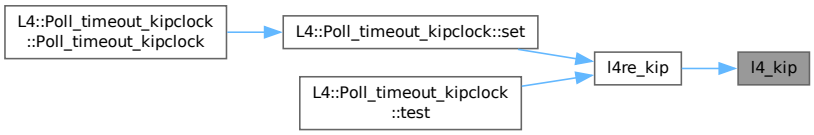
```
l4_kernel_info_t const * l4_kip (
            void )  [inline]
```

Get Kernel Info Page.

Returns

Pointer to Kernel Info Page (KIP) structure.

Definition at line 226 of file kip.h.
References L4_NOTHROW.
Referenced by l4re_kip().
Here is the caller graph for this function:



13.1.11.4.3 l4_kip_clock()

```
l4_cpu_time_t l4_kip_clock (
            l4_kernel_info_t const * kip)  [inline]
```

Return clock value from the KIP.

Parameters

kip	Pointer to the kernel info page (KIP).

Returns

Value of the clock field in the KIP.

The KIP clock always contains the current (relative) time in micro seconds independently of the CPU frequency. The clock is only guaranteed to be accurate within the scheduling granularity announced in the KIP.
This function basically calls the KIP code for reading the KIP clock with microseconds resolution. The accuracy depends on the platform and the kernel configuration.

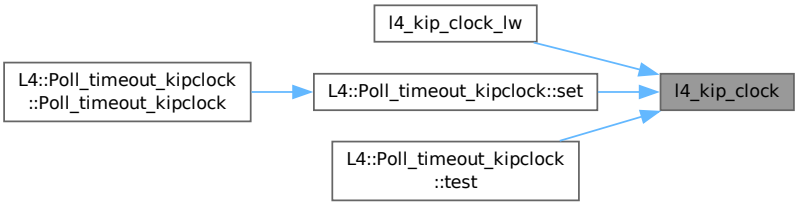
L4_KIP_OFFS_READ_US.

Examples

examples/libs/shmc/prodcons.c.

Definition at line 242 of file kip.h.
References L4_KIP_OFFS_READ_US, and L4_NOTHROW.
Referenced by l4_kip_clock_lw(), L4::Poll_timeout_kipclock::set(), and L4::Poll_timeout_kipclock::test().
Here is the caller graph for this function:



13.1.11.4.4 l4_kip_clock_lw()

```
l4_umword_t l4_kip_clock_lw (
            l4_kernel_info_t const * kip)  [inline]
```

Return least significant machine word of clock value from the KIP.

Parameters

kip	Pointer to the kernel info page (KIP).

Returns

Lower machine word of clock value from the KIP.

Deprecated Use l4_kip_clock() instead.

This function will always provide the least significant machine word of the clock value from the KIP, regardless of the kernel configuration.
Definition at line 261 of file kip.h.
References l4_kip_clock(), and L4_NOTHROW.
Here is the call graph for this function:

13.1.11.4.5 l4_kip_clock_ns()

```
l4_cpu_time_t l4_kip_clock_ns (
            l4_kernel_info_t const * kip)  [inline]
```

Return current clock using the KIP in nanoseconds.

Parameters

kip	Pointer to the kernel info page (KIP).

Returns

Value of the current clock in nanoseconds.

This function basically calls the KIP code for reading the KIP clock with nanoseconds resolution. The accuracy depends on the platform and the kernel configuration.

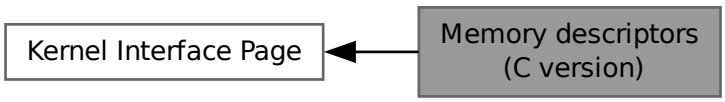
13.1.11.5 Memory descriptors (C version)

C Interface for KIP memory descriptors.
Collaboration diagram for Memory descriptors (C version):



Data Structures

- struct l4_kernel_info_mem_desc_t

  Memory descriptor data structure.

Typedefs

- typedef struct l4_kernel_info_mem_desc_t l4_kernel_info_mem_desc_t

  Memory descriptor data structure.

Enumerations

- enum l4_mem_type_t {
  l4_mem_type_undefined = 0x0 , l4_mem_type_conventional = 0x1 , l4_mem_type_reserved = 0x2 , l4_mem_type_dedicated = 0x3 ,
  l4_mem_type_shared = 0x4 , l4_mem_type_kmem = 0x5 , l4_mem_type_info = 0xd , l4_mem_type_bootloader = 0xe ,
  l4_mem_type_archspecific = 0xf }

  Type of a memory descriptor.
- enum l4_mem_info_sub_type_t { l4_mem_info_acpi_rsdp = 0 , l4_mem_reserved_kernel = 0 , l4_mem_reserved_heap = 1 , l4_mem_reserved_mmio = 2 }

  Memory sub types for l4_mem_type_info descriptors.
- enum l4_mem_archspecific_sub_type_common_t { l4_mem_archspecific_acpi_tables = 3 , l4_mem_archspecific_acpi_nvs = 4 , l4_mem_archspecific_cpu_fw = 5 }

  Memory sub types for l4_mem_type_archspecific descriptors.

Functions

- l4_kernel_info_mem_desc_t * **l4_kernel_info_get_mem_descs** (l4_kernel_info_t *kip) L4_NOTHROW

  Get pointer to memory descriptors from KIP.
- unsigned l4_kernel_info_get_num_mem_descs (l4_kernel_info_t *kip) L4_NOTHROW

  Get number of memory descriptors in KIP.
- void l4_kernel_info_set_mem_desc (l4_kernel_info_mem_desc_t *md, l4_addr_t start, l4_addr_t end, unsigned type, unsigned virt, unsigned sub_type) L4_NOTHROW

  Populate a memory descriptor.
- l4_umword_t l4_kernel_info_get_mem_desc_start (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get start address of the region described by the memory descriptor.
- l4_umword_t l4_kernel_info_get_mem_desc_end (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get end address of the region described by the memory descriptor.
- l4_umword_t l4_kernel_info_get_mem_desc_type (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

Get type of the memory region.

- l4_umword_t l4_kernel_info_get_mem_desc_subtype (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get sub-type of memory region.

- l4_umword_t l4_kernel_info_get_mem_desc_is_virtual (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get virtual flag of the memory descriptor.

13.1.11.5.1 Detailed Description

C Interface for KIP memory descriptors.

Include File

```
#include <l4/sys/memdesc.h>
```

This module contains the C functions to access the memory descriptor in the kernel interface page (KIP).

13.1.11.5.2 Typedef Documentation

13.1.11.5.2.1 l4_kernel_info_mem_desc_t

`typedef struct l4_kernel_info_mem_desc_t l4_kernel_info_mem_desc_t`
Memory descriptor data structure.

Note

This data type is opaque, and must be accessed by the accessor functions defined in this module.

13.1.11.5.3 Enumeration Type Documentation

13.1.11.5.3.1 l4_mem_archspecific_sub_type_common_t

`enum l4_mem_archspecific_sub_type_common_t`
Memory sub types for l4_mem_type_archspecific descriptors.

Enumerator

l4_mem_archspecific_acpi_tables	Firmware ACPI tables.
l4_mem_archspecific_acpi_nvs	Firmware reserved address space.
l4_mem_archspecific_cpu_fw	CPU firmware.

Definition at line 66 of file memdesc.h.

13.1.11.5.3.2 l4_mem_info_sub_type_t

`enum l4_mem_info_sub_type_t`
Memory sub types for l4_mem_type_info descriptors.

Enumerator

l4_mem_info_acpi_rsdp	Physical address of the ACPI root pointer.
l4_mem_reserved_kernel	Kernel image.
l4_mem_reserved_heap	Kernel heap.
l4_mem_reserved_mmio	MMIO range reserved by kernel.

Definition at line 53 of file memdesc.h.

13.1.11.5.3.3 l4_mem_type_t

enum l4_mem_type_t
Type of a memory descriptor.

Enumerator

l4_mem_type_undefined	Undefined, unused descriptor.
l4_mem_type_conventional	Conventional memory.
l4_mem_type_reserved	Reserved memory for kernel etc.
l4_mem_type_dedicated	Dedicated memory (some device memory).
l4_mem_type_shared	Shared memory (not implemented).
l4_mem_type_kmem	Kernel memory.
l4_mem_type_info	Info from the boot loader.
l4_mem_type_bootloader	Memory owned by the boot loader.
l4_mem_type_archspecific	Architecture specific memory (e.g., ACPI memory).

Definition at line 33 of file memdesc.h.

13.1.11.5.4 Function Documentation

13.1.11.5.4.1 l4_kernel_info_get_mem_desc_end()

```
l4_umword_t l4_kernel_info_get_mem_desc_end (
            l4_kernel_info_mem_desc_t * md)  [inline]
```

Get end address of the region described by the memory descriptor.

Returns

End address.

Definition at line 223 of file memdesc.h.
References L4_NOTHROW.

13.1.11.5.4.2 l4_kernel_info_get_mem_desc_is_virtual()

```
l4_umword_t l4_kernel_info_get_mem_desc_is_virtual (
            l4_kernel_info_mem_desc_t * md)  [inline]
```

Get virtual flag of the memory descriptor.

Returns

1 if region is virtual memory, 0 if region is physical memory

Definition at line 244 of file memdesc.h.
References L4_NOTHROW.

13.1.11.5.4.3 l4_kernel_info_get_mem_desc_start()

```
l4_umword_t l4_kernel_info_get_mem_desc_start (
            l4_kernel_info_mem_desc_t * md)  [inline]
```

Get start address of the region described by the memory descriptor.

Returns

Start address.

Definition at line 216 of file memdesc.h.
References L4_NOTHROW.

13.1.11.5.4.4 l4_kernel_info_get_mem_desc_subtype()

```
l4_umword_t l4_kernel_info_get_mem_desc_subtype (
             l4_kernel_info_mem_desc_t * md)  [inline]
```

Get sub-type of memory region.

Returns

Sub-type.

The sub type is defined for architecture specific memory descriptors (see l4_mem_type_archspecific) and has architecture specific meaning.
Definition at line 237 of file memdesc.h.
References L4_NOTHROW.

13.1.11.5.4.5 l4_kernel_info_get_mem_desc_type()

```
l4_umword_t l4_kernel_info_get_mem_desc_type (
             l4_kernel_info_mem_desc_t * md)  [inline]
```

Get type of the memory region.

Returns

Type of the region (see l4_mem_type_t).

Definition at line 230 of file memdesc.h.
References L4_NOTHROW.

13.1.11.5.4.6 l4_kernel_info_get_num_mem_descs()

```
unsigned l4_kernel_info_get_num_mem_descs (
             l4_kernel_info_t * kip)  [inline]
```

Get number of memory descriptors in KIP.

Returns

Number of memory descriptors.

Definition at line 194 of file memdesc.h.
References L4_NOTHROW.

13.1.11.5.4.7 l4_kernel_info_set_mem_desc()

```
void l4_kernel_info_set_mem_desc (
             l4_kernel_info_mem_desc_t * md,
             l4_addr_t start,
             l4_addr_t end,
             unsigned type,
             unsigned virt,
             unsigned sub_type)  [inline]
```

Populate a memory descriptor.

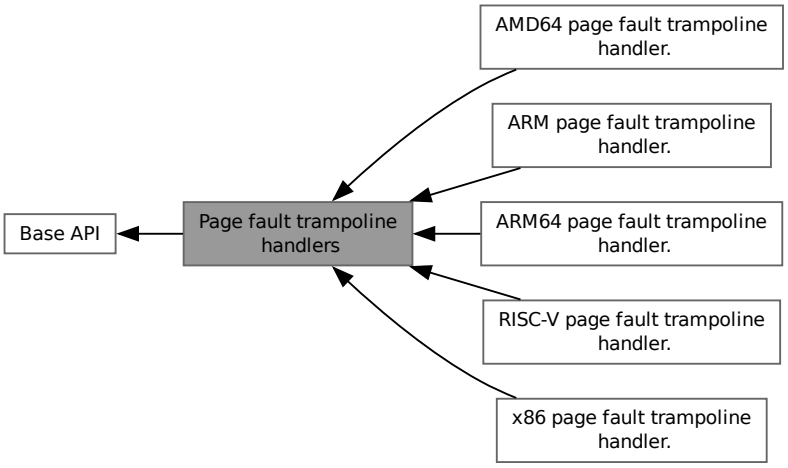
Parameters

md	Pointer to memory descriptor
start	Start of region
end	End of region
type	Type of region
virt	1 if virtual region, 0 if physical region
sub_type	Sub type.

Definition at line 201 of file memdesc.h.
References L4_NOTHROW.

13.1.12 Page fault trampoline handlers

A page fault trampoline handler is an alternative mechanism to handle page faults.
Collaboration diagram for Page fault trampoline handlers:



Topics

- ARM page fault trampoline handler. . . . 412
- ARM64 page fault trampoline handler. . . . 412
- AMD64 page fault trampoline handler. . . . 413
- x86 page fault trampoline handler. . . . 413
- RISC-V page fault trampoline handler. . . . 414

Data Structures

- struct l4_pf_trampoline_t

  State for page fault trampoline handler.

Typedefs

- typedef struct l4_pf_trampoline_regs_t **l4_pf_trampoline_regs_t**

  Opaque type for the page fault trampoline register state.
- typedef struct l4_pf_trampoline_t l4_pf_trampoline_t

  Opaque type for the page fault trampoline state.

Enumerations

- enum L4_pf_trampoline_flags { Page_fault_in_progress = 1 << 0 , Trigger_exception_after_resume = 1 << 1 }

  Definitions for l4_pf_trampoline_t::flags.

13.1.12.1 Detailed Description

A page fault trampoline handler is an alternative mechanism to handle page faults.
Instead of sending a page fault IPC to the pager of the faulting thread, a dedicated page fault handler is directly called by the kernel in the context of the faulting thread.
The handler has access to the instruction pointer and the page fault address. The l4_pf_trampoline_t state contains this information plus additional information saved by the kernel on entering the kernel page fault handler and restored before leaving the kernel page fault handler.

Include File

```
#include <l4/sys/pf_trampoline.h>
```

13.1.12.2 Typedef Documentation

13.1.12.2.1 l4_pf_trampoline_t

```
typedef struct l4_pf_trampoline_t l4_pf_trampoline_t
```

Opaque type for the page fault trampoline state.
State for page fault trampoline handler.
Definition at line 75 of file pf_trampoline.h.

13.1.12.3 Enumeration Type Documentation

13.1.12.3.1 L4_pf_trampoline_flags

```
enum L4_pf_trampoline_flags
```

Definitions for l4_pf_trampoline_t::flags.

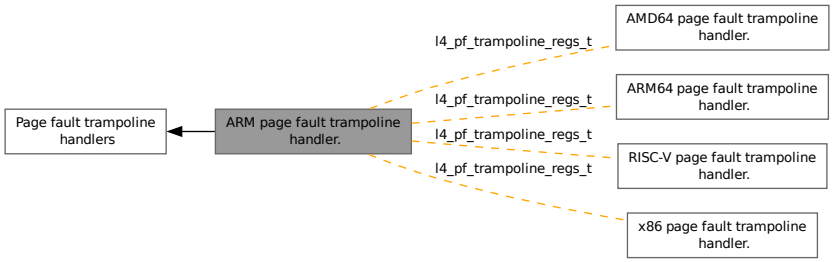
Enumerator

Page_fault_in_progress	The corresponding thread is currently handling a page fault using the trampoline handler. The thread must not be ex-regs'd during that time!
Trigger_exception_after_resume	Trigger an exception at the corresponding thread when the thread resumes execution after returning from a page fault trampoline handler. Used for deferred triggering of an artificial exception, for example, for signal handling↩ : If a thread resolving a page fault using a trampoline page fault handler is being ex_regs'd(L4_THREAD_EX_REGS_TRIGGER_EXCEPTION), the thread must not longjmp before the trampoline page fault handler resumed. Instead, the signal handler just sets Trigger_exception_after_resume and returns. Once the trampoline page fault handler resumes, the kernel resets this flags and triggers the artificial exception which is again handled by the signal handler.

Definition at line 40 of file pf_trampoline.h.

13.1.12.4 ARM page fault trampoline handler.

Collaboration diagram for ARM page fault trampoline handler.:



Data Structures

- struct l4_pf_trampoline_regs_t

  Register state for page fault trampoline handlers.

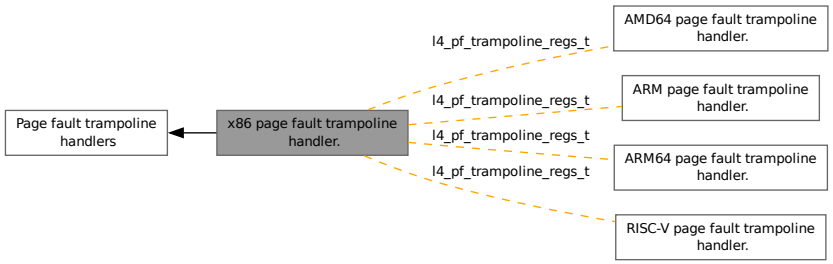
13.1.12.7 x86 page fault trampoline handler.

Collaboration diagram for x86 page fault trampoline handler.:



Data Structures

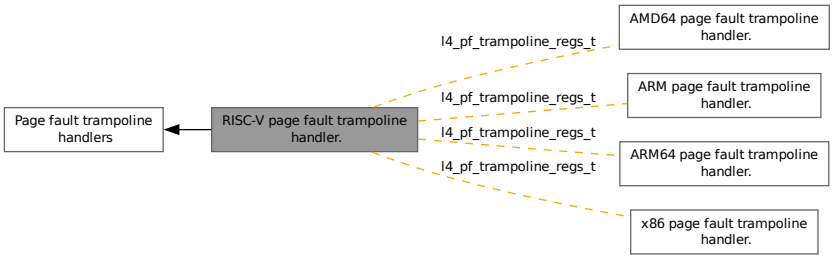
- struct l4_pf_trampoline_regs_t

  Register state for page fault trampoline handlers.

13.1.12.7.1 Detailed Description

13.1.12.8 RISC-V page fault trampoline handler.

Collaboration diagram for RISC-V page fault trampoline handler.:



Data Structures

- struct l4_pf_trampoline_regs_t

  Register state for page fault trampoline handlers.

13.1.12.8.1 Detailed Description

13.1.13 Capabilities

C interface for capabilities.
Collaboration diagram for Capabilities:

Macros

- #define **L4_CAP_SHIFT**

  Capability index shift; see l4_cap_idx_t.
- #define L4_CAP_SIZE

  Deprecated.
- #define **L4_CAP_OFFSET**

  Offset of two consecutive capability indices.
- #define **L4_CAP_MASK**

  Mask to get only the relevant bits of an l4_cap_idx_t.
- #define **L4_INVALID_CAP**

  Invalid capability selector; see l4_cap_idx_t.
- #define L4_INVALID_CAP_BIT

  Bit indicating if a capability selector is invalid.

Typedefs

- typedef unsigned long l4_cap_idx_t

  Capability selector type.

Enumerations

- enum l4_default_caps_t {
  L4_BASE_TASK_CAP , L4_BASE_FACTORY_CAP , L4_BASE_THREAD_CAP , L4_BASE_PAGER_CAP ,
  L4_BASE_LOG_CAP , L4_BASE_ICU_CAP , L4_BASE_SCHEDULER_CAP , L4_BASE_IOMMU_CAP ,
  L4_BASE_DEBUGGER_CAP , L4_BASE_ARM_SMCCC_CAP , **L4_BASE_CAPS_LAST_P1** , L4_BASE_CAPS_LAST
  = L4_BASE_CAPS_LAST_P1 - 1 }

  Default capabilities setup for the initial tasks.

Functions

- unsigned l4_is_invalid_cap (l4_cap_idx_t c) L4_NOTHROW

  Test if a capability selector is invalid (i.e., L4_INVALID_CAP_BIT is set).
- unsigned l4_is_valid_cap (l4_cap_idx_t c) L4_NOTHROW

  Test if a capability selector is valid (i.e., L4_INVALID_CAP_BIT is not set).
- unsigned l4_capability_equal (l4_cap_idx_t c1, l4_cap_idx_t c2) L4_NOTHROW

  Test if the capability indices of two capability selectors are equal.

13.1.13.1 Detailed Description

C interface for capabilities.
Add

```
#include <l4/sys/types.h>
#include <l4/sys/consts.h>
```

to your code to use the functions and definitions explained here.

13.1.13.2 Macro Definition Documentation

13.1.13.2.1 L4_CAP_SIZE

```
#define L4_CAP_SIZE
```

Deprecated.

Deprecated Superseded by L4_CAP_OFFSET.

Definition at line 149 of file consts.h.

13.1.13.2.2 L4_INVALID_CAP_BIT

```
#define L4_INVALID_CAP_BIT
```

Bit indicating if a capability selector is invalid.
If the bit is set, the capability selector is considered invalid.
Definition at line 173 of file consts.h.
Referenced by L4::Cap_base::invalid_cap_error(), L4::Cap_base::is_valid(), L4::Ipc::Cap< A >::is_valid(), l4_is_invalid_cap(), and l4_is_valid_cap().

13.1.13.3 Typedef Documentation

13.1.13.3.1 l4_cap_idx_t

```
typedef unsigned long l4_cap_idx_t
```

Capability selector type.
A capability selector is either a (shifted) capability index, a (shifted) reply capability index or the invalid capability selector L4_INVALID_CAP.

An alternative, synonymous term for capability index is capability slot.
When an interface expects an argument of type l4_cap_idx_t and the documentation does not state any specifics, it is assumed that the argument is an object capability index, i.e., `idx` << L4_CAP_SHIFT for arbitrary `idx`. The behavior for other values is then undefined.
Some interfaces allow use of L4_INVALID_CAP for indicating the absence of a capability index.
When invoking IPC (see Object Invocation), all types of capability selectors are relevant. The particular type is determined by the IPC operation.

- When the operation is a reply (with or without a receive phase) or an open wait without a send, then the selector refers to a reply capability.
- Otherwise, the selector refers to an object capability.

When not L4_INVALID_CAP, the selector contains a capability index for the respective space (reply capability space or object capability space) of the current task. When the selector is L4_INVALID_CAP, the meaning depends on the type of capability:

- When the operation needs a reply capability, the implicit reply capability of the invoking thread is used.
- When the operation needs an object capability, an implicit object capability for the current thread with full permissions is used.

Examples

examples/libs/shmc/prodcons.c, examples/sys/aliens/main.c, examples/sys/isr/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 374 of file types.h.

13.1.13.4 Enumeration Type Documentation

13.1.13.4.1 l4_default_caps_t

`enum l4_default_caps_t`
Default capabilities setup for the initial tasks.
These capability indices are setup per default by the micro kernel for the two initial tasks, the Root-Pager (Sigma0) and the Root-Task (Moe).

Attention

These constants do not have any particular meaning for applications started by Moe, see Initial Environment for this kind of information.

See also

Initial Environment for information useful for normal user applications.

Enumerator

L4_BASE_TASK_CAP	Capability index for the current task.
L4_BASE_FACTORY_CAP	Capability index for the factory.
L4_BASE_THREAD_CAP	Capability index for the first thread.
L4_BASE_PAGER_CAP	Capability index for the pager gate. For Sigma0, the pager is not present since it never raises page faults. For Moe, the pager is set to Sigma0.
L4_BASE_LOG_CAP	Capability index for the log object. Present if the corresponding feature is turned on in the microkernel configuration.
L4_BASE_ICU_CAP	Capability index for the base icu object.
L4_BASE_SCHEDULER_CAP	Capability index for the scheduler cap.

L4_BASE_IOMMU_CAP	Capability index for the IO-MMU cap. Present if the microkernel detected an IO-MMU.
L4_BASE_DEBUGGER_CAP	Capability index for the debugger cap. Present if the corresponding feature is turned on in the microkernel configuration.
L4_BASE_ARM_SMCCC_CAP	Capability index for the ARM SMCCC cap. Present if the microkernel detected an ARM SMC capable trusted execution environment.
L4_BASE_CAPS_LAST	Last capability index used for base capabilities.

Definition at line 341 of file consts.h.

13.1.13.5 Function Documentation

13.1.13.5.1 l4_capability_equal()

```
unsigned l4_capability_equal (
             l4_cap_idx_t c1,
             l4_cap_idx_t c2)  [inline]
```

Test if the capability indices of two capability selectors are equal.

Parameters

c1	Capability selector.
c2	Capability selector.

Return values

0	The index parts of the capability selectors differ.
1	The index parts of the capability selectors are equal.

Precondition

Both capability selectors must be valid (cf. l4_is_valid_cap()) otherwise the return value is undefined.

Definition at line 436 of file types.h.
References L4_CAP_SHIFT, and L4_NOTHROW.

13.1.13.5.2 l4_is_invalid_cap()

```
unsigned l4_is_invalid_cap (
             l4_cap_idx_t c)  [inline]
```

Test if a capability selector is invalid (i.e., L4_INVALID_CAP_BIT is set).

Parameters

c	Capability selector

Return values

0	The capability selector is not the invalid capability.
>0	The capability selector is the invalid capability.

Examples

examples/libs/l4re/c/ma+rm.c, examples/sys/aliens/main.c, examples/sys/isr/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 428 of file types.h.
References L4_INVALID_CAP_BIT, and L4_NOTHROW.

13.1.13.5.3 l4_is_valid_cap()

```
unsigned l4_is_valid_cap (
            l4_cap_idx_t c)  [inline]
```

Test if a capability selector is valid (i.e., L4_INVALID_CAP_BIT is not set).

Parameters

c	Capability selector

Return values

0	The capability selector is not valid.
>0	The capability selector is valid.

Definition at line 432 of file types.h.
References L4_INVALID_CAP_BIT, and L4_NOTHROW.
Referenced by L4Re::Util::Cap_alloc_base::free(), and L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::free().

13.1.14 Memory Operations

Operations for memory access.

Collaboration diagram for Memory Operations:

Enumerations

- enum L4_mem_op_widths { L4_MEM_WIDTH_1BYTE = 0 , L4_MEM_WIDTH_2BYTE = 1 , L4_MEM_WIDTH_4BYTE = 2 }

  Memory access width definitions.

Functions

- unsigned long l4_mem_read (unsigned long virtaddress, unsigned width)

  Read user task memory from kernel privilege level.
- void l4_mem_write (unsigned long virtaddress, unsigned width, unsigned long value)

  Write user task memory from kernel privilege level.

13.1.14.1 Detailed Description

Operations for memory access.
This module provides functionality to access user task memory from the kernel. This is needed for some devices that are only accessible from privileged processor mode. Only use this when absolutely required. This functionality is only available on the ARM architecture.
`#include <l4/sys/mem_op.h>`

13.1.14.2 Enumeration Type Documentation

13.1.14.2.1 L4_mem_op_widths

`enum L4_mem_op_widths`
Memory access width definitions.

Enumerator

L4_MEM_WIDTH_1BYTE	Access one byte (8-bit width).
L4_MEM_WIDTH_2BYTE	Access two bytes (16-bit width).
L4_MEM_WIDTH_4BYTE	Access four bytes (32-bit width).

Definition at line 40 of file mem_op.h.

13.1.14.3 Function Documentation

13.1.14.3.1 l4_mem_read()

```
unsigned long l4_mem_read (
            unsigned long virtaddress,
            unsigned width)  [inline]
```

Read user task memory from kernel privilege level.

Parameters

virtaddress	Virtual address in the calling task.
width	Width of access in bytes in log2,

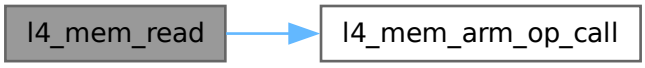
See also

L4_mem_op_widths

Returns

Read value.

Upon a given invalid address or invalid width value the function does nothing.
Definition at line 130 of file mem_op.h.
References l4_mem_arm_op_call().
Here is the call graph for this function:



13.1.14.3.2 l4_mem_write()

```
void l4_mem_write (
             unsigned long virtaddress,
             unsigned width,
             unsigned long value)  [inline]
```

Write user task memory from kernel privilege level.

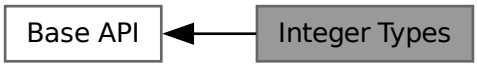
Parameters

virtaddress	Virtual address in the calling task.
width	Width of access in bytes in log2 (i.e. allowed values: 0, 1, 2)
value	Value to write.

Upon a given invalid address or invalid width value the function does nothing.
Definition at line 136 of file mem_op.h.
References l4_mem_arm_op_call().
Here is the call graph for this function:

13.1.15 Integer Types

Collaboration diagram for Integer Types:



Files

- file l4int.h

  Fixed sized integer types, generic version.
- file l4int.h

  Fixed sized integer types, arm version.
- file l4int.h

  Fixed sized integer types, arm version.
- file l4int.h

  Fixed sized integer types, AMD64 version.
- file l4int.h

  Fixed sized integer types, x86 version.
- file l4int.h

  Fixed sized integer types, RISC-V version.

Macros

- #define **L4_MWORD_BITS** 32

  Size of machine words in bits.
- #define **L4_MWORD_BITS** 64

  Size of machine words in bits.
- #define **L4_MWORD_BITS** 64

  Size of machine words in bits.
- #define **L4_MWORD_BITS** 32

  Size of machine words in bits.
- #define **L4_MWORD_BITS** __riscv_xlen

  Size of machine words in bits.

Typedefs

- typedef signed char **l4_int8_t**

  Signed 8bit value.
- typedef unsigned char **l4_uint8_t**

  Unsigned 8bit value.
- typedef signed short int **l4_int16_t**

  Signed 16bit value.
- typedef unsigned short int **l4_uint16_t**

  Unsigned 16bit value.
- typedef signed int **l4_int32_t**

  Signed 32bit value.

- typedef unsigned int **l4_uint32_t**

  Unsigned 32bit value.
- typedef signed long long **l4_int64_t**

  Signed 64bit value.
- typedef unsigned long long **l4_uint64_t**

  Unsigned 64bit value.
- typedef unsigned long **l4_addr_t**

  Address type.
- typedef signed long **l4_mword_t**

  Signed machine word.
- typedef unsigned long **l4_umword_t**

  Unsigned machine word.
- typedef l4_uint64_t **l4_cpu_time_t**

  CPU clock type.
- typedef l4_uint64_t **l4_kernel_clock_t**

  Kernel clock type.
- typedef unsigned int **l4_size_t**

  Unsigned size type.
- typedef signed int **l4_ssize_t**

  Signed size type.
- typedef unsigned long **l4_size_t**

  Unsigned size type.
- typedef signed long **l4_ssize_t**

  Signed size type.
- typedef unsigned long **l4_size_t**

  Unsigned size type.
- typedef signed long **l4_ssize_t**

  Signed size type.
- typedef unsigned int **l4_size_t**

  Unsigned size type.
- typedef signed int **l4_ssize_t**

  Signed size type.
- typedef unsigned int **l4_size_t**

  Unsigned size type.
- typedef signed int **l4_ssize_t**

  Signed size type.

13.1.15.1 Detailed Description

Include File

```
#include <l4/sys/l4int.h>
```

13.2 EDID parsing functionality

Enumerations

- enum Libedid_consts { Libedid_block_size = 128 }

  EDID constants.

Functions

- int libedid_check_header (const unsigned char *edid)
  Check for valid EDID header.
- int libedid_checksum (const unsigned char *edid)
  Calculates the EDID checksum.
- unsigned libedid_version (const unsigned char *edid)
  Returns the EDID version number.
- unsigned libedid_revision (const unsigned char *edid)
  Returns the EDID revision number.
- void libedid_pnp_id (const unsigned char *edid, unsigned char *id)
  Extracts the display's PnP ID.
- void libedid_prefered_resolution (const unsigned char *edid, unsigned *w, unsigned *h)
  Extract the display's prefered mode.
- unsigned libedid_num_ext_blocks (const unsigned char *edid)
  Get the number of EDID extension blocks.
- unsigned libedid_dump_standard_timings (const unsigned char *edid)
  Dump the standard timings to stdout.
- void libedid_dump (const unsigned char *edid)
  Dump raw EDID data to stdout.

13.2.1 Detailed Description

13.2.2 Enumeration Type Documentation

13.2.2.1 Libedid_consts

```
enum Libedid_consts
```

EDID constants.

Enumerator

Libedid_block_size	Size of one EDID block in bytes.

Definition at line 23 of file edid.h.

13.2.3 Function Documentation

13.2.3.1 libedid_check_header()

```
int libedid_check_header (
            const unsigned char * edid)
```

Check for valid EDID header.

Parameters

edid	Pointer to a 128byte EDID block

Returns

0 if the header is correct, -EINVAL otherwise

13.2.3.2 libedid_checksum()

```
int libedid_checksum (
            const unsigned char * edid)
```

Calculates the EDID checksum.

Parameters

edid	Pointer to a 128byte EDID block

Returns

0 if checksum is correct, -EINVAL otherwise

13.2.3.3 libedid_dump()

```
void libedid_dump (
            const unsigned char * edid)
```

Dump raw EDID data to stdout.

Parameters

edid	Pointer to a 128byte EDID block

13.2.3.4 libedid_dump_standard_timings()

```
unsigned libedid_dump_standard_timings (
            const unsigned char * edid)
```

Dump the standard timings to stdout.

Parameters

edid	Pointer to a 128byte EDID block

Returns

Number of standard timings stored in EDID

13.2.3.5 libedid_num_ext_blocks()

```
unsigned libedid_num_ext_blocks (
            const unsigned char * edid)
```

Get the number of EDID extension blocks.

Parameters

edid	Pointer to a 128byte EDID block

Returns

Number of EDID extension blocks

13.2.3.6 libedid_pnp_id()

```
void libedid_pnp_id (
            const unsigned char * edid,
            unsigned char * id)
```

Extracts the display's PnP ID.

Parameters

	edid	Pointer to a 128byte EDID block
out	*id*	Return the PnP id. Must point to 4 bytes.

13.2.3.7 libedid_prefered_resolution()

```
void libedid_prefered_resolution (
            const unsigned char * edid,
            unsigned * w,
            unsigned * h)
```

Extract the display's prefered mode.

Parameters

	edid	Pointer to a 128byte EDID block
out	*w*	X resolution of prefered video mode in pixels.
out	*h*	Y resolution of prefered video mode in pixels.

13.2.3.8 libedid_revision()

```
unsigned libedid_revision (
            const unsigned char * edid)
```

Returns the EDID revision number.

Parameters

edid	Pointer to a 128 EDID block

Returns

Revision number

13.2.3.9 libedid_version()

```
unsigned libedid_version (
            const unsigned char * edid)
```

Returns the EDID version number.

Parameters

edid	Pointer to a 128byte EDID block

Returns

Version number

13.3 IO interface

Typedefs

- typedef l4vbus_resource_t l4io_resource_t

  Resource descriptor.
- typedef l4vbus_device_t **l4io_device_t**

  Device descriptor.

Enumerations

- enum l4io_iomem_flags_t {
  L4IO_MEM_NONCACHED = 0 , L4IO_MEM_CACHED = 1 , L4IO_MEM_USE_MTRR = 2 , **L4IO_MEM_ATTR_MASK** = 0xf ,
  L4IO_MEM_WRITE_COMBINED = L4IO_MEM_USE_MTRR | L4IO_MEM_CACHED , L4IO_MEM_USE_RESERVED_AREA = 0x40 << 8 , L4IO_MEM_EAGER_MAP = 0x80 << 8 }

  Flags for IO memory.
- enum l4io_device_types_t {
  L4IO_DEVICE_INVALID = 0 , L4IO_DEVICE_PCI , L4IO_DEVICE_USB , L4IO_DEVICE_OTHER ,
  L4IO_DEVICE_ANY = ~0 }

  Device types.
- enum l4io_resource_types_t {
  L4IO_RESOURCE_INVALID = L4VBUS_RESOURCE_INVALID , L4IO_RESOURCE_IRQ = L4VBUS_RESOURCE_IRQ , L4IO_RESOURCE_MEM = L4VBUS_RESOURCE_MEM , L4IO_RESOURCE_PORT = L4VBUS_RESOURCE_PORT ,
  L4IO_RESOURCE_ANY = ~0 }

  Resource types.

Functions

- long l4io_request_iomem (l4_addr_t phys, unsigned long size, int flags, l4_addr_t *virt)

  Request an IO memory region.
- long l4io_request_iomem_region (l4_addr_t phys, l4_addr_t virt, unsigned long size, int flags)

  Request an IO memory region and map it to a specified region.
- long l4io_release_iomem (l4_addr_t virt, unsigned long size)

  Release an IO memory region.
- long l4io_request_ioport (unsigned portnum, unsigned len)

  Request an IO port region.
- long l4io_release_ioport (unsigned portnum, unsigned len)

  Release an IO port region.
- int l4io_lookup_device (const char *devname, l4io_device_handle_t *dev_handle, l4io_device_t *dev, l4io_resource_handle_t *res_handle)

  Find a device by name.
- int l4io_lookup_resource (l4io_device_handle_t devhandle, enum l4io_resource_types_t type, l4io_resource_handle_t *reshandle, l4io_resource_t *res)

  Request a specific resource from a device description.
- l4_addr_t l4io_request_resource_iomem (l4io_device_handle_t devhandle, l4io_resource_handle_t *reshandle)

  Request IO memory.
- int l4io_has_resource (enum l4io_resource_types_t type, l4vbus_paddr_t start, l4vbus_paddr_t end)

  Check if a resource is available.

13.3.1 Detailed Description

13.3.2 Typedef Documentation

13.3.2.1 l4io_resource_t

`typedef l4vbus_resource_t l4io_resource_t`
Resource descriptor.
For IRQ types, the end field is not used, i.e. only a single interrupt can be described with a l4io_resource_t
Definition at line 67 of file types.h.

13.3.3 Enumeration Type Documentation

13.3.3.1 l4io_device_types_t

`enum l4io_device_types_t`
Device types.

Enumerator

L4IO_DEVICE_INVALID	Invalid type.
L4IO_DEVICE_PCI	PCI device.
L4IO_DEVICE_USB	USB device.
L4IO_DEVICE_OTHER	Any other device without unique IDs.
L4IO_DEVICE_ANY	any type

Definition at line 36 of file types.h.

13.3.3.2 l4io_iomem_flags_t

`enum l4io_iomem_flags_t`
Flags for IO memory.

Enumerator

L4IO_MEM_NONCACHED	Non-cache memory.
L4IO_MEM_CACHED	Cache memory.
L4IO_MEM_USE_MTRR	Use MTRR.
L4IO_MEM_USE_RESERVED_AREA	Use reserved area for mapping I/O memory. Flag only valid for l4io_request_iomem_region()
L4IO_MEM_EAGER_MAP	Eagerly map the I/O memory. Passthrough to the l4re-rm.

Definition at line 14 of file types.h.

13.3.3.3 l4io_resource_types_t

`enum l4io_resource_types_t`
Resource types.

Enumerator

L4IO_RESOURCE_INVALID	Invalid type.
L4IO_RESOURCE_IRQ	Interrupt resource.
L4IO_RESOURCE_MEM	I/O memory resource.

L4IO_RESOURCE_PORT	I/O port resource (x86 only).
L4IO_RESOURCE_ANY	any type

Definition at line 48 of file types.h.

13.3.4 Function Documentation

13.3.4.1 l4io_has_resource()

```
int l4io_has_resource (
            enum l4io_resource_types_t type,
            l4vbus_paddr_t start,
            l4vbus_paddr_t end)
```

Check if a resource is available.

Parameters

type	Type of resource
start	Minimal value.
end	Maximum value.

References L4_INLINE.

13.3.4.2 l4io_lookup_device()

```
int l4io_lookup_device (
            const char * devname,
            l4io_device_handle_t * dev_handle,
            l4io_device_t * dev,
            l4io_resource_handle_t * res_handle)
```

Find a device by name.

Parameters

	devname	Name of device.
out	*dev_handle*	Device handle for found device, can be NULL.
out	*dev*	Device information, filled by the function, can be NULL.
out	*res_handle*	Resource handle, can be NULL.

Returns

0 on success, error code otherwise

References L4_CV, and L4_EXPORT.

13.3.4.3 l4io_lookup_resource()

```
int l4io_lookup_resource (
            l4io_device_handle_t devhandle,
            enum l4io_resource_types_t type,
            l4io_resource_handle_t * reshandle,
            l4io_resource_t * res)
```

Request a specific resource from a device description.

Parameters

	devhandle	Device handle.
	type	Type of resource to request (see l4io_resource_types_t).
in,out	*reshandle*	Resource handle, start with handle returned by device functions. The next resource handle is returned here.
out	*res*	Device descriptor.

Returns

0 on success, error code otherwise, esp. -L4_ENOENT if no more resources found

References L4_CV, and L4_EXPORT.

13.3.4.4 l4io_release_iomem()

```
long l4io_release_iomem (
             l4_addr_t virt,
             unsigned long size)
```

Release an IO memory region.

Parameters

virt	Virtual address of region to free, see l4io_request_iomem
size	Size of the region to release.

Returns

0 on success, <0 on error

References L4_CV, and L4_EXPORT.

13.3.4.5 l4io_release_ioport()

```
long l4io_release_ioport (
             unsigned portnum,
             unsigned len)
```

Release an IO port region.

Parameters

portnum	Start of port range to release
len	Length of range to request

Returns

0 on success, <0 on error

Note

X86 architecture only

References L4_CV, L4_EXPORT, and L4_INLINE.

13.3.4.6 l4io_request_iomem()

```
long l4io_request_iomem (
             l4_addr_t phys,
             unsigned long size,
             int flags,
             l4_addr_t * virt)
```

Request an IO memory region.

Parameters

	phys	Physical address of the I/O memory region
	size	Size of the region in Bytes, granularity pages.
	flags	See l4io_iomem_flags_t
in,out	*virt*	Virtual address where the IO memory region should be mapped to. If the caller passes '0' a region in the caller's address space is searched and the virtual address is returned.

Return values

0	Success.
-L4_ENOENT	No area in the caller's address space could be found to map the IO memory region.
-L4_EPERM	Operation not allowed.
-L4_EINVAL	Invalid value.
-L4_EADDRNOTAVAIL	The requested virtual address is not available.
-L4_ENOMEM	The requested IO memory region could not be allocated.
<0	IPC errors.

Note

This function uses L4Re functionality to reserve a part of the virtual address space of the caller.

References L4_CV, and L4_EXPORT.

13.3.4.7 l4io_request_iomem_region()

```
long l4io_request_iomem_region (
             l4_addr_t phys,
             l4_addr_t virt,
             unsigned long size,
             int flags)
```

Request an IO memory region and map it to a specified region.

Parameters

phys	Physical address of the I/O memory region
virt	Virtual address.
size	Size of the region in Bytes, granularity pages.
flags	See l4io_iomem_flags_t

Return values

0	Success.
-L4_ENOENT	No area could be found to map the IO memory region.
-L4_EPERM	Operation not allowed.
-L4_EINVAL	Invalid value.
-L4_EADDRNOTAVAIL	The requested virtual address is not available.
-L4_ENOMEM	The requested IO memory region could not be allocated.
<0	IPC errors.

Note

This function uses L4Re functionality to reserve a part of the virtual address space of the caller.

References L4_CV, and L4_EXPORT.

13.3.4.8 l4io_request_ioport()

```
long l4io_request_ioport (
            unsigned portnum,
            unsigned len)
```

Request an IO port region.

Parameters

portnum	Start of port range to request
len	Length of range to request

Returns

0 on success, <0 on error

Note

X86 architecture only

References L4_CV, and L4_EXPORT.

13.3.4.9 l4io_request_resource_iomem()

```
l4_addr_t l4io_request_resource_iomem (
            l4io_device_handle_t devhandle,
            l4io_resource_handle_t * reshandle)
```

Request IO memory.

Parameters

	devhandle	Device handle.
in,out	*reshandle*	Resource handle from which IO memory should be requested. Upon successfull completion 'reshandle' points to the device's next resource.

Return values

0	An error occured. The value of 'reshandle' is undefined.
>0	The virtual address of the IO memory mapping.

References L4_CV, and L4_EXPORT.

13.4 IPC Helpers

Functions

- void L4::throw_ipc_exception (L4::Cap< void > const &o, l4_msgtag_t const &err, l4_utcb_t *utcb)

  Throw an L4 IPC error as exception.
- void L4::throw_ipc_exception (void const *o, l4_msgtag_t const &err, l4_utcb_t *utcb)

  Throw an L4 IPC error as exception.

13.4.1 Detailed Description

13.4.2 Function Documentation

13.4.2.1 throw_ipc_exception() [1/2]

```
void L4::throw_ipc_exception (
            L4::Cap< void > const & o,
            l4_msgtag_t const & err,
            l4_utcb_t * utcb)  [inline]
```

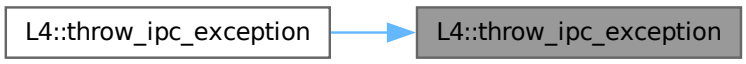
Throw an L4 IPC error as exception.

Parameters

o	The client side object, for which the IPC was invoked.
err	The IPC result code (error code).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Definition at line 34 of file ipc_helper.
References l4_msgtag_t::has_error().
Referenced by throw_ipc_exception().
Here is the call graph for this function:

Here is the caller graph for this function:



13.4.2.2 throw_ipc_exception() [2/2]

```
void L4::throw_ipc_exception (
            void const * o,
            l4_msgtag_t const & err,
            l4_utcb_t * utcb)  [inline]
```

Throw an L4 IPC error as exception.

Parameters

o	The client side object, for which the IPC was invoked.
err	The IPC result code (error code).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Definition at line 50 of file ipc_helper.
References throw_ipc_exception().

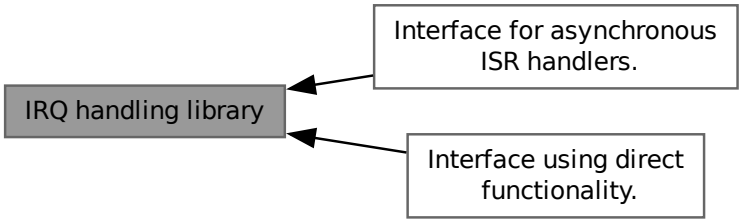
13.5 IRQ handling library

Collaboration diagram for IRQ handling library:



Topics

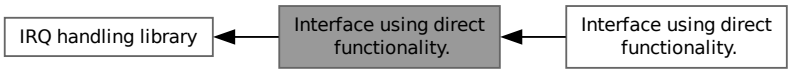
- Interface using direct functionality. 434
- Interface for asynchronous ISR handlers. 440

  This interface has just two (main) functions.

13.5.1 Detailed Description

13.5.2 Interface using direct functionality.

Collaboration diagram for Interface using direct functionality.:



Topics

- Interface using direct functionality. 438

Functions

- l4irq_t ∗ l4irq_attach (int irqnum)

  Attach/connect to IRQ.
- l4irq_t ∗ l4irq_attach_ft (int irqnum, unsigned mode)

  Attach/connect to IRQ using given type.
- l4irq_t ∗ l4irq_attach_thread (int irqnum, l4_cap_idx_t to_thread)

  Attach/connect to IRQ.
- l4irq_t ∗ l4irq_attach_thread_ft (int irqnum, l4_cap_idx_t to_thread, unsigned mode)

  Attach/connect to IRQ using given type.
- long l4irq_wait (l4irq_t ∗irq)

  Wait for specified IRQ.
- long l4irq_unmask_and_wait_any (l4irq_t ∗unmask_irq, l4irq_t ∗∗ret_irq)

  Unmask a specific IRQ and wait for any attached IRQ.
- long l4irq_wait_any (l4irq_t ∗∗irq)

  Wait for any attached IRQ.
- long l4irq_unmask (l4irq_t ∗irq)

  Unmask a specific IRQ.
- long l4irq_detach (l4irq_t ∗irq)

  Detach from IRQ.

13.5.2.1 Detailed Description

13.5.2.2 Function Documentation

13.5.2.2.1 l4irq_attach()

```
l4irq_t * l4irq_attach (
             int irqnum)
```

Attach/connect to IRQ.

Parameters

irqnum	IRQ number to request

Returns

Pointer to l4irq_t structure, 0 on error

This l4irq_attach has to be called in the same thread as l4irq_wait and caller has to be a pthread thread.

Examples

examples/libs/libirq/loop.c.

References L4_CV.

13.5.2.2.2 l4irq_attach_ft()

```
l4irq_t * l4irq_attach_ft (
             int irqnum,
             unsigned mode)
```

Attach/connect to IRQ using given type.

Parameters

irqnum	IRQ number to request
mode	Interrupt type,

See also

L4_irq_mode

Returns

Pointer to l4irq_t structure, 0 on error

This l4irq_attach has to be called in the same thread as l4irq_wait and caller has to be a pthread thread.
References L4_CV.

13.5.2.2.3 l4irq_attach_thread()

```
l4irq_t * l4irq_attach_thread (
             int irqnum,
             l4_cap_idx_t to_thread)
```

Attach/connect to IRQ.

Parameters

irqnum	IRQ number to request
to_thread	Attach IRQ to this specified thread.

Returns

Pointer to l4irq_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.
References L4_CV.

13.5.2.2.4 l4irq_attach_thread_ft()

```
l4irq_t * l4irq_attach_thread_ft (
            int irqnum,
            l4_cap_idx_t to_thread,
            unsigned mode)
```

Attach/connect to IRQ using given type.

Parameters

irqnum	IRQ number to request
to_thread	Attach IRQ to this specified thread.
mode	Interrupt type,

See also

L4_irq_mode

Returns

Pointer to l4irq_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.
References L4_CV.

13.5.2.2.5 l4irq_detach()

```
long l4irq_detach (
            l4irq_t * irq)
```

Detach from IRQ.

Parameters

irq	IRQ data structure

Returns

0 on success, != 0 on error

References L4_CV.

13.5.2.2.6 l4irq_unmask()

```
long l4irq_unmask (
            l4irq_t * irq)
```

Unmask a specific IRQ.

Parameters

irq	IRQ data structure

Returns

0 on success, != 0 on error

This function is useful if a thread wants to wait for multiple IRQs using l4_ipc_wait.
References L4_CV.

13.5.2.2.7 l4irq_unmask_and_wait_any()

```
long l4irq_unmask_and_wait_any (
             l4irq_t * unmask_irq,
             l4irq_t ** ret_irq)
```

Unmask a specific IRQ and wait for any attached IRQ.

Parameters

	unmask_irq	IRQ data structure for unmask.
out	*ret_irq*	Received interrupt.

Returns

0 on success, != 0 on error

References L4_CV.

13.5.2.2.8 l4irq_wait()

```
long l4irq_wait (
             l4irq_t * irq)
```

Wait for specified IRQ.

Parameters

irq	IRQ data structure

Returns

0 on success, != 0 on error

Examples

examples/libs/libirq/loop.c.

References L4_CV.

13.5.2.2.9 l4irq_wait_any()

```
long l4irq_wait_any (
             l4irq_t ** irq)
```

Wait for any attached IRQ.

Return values

irq	Received interrupt.

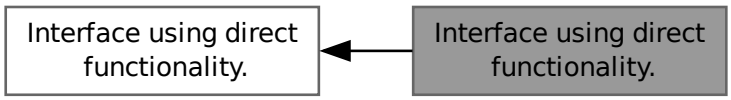
Returns

0 on success, != 0 on error

References L4_CV.

13.5.2.3 Interface using direct functionality.

Collaboration diagram for Interface using direct functionality.:



Functions

- l4irq_t * l4irq_attach_cap (l4_cap_idx_t irqcap)

  Attach/connect to IRQ.
- l4irq_t * l4irq_attach_cap_ft (l4_cap_idx_t irqcap, unsigned mode)

  Attach/connect to IRQ using given type.
- l4irq_t * l4irq_attach_thread_cap (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread)

  Attach/connect to IRQ.
- l4irq_t * l4irq_attach_thread_cap_ft (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread, unsigned mode)

  Attach/connect to IRQ using given type.

13.5.2.3.1 Detailed Description

13.5.2.3.2 Function Documentation

13.5.2.3.2.1 l4irq_attach_cap()

```
l4irq_t * l4irq_attach_cap (
             l4_cap_idx_t irqcap)
```

Attach/connect to IRQ.

Parameters

irqcap	IRQ capability

Returns

Pointer to l4irq_t structure, 0 on error

This l4irq_attach has to be called in the same thread as l4irq_wait and caller has to be a pthread thread.
References L4_CV.

13.5.2.3.2.2 l4irq_attach_cap_ft()

```
l4irq_t * l4irq_attach_cap_ft (
             l4_cap_idx_t irqcap,
             unsigned mode)
```

Attach/connect to IRQ using given type.

Parameters

irqcap	IRQ capability
mode	Interrupt type,

See also

L4_irq_mode

Returns

Pointer to l4irq_t structure, 0 on error

This l4irq_attach has to be called in the same thread as l4irq_wait and caller has to be a pthread thread.
References L4_CV.

13.5.2.3.2.3 l4irq_attach_thread_cap()

```
l4irq_t * l4irq_attach_thread_cap (
             l4_cap_idx_t irqcap,
             l4_cap_idx_t to_thread)
```

Attach/connect to IRQ.

Parameters

irqcap	IRQ capability
to_thread	Attach IRQ to this thread.

Returns

Pointer to l4irq_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.
References L4_CV.

13.5.2.3.2.4 l4irq_attach_thread_cap_ft()

```
l4irq_t * l4irq_attach_thread_cap_ft (
             l4_cap_idx_t irqcap,
             l4_cap_idx_t to_thread,
             unsigned mode)
```

Attach/connect to IRQ using given type.

Parameters

irqcap	IRQ capability
to_thread	Attach IRQ to this thread.
mode	Interrupt type,

See also

L4_irq_mode

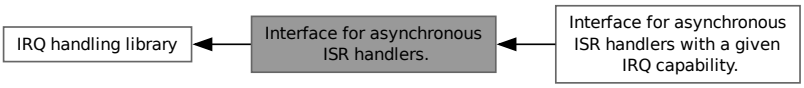
Returns

Pointer to l4irq_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.
References L4_CV.

13.5.3 Interface for asynchronous ISR handlers.

This interface has just two (main) functions.
Collaboration diagram for Interface for asynchronous ISR handlers.:



Topics

- Interface for asynchronous ISR handlers with a given IRQ capability. 441
  This group is just an enhanced version to l4irq_request() which takes a capability object instead of a plain number.

Functions

- l4irq_t * l4irq_request (int irqnum, void(*isr_handler)(void *), void *isr_data, int irq_thread_prio, unsigned mode)
  Attach asychronous ISR handler to IRQ.
- long l4irq_release (l4irq_t *irq)
  Release asynchronous ISR handler and free resources.

13.5.3.1 Detailed Description

This interface has just two (main) functions.
l4irq_request to install a handler for an interrupt and l4irq_release to uninstall the handler again and release all resources associated with it.

13.5.3.2 Function Documentation

13.5.3.2.1 l4irq_release()

```
long l4irq_release (
             l4irq_t * irq)
```

Release asynchronous ISR handler and free resources.

Parameters

irq	IRQ data structure

Returns

0 sucess, != 0 failure

Examples

examples/libs/libirq/async_isr.c.

References L4_CV.

13.5.3.2.2 l4irq_request()

```
l4irq_t * l4irq_request (
             int irqnum,
             void(* isr_handler )(void *),
             void * isr_data,
             int irq_thread_prio,
             unsigned mode)
```

Attach asychronous ISR handler to IRQ.

Parameters

irqnum	IRQ number to request
isr_handler	Handler routine that is called when an interrupt triggers
isr_data	Pointer given as argument to isr_handler
irq_thread_prio	L4 thread priority of the ISR handler. Give -1 for same priority as creator.
mode	Interrupt type,

See also

L4_irq_mode

Returns

Pointer to l4irq_t structure, 0 on error

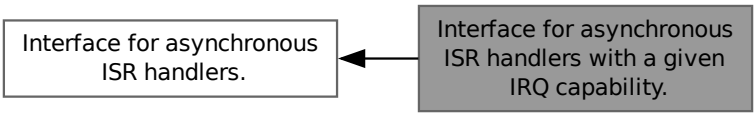
Examples

examples/libs/libirq/async_isr.c.

References L4_CV.

13.5.3.3 Interface for asynchronous ISR handlers with a given IRQ capability.

This group is just an enhanced version to l4irq_request() which takes a capability object instead of a plain number.
Collaboration diagram for Interface for asynchronous ISR handlers with a given IRQ capability.:



Functions

- l4irq_t * l4irq_request_cap (l4_cap_idx_t irqcap, void(*isr_handler)(void *), void *isr_data, int irq_thread_↩ prio, unsigned mode)

  Attach asychronous ISR handler to IRQ.

13.5.3.3.1 Detailed Description

This group is just an enhanced version to l4irq_request() which takes a capability object instead of a plain number.

13.5.3.3.2 Function Documentation

13.5.3.3.2.1 l4irq_request_cap()

```
l4irq_t * l4irq_request_cap (
            l4_cap_idx_t irqcap,
            void(* isr_handler )(void *),
            void * isr_data,
            int irq_thread_prio,
            unsigned mode)
```

Attach asychronous ISR handler to IRQ.

Parameters

irqcap	IRQ capability
isr_handler	Handler routine that is called when an interrupt triggers
isr_data	Pointer given as argument to isr_handler
irq_thread_prio	L4 thread priority of the ISR handler. Give -1 for same priority as creator.
mode	Interrupt type,

See also

L4_irq_mode

Returns

Pointer to l4irq_t structure, 0 on error

13.6 L4 IPC Opcodes

List of protocol specific opcodes used for communication with L4Re and Kernel objects.

Enumerations

- enum L4_icu_opcode {
  L4_ICU_OP_BIND , L4_ICU_OP_UNBIND , L4_ICU_OP_INFO , L4_ICU_OP_MSI_INFO ,
  L4_ICU_OP_UNMASK , L4_ICU_OP_MASK , L4_ICU_OP_SET_MODE }

  Opcodes to the ICU interface.
- enum L4_ipc_gate_ops { L4_IPC_GATE_BIND_OP = 0x10 , L4_IPC_GATE_GET_INFO_OP = 0x11 }

  Operations on the IPC-gate.
- enum L4_pi_mutex_ops { L4_PI_MUTEX_LOCK_OP = 0UL , L4_PI_MUTEX_UNLOCK_OP = 1UL }

  Operations on priority inheritance mutex objects.
- enum L4_platform_ctl_ops {
  L4_PLATFORM_CTL_SYS_SUSPEND_OP = 0UL , L4_PLATFORM_CTL_SYS_SHUTDOWN_OP = 1UL ,
  L4_PLATFORM_CTL_CPU_ALLOW_SHUTDOWN_OP = 2UL , L4_PLATFORM_CTL_CPU_ENABLE_OP =
  3UL ,
  L4_PLATFORM_CTL_CPU_DISABLE_OP = 4UL , L4_PLATFORM_CTL_SET_TASK_ASID_OP = 0x10UL }

  Operations on platform-control objects.
- enum L4_task_ops {
  L4_TASK_MAP_OP = 0UL , L4_TASK_UNMAP_OP = 1UL , L4_TASK_CAP_INFO_OP = 2UL ,
  L4_TASK_ADD_KU_MEM_OP = 3UL ,
  L4_TASK_LDT_SET_X86_OP = 0x11UL , L4_TASK_MAP_VGICC_ARM_OP = 0x12UL }

  Operations on task objects.

- enum L4_thread_ops { L4_THREAD_CONTROL_OP = 0UL , L4_THREAD_EX_REGS_OP = 1UL , L4_THREAD_SWITCH_OP = 2UL , L4_THREAD_STATS_OP = 3UL , L4_THREAD_VCPU_RESUME_OP = 4UL , L4_THREAD_REGISTER_DELETE_IRQ_OP = 5UL , L4_THREAD_MODIFY_SENDER_OP = 6UL , L4_THREAD_VCPU_CONTROL_OP = 7UL , **L4_THREAD_VCPU_CONTROL_EXT_OP** = L4_THREAD_VCPU_CONTROL_OP | 0x10000 , L4_THREAD_REGISTER_DO = 8UL , L4_THREAD_PF_TRAMP_CONTROL_OP = 9UL , L4_THREAD_X86_GDT_OP = 0x10UL , L4_THREAD_ARM_TPIDRURO_OP = 0x10UL , L4_THREAD_AMD64_SET_SEGMENT_BASE_OP = 0x12UL , L4_THREAD_AMD64_GET_SEGMENT_INFO_OP = 0x13UL , L4_THREAD_OPCODE_MASK = 0xffff }

  Operations on thread objects.
- enum L4_vcon_ops { L4_VCON_WRITE_OP = 0UL , L4_VCON_READ_OP = 1UL , L4_VCON_SET_ATTR_OP = 2UL , L4_VCON_GET_ATTR_OP = 3UL }

  Operations on vcon objects.

13.6.1 Detailed Description

List of protocol specific opcodes used for communication with L4Re and Kernel objects.

13.6.2 Enumeration Type Documentation

13.6.2.1 L4_icu_opcode

`enum L4_icu_opcode`

Opcodes to the ICU interface.

Enumerator

L4_ICU_OP_BIND	Bind opcode. **See also** l4_icu_bind()
L4_ICU_OP_UNBIND	Unbind opcode. **See also** l4_icu_unbind()
L4_ICU_OP_INFO	Info opcode. **See also** l4_icu_info()
L4_ICU_OP_MSI_INFO	Msi-info opcode. **See also** l4_icu_msi_info()
L4_ICU_OP_UNMASK	Unmask opcode. **See also** l4_icu_unmask()

L4_ICU_OP_MASK	Mask opcode. **See also** l4_icu_mask()
L4_ICU_OP_SET_MODE	Set-mode opcode. **See also** l4_icu_set_mode()

Definition at line 97 of file icu.h.

13.6.2.2 L4_ipc_gate_ops

`enum L4_ipc_gate_ops`
Operations on the IPC-gate.

Enumerator

L4_IPC_GATE_BIND_OP	Bind operation.
L4_IPC_GATE_GET_INFO_OP	Info operation.

Definition at line 108 of file ipc_gate.h.

13.6.2.3 L4_pi_mutex_ops

`enum L4_pi_mutex_ops`
Operations on priority inheritance mutex objects.
See L4_PROTO_PI_MUTEX for the protocol type to use for messages to priority inheritance mutex objects.

Enumerator

L4_PI_MUTEX_LOCK_OP	Lock mutex.
L4_PI_MUTEX_UNLOCK_OP	Unlock mutex.

Definition at line 114 of file pi_mutex.h.

13.6.2.4 L4_platform_ctl_ops

`enum L4_platform_ctl_ops`
Operations on platform-control objects.
See L4_PROTO_PLATFORM_CTL for the protocol type to use for messages to platform-control objects.

Enumerator

L4_PLATFORM_CTL_SYS_SUSPEND_OP	Suspend.
L4_PLATFORM_CTL_SYS_SHUTDOWN_OP	shutdown/reboot
L4_PLATFORM_CTL_CPU_ALLOW_SHUTDOWN_OP	allow CPU shutdown
L4_PLATFORM_CTL_CPU_ENABLE_OP	enable an offline CPU
L4_PLATFORM_CTL_CPU_DISABLE_OP	disable an online CPU
L4_PLATFORM_CTL_SET_TASK_ASID_OP	Arm: set task ASID.

Definition at line 159 of file platform_control.h.

13.6.2.5 L4_task_ops

enum L4_task_ops
Operations on task objects.

Enumerator

L4_TASK_MAP_OP	Map.
L4_TASK_UNMAP_OP	Unmap.
L4_TASK_CAP_INFO_OP	Cap info.
L4_TASK_ADD_KU_MEM_OP	Add kernel-user memory.
L4_TASK_LDT_SET_X86_OP	x86: LDT set
L4_TASK_MAP_VGICC_ARM_OP	Arm: Map virtual GICC area.

Definition at line 341 of file task.h.

13.6.2.6 L4_thread_ops

enum L4_thread_ops
Operations on thread objects.

Enumerator

L4_THREAD_CONTROL_OP	Control operation.
L4_THREAD_EX_REGS_OP	Exchange registers operation.
L4_THREAD_SWITCH_OP	Do a thread switch.
L4_THREAD_STATS_OP	Thread statistics.
L4_THREAD_VCPU_RESUME_OP	VCPU resume.
L4_THREAD_REGISTER_DELETE_IRQ_OP	Register an IPC-gate deletion IRQ.
L4_THREAD_MODIFY_SENDER_OP	Modify all senders IDs that match the given pattern.
L4_THREAD_VCPU_CONTROL_OP	Enable / disable VCPU feature.
L4_THREAD_REGISTER_DOORBELL_IRQ_OP	Register direct IRQ injection doorbell IRQ.
L4_THREAD_PF_TRAMP_CONTROL_OP	Page fault trampoline control operation.
L4_THREAD_X86_GDT_OP	Gdt.
L4_THREAD_ARM_TPIDRURO_OP	Set TPIDRURO register.
L4_THREAD_AMD64_SET_SEGMENT_BASE_OP	Set segment base.
L4_THREAD_AMD64_GET_SEGMENT_INFO_OP	Get segment information.
L4_THREAD_OPCODE_MASK	Mask for opcodes.

Definition at line 846 of file thread.h.

13.6.2.7 L4_vcon_ops

enum L4_vcon_ops
Operations on vcon objects.

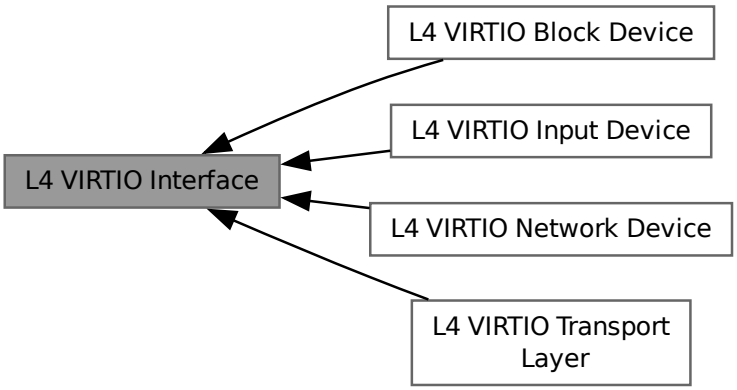
Enumerator

L4_VCON_WRITE_OP	Write.
L4_VCON_READ_OP	Read.
L4_VCON_SET_ATTR_OP	Get console attributes.
L4_VCON_GET_ATTR_OP	Set console attributes.

Definition at line 291 of file vcon.h.

13.7 L4 VIRTIO Interface

Collaboration diagram for L4 VIRTIO Interface:



Topics

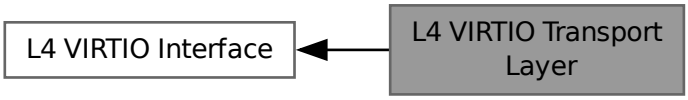
- L4 VIRTIO Transport Layer 446
  L4 specific VIRTIO Transport layer.
- L4 VIRTIO Block Device 454
- L4 VIRTIO Input Device 456
- L4 VIRTIO Network Device 456

13.7.1 Detailed Description

13.7.2 L4 VIRTIO Transport Layer

L4 specific VIRTIO Transport layer.

Collaboration diagram for L4 VIRTIO Transport Layer:



Namespaces

- namespace L4virtio

  L4-VIRTIO Transport C++ API.

Data Structures

- struct l4virtio_config_hdr_t

  L4-VIRTIO config header, provided in shared data space.
- struct l4virtio_config_queue_t

  Queue configuration entry.

Typedefs

- typedef struct l4virtio_config_hdr_t **l4virtio_config_hdr_t**

  L4-VIRTIO config header, provided in shared data space.
- typedef struct l4virtio_config_queue_t l4virtio_config_queue_t

  Queue configuration entry.

Enumerations

- enum L4_virtio_protocol

  L4-VIRTIO protocol number.
- enum L4_virtio_opcodes {
  L4VIRTIO_OP_SET_STATUS = 0 , L4VIRTIO_OP_CONFIG_QUEUE = 1 , L4VIRTIO_OP_REGISTER_DS = 3 , L4VIRTIO_OP_DEVICE_CONFIG = 4 ,
  L4VIRTIO_OP_GET_DEVICE_IRQ = 5 }

  Opcodes to setup and configure a device.
- enum L4virtio_device_ids {
  L4VIRTIO_ID_NET = 1 , L4VIRTIO_ID_BLOCK = 2 , L4VIRTIO_ID_CONSOLE = 3 , L4VIRTIO_ID_RNG = 4 ,
  L4VIRTIO_ID_BALLOON = 5 , L4VIRTIO_ID_RPMSG = 7 , L4VIRTIO_ID_SCSI = 8 , L4VIRTIO_ID_9P = 9 ,
  L4VIRTIO_ID_RPROC_SERIAL = 11 , L4VIRTIO_ID_CAIF = 12 , L4VIRTIO_ID_GPU = 16 , L4VIRTIO_ID_INPUT = 18 ,
  L4VIRTIO_ID_VSOCK = 19 , L4VIRTIO_ID_CRYPTO = 20 , L4VIRTIO_ID_SOUND = 25 , L4VIRTIO_ID_FS = 26 ,
  L4VIRTIO_ID_SCMI = 32 , L4VIRTIO_ID_I2C = 34 , L4VIRTIO_ID_WATCHDOG = 35 , L4VIRTIO_ID_CAN = 36 ,
  L4VIRTIO_ID_GPIO = 41 , L4VIRTIO_ID_SPI = 45 , L4VIRTIO_ID_SOCK = 0x9999 }

  Virtio device IDs as reported in the driver's config space.
- enum L4virtio_device_status {
  L4VIRTIO_STATUS_ACKNOWLEDGE = 1 , L4VIRTIO_STATUS_DRIVER = 2 , L4VIRTIO_STATUS_DRIVER_OK = 4 , L4VIRTIO_STATUS_FEATURES_OK = 8 ,
  L4VIRTIO_STATUS_DEVICE_NEEDS_RESET = 0x40 , L4VIRTIO_STATUS_FAILED = 0x80 }

Virtio device status bits.

- enum L4virtio_feature_bits { L4VIRTIO_FEATURE_VERSION_1 = 32 , L4VIRTIO_FEATURE_CMD_CONFIG = 160 }

  L4virtio-specific feature bits.
- enum L4_virtio_irq_status { L4VIRTIO_IRQ_STATUS_VRING = 1 , L4VIRTIO_IRQ_STATUS_CONFIG = 2 }

  VIRTIO IRQ status codes (l4virtio_config_hdr_t::irq_status).
- enum L4_virtio_cmd {
  L4VIRTIO_CMD_NONE = 0x00000000 , L4VIRTIO_CMD_SET_STATUS = 0x01000000 , L4VIRTIO_CMD_CFG_QUEUE = 0x02000000 , L4VIRTIO_CMD_CFG_CHANGED = 0x04000000 ,
  L4VIRTIO_CMD_NOTIFY_QUEUE = 0x08000000 , L4VIRTIO_CMD_MASK = 0xff000000 }

  Virtio commands for device configuration.

Functions

- L4_BEGIN_DECLS l4virtio_config_queue_t ∗ l4virtio_config_queues (l4virtio_config_hdr_t const ∗cfg)

  Get the pointer to the first queue config.
- void ∗ l4virtio_device_config (l4virtio_config_hdr_t const ∗cfg)

  Get the pointer to the device configuration.
- void **l4virtio_set_feature** (l4_uint32_t ∗feature_map, unsigned feat)

  Set the given feature bit in a feature map.
- void **l4virtio_clear_feature** (l4_uint32_t ∗feature_map, unsigned feat)

  Clear the given feature bit in a feature map.
- unsigned **l4virtio_get_feature** (l4_uint32_t ∗feature_map, unsigned feat)

  Check if the given bit in a feature map is set.
- int l4virtio_set_status (l4_cap_idx_t cap, unsigned status) L4_NOTHROW
- int l4virtio_config_queue (l4_cap_idx_t cap, unsigned queue) L4_NOTHROW
- int l4virtio_register_ds (l4_cap_idx_t cap, l4_cap_idx_t ds_cap, l4_uint64_t base, l4_umword_t offset, l4_umword_t size) L4_NOTHROW
- int l4virtio_device_config_ds (l4_cap_idx_t cap, l4_cap_idx_t config_ds, l4_addr_t ∗ds_offset) L4_NOTHROW
- int l4virtio_device_notification_irq (l4_cap_idx_t cap, unsigned index, l4_cap_idx_t irq) L4_NOTHROW

13.7.2.1 Detailed Description

L4 specific VIRTIO Transport layer.
The L4 specific VIRTIO Transport layer is based on L4Re::Dataspace as shared memory and L4::Irq for signaling. The VIRTIO configuration space is mostly based on a shared memory implementation too and accompanied by two IPC functions to synchronize the configuration between device and driver.

13.7.2.2 Typedef Documentation

13.7.2.2.1 l4virtio_config_queue_t

```
typedef struct l4virtio_config_queue_t l4virtio_config_queue_t
```

Queue configuration entry.
An array of such entries is available at the l4virtio_config_hdr_t::queues_offset in the config data space.
Consistency rules for the queue config are:

- A driver might read `num_max` at any time.
- A driver must write to `num`, `desc_addr`, `avail_addr`, and `used_addr` only when `ready` is zero (0). Values in these fields are validated and used by the device only after successfully setting `ready` to one (1), either by the IPC or by L4VIRTIO_CMD_CFG_QUEUE.
- The value of `device_notify_index` is valid only when `ready` is one.
- The driver might write to `device_notify_index` at any time, however the change is guaranteed to take effect after a successful L4VIRTIO_CMD_CFG_QUEUE or after a config_queue IPC. Note, the change might also have immediate effect, depending on the device implementation.

13.7.2.3 Enumeration Type Documentation

13.7.2.3.1 L4_virtio_cmd

enum L4_virtio_cmd
Virtio commands for device configuration.

Enumerator

L4VIRTIO_CMD_NONE	No command pending.
L4VIRTIO_CMD_SET_STATUS	Set the status register.
L4VIRTIO_CMD_CFG_QUEUE	Configure a queue.
L4VIRTIO_CMD_CFG_CHANGED	Device config changed.
L4VIRTIO_CMD_NOTIFY_QUEUE	Configure a queue.
L4VIRTIO_CMD_MASK	Mask to get command bits.

Definition at line 128 of file virtio.h.

13.7.2.3.2 L4_virtio_irq_status

enum L4_virtio_irq_status
VIRTIO IRQ status codes (l4virtio_config_hdr_t::irq_status).

Note

l4virtio_config_hdr_t::irq_status is currently unused.

Enumerator

L4VIRTIO_IRQ_STATUS_VRING	VRING IRQ pending flag.
L4VIRTIO_IRQ_STATUS_CONFIG	CONFIG IRQ pending flag.

Definition at line 119 of file virtio.h.

13.7.2.3.3 L4_virtio_opcodes

enum L4_virtio_opcodes
Opcodes to setup and configure a device.

Enumerator

L4VIRTIO_OP_SET_STATUS	Write device status register.
L4VIRTIO_OP_CONFIG_QUEUE	Configure queue.
L4VIRTIO_OP_REGISTER_DS	Register shared memory with device.
L4VIRTIO_OP_DEVICE_CONFIG	Get device config page.
L4VIRTIO_OP_GET_DEVICE_IRQ	Retrieve device notification IRQ.

Definition at line 52 of file virtio.h.

13.7.2.3.4 L4virtio_device_ids

enum L4virtio_device_ids
Virtio device IDs as reported in the driver's config space.

Enumerator

L4VIRTIO_ID_NET	Virtual ethernet card.
L4VIRTIO_ID_BLOCK	General block device.
L4VIRTIO_ID_CONSOLE	Simple device for data IO via ports.
L4VIRTIO_ID_RNG	Entropy source.
L4VIRTIO_ID_BALLOON	Memory ballooning device.
L4VIRTIO_ID_RPMSG	Device using rpmsg protocol.
L4VIRTIO_ID_SCSI	SCSI host device.
L4VIRTIO_ID_9P	Device using 9P transport protocol.
L4VIRTIO_ID_RPROC_SERIAL	Rproc serial device.
L4VIRTIO_ID_CAIF	Device using CAIF network protocol.
L4VIRTIO_ID_GPU	GPU.
L4VIRTIO_ID_INPUT	Input.
L4VIRTIO_ID_VSOCK	Vsock transport.
L4VIRTIO_ID_CRYPTO	Crypto.
L4VIRTIO_ID_SOUND	Sound device.
L4VIRTIO_ID_FS	FS.
L4VIRTIO_ID_SCMI	Scmi device.
L4VIRTIO_ID_I2C	I2C device.
L4VIRTIO_ID_WATCHDOG	Watchdog device.
L4VIRTIO_ID_CAN	CAN device.
L4VIRTIO_ID_GPIO	Gpio device.
L4VIRTIO_ID_SPI	SPI device.
L4VIRTIO_ID_SOCK	Unofficial socket device.

Definition at line 62 of file virtio.h.

13.7.2.3.5 L4virtio_device_status

`enum L4virtio_device_status`
Virtio device status bits.

Enumerator

L4VIRTIO_STATUS_ACKNOWLEDGE	Guest OS has found device.
L4VIRTIO_STATUS_DRIVER	Guest OS knows how to drive device.
L4VIRTIO_STATUS_DRIVER_OK	Driver is set up.
L4VIRTIO_STATUS_FEATURES_OK	Driver has acknowledged feature set.
L4VIRTIO_STATUS_DEVICE_NEEDS_RESET	Device detected fatal error.
L4VIRTIO_STATUS_FAILED	Driver detected fatal error.

Definition at line 91 of file virtio.h.

13.7.2.3.6 L4virtio_feature_bits

`enum L4virtio_feature_bits`
L4virtio-specific feature bits.

Enumerator

L4VIRTIO_FEATURE_VERSION_1	Virtio protocol version 1 supported. Must be 1 for L4virtio.
L4VIRTIO_FEATURE_CMD_CONFIG	Status and queue config are set via cmd field instead of via IPC.

Definition at line 107 of file virtio.h.

13.7.2.4 Function Documentation

13.7.2.4.1 l4virtio_config_queue()

```
int l4virtio_config_queue (
             l4_cap_idx_t cap,
             unsigned queue)
```

Parameters

cap	Capability to the VIRTIO host.

Trigger queue configuration of the given queue.
Usually all queues are configured when the status is written to running. However, in some cases queues shall be disabled or enabled dynamically, in this case this function triggers a reconfiguration from the shared memory register of the queue config.

Parameters

queue	Queue index for the queue to be configured.

Return values

0	on success.
-L4_EIO	The queue's status is invalid.
-L4_ERANGE	The queue index exceeds the number of queues.
-L4_EINVAL	Otherwise.

References L4_CV, and L4_NOTHROW.

13.7.2.4.2 l4virtio_config_queues()

```
L4_BEGIN_DECLS l4virtio_config_queue_t * l4virtio_config_queues (
             l4virtio_config_hdr_t const * cfg)  [inline]
```

Get the pointer to the first queue config.

Parameters

cfg	Pointer to the config header.

Returns

pointer to queue config of queue 0.

Definition at line 261 of file virtio.h.
References l4virtio_config_hdr_t::queues_offset.

13.7.2.4.3 l4virtio_device_config()

```
void * l4virtio_device_config (
            l4virtio_config_hdr_t const * cfg)  [inline]
```

Get the pointer to the device configuration.

Parameters

cfg	Pointer to the config header.

Returns

pointer to device configuration structure.

Definition at line 272 of file virtio.h.

13.7.2.4.4 l4virtio_device_config_ds()

```
int l4virtio_device_config_ds (
            l4_cap_idx_t cap,
            l4_cap_idx_t config_ds,
            l4_addr_t * ds_offset)
```

Parameters

cap	Capability to the L4-VIRTIO host

Get the dataspace with the L4virtio configuration page.

Parameters

config_ds	Capability for receiving the dataspace capability for the shared L4-VIRTIO config data space.
ds_offset	Offset into the dataspace where the device configuration structure starts.

References L4_CV, and L4_NOTHROW.

13.7.2.4.5 l4virtio_device_notification_irq()

```
int l4virtio_device_notification_irq (
            l4_cap_idx_t cap,
            unsigned index,
            l4_cap_idx_t irq)
```

Parameters

cap	Capability to the L4-VIRTIO host

Get the notification interrupt corresponding to the given index.

Parameters

	index	Index of the interrupt.
out	*irq*	Triggerable for the given index.

Return values

L4_EOK	Success.
L4_ENOSYS	IRQ notification not supported by device.
<0	Other error.

An index is only guaranteed to return an IRQ object when the index is set in one of the device notify index fields. The device must return the same interrupt for a given index as long as the index is in use. If an index disappears as a result of a configuration change and then is reused later, the interrupt is not guaranteed to be the same.
Interrupts must always be rerequested after a device reset.
References L4_END_DECLS, and L4_NOTHROW.

13.7.2.4.6 l4virtio_register_ds()

```
int l4virtio_register_ds (
              l4_cap_idx_t cap,
              l4_cap_idx_t ds_cap,
              l4_uint64_t base,
              l4_umword_t offset,
              l4_umword_t size)
```

Parameters

cap	Capability to the VIRTIO host

Register a shared data space with VIRTIO host.

Parameters

ds_cap	Dataspace capability to register. The lower 8 bits determine the rights mask with which the guest's rights are masked during the registration of the dataspace at the VIRTIO host.
base	VIRTIO guest physical start address of shared memory region
offset	Offset within the data space that is attached to the given `base` in the guest physical memory.
size	Size of the memory region in the guest

Return values

L4_EOK	Operation successful.
-L4_EINVAL	The `ds_cap` capability is invalid, does not refer to a valid dataspace, is not a trusted dataspace if trusted dataspace validation is enabled, or `size` and `offset` specify an invalid region.
-L4_ENOMEM	The limit of dataspaces that can be registered has been reached or no capability slot could be allocated.
-L4_ERANGE	`offset` is lager than the size of the dataspace.

<0	Any error returned by the dataspace when queried for information during setup or any error returned by the region manager from attaching the dataspace.

References L4_CV, and L4_NOTHROW.

13.7.2.4.7 l4virtio_set_status()

```
int l4virtio_set_status (
             l4_cap_idx_t cap,
             unsigned status)
```

Parameters

cap	Capability to the VIRTIO host

Write the VIRTIO status register.

Parameters

status	Status word to write to the VIRTIO status.

Return values

0	on success.

Note

All other registers are accessed via shared memory.

References L4_CV, and L4_NOTHROW.

13.7.3 L4 VIRTIO Block Device

Collaboration diagram for L4 VIRTIO Block Device:

Data Structures

- struct l4virtio_block_header_t

  Header structure of a request for a block device.
- struct l4virtio_block_discard_t

  Structure used for the write zeroes and discard commands.
- struct l4virtio_block_config_t

  Device configuration for block devices.

Typedefs

- typedef struct l4virtio_block_header_t **l4virtio_block_header_t**

  Header structure of a request for a block device.
- typedef struct l4virtio_block_discard_t **l4virtio_block_discard_t**

  Structure used for the write zeroes and discard commands.
- typedef struct l4virtio_block_config_t **l4virtio_block_config_t**

  Device configuration for block devices.

Enumerations

- enum L4virtio_block_operations {
  L4VIRTIO_BLOCK_T_IN = 0 , L4VIRTIO_BLOCK_T_OUT = 1 , L4VIRTIO_BLOCK_T_FLUSH = 4 ,
  L4VIRTIO_BLOCK_T_GET_ID = 8 ,
  L4VIRTIO_BLOCK_T_DISCARD = 11 , L4VIRTIO_BLOCK_T_WRITE_ZEROES = 13 }

  Kinds of operation over a block device.
- enum L4virtio_block_status { L4VIRTIO_BLOCK_S_OK = 0 , L4VIRTIO_BLOCK_S_IOERR = 1 ,
  L4VIRTIO_BLOCK_S_UNSUPP = 2 }

  Status of a finished block request.
- enum L4virtio_block_feature_bits

  Block device feature bits.

13.7.3.1 Detailed Description

13.7.3.2 Enumeration Type Documentation

13.7.3.2.1 L4virtio_block_operations

`enum L4virtio_block_operations`
Kinds of operation over a block device.

Enumerator

L4VIRTIO_BLOCK_T_IN	Read from device.
L4VIRTIO_BLOCK_T_OUT	Write to device.
L4VIRTIO_BLOCK_T_FLUSH	Flush data to disk.
L4VIRTIO_BLOCK_T_GET_ID	Get device ID.
L4VIRTIO_BLOCK_T_DISCARD	Discard a range of sectors.
L4VIRTIO_BLOCK_T_WRITE_ZEROES	Write zeroes to a range of sectors.

Definition at line 19 of file virtio_block.h.

13.7.3.2.2 L4virtio_block_status

`enum L4virtio_block_status`
Status of a finished block request.

Enumerator

L4VIRTIO_BLOCK_S_OK	Request finished successfully.
L4VIRTIO_BLOCK_S_IOERR	IO error on device.
L4VIRTIO_BLOCK_S_UNSUPP	Operation is not supported.

Definition at line 32 of file virtio_block.h.

13.7.4 L4 VIRTIO Input Device

Collaboration diagram for L4 VIRTIO Input Device:

Data Structures

- struct l4virtio_input_absinfo_t

  Information about the absolute axis in the underlying evdev implementation.
- struct l4virtio_input_devids_t

  Device ID information for the device.
- struct l4virtio_input_config_t

  Device configuration for input devices.
- struct l4virtio_input_event_t

  Single event in event or status queue.

Typedefs

- typedef struct l4virtio_input_absinfo_t **l4virtio_absinfo_t**

  Information about the absolute axis in the underlying evdev implementation.
- typedef struct l4virtio_input_devids_t **l4virtio_input_devids_t**

  Device ID information for the device.
- typedef struct l4virtio_input_config_t **l4virtio_input_config_t**

  Device configuration for input devices.
- typedef struct l4virtio_input_event_t **l4virtio_input_event_t**

  Single event in event or status queue.

Enumerations

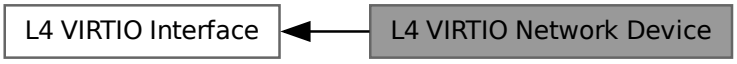
- enum L4virtio_input_config_select

  Device information selectors.

13.7.4.1 Detailed Description

13.7.5 L4 VIRTIO Network Device

Collaboration diagram for L4 VIRTIO Network Device:



Data Structures

- struct l4virtio_net_header_t

  Header structure of a request for a network device.
- struct l4virtio_net_config_t

  Device configuration for network devices.

Typedefs

- typedef struct l4virtio_net_header_t **l4virtio_net_header_t**

  Header structure of a request for a network device.
- typedef struct l4virtio_net_config_t **l4virtio_net_config_t**

  Device configuration for network devices.

Enumerations

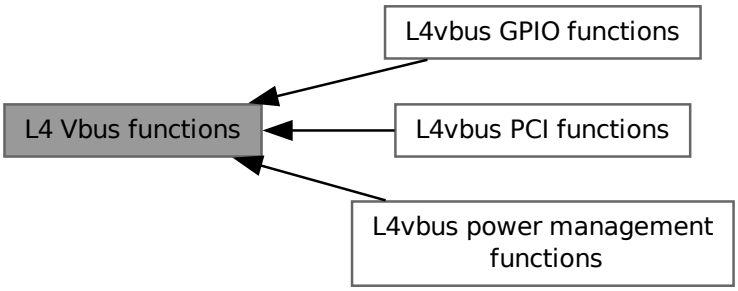
- enum L4virtio_net_feature_bits

  Network device feature bits.

13.7.5.1 Detailed Description

13.8 L4 Vbus functions

C interface of the Vbus API.
Collaboration diagram for L4 Vbus functions:



Topics

- L4vbus GPIO functions 466
- L4vbus PCI functions 475
- L4vbus power management functions 480

Enumerations

- enum L4vbus_dma_domain_assign_flags { L4VBUS_DMAD_UNBIND = 0 , L4VBUS_DMAD_BIND = 1 , L4VBUS_DMAD_L4RE_DMA_SPACE = 0 }

  Flags for l4vbus_assign_dma_domain().

Functions

- L4_BEGIN_DECLS int l4vbus_get_device_by_hid (l4_cap_idx_t vbus, l4vbus_device_handle_t parent, l4vbus_device_handle_t *child, char const *hid, int depth, l4vbus_device_t *devinfo)

  Find a device by the hardware interface identifier (HID).
- int l4vbus_get_next_device (l4_cap_idx_t vbus, l4vbus_device_handle_t parent, l4vbus_device_handle_t *child, int depth, l4vbus_device_t *devinfo)

  Find next child following `child`.
- int l4vbus_get_device (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, l4vbus_device_t *devinfo)

  Obtain detailed information about a Vbus device.
- int l4vbus_get_resource (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, unsigned res_idx, l4vbus_resource_t *res)

  Obtain the resource description of an individual device resource.
- int l4vbus_is_compatible (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, char const *cid)

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- int l4vbus_get_hid (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, char *hid, unsigned long max_len)

  Get the HID (hardware identifier) of a device.
- int l4vbus_get_adr (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, l4_uint32_t *adr)

  Get the bus-specific address of a device.
- int l4vbus_request_ioport (l4_cap_idx_t vbus, l4vbus_resource_t const *res)

  Request an IO port resource.
- int l4vbus_assign_dma_domain (l4_cap_idx_t vbus, unsigned domain_id, unsigned flags, l4_cap_idx_t dma_space)

  Bind or unbind a kernel DMA space or a L4Re::Dma_space to a DMA domain.
- int l4vbus_release_ioport (l4_cap_idx_t vbus, l4vbus_resource_t const *res)

  Release a previously requested IO port resource.
- int l4vbus_vicu_get_cap (l4_cap_idx_t vbus, l4vbus_device_handle_t icu, l4_cap_idx_t cap)

  Get capability of ICU.

13.8.1 Detailed Description

C interface of the Vbus API.
The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an Icu (Interrupt controller) for interrupt handling.
The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

Include File

```
#include <l4/vbus/vbus.h>
```

Refer to L4vbus for the C++ API.

13.8.2 Enumeration Type Documentation

13.8.2.1 L4vbus_dma_domain_assign_flags

`enum L4vbus_dma_domain_assign_flags`
Flags for l4vbus_assign_dma_domain().

Enumerator

L4VBUS_DMAD_UNBIND	Unbind the given DMA space from the DMA domain.
L4VBUS_DMAD_BIND	Bind the given DMA space to the DMA domain.
L4VBUS_DMAD_L4RE_DMA_SPACE	The given DMA space is an L4Re::Dma_space.

Definition at line 174 of file vbus.h.

13.8.3 Function Documentation

13.8.3.1 l4vbus_assign_dma_domain()

```
int l4vbus_assign_dma_domain (
             l4_cap_idx_t vbus,
             unsigned domain_id,
             unsigned flags,
             l4_cap_idx_t dma_space)
```

Bind or unbind a kernel DMA space or a L4Re::Dma_space to a DMA domain.

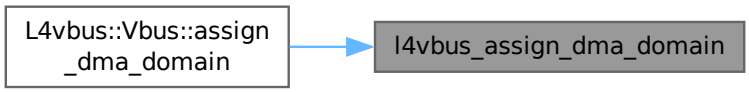
Parameters

vbus	Capability of the system bus
domain_id	DMA domain ID (resource address of DMA domain found on the vBUS). If the value is ~0U the DMA space of the whole vBUS is used.
flags	A combination of L4vbus_dma_domain_assign_flags.
dma_space	The DMA space capability to bind, this must be an L4Re::Dma_space. For unbind the `dma_space` is ignored and should be L4_INVALID_CAP.

Return values

0	Operation completed successfully.
-L4_ENOENT	The vbus does not support a global DMA domain or no DMA domain could be found.
-L4_EINVAL	Invalid argument used.
-L4_EBUSY	DMA domain is already active, this means another DMA space is already assigned.

References L4_CV.
Referenced by L4vbus::Vbus::assign_dma_domain().
Here is the caller graph for this function:



13.8.3.2 l4vbus_get_adr()

```
int l4vbus_get_adr (
             l4_cap_idx_t vbus,
             l4vbus_device_handle_t dev,
             l4_uint32_t * adr)
```

Get the bus-specific address of a device.

Parameters

	vbus	Capability of the system bus

	dev	Handle of the device
out	*adr*	Address

Return values

L4_EOK	Success.
-L4_ENOSYS	Device has no valid address.

References L4_CV.

13.8.3.3 l4vbus_get_device()

```
int l4vbus_get_device (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t dev,
              l4vbus_device_t * devinfo)
```

Obtain detailed information about a Vbus device.

Parameters

	vbus	Capability of the vbus to which the device is connected.
	dev	Device handle of the device from which to retrieve the details.
out	*devinfo*	Information structure which contains details about the device. The pointer might be NULL.

Return values

0	Success.
-L4_ENODEV	No device with the given device handle `dev` could be found.

References L4_CV.
Referenced by L4vbus::Device::device().
Here is the caller graph for this function:

13.8.3.4 l4vbus_get_device_by_hid()

```
L4_BEGIN_DECLS int l4vbus_get_device_by_hid (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t parent,
              l4vbus_device_handle_t * child,
              char const * hid,
```

```
            int depth,
            l4vbus_device_t * devinfo)
```

Find a device by the hardware interface identifier (HID).

Parameters

vbus	Capability of the system bus
parent	Handle to the parent to start the search

This function searches the vbus for a device with the given HID and returns a handle to the first matching device. The HID usually conforms to an ACPI HID or a Linux device tree compatible identifier.
It is possible to have multiple devices with the same HID on a vbus. In order to find all matching devices this function has to be called repeatedly with `child` pointing to the device found in the previous iteration. The iteration starts at `child` that might be any device node in the tree.

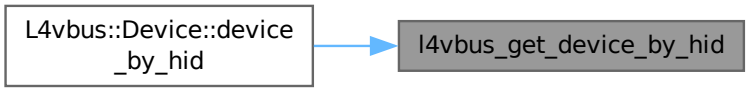
Parameters

`in,out`	*child*	Handle of the device from where in the device tree the search should start. To start searching from the beginning `child` must be initialized using the default (L4VBUS_NULL). If a matching device is found, its handle is returned through this parameter.
	hid	HID of the device
	depth	Maximum depth for the recursive lookup
`out`	*devinfo*	Device information structure (might be NULL)

Return values

>=0	A device with the given HID was found.
-L4_ENOENT	No device with the given HID could be found on the vbus.
-L4_EINVAL	Invalid or no HID provided.
-L4_ENODEV	Function called on a non-existing device.

References L4_CV.
Referenced by L4vbus::Device::device_by_hid().
Here is the caller graph for this function:



13.8.3.5 l4vbus_get_hid()

```
int l4vbus_get_hid (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t dev,
```

```
            char * hid,
            unsigned long max_len)
```

Get the HID (hardware identifier) of a device.

Parameters

vbus	Capability of the system bus
dev	Handle of the device
hid	Pointer to a buffer for the HID string
max_len	The size of the buffer (*hid*)

Returns

the length of the HID string on success, else failure

References L4_CV.

13.8.3.6 l4vbus_get_next_device()

```
int l4vbus_get_next_device (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t parent,
            l4vbus_device_handle_t * child,
            int depth,
            l4vbus_device_t * devinfo)
```

Find next child following `child`.

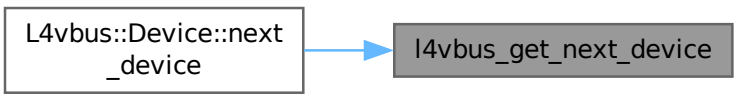
Parameters

	vbus	Capability of the system bus
	parent	Handle to the parent device (use L4VBUS_ROOT_BUS for the system bus)
`in,out`	*child*	Handle of the device that precedes the device that shall be returned. To start from the beginning, `child` must be initialized with L4VBUS_NULL. If a device is found, its handle is returned through this parameter.
	depth	Depth to look for
`out`	*devinfo*	Device information (might be NULL)

Returns

0 on success, else failure

References L4_CV.
Referenced by L4vbus::Device::next_device().
Here is the caller graph for this function:



13.8.3.7 l4vbus_get_resource()

```
int l4vbus_get_resource (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t dev,
            unsigned res_idx,
            l4vbus_resource_t * res)
```

Obtain the resource description of an individual device resource.

Parameters

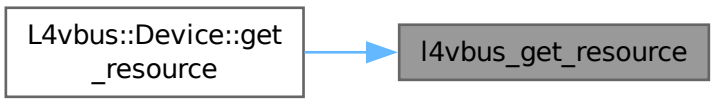
	vbus	Capability of the vbus to which the device is connected.
	dev	Device handle of the device on the vbus. The device handle can be obtained by using the l4vbus_get_device_by_hid() and l4vbus_get_next_device() functions.
	res_idx	Index of the resource for which the resource description should be returned. The total number of resources for a device is available in the l4vbus_device_t structure that is returned by L4vbus::Device::device_by_hid() and L4vbus::Device::next_device().
out	*res*	Descriptor of the resource.

This function returns the resource descriptor of an individual device resource selected by the `res_idx` parameter.

Return values

0	Success.
-L4_ENOENT	Invalid resource index `res_idx`.

References L4_CV.
Referenced by L4vbus::Device::get_resource().
Here is the caller graph for this function:



13.8.3.8 l4vbus_is_compatible()

```
int l4vbus_is_compatible (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t dev,
            char const * cid)
```

Check if the given device has a compatibility ID (CID) or HID that matches *cid*.

Parameters

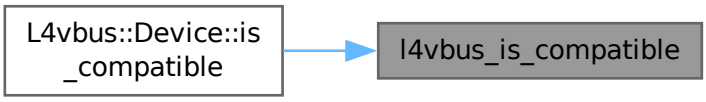
vbus	Capability of the system bus
dev	device handle for which the CID shall be tested

cid	the compatibility ID to test

Returns

1 when the given ID (*cid*) matches this device, 0 when the given ID does not match, <0 on error.

References L4_CV.
Referenced by L4vbus::Device::is_compatible().
Here is the caller graph for this function:



13.8.3.9 l4vbus_release_ioport()

```
int l4vbus_release_ioport (
            l4_cap_idx_t vbus,
            l4vbus_resource_t const * res)
```

Release a previously requested IO port resource.

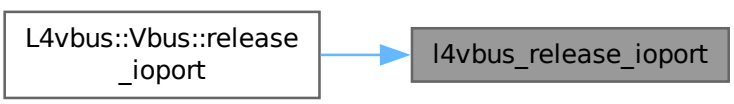
Parameters

	vbus	Capability of the system bus.
in	*res*	The IO port resource to be released from the bus.

Returns

>=0 on success, <0 on error.

References L4_CV.
Referenced by L4vbus::Vbus::release_ioport().
Here is the caller graph for this function:



13.8.3.10 l4vbus_request_ioport()

```
int l4vbus_request_ioport (
             l4_cap_idx_t vbus,
             l4vbus_resource_t const * res)
```

Request an IO port resource.

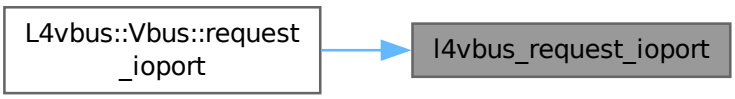
Parameters

	vbus	Capability of the system bus.
in	*res*	The IO port resource to be requested from the bus.

Return values

0	Success.
-L4_EINVAL	Resource is not an IO port resource.
-L4_ENOENT	No matching IO port resource found.

If any IO port resource is found that contains the requested IO port range the IO ports are obtained.
Referenced by L4vbus::Vbus::request_ioport().
Here is the caller graph for this function:



13.8.3.11 l4vbus_vicu_get_cap()

```
int l4vbus_vicu_get_cap (
             l4_cap_idx_t vbus,
             l4vbus_device_handle_t icu,
             l4_cap_idx_t cap)
```

Get capability of ICU.

Parameters

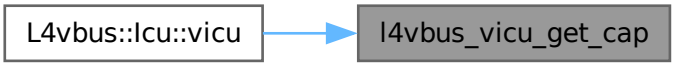
vbus	Capability of the system bus.
icu	ICU device handle.
cap	Capability slot for the capability.

Returns

0 on success, else failure

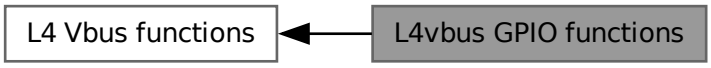
References L4_END_DECLS.

Referenced by L4vbus::Icu::vicu().
Here is the caller graph for this function:



13.8.4 L4vbus GPIO functions

Collaboration diagram for L4vbus GPIO functions:



Enumerations

- enum L4vbus_gpio_generic_func { L4VBUS_GPIO_SETUP_INPUT = 0x100 , L4VBUS_GPIO_SETUP_OUTPUT = 0x200 , L4VBUS_GPIO_SETUP_IRQ = 0x300 }

  Constants for generic GPIO functions.
- enum L4vbus_gpio_pull_modes { L4VBUS_GPIO_PIN_PULL_NONE = 0x100 , L4VBUS_GPIO_PIN_PULL_UP = 0x200 , L4VBUS_GPIO_PIN_PULL_DOWN = 0x300 }

  Constants for generic GPIO pull up/down resistor configuration.

Functions

- int l4vbus_gpio_setup (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin, unsigned mode, int value)

  Configure the function of a GPIO pin.
- int l4vbus_gpio_config_pull (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin, unsigned mode)

  Generic function to set pull up/down mode.
- int l4vbus_gpio_config_pad (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin, unsigned func, unsigned value)

  Hardware specific configuration function.
- int l4vbus_gpio_config_get (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin, unsigned func, unsigned *value)

  Read hardware specific configuration.
- int l4vbus_gpio_get (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin)

  Read value of GPIO input pin.
- int l4vbus_gpio_set (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin, int value)

  Set GPIO output pin.

- int l4vbus_gpio_multi_setup (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned offset, unsigned mask, unsigned mode, unsigned value)

  Configure function of multiple GPIO pins at once.
- int l4vbus_gpio_multi_config_pad (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned offset, unsigned mask, unsigned func, unsigned value)

  Hardware specific configuration function for multiple GPIO pins.
- int l4vbus_gpio_multi_get (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned offset, unsigned *data)

  Read values of multiple GPIO pins at once.
- int l4vbus_gpio_multi_set (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned offset, unsigned mask, unsigned data)

  Set multiple GPIO output pins at once.
- int l4vbus_gpio_to_irq (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned pin)

  Create IRQ for GPIO pin.

13.8.4.1 Detailed Description

13.8.4.2 Enumeration Type Documentation

13.8.4.2.1 L4vbus_gpio_generic_func

`enum L4vbus_gpio_generic_func`
Constants for generic GPIO functions.

Enumerator

L4VBUS_GPIO_SETUP_INPUT	Set GPIO pin to input.
L4VBUS_GPIO_SETUP_OUTPUT	Set GPIO pin to output.
L4VBUS_GPIO_SETUP_IRQ	Set GPIO pin to IRQ.

Definition at line 24 of file vbus_gpio.h.

13.8.4.2.2 L4vbus_gpio_pull_modes

`enum L4vbus_gpio_pull_modes`
Constants for generic GPIO pull up/down resistor configuration.

Enumerator

L4VBUS_GPIO_PIN_PULL_NONE	No pull up or pull down resistors.
L4VBUS_GPIO_PIN_PULL_UP	enable pull up resistor
L4VBUS_GPIO_PIN_PULL_DOWN	enable pull down resistor

Definition at line 34 of file vbus_gpio.h.

13.8.4.3 Function Documentation

13.8.4.3.1 l4vbus_gpio_config_get()

```
int l4vbus_gpio_config_get (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t handle,
            unsigned pin,
            unsigned func,
            unsigned * value)
```

Read hardware specific configuration.

Parameters

	vbus	V-BUS capability
	handle	Device handle for the GPIO chip
	pin	GPIO pin number
	func	Hardware specific configuration register to read from. Usually this is an offset to the GPIO chip's base address.
out	*value*	The configuration value.

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_pin::config_get().
Here is the caller graph for this function:

13.8.4.3.2 l4vbus_gpio_config_pad()

```
int l4vbus_gpio_config_pad (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t handle,
            unsigned pin,
            unsigned func,
            unsigned value)
```

Hardware specific configuration function.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
pin	GPIO pin number
func	Hardware specific configuration register, usually offset to the GPIO chip's base address
value	Value which is written into the hardware specific configuration register for the specified pin

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_pin::config_pad().

Here is the caller graph for this function:

13.8.4.3.3 l4vbus_gpio_config_pull()

```
int l4vbus_gpio_config_pull (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              unsigned pin,
              unsigned mode)
```

Generic function to set pull up/down mode.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
pin	GPIO pin number
mode	mode for pull up/down resistors, see L4vbus_gpio_pull_modes

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_pin::config_pull().
Here is the caller graph for this function:

13.8.4.3.4 l4vbus_gpio_get()

```
int l4vbus_gpio_get (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              unsigned pin)
```

Read value of GPIO input pin.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
pin	GPIO pin number to read from

Returns

Value of GPIO pin (usually 0 or 1), negative error code otherwise.

References L4_CV.
Referenced by L4vbus::Gpio_pin::get().
Here is the caller graph for this function:

13.8.4.3.5 l4vbus_gpio_multi_config_pad()

```
int l4vbus_gpio_multi_config_pad (
             l4_cap_idx_t vbus,
             l4vbus_device_handle_t handle,
             unsigned offset,
             unsigned mask,
             unsigned func,
             unsigned value)
```

Hardware specific configuration function for multiple GPIO pins.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
offset	Pin corresponding to the LSB in *mask*. Note: allowed may be hardware specific.
mask	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
func	Hardware specific configuration register, usually offset to the GPIO chip's base address.
value	Value which is written into the hardware specific configuration register for the specified pins

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_module::config_pad().

Here is the caller graph for this function:

13.8.4.3.6 l4vbus_gpio_multi_get()

```
int l4vbus_gpio_multi_get (
             l4_cap_idx_t vbus,
             l4vbus_device_handle_t handle,
             unsigned offset,
             unsigned * data)
```

Read values of multiple GPIO pins at once.

Parameters

	vbus	V-BUS capability
	handle	Device handle for the GPIO chip
	offset	Pin corresponding to the LSB in *data*. Note: allowed may be hardware specific.
out	*data*	Each bit returns the value (0 or 1) for the corresponding GPIO pin. The value of pins that are not accessible is undefined.

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_module::get().
Here is the caller graph for this function:

13.8.4.3.7 l4vbus_gpio_multi_set()

```
int l4vbus_gpio_multi_set (
             l4_cap_idx_t vbus,
             l4vbus_device_handle_t handle,
             unsigned offset,
             unsigned mask,
             unsigned data)
```

Set multiple GPIO output pins at once.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
offset	Pin corresponding to the LSB in *data*. Note: allowed may be hardware specific.
mask	Mask of GPIO pins to set. A bit set to 1 selects this pin. A maximum of 32 pins can be set at once. The real number depends on the hardware and the driver implementation.
data	Each bit corresponds to the GPIO pin in *mask*. The value of each bit is written to the GPIO pin if its bit in *mask* is set.

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_module::set().
Here is the caller graph for this function:

13.8.4.3.8 l4vbus_gpio_multi_setup()

```
int l4vbus_gpio_multi_setup (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              unsigned offset,
              unsigned mask,
              unsigned mode,
              unsigned value)
```

Configure function of multiple GPIO pins at once.

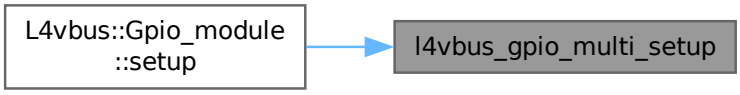
Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
offset	Pin corresponding to the LSB in *mask*. Note: allowed may be hardware specific.
mask	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
mode	GPIO function, see L4vbus_gpio_generic_func for generic functions. Hardware specific functions must be provided in the lower 8 bits.
value	Optional value to set the GPIO pins to if they are configured as output pins

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_module::setup().
Here is the caller graph for this function:



13.8.4.3.9 l4vbus_gpio_set()

```
int l4vbus_gpio_set (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              unsigned pin,
              int value)
```

Set GPIO output pin.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
pin	GPIO pin number to write to
value	Value to write to the GPIO pin (usually 0 or 1)

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_pin::set().
Here is the caller graph for this function:

13.8.4.3.10 l4vbus_gpio_setup()

```
int l4vbus_gpio_setup (
              l4_cap_idx_t vbus,
```

```
                l4vbus_device_handle_t handle,
                unsigned pin,
                unsigned mode,
                int value)
```

Configure the function of a GPIO pin.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
pin	GPIO pin number
mode	GPIO function, see L4vbus_gpio_generic_func for generic functions. Hardware specific functions must be provided in the lower 8 bits.
value	Optional value to set the GPIO pin to if it is configured as an output pin

Returns

0 if OK, error code otherwise

References L4_CV.
Referenced by L4vbus::Gpio_pin::setup().
Here is the caller graph for this function:

13.8.4.3.11 l4vbus_gpio_to_irq()

```
int l4vbus_gpio_to_irq (
                l4_cap_idx_t vbus,
                l4vbus_device_handle_t handle,
                unsigned pin)
```

Create IRQ for GPIO pin.

Parameters

vbus	V-BUS capability
handle	Device handle for the GPIO chip
pin	GPIO pin to create an IRQ for.

Returns

IRQ number if OK, negative error code otherwise

References L4_END_DECLS.
Referenced by L4vbus::Gpio_pin::to_irq().

Here is the caller graph for this function:

13.8.5 L4vbus PCI functions

Collaboration diagram for L4vbus PCI functions:

Functions

- L4_BEGIN_DECLS int l4vbus_pci_cfg_read (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width)

  Read from the vPCI configuration space using the PCI root bridge.
- int l4vbus_pci_cfg_write (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width)

  Write to the vPCI configuration space using the PCI root bridge.
- int l4vbus_pci_irq_enable (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, int pin, unsigned char *trigger, unsigned char *polarity)

  Enable PCI interrupt for a specific device using the PCI root bridge.
- int l4vbus_pcidev_cfg_read (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width)

  Read from the device's vPCI configuration space.
- int l4vbus_pcidev_cfg_write (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width)

  Write to the device's vPCI configuration space.
- int l4vbus_pcidev_irq_enable (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned char *trigger, unsigned char *polarity)

  Enable the device's PCI interrupt.

13.8.5.1 Detailed Description

13.8.5.2 Function Documentation

13.8.5.2.1 l4vbus_pci_cfg_read()

```
L4_BEGIN_DECLS int l4vbus_pci_cfg_read (
             l4_cap_idx_t vbus,
             l4vbus_device_handle_t handle,
             l4_uint32_t bus,
```

```
                l4_uint32_t devfn,
                l4_uint32_t reg,
                l4_uint32_t * value,
                l4_uint32_t width)
```

Read from the vPCI configuration space using the PCI root bridge.

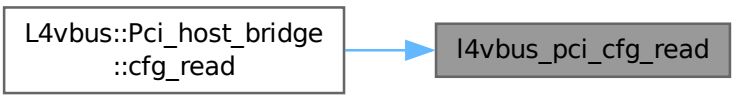
Parameters

	vbus	Capability of the system bus
	handle	Device handle of the PCI root bridge
	bus	Bus number
	devfn	Device id (upper 16bit) and function (lower 16bit)
	reg	Register in configuration space to read
out	*value*	Value that has been read
	width	Width to read in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

References L4_CV.
Referenced by L4vbus::Pci_host_bridge::cfg_read().
Here is the caller graph for this function:



13.8.5.2.2 l4vbus_pci_cfg_write()

```
int l4vbus_pci_cfg_write (
                l4_cap_idx_t vbus,
                l4vbus_device_handle_t handle,
                l4_uint32_t bus,
                l4_uint32_t devfn,
                l4_uint32_t reg,
                l4_uint32_t value,
                l4_uint32_t width)
```

Write to the vPCI configuration space using the PCI root bridge.

Parameters

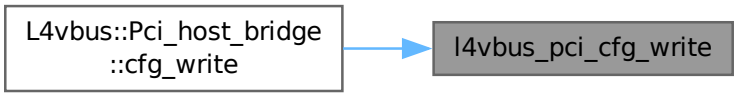
vbus	Capability of the system bus
handle	Device handle of the PCI root bridge
bus	Bus number

devfn	Device id (upper 16bit) and function (lower 16bit)
reg	Register in configuration space to write
value	Value to write
width	Width to write in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

References L4_CV.
Referenced by L4vbus::Pci_host_bridge::cfg_write().
Here is the caller graph for this function:



13.8.5.2.3 l4vbus_pci_irq_enable()

```
int l4vbus_pci_irq_enable (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              l4_uint32_t bus,
              l4_uint32_t devfn,
              int pin,
              unsigned char * trigger,
              unsigned char * polarity)
```

Enable PCI interrupt for a specific device using the PCI root bridge.

Parameters

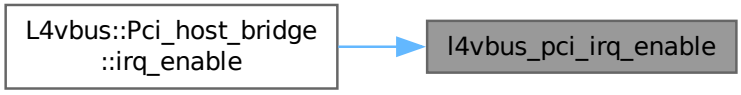
	vbus	Capability of the system bus
	handle	Device handle of the PCI root bridge
	bus	Bus number
	devfn	Device id (upper 16bit) and function (lower 16bit)
	pin	Interrupt pin (normally as reported in configuration register INTR)
out	*trigger*	False if interrupt is level-triggered
out	*polarity*	True if interrupt is of low polarity

Returns

On success: Interrupt line to be used, else failure

References L4_CV.
Referenced by L4vbus::Pci_host_bridge::irq_enable().

Here is the caller graph for this function:



13.8.5.2.4 l4vbus_pcidev_cfg_read()

```
int l4vbus_pcidev_cfg_read (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              l4_uint32_t reg,
              l4_uint32_t * value,
              l4_uint32_t width)
```

Read from the device's vPCI configuration space.

Parameters

	vbus	Capability of the system bus
	handle	Device handle of the PCI device
	reg	Register in configuration space to read
out	*value*	Value that has been read
	width	Width to read in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

References L4_CV.
Referenced by L4vbus::Pci_dev::cfg_read().
Here is the caller graph for this function:

13.8.5.2.5 l4vbus_pcidev_cfg_write()

```
int l4vbus_pcidev_cfg_write (
              l4_cap_idx_t vbus,
              l4vbus_device_handle_t handle,
              l4_uint32_t reg,
```

```
                l4_uint32_t value,
                l4_uint32_t width)
```

Write to the device's vPCI configuration space.

Parameters

vbus	Capability of the system bus
handle	Device handle of the PCI device
reg	Register in configuration space to write
value	Value to write
width	Width to write in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

References L4_CV.

13.8.5.2.6 l4vbus_pcidev_irq_enable()

```
int l4vbus_pcidev_irq_enable (
                l4_cap_idx_t vbus,
                l4vbus_device_handle_t handle,
                unsigned char * trigger,
                unsigned char * polarity)
```

Enable the device's PCI interrupt.

Parameters

	vbus	Capability of the system bus
	handle	Device handle of the PCI device
out	*trigger*	False if interrupt is level-triggered
out	*polarity*	True if interrupt is of low polarity

Returns

On success: Interrupt line to be used, else failure

References L4_END_DECLS.

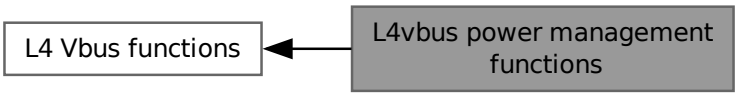
13.8.6 L4vbus power management functions

Collaboration diagram for L4vbus power management functions:



Functions

- L4_BEGIN_DECLS int l4vbus_pm_suspend (l4_cap_idx_t vbus, l4vbus_device_handle_t handle)

  Suspend the device.
- int l4vbus_pm_resume (l4_cap_idx_t vbus, l4vbus_device_handle_t handle)

  Resume the device.

13.8.6.1 Detailed Description

13.8.6.2 Function Documentation

13.8.6.2.1 l4vbus_pm_resume()

```
int l4vbus_pm_resume (
            l4_cap_idx_t vbus,
            l4vbus_device_handle_t handle)
```

Resume the device.

Parameters

vbus	V-BUS capability
handle	Handle for the device to be resumed Switches the device from low-power mode to normal operation and restores the saved state.

Return values

0	Success.

References L4_END_DECLS.
Referenced by L4vbus::Pm< DEC >::pm_resume().

            l4_cap_idx_t vbus,
            l4vbus_device_handle_t handle)
```

Suspend the device.

Parameters

vbus	V-BUS capability
handle	Handle for the device to be suspended Saves the state of the device and puts it into a low-power mode.

Return values

0	Success.

References L4_CV.
Referenced by L4vbus::Pm< DEC >::pm_suspend().

  Get information on the dataspace.

- l4_ret_t l4re_ds_map_info (l4re_ds_t ds, l4_addr_t *start_addr, l4_addr_t *end_addr) L4_NOTHROW

  Get mapping range of dataspace.

Variables

- L4_BEGIN_DECLS typedef l4_cap_idx_t **l4re_ds_t**

  Dataspace type.

13.9.3.1 Detailed Description

Dataspace C interface.

13.9.3.2 Enumeration Type Documentation

13.9.3.2.1 l4re_ds_map_flags

```
enum l4re_ds_map_flags
```

Flags to specify the memory mapping type of a request.

Enumerator

L4RE_DS_F_NORMAL	request normal memory mapping
L4RE_DS_F_CACHEABLE	request normal memory mapping
L4RE_DS_F_BUFFERABLE	request bufferable (write buffered) mappings
L4RE_DS_F_UNCACHEABLE	request uncacheable memory mappings
L4RE_DS_F_CACHING_MASK	mask for caching flags
L4RE_DS_F_CACHING_SHIFT	shift value for caching flags

Definition at line 48 of file dataspace.h.

13.9.3.3 Function Documentation

13.9.3.3.1 l4re_ds_allocate()

```
l4_ret_t l4re_ds_allocate (
             l4re_ds_t ds,
             l4re_ds_offset_t offset,
             l4re_ds_size_t size)
```

Allocate a range in the dataspace.

Parameters

ds	Dataspace capability.
offset	Offset in the dataspace, in bytes.
size	Size of the range, in bytes.

Return values

L4_EOK	Success
-L4_ERANGE	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
-L4_ENOMEM	Not enough memory available.

<0	IPC errors

On success, at least the given range is guaranteed to be allocated. The dataspace manager may also allocate more memory due to page granularity.
The memory is allocated with the same rights as the dataspace capability.
References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.3.3.2 l4re_ds_clear()

```
l4_ret_t l4re_ds_clear (
             l4re_ds_t ds,
             l4re_ds_offset_t offset,
             l4re_ds_size_t size)
```

Clear parts of a dataspace.

Parameters

ds	Dataspace capability.
offset	Offset within dataspace (in bytes).
size	Size of region to clear (in bytes).

Return values

>=0	Success.
-L4_ERANGE	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
-L4_EACCESS	No L4_CAP_FPAGE_W right on dataspace capability.
<0	IPC errors

Zeroes out the memory. Depending on the type of memory the memory could also be deallocated and replaced by a shared zero-page.
References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.3.3.3 l4re_ds_copy_in()

```
l4_ret_t l4re_ds_copy_in (
             l4re_ds_t ds,
             l4re_ds_offset_t dst_offs,
             l4re_ds_t src,
             l4re_ds_offset_t src_offs,
             l4re_ds_size_t size)
```

Copy contents from another dataspace.

Parameters

ds	Destination dataspace.
dst_offs	Offset in destination dataspace.
src	Source dataspace to copy from.
src_offs	Offset in the source dataspace.
size	Size to copy (in bytes).

Return values

L4_EOK	Success
-L4_EACCESS	No L4_CAP_FPAGE_W right on the destination dataspace.
-L4_EINVAL	Invalid parameter supplied.
<0	IPC errors

The copy operation may use copy-on-write mechanisms. The operation may also fail if both dataspaces are not from the same dataspace manager or the dataspace managers do not cooperate.
References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.3.3.4 l4re_ds_flags()

```
l4re_ds_flags_t l4re_ds_flags (
            l4re_ds_t ds)
```

Get flags of the dataspace.

Parameters

ds	Dataspace capability.

Return values

>=0	Flags of the dataspace
<0	IPC errors

See also

L4Re::Dataspace::F::Flags

References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.3.3.5 l4re_ds_info()

```
l4_ret_t l4re_ds_info (
            l4re_ds_t ds,
            l4re_ds_stats_t * stats)
```

Get information on the dataspace.

Parameters

	ds	Dataspace capability.
out	*stats*	Dataspace information

Return values

0	Success
<0	IPC errors

References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.3.3.6 l4re_ds_map_info()

```
l4_ret_t l4re_ds_map_info (
             l4re_ds_t ds,
             l4_addr_t * start_addr,
             l4_addr_t * end_addr)
```

Get mapping range of dataspace.

Parameters

ds	Dataspace capability. In case of a MMU-less system, the dataspace must be mapped at the correct address in the task because virtual and physical address must match. This method returns the start and end address of the physically contiguous buffer backing the dataspace.

On MMU-enabled system any page aligned address is permissible. On such systems the method is just a stub.

Parameters

out	*start_addr*	Start address of dataspace.
out	*end_addr*	End address (inclusive) of dataspace.

Return values

>0	Start/end address have been set and need to be obeyed.
0	No constraint of mapping address.
-L4_EPERM	Cannot infer mapping address. Dataspace not mappable.
<0	IPC errors.

References L4_END_DECLS, L4_NOTHROW, and l4re_ds_t.

13.9.3.3.7 l4re_ds_size()

```
l4re_ds_size_t l4re_ds_size (
             l4re_ds_t ds)
```

Get size of a dataspace.

Parameters

ds	Dataspace capability.

Returns

Size of the dataspace in bytes.

References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.4 Debug interface

Collaboration diagram for Debug interface:

Functions

- L4_BEGIN_DECLS l4_ret_t l4re_debug_obj_debug (l4_cap_idx_t srv, unsigned long function) L4_NOTHROW
  Call debug function of L4Re service.

13.9.4.1 Detailed Description

13.9.4.2 Function Documentation

13.9.4.2.1 l4re_debug_obj_debug()

```
L4_BEGIN_DECLS l4_ret_t l4re_debug_obj_debug (
             l4_cap_idx_t srv,
             unsigned long function)
```

Call debug function of L4Re service.

Parameters

srv	Object to call.
function	Function to call.

See also

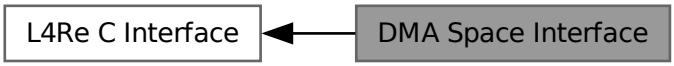
L4Re::Debug_obj::debug

References L4_END_DECLS, and L4_NOTHROW.

13.9.5 DMA Space Interface

DMA Space C interface.

Collaboration diagram for DMA Space Interface:



Typedefs

- typedef l4_cap_idx_t l4re_dma_space_t

  DMA space capability type.
- typedef l4_cap_idx_t l4re_dma_space_mgr_t

  DMA space manager capability type.

Functions

- l4_ret_t l4re_dma_space_map (l4re_dma_space_t dma, l4re_ds_t src, l4re_ds_offset_t offset, l4_size_t *size, unsigned long attrs, enum l4re_dma_space_direction dir, l4re_dma_space_dma_addr_t *dma_addr) L4_NOTHROW

  Map the given part of this data space into the DMA address space.
- l4_ret_t l4re_dma_space_unmap (l4re_dma_space_t dma, l4re_dma_space_dma_addr_t dma_addr, l4_size_t size, unsigned long attrs, enum l4re_dma_space_direction dir) L4_NOTHROW

  Unmap the given part of this data space from the DMA address space.
- l4_ret_t l4re_dma_space_mgr_associate (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, l4_cap_idx_t dma_task, enum l4re_dma_space_mgr_space_attribs attr) L4_NOTHROW

  Associate a (kernel) DMA space for a device to a Dma_space.
- l4_ret_t l4re_dma_space_mgr_associate_phys (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, enum l4re_dma_space_mgr_space_attribs attr) L4_NOTHROW

  Register a Dma_space to use for DMA.
- l4_ret_t l4re_dma_space_mgr_disassociate (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space) L4_NOTHROW
- l4_ret_t l4re_dma_space_mgr_block_area (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, l4re_dma_space_dma_addr_t *addr, l4re_dma_space_dma_size_t size, l4re_dma_space_dma_addr_t max_addr, enum l4re_dma_space_mgr_block_flags flags, unsigned char align) L4_NOTHROW
- l4_ret_t l4re_dma_space_mgr_set_limits (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, l4re_dma_space_dma_addr_t min_addr, l4re_dma_space_dma_addr_t max_addr) L4_NOTHROW

13.9.5.1 Detailed Description

DMA Space C interface.

13.9.5.2 Typedef Documentation

13.9.5.2.1 l4re_dma_space_mgr_t

```
typedef l4_cap_idx_t l4re_dma_space_mgr_t
```

DMA space manager capability type.
A privileged interface to manage Dma_space associations for the clients.
This interface is provided as a singleton by Moe.
Definition at line 76 of file dma_space.h.

13.9.5.2.2 l4re_dma_space_t

```
typedef l4_cap_idx_t l4re_dma_space_t
```

DMA space capability type.
Managed DMA Address Space.
A managed Dma_space represents the L4Re abstraction of an DMA address space of one or several devices. Devices are assigned to a managed Dma_space by binding the Dma_space to the respective DMA domain (see L4vbus::Vbus::assign_dma_domain()), which might link the Dma_space with a kernel DMA space. Note that several DMA domains can be bound to the same Dma_space. Whenever a device needs direct access to parts of an L4Re::Dataspace, that part of the data space must be mapped to the managed Dma_space that is assigned to that device. Binding to DMA domains must happen before mapping. After the DMA accesses to the memory are finished the memory must be unmapped from the device's DMA address space.
Mapping to a managed DMA address space, using map(), makes the given parts of the data space visible to the associated device at the returned DMA address. As long as the memory is mapped into a DMA space it is 'pinned' and cannot be subject to dynamic memory management such as swapping.
unmap() is the reverse operation to map() and unmaps the given data-space part for the DMA address space.
Definition at line 69 of file dma_space.h.

13.9.5.3 Function Documentation

13.9.5.3.1 l4re_dma_space_map()

```
l4_ret_t l4re_dma_space_map (
             l4re_dma_space_t dma,
             l4re_ds_t src,
             l4re_ds_offset_t offset,
             l4_size_t * size,
             unsigned long attrs,
             enum l4re_dma_space_direction dir,
             l4re_dma_space_dma_addr_t * dma_addr)
```

Map the given part of this data space into the DMA address space.

Parameters

	dma	DMA space capability A suitable address in the DMA task will be chosen automatically.
in	*src*	Source data space (that describes the memory).
in	*offset*	The offset (bytes) within src.
in,out	*size*	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call map() again with a new offset and the remaining size.
in	*attrs*	The attributes used for this DMA mapping (a combination of Dma_space::Attribute values). The Search_addr attribute is forced by this overload!
in	*dir*	The direction of the DMA transfer issued with this mapping. The same value must later be passed to unmap(). (ignored)
out	*dma_addr*	The DMA address to use for DMA with the associated device.

Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	The specified region overlaps an existing mapping.
-L4_EINVAL	The capability src is invalid or does not refer to a valid dataspace.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.

-L4_ERANGE	`offset` is larger than the size of the dataspace.

The DMA mapping is created writable if capability `src` has the permission L4_CAP_FPAGE_W. Otherwise, a read-only DMA mapping is established.

Note

Dma_space_mgr::associate() or Dma_space_mgr::associate_phys() must be called prior to mapping memory. Usually this is done implicitly when binding the managed Dma_space to a DMA domain (see L4vbus::Vbus::assign_dma_domain()).

Deprecated Use the other overload without `dir` parameter.

References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.5.3.2 l4re_dma_space_mgr_associate()

```
l4_ret_t l4re_dma_space_mgr_associate (
             l4re_dma_space_mgr_t dma_mgr,
             l4re_dma_space_t dma_space,
             l4_cap_idx_t dma_task,
             enum l4re_dma_space_mgr_space_attribs attr)
```

Associate a (kernel) DMA space for a device to a Dma_space.

Parameters

	dma_mgr	DMA space manager capability
`in`	*dma_space*	The Dma_space to associate the (kernel) DMA space with.
`in`	*dma_task*	The (kernel) DMA space used for the device that shall be associated with this DMA space.
`in`	*attr*	Attributes for this DMA space. See L4Re::Dma_space::Space_attrib.

Return values

L4_EOK	Operation successful.
-L4_EBUSY	The Dma_space is already associated.
-L4_EINVAL	Invalid arguments, e.g. no `dma_task` capability passed. In particular, when Space_attrib↩ ::Identity_map is requested, the Dma_space must not have any pre-existing blockings (see Dma_space_mgr::block_area()) and must not have custom address limits set (see Dma_↩ space_mgr::set_limits()).
-L4_ENOENT	Invalid `dma_space` was passed.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The `dma_space` and `dma_task` capabilities must have the permission L4_CAP_FPAGE_W.

References L4_CV, and L4_NOTHROW.

13.9.5.3.3 l4re_dma_space_mgr_associate_phys()

```
l4_ret_t l4re_dma_space_mgr_associate_phys (
             l4re_dma_space_mgr_t dma_mgr,
```

```
            l4re_dma_space_t dma_space,
            enum l4re_dma_space_mgr_space_attribs attr)
```

Register a Dma_space to use for DMA.

Parameters

	dma_mgr	DMA space manager capability This function should be used, in case no IOMMU is present or configured. The CPU's physical memory is used as DMA address space.
in	*dma_space*	The Dma_space to register.
in	*attr*	Attributes for the provided DMA space. Currently not used; must be the default-constructed Space_attribs() value.

Return values

L4_EOK	Operation successful.
-L4_EBUSY	The Dma_space is already associated.
-L4_EINVAL	Invalid arguments, for example a non-zero `attr`, pre-existing blockings on `dma_space` (see Dma_space_mgr::block_area()), or custom address limits set on `dma_space` (see Dma_↩ space_mgr::set_limits()).
-L4_ENOENT	Invalid `dma_space` was passed.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The `dma_space` capability must have the permission L4_CAP_FPAGE_W.

References L4_CV, and L4_NOTHROW.

13.9.5.3.4 l4re_dma_space_mgr_block_area()

```
l4_ret_t l4re_dma_space_mgr_block_area (
            l4re_dma_space_mgr_t dma_mgr,
            l4re_dma_space_t dma_space,
            l4re_dma_space_dma_addr_t * addr,
            l4re_dma_space_dma_size_t size,
            l4re_dma_space_dma_addr_t max_addr,
            enum l4re_dma_space_mgr_block_flags flags,
            unsigned char align)
```

Parameters

dma_mgr	DMA space manager capability Block an area in a Dma_space.

The blocked area cannot be used for mappings in the given `dma_space` after the call. The call will fail if there are already mappings in the requested range. It is allowed to add block areas before associate() or associate_phys() has been called.
Blocked areas are allowed to overlap.

Parameters

in	*dma_space*	The Dma_space to add blocked areas.
in,out	*addr*	The DMA address of the blocked area. Either taken literally (in which case it must be page aligned) or as start address if Block_flag::Search_addr is passed.
in	*size*	Size of the blocked region. Must be page aligned.
in	*max_addr*	Highest allowed DMA address of the region (inclusive).
in	*flags*	The attributes used for this blocking (a combination of Dma_space_mgr::Block_flag values).
in	*align*	The log2 alignment of the blocked area. Only used if Block_flag::Search_addr is passed.

Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	The specified region overlaps an existing mapping or no space left for the blocking.
-L4_EINVAL	Invalid address, alignment or flag passed. Block_flag::Search_addr passed but dma_space is not associated yet.
-L4_EPERM	Dma_space is associated with physical DMA domain or insufficient permissions; see precondition.
-L4_ENOMEM	There is not enough memory to allocate internal data structures.

Precondition

The dma_space capability must have the permission L4_CAP_FPAGE_W.

References L4_CV, and L4_NOTHROW.

13.9.5.3.5 l4re_dma_space_mgr_disassociate()

```
l4_ret_t l4re_dma_space_mgr_disassociate (
             l4re_dma_space_mgr_t dma_mgr,
             l4re_dma_space_t dma_space)
```

Parameters

	dma_mgr	DMA space manager capability Disassociate the (kernel) DMA space from this Dma_space.
in	*dma_space*	The Dma_space to de-register.

Return values

L4_EOK	Operation successful.
-L4_ENOENT	Invalid dma_space was passed or disassociate() called without prior calling associate()/associate_phys().
-L4_EPERM	Insufficient permissions; see precondition.

Attention

This will remove all mappings, reservations and blockings from dma_space.

Precondition

The dma_space capability must have the permission L4_CAP_FPAGE_W.

References L4_CV, and L4_NOTHROW.

13.9.5.3.6 l4re_dma_space_mgr_set_limits()

```
l4_ret_t l4re_dma_space_mgr_set_limits (
             l4re_dma_space_mgr_t dma_mgr,
             l4re_dma_space_t dma_space,
             l4re_dma_space_dma_addr_t min_addr,
             l4re_dma_space_dma_addr_t max_addr)
```

Parameters

dma_mgr	DMA space manager capability Set lower and upper bound of DMA addresses.

Mappings and blockings are only allowed in the given range.
If multiple Dma_spaces share the same kernel DMA space (i.e., were associated by passing the same dma_task to associate()), all DMA address allocations, reservations and blockings performed through any of these Dma↩ _spaces use the intersection of all their individual limits. Tightening the limits on one Dma_space therefore also constrains all other Dma_spaces sharing the same DMA task; loosening the limits on one Dma_space has no effect beyond what the most-restrictive peer Dma_space allows.

Parameters

in	*dma_space*	The Dma_space whose limits shall be changed.
in	*min_addr*	The lowest usable address in the Dma_space.
in	*max_addr*	The highest usable address in the Dma_space (inclusive).

Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	There are existing mappings or blocking outside the bounds.
-L4_EPERM	Dma_space is associated with physical DMA domain or insufficient permissions; see precondition.
-L4_EINVAL	Invalid address passed.

Precondition

The dma_space capability must have the permission L4_CAP_FPAGE_W.

References L4_END_DECLS, and L4_NOTHROW.

13.9.5.3.7 l4re_dma_space_unmap()

```
l4_ret_t l4re_dma_space_unmap (
             l4re_dma_space_t dma,
             l4re_dma_space_dma_addr_t dma_addr,
             l4_size_t size,
             unsigned long attrs,
             enum l4re_dma_space_direction dir)
```

Unmap the given part of this data space from the DMA address space.

Parameters

dma	DMA space capability The calls to map() and unmap() must be balanced. That is, each page of a mapping that was established by `map()` previously must be unmapped exactly once.

Sub-ranges that do not currently hold a mapping are silently skipped. That is, unmapping the same region too often, is not treated as an error.

Parameters

dma_addr	The DMA address (returned by Dma_space::map()).
size	The size (bytes) of the memory region to unmap.
attrs	The attributes for the unmap (currently none, ignored).
dir	The direction of the finished DMA operation (ignored).

Return values

L4_EOK	Operation successful.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.

Deprecated Use the overload without `attrs` and `dir` because they are ignored.

References L4_CV, and L4_NOTHROW.

13.9.6 Event interface

Event C interface.
Collaboration diagram for Event interface:

Functions

- l4_ret_t l4re_event_get_buffer (const l4_cap_idx_t server, const l4re_ds_t ds) L4_NOTHROW

  Get an event signal buffer.
- l4_ret_t l4re_event_get_num_streams (const l4_cap_idx_t server) L4_NOTHROW

  Get number of streams.
- l4_ret_t l4re_event_get_stream_info (const l4_cap_idx_t server, int idx, l4re_event_stream_info_t *info) L4_NOTHROW

  Get information on a stream.
- l4_ret_t l4re_event_get_stream_info_for_id (const l4_cap_idx_t server, l4_umword_t stream_id, l4re_event↩ _stream_info_t *info) L4_NOTHROW

  Get info for a stream given a stream id.
- l4_ret_t l4re_event_get_axis_info (const l4_cap_idx_t server, l4_umword_t id, unsigned naxes, unsigned const *axis, l4re_event_absinfo_t *info) L4_NOTHROW

Get Axis information for a stream.

13.9.6.1 Detailed Description

Event C interface.

13.9.6.2 Function Documentation

13.9.6.2.1 l4re_event_get_axis_info()

```
l4_ret_t l4re_event_get_axis_info (
             const l4_cap_idx_t server,
             l4_umword_t id,
             unsigned naxes,
             unsigned const * axis,
             l4re_event_absinfo_t * info)
```

Get Axis information for a stream.

Parameters

	server	Server to talk to.
	id	Id of the stream to get information from.
	naxes	Number of axes in `axis` array.
`in`	*axis*	Array of axis IDs whose information should be retrieved.
`out`	*info*	Information buffer to store the retrieved axis infos.

Return values

0	Success
<0	Error

See also

L4Re::Event::get_axis_info

References L4_END_DECLS, and L4_NOTHROW.

13.9.6.2.2 l4re_event_get_buffer()

```
l4_ret_t l4re_event_get_buffer (
             const l4_cap_idx_t server,
             const l4re_ds_t ds)
```

Get an event signal buffer.

Parameters

server	Server to talk to.
ds	Buffer to event data.

Returns

0 for success, <0 on error

See also

L4Re::Event::get_buffer

References L4_CV, L4_NOTHROW, and l4re_ds_t.

13.9.6.2.3 l4re_event_get_num_streams()

```
l4_ret_t l4re_event_get_num_streams (
            const l4_cap_idx_t server)
```

Get number of streams.

Parameters

server	Server to talk to.

Returns

0 for success, <0 on error

See also

L4Re::Event::get_num_streams

References L4_CV, and L4_NOTHROW.

13.9.6.2.4 l4re_event_get_stream_info()

```
l4_ret_t l4re_event_get_stream_info (
            const l4_cap_idx_t server,
            int idx,
            l4re_event_stream_info_t * info)
```

Get information on a stream.

Parameters

	server	Server to talk to.
	idx	Index value.
out	*info*	Information buffer.

Returns

0 for success, <0 on error

See also

L4Re::Event::get_stream_info

References L4_CV, and L4_NOTHROW.

13.9.6.2.5 l4re_event_get_stream_info_for_id()

```
l4_ret_t l4re_event_get_stream_info_for_id (
            const l4_cap_idx_t server,
            l4_umword_t stream_id,
            l4re_event_stream_info_t * info)
```

Get info for a stream given a stream id.

Parameters

	server	Server to talk to.
	stream↩ _id	Stream ID.
out	*info*	Information buffer.

Returns

0 for success, <0 on error

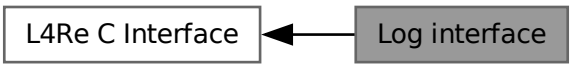
See also

L4Re::Event::get_stream_info_for_id

References L4_CV, and L4_NOTHROW.

13.9.7 Log interface

Log C interface.
Collaboration diagram for Log interface:



Functions

- L4_BEGIN_DECLS void l4re_log_print (char const *string) L4_NOTHROW
  Write a null terminated string to the default log.
- void l4re_log_printn (char const *string, int len) L4_NOTHROW
  Write a string of a given length to the default log.
- void l4re_log_print_srv (const l4_cap_idx_t logcap, char const *string) L4_NOTHROW
  Write a null terminated string to a log.
- void l4re_log_printn_srv (const l4_cap_idx_t logcap, char const *string, int len) L4_NOTHROW
  Write a string of a given length to a log.

13.9.7.1 Detailed Description

Log C interface.

13.9.7.2 Function Documentation

13.9.7.2.1 l4re_log_print()

```
void l4re_log_print (
            char const * string)  [inline]
```

Write a null terminated string to the default log.

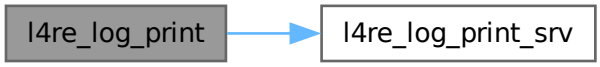
Parameters

string	Text to print, null terminated.

See also

L4Re::Log::print

Definition at line 81 of file log.h.
References L4_NOTHROW, and l4re_log_print_srv().
Here is the call graph for this function:



13.9.7.2.2 l4re_log_print_srv()

```
void l4re_log_print_srv (
             const l4_cap_idx_t logcap,
             char const * string)
```

Write a null terminated string to a log.

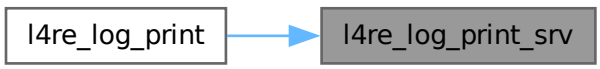
Parameters

logcap	Log capability (service).
string	Text to print, null terminated.

See also

L4Re::Log::print

References L4_CV, and L4_NOTHROW.
Referenced by l4re_log_print().
Here is the caller graph for this function:



13.9.7.2.3 l4re_log_printn()

```
void l4re_log_printn (
             char const * string,
             int len)  [inline]
```

Write a string of a given length to the default log.

Parameters

string	Text to print, null terminated.
len	Length of string in bytes.

See also

L4Re::Log::printn

Definition at line 87 of file log.h.
References L4_NOTHROW, and l4re_log_printn_srv().
Here is the call graph for this function:

13.9.8 Memory allocator

Memory allocator C interface.
Collaboration diagram for Memory allocator:

Enumerations

- enum l4re_ma_flags

  Flags for requesting memory at the memory allocator.

Functions

- l4_ret_t l4re_ma_alloc (long size, l4re_ds_t const mem, unsigned long flags) L4_NOTHROW

  Allocate memory.
- l4_ret_t l4re_ma_alloc_align (long size, l4re_ds_t const mem, unsigned long flags, unsigned long align) L4_NOTHROW

  Allocate memory.
- l4_ret_t l4re_ma_alloc_align_srv (l4_cap_idx_t srv, long size, l4re_ds_t const mem, unsigned long flags, unsigned long align) L4_NOTHROW

  Allocate memory.

13.9.8.1 Detailed Description

Memory allocator C interface.

13.9.8.2 Enumeration Type Documentation

13.9.8.2.1 l4re_ma_flags

`enum l4re_ma_flags`
Flags for requesting memory at the memory allocator.

See also

L4Re::Mem_alloc::Mem_alloc_flags

Definition at line 32 of file mem_alloc.h.

13.9.8.3 Function Documentation

13.9.8.3.1 l4re_ma_alloc()

```
l4_ret_t l4re_ma_alloc (
            long size,
            l4re_ds_t const mem,
            unsigned long flags)  [inline]
```

Allocate memory.

Parameters

size	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if `size` is a negative value and `flags` set the Mem_alloc_flags::Continuous bit, the allocator tries to allocate as much memory as possible leaving an amount of at least `-size` bytes within the associated quota.
mem	Capability slot where the capability to the dataspace is received.
flags	Special dataspace properties, see l4re_ma_flags

Return values

0	Success
-L4_ERANGE	Given size not supported.
-L4_ENOMEM	Not enough memory available.
<0	IPC error

See also

L4Re::Mem_alloc::alloc

The memory allocator returns a dataspace.

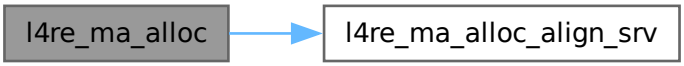
Note

This function is using the L4Re::Env::env()->mem_alloc() service.

Examples

examples/libs/l4re/c/ma+rm.c.

Definition at line 136 of file mem_alloc.h.
References L4_NOTHROW, l4re_ds_t, and l4re_ma_alloc_align_srv().
Here is the call graph for this function:



13.9.8.3.2 l4re_ma_alloc_align()

```
l4_ret_t l4re_ma_alloc_align (
             long size,
             l4re_ds_t const mem,
             unsigned long flags,
             unsigned long align)  [inline]
```

Allocate memory.

Parameters

size	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if `size` is a negative value and `flags` set the Mem_alloc_flags::Continuous bit, the allocator tries to allocate as much memory as possible leaving an amount of at least `-size` bytes within the associated quota.
mem	Capability slot where the capability to the dataspace is received.
flags	Special dataspace properties, see l4re_ma_flags
align	Log2 alignment of dataspace if supported by allocator, will be at least L4_PAGESHIFT, with Super_↩ pages flag set at least L4_SUPERPAGESHIFT

Return values

0	Success
-L4_ERANGE	Given size not supported.
-L4_ENOMEM	Not enough memory available.
<0	IPC error

13.9.8.3.3 l4re_ma_alloc_align_srv()

```
l4_ret_t l4re_ma_alloc_align_srv (
             l4_cap_idx_t srv,
             long size,
             l4re_ds_t const mem,
             unsigned long flags,
             unsigned long align)
```

Allocate memory.

Parameters

srv	Memory allocator service.
size	Size to be requested.
mem	Capability slot to put the requested dataspace in
flags	Flags, see l4re_ma_flags
align	Log2 alignment of dataspace if supported by allocator, will be at least L4_PAGESHIFT, with Super_↩ pages flag set at least L4_SUPERPAGESHIFT, default 0

Returns

0 on success, <0 on error

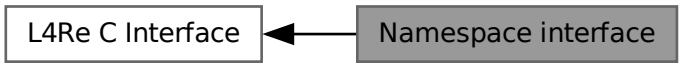
13.9.9 Namespace interface

Namespace C interface.
Collaboration diagram for Namespace interface:



Enumerations

- enum l4re_ns_register_flags

  Namespace register flags.

Functions

- l4_ret_t l4re_ns_query_to_srv (l4re_namespace_t srv, char const ∗name, l4_cap_idx_t const cap, int timeout) L4_NOTHROW

  Query the name space for the object named by `name`.
- l4_ret_t l4re_ns_query_srv (l4re_namespace_t srv, char const ∗name, l4_cap_idx_t const cap) L4_NOTHROW

  Query the name space for the object named by `name`.
- l4_ret_t l4re_ns_register_obj_srv (l4re_namespace_t srv, char const ∗name, l4_cap_idx_t const obj, unsigned flags) L4_NOTHROW

  Register an object with a name.

Variables

- L4_BEGIN_DECLS typedef l4_cap_idx_t **l4re_namespace_t**

  Namespace type.

13.9.9.1 Detailed Description

Namespace C interface.

13.9.9.2 Enumeration Type Documentation

13.9.9.2.1 l4re_ns_register_flags

```
enum l4re_ns_register_flags
```

Namespace register flags.

See also

L4Re::Namespace::Register_flags

Definition at line 29 of file namespace.h.

13.9.9.3 Function Documentation

13.9.9.3.1 l4re_ns_query_srv()

```
l4_ret_t l4re_ns_query_srv (
            l4re_namespace_t srv,
            char const * name,
            l4_cap_idx_t const cap)  [inline]
```

Query the name space for the object named by `name`.

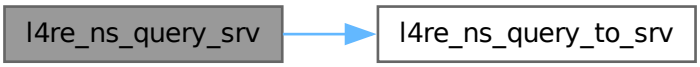
Parameters

srv	Name space server to use for the query.
name	String to query.
cap	Capability slot where the received capability will be stored.

Return values

0	Name could be fully resolved.
>0	Name could only be partly resolved. The number of remaining characters is returned.
-L4_ENOENT	Entry could not be found.
-L4_EAGAIN	Entry exists but no object is yet attached. Try again later.
<0	IPC errors, see l4_error_code_t.

Definition at line 95 of file namespace.h.
References L4_NOTHROW, l4re_namespace_t, and l4re_ns_query_to_srv().
Here is the call graph for this function:



13.9.9.3.2 l4re_ns_query_to_srv()

```
l4_ret_t l4re_ns_query_to_srv (
            l4re_namespace_t srv,
```

```
            char const * name,
            l4_cap_idx_t const cap,
            int timeout)
```

Query the name space for the object named by `name`.

Parameters

timeout	Timeout of query in milliseconds. The client will only wait if a name already has been registered with the server but no object has been attached yet.
srv	Name space server to use for the query.
name	String to query.
cap	Capability slot where the received capability will be stored.

Return values

0	Name could be fully resolved.
>0	Name could only be partly resolved. The number of remaining characters is returned.
-L4_ENOENT	Entry could not be found.
-L4_EAGAIN	Entry exists but no object is yet attached. Try again later.
<0	IPC errors, see l4_error_code_t.

13.9.9.3.3 l4re_ns_register_obj_srv()

```
l4_ret_t l4re_ns_register_obj_srv (
            l4re_namespace_t srv,
            char const * name,
            l4_cap_idx_t const obj,
            unsigned flags)
```

Register an object with a name.

Parameters

srv	Name space server to use for the query.
name	Name under which the object should be registered.
obj	Capability to object to register. An invalid capability may be given to only reserve the name for later use.

flags	Flags to assign to the entry, see L4Re::Namespace::Register_flags. Note that the rights that are assigned to a capability are not only determined by the rights given in these flags but also by the rights with which the `obj` capability was mapped to the name space.

Return values

0	Object was successfully registered with *name*.
-L4_EEXIST	Name already registered.
-L4_EPERM	Insufficient permissions; see precondition.
-L4_ENOMEM	Server has insufficient resources.
-L4_EINVAL	Invalid parameter.
<0	IPC errors, see l4_error_code_t.

Precondition

The invoked Namespace capability must have the permission L4_CAP_FPAGE_W.

References L4_CV, L4_INLINE, L4_NOTHROW, and l4re_namespace_t.

13.9.10 Parent interface

- int l4re_rm_get_info_srv (l4_cap_idx_t rm, l4_addr_t addr, char *name, unsigned int len, l4re_rm_offset_t *backing_offset) L4_NOTHROW
- void **l4re_rm_show_lists_srv** (l4_cap_idx_t rm) L4_NOTHROW

  Dump region map internal data structures.

13.9.11.1 Detailed Description

Region map C interface.

13.9.11.2 Enumeration Type Documentation

13.9.11.2.1 l4re_rm_flags_values

`enum l4re_rm_flags_values`
Flags for region operations.

Enumerator

L4RE_RM_F_R	Region is read-only.
L4RE_RM_F_KERNEL	Kernel-provided memory (KUMEM).
L4RE_RM_F_DETACH_FREE	Free the portion of the data space after detach.
L4RE_RM_F_PAGER	Region has a pager.
L4RE_RM_F_RESERVED	Region is reserved (blocked).
L4RE_RM_CACHING_SHIFT	Start of region mapper cache bits.
L4RE_RM_F_CACHING	Mask of all region manager cache bits.
L4RE_RM_REGION_FLAGS	Mask of all region flags.
L4RE_RM_F_CACHE_NORMAL	Cache bits for normal cacheable memory.
L4RE_RM_F_CACHE_BUFFERED	Cache bits for buffered (write combining) memory.
L4RE_RM_F_CACHE_UNCACHED	Cache bits for uncached memory.
L4RE_RM_F_SEARCH_ADDR	Search for a suitable address range.
L4RE_RM_F_IN_AREA	Search only in area, or map into area.
L4RE_RM_F_EAGER_MAP	Eagerly map the attached data space in.
L4RE_RM_F_NO_EAGER_MAP	Prevent eager mapping of the attached data space.
L4RE_RM_F_ATTACH_FLAGS	Mask of all attach flags.

13.9.11.3 Function Documentation

13.9.11.3.1 l4re_rm_attach()

```
int l4re_rm_attach (
             void ** start,
             unsigned long size,
             l4re_rm_flags_t flags,
             l4re_ds_t mem,
             l4re_rm_offset_t offs,
             unsigned char align)  [inline]
```

Attach a data space to a region.

Parameters

in,out	*start*	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If L4Re::Rm::F::Search_addr is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If L4Re::Rm::F::In_area is given the value is used as a selector for the area (see L4Re::Rm::reserve_area) to attach the data space to.

	size	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	flags	The flags control how and with which rights the dataspace is attached to the region. See L4Re::Rm::F::Attach_flags and L4Re::Rm::F::Region_flags. The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the `F::Eager_map` flag is set this function may also return L4Re::Dataspace::map error codes if the mapping fails.
	mem	Data space.
	offs	Offset into the data space to use.
	align	Alignment of the virtual region, log2-size, default: a page (L4_PAGESHIFT). This is only meaningful if the L4Re::Rm::F::Search_addr flag is used.

Return values

0	Success
-L4_ENOENT	No area could be found (see L4Re::Rm::F::In_area)
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is

             unsigned char align,
             char const * name,
             l4re_ds_offset_t backing_offset)  [inline]
```

Attach a data space to a region.

Parameters

in,out	*start*	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If L4Re::Rm::F::Search_addr is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If L4Re::Rm::F::In_area is given the value is used as a selector for the area (see L4Re::Rm::reserve_area) to attach the data space to.
	size	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	flags	The flags control how and with which rights the dataspace is attached to the region. See L4Re::Rm::F::Attach_flags and L4Re::Rm::F::Region_flags. The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the `F::Eager_map` flag is set this function may also return L4Re::Dataspace::map error codes if the mapping fails.

	mem	Data space.
	offs	Offset into the data space to use.
	align	Alignment of the virtual region, log2-size, default: a page (L4_PAGESHIFT). This is only meaningful if the L4Re::Rm::F::Search_addr flag is used.
	name	Optional name of the region.
	backing_offset	Optional value describing an offset into the backing store of this region.

Return values

0	Success
-L4_ENOENT	No area could be found (see L4Re::Rm::F::In_area)
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is

13.9.11.3.5 l4re_rm_detach()

```
int l4re_rm_detach (
            void * addr)  [inline]
```

Detach and unmap a region from the address space in the current task.

Parameters

addr	Address of the region to detach.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees a region in the virtual address space given by addr. The corresponding part of the address space is now available again.

References L4_NOTHROW, and l4re_rm_detach_srv().
Here is the call graph for this function:

13.9.11.3.10 l4re_rm_find()

```
int l4re_rm_find (
            l4_addr_t * addr,
            unsigned long * size,
            l4re_rm_offset_t * offset,
            l4re_rm_flags_t * flags,
            l4re_ds_t * m)  [inline]
```

Find a region given an address and size.

Parameters

in,out	*addr*	Address to look for. Returns the start address of the found region.
in,out	*size*	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	*offset*	Offset at the beginning of the region within the associated dataspace.
out	*flags*	Region flags, see F::Region_flags (and F::In_area).
out	*m*	Associated dataspace or paging service. May be an invalid capability, see below.

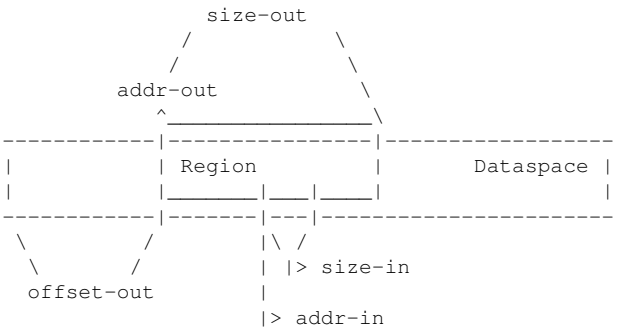
Return values

0	Success
-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the addr and size parameter. If no such region is found but a reserved area, the area is returned and F::In_area is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

Note

`m` is the dataspace that was passed when the region was attached. It is L4_INVALID_CAP whenever the region has no such dataspace, which is the case for regions attached with F::Anonymous because the memory is provided by the region manager itself. Additionally, the capability slot may have been reused by the application in the meantime. Thus, callers must be careful when using `m` of regions that have been created or manipulated by other code.



Note

The value of the size input parameter should be 1 to assure that a region can be determined unambiguously.

            l4re_rm_offset_t * backing_offset)  [inline]
```

Return auxiliary information of a region.
This is a debugging feature and might not be available.

Parameters

	addr	Virtual address of the region.
out	*name*	Name of the region.
out	*backing_offset*	Backing offset information.

Return values

0	Success
-L4_ENOENT	Region not found.
-L4_ENOSYS	Function not available.
<0	IPC errors

Parameters

len	Length of the name given in name argument, in bytes.

             unsigned long size,
             l4re_rm_flags_t flags,
             unsigned char align)  [inline]
```

Reserve the given area in the region map.

Parameters

in,out	*start*	The virtual start address of the area to reserve. Returns the start address of the area.

	size	The size of the area to reserve (in bytes).
	flags	Flags for the reserved area (see F::Search_addr, F::Kernel and F::Reserved).
	align	Alignment of area if searched as bits (log2 value).

Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
-L4_EINVAL	Invalid parameters
<0	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (*flags* = L4Re::Rm::F::Reserved), where no data spaces can be attached
- Special purpose areas (*flags* = 0), where data spaces can be attached to the area via the L4Re::Rm::F::In_area flag and a start address within the area itself.

Note

When searching for a free place in the virtual address space (with *flags* = L4Re::Rm::F::Search_addr), the space between *start* and the end of the virtual address space is searched.

Functions

- L4_BEGIN_DECLS int l4re_video_goos_info (l4re_video_goos_t goos, l4re_video_goos_info_t *ginfo) L4_NOTHROW

  Get information on a goos.
- int l4re_video_goos_refresh (l4re_video_goos_t goos, int x, int y, int w, int h) L4_NOTHROW

  Flush a rectangle of pixels of the goos screen.
- int l4re_video_goos_create_buffer (l4re_video_goos_t goos, unsigned long size, l4_cap_idx_t buffer) L4_NOTHROW

  Create a new buffer (memory buffer) for pixel data.
- int l4re_video_goos_delete_buffer (l4re_video_goos_t goos, unsigned idx) L4_NOTHROW

  Delete a pixel buffer.
- int l4re_video_goos_get_static_buffer (l4re_video_goos_t goos, unsigned idx, l4_cap_idx_t buffer) L4_NOTHROW

Get the data-space capability of the static pixel buffer.

- int l4re_video_goos_create_view (l4re_video_goos_t goos, l4re_video_view_t *view) L4_NOTHROW

  Create a new view (.

- int l4re_video_goos_delete_view (l4re_video_goos_t goos, l4re_video_view_t *view) L4_NOTHROW

  Delete a view.

- int l4re_video_goos_get_view (l4re_video_goos_t goos, unsigned idx, l4re_video_view_t *view) L4_NOTHROW

  Get a view for the given index.

- L4_BEGIN_DECLS int l4re_video_view_refresh (l4re_video_view_t *view, int x, int y, int w, int h) L4_NOTHROW

  Flush the given rectangle of pixels of the given view.

- int l4re_video_view_get_info (l4re_video_view_t *view, l4re_video_view_info_t *info) L4_NOTHROW

  Retrieve information about the given view.

- int l4re_video_view_set_info (l4re_video_view_t *view, l4re_video_view_info_t *info) L4_NOTHROW

  Set properties of the view.

- int l4re_video_view_set_viewport (l4re_video_view_t *view, int x, int y, int w, int h, unsigned long bofs) L4_NOTHROW

  Set the viewport parameters of a view.

- int l4re_video_view_stack (l4re_video_view_t *view, l4re_video_view_t *pivot, int behind) L4_NOTHROW

  Change the stacking order in the stack of visible views.

13.9.14.1 Detailed Description

13.9.14.2 Typedef Documentation

13.9.14.2.1 l4re_video_view_t

```
typedef struct l4re_video_view_t l4re_video_view_t
```

C representation of a goos view.
A view is a visible rectangle that provides a view to the contents of a buffer (frame buffer) memory object and is placed on a real screen.

13.9.14.3 Enumeration Type Documentation

13.9.14.3.1 l4re_video_goos_info_flags_t

```
enum l4re_video_goos_info_flags_t
```

Flags of information on the goos.

Enumerator

F_l4re_video_goos_auto_refresh	The graphics display is automatically refreshed.
F_l4re_video_goos_pointer	We have a mouse pointer.
F_l4re_video_goos_dynamic_views	Supports dynamically allocated views.
F_l4re_video_goos_dynamic_buffers	Supports dynamically allocated buffers.

Definition at line 29 of file goos.h.

13.9.14.3.2 l4re_video_view_info_flags_t

```
enum l4re_video_view_info_flags_t
```

Flags of information on a view.

Enumerator

F_l4re_video_view_none	everything for this view is static (the BOOT-FB case)
F_l4re_video_view_set_buffer	buffer object for this view can be changed
F_l4re_video_view_set_buffer_offset	buffer offset can be set
F_l4re_video_view_set_bytes_per_line	bytes per line can be set
F_l4re_video_view_set_pixel	pixel type can be set
F_l4re_video_view_set_position	position on screen can be set
F_l4re_video_view_dyn_allocated	View is dynamically allocated.
F_l4re_video_view_set_background	Set view as background for session.
F_l4re_video_view_set_flags	Set view property flags.
F_l4re_video_view_above	Flag the view as stay on top.
F_l4re_video_view_flags_mask	Mask containing all possible property flags.

Definition at line 23 of file view.h.

13.9.14.4 Function Documentation

13.9.14.4.1 l4re_video_goos_create_buffer()

```
int l4re_video_goos_create_buffer (
             l4re_video_goos_t goos,
             unsigned long size,
             l4_cap_idx_t buffer)
```

Create a new buffer (memory buffer) for pixel data.

Parameters

goos	the target object for the operation.
size	the size in bytes for the pixel buffer.
buffer	a capability index to receive the data-space capability for the buffer.

Returns

>=0: The index of the created buffer (used to assign views and for deletion). < 0: on error

References L4_CV, and L4_NOTHROW.

13.9.14.4.2 l4re_video_goos_create_view()

```
int l4re_video_goos_create_view (
             l4re_video_goos_t goos,
             l4re_video_view_t * view)
```

Create a new view (.

See also

l4re_video_view_t)

Parameters

	goos	the goos session to use.
out	*view*	structure initialized to the new view.

References L4_CV, and L4_NOTHROW.

13.9.14.4.3 l4re_video_goos_delete_buffer()

```
int l4re_video_goos_delete_buffer (
            l4re_video_goos_t goos,
            unsigned idx)
```

Delete a pixel buffer.

Parameters

goos	the target goos object.
idx	the buffer index of the buffer to delete (the return value of l4re_video_goos_create_buffer())

References L4_CV, and L4_NOTHROW.

13.9.14.4.4 l4re_video_goos_delete_view()

```
int l4re_video_goos_delete_view (
            l4re_video_goos_t goos,
            l4re_video_view_t * view)
```

Delete a view.

Parameters

goos	the goos session to use.
view	the view to delete, the given data-structure is invalid afterwards.

References L4_CV, and L4_NOTHROW.

13.9.14.4.5 l4re_video_goos_get_static_buffer()

```
int l4re_video_goos_get_static_buffer (
            l4re_video_goos_t goos,
            unsigned idx,
            l4_cap_idx_t buffer)
```

Get the data-space capability of the static pixel buffer.

Parameters

goos	The target goos object.
idx	Index of the static buffer.
buffer	A capability index to receive the data-space capability.

This function allows access to static, preexisting pixel buffers. Such static buffers exist for static configurations, such as the bootloader's framebuffer.
References L4_CV, and L4_NOTHROW.

13.9.14.4.6 l4re_video_goos_get_view()

```
int l4re_video_goos_get_view (
            l4re_video_goos_t goos,
            unsigned idx,
            l4re_video_view_t * view)
```

Get a view for the given index.

Parameters

	goos	the target goos session.
	idx	the index of the view to retrieve.
out	*view*	structure initialized to the view with the given index.

This function allows to access static views as provided, for example, by the bootloader's framebuffer. However, it also allows to access dynamic views created with l4re_video_goos_create_view().
References L4_END_DECLS, and L4_NOTHROW.

13.9.14.4.7 l4re_video_goos_info()

```
L4_BEGIN_DECLS int l4re_video_goos_info (
            l4re_video_goos_t goos,
            l4re_video_goos_info_t * ginfo)
```

Get information on a goos.

Parameters

	goos	Goos object
out	*ginfo*	Pointer to goos information structure.

Returns

0 for success, <0 on error

- -L4_ENODEV
- IPC errors

References L4_CV, and L4_NOTHROW.

13.9.14.4.8 l4re_video_goos_refresh()

```
int l4re_video_goos_refresh (
            l4re_video_goos_t goos,
            int x,
            int y,
            int w,
            int h)
```

Flush a rectangle of pixels of the goos screen.

Parameters

goos	the target object of the operation.
x	the x-coordinate of the upper left corner of the rectangle
y	the y-coordinate of the upper left corner of the rectangle
w	the width of the rectangle to be flushed
h	the height of the rectangle

References L4_CV, and L4_NOTHROW.

13.9.14.4.9 l4re_video_view_get_info()

```
int l4re_video_view_get_info (
```

```
            l4re_video_view_t * view,
            l4re_video_view_info_t * info)
```

Retrieve information about the given *view*.

Parameters

	view	the target view for the operation.
out	*info*	a buffer receiving the information about the view.

References L4_CV, and L4_NOTHROW.

13.9.14.4.10 l4re_video_view_refresh()

```
L4_BEGIN_DECLS int l4re_video_view_refresh (
            l4re_video_view_t * view,
            int x,
            int y,
            int w,
            int h)
```

Flush the given rectangle of pixels of the given *view*.

Parameters

view	the target view of the operation.
x	x-coordinate of the upper left corner
y	y-coordinate of the upper left corner
w	the width of the rectangle
h	the height of the rectangle

References L4_CV, and L4_NOTHROW.

13.9.14.4.11 l4re_video_view_set_info()

```
int l4re_video_view_set_info (
            l4re_video_view_t * view,
            l4re_video_view_info_t * info)
```

Set properties of the view.

Parameters

view	the target view of the operation.
info	the parameters to be set on the view.

Which parameters can be manipulated on a given view can be figured out with l4re_video_view_get_info() and this depends on the concrete instance the view object.
References L4_CV, and L4_NOTHROW.

13.9.14.4.12 l4re_video_view_set_viewport()

```
int l4re_video_view_set_viewport (
            l4re_video_view_t * view,
            int x,
            int y,
            int w,
```

```
            int h,
            unsigned long bofs)
```

Set the viewport parameters of a view.

Parameters

view	the target view of the operation.
x	the x-coordinate of the upper left corner on the screen.
y	the y-coordinate of the upper left corner on the screen.
w	the width of the view.
h	the height of the view.
bofs	the offset (in bytes) of the upper left pixel in the memory buffer

This function is a convenience wrapper for l4re_video_view_set_info(), just setting the often changed parameters of a dynamic view. With this function a view can be placed on the real screen and at the same time on its backing buffer.
References L4_CV, and L4_NOTHROW.

13.9.14.4.13 l4re_video_view_stack()

```
int l4re_video_view_stack (
            l4re_video_view_t * view,
            l4re_video_view_t * pivot,
            int behind)
```

Change the stacking order in the stack of visible views.

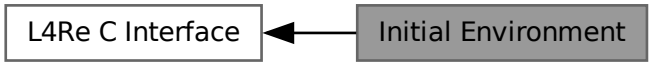
Parameters

view	the target view for the operation.
pivot	the neighbor view, relative to which *view* shall be stacked. a NULL value allows top (*behind* = 1) and bottom (*behind* = 0) placement of the view.
behind	describes the placement of the view relative to the *pivot* view.

References L4_END_DECLS, and L4_NOTHROW.

13.9.15 Initial Environment

C interface of the initial environment that is provided to an L4 task.
Collaboration diagram for Initial Environment:



Data Structures

- struct l4re_env_cap_entry_t

  Entry in the L4Re environment array for the named initial objects.

Typedefs

- typedef struct l4re_env_cap_entry_t **l4re_env_cap_entry_t**

  Entry in the L4Re environment array for the named initial objects.

Functions

- l4re_env_t * l4re_env (void) L4_NOTHROW

  Get L4Re initial environment.
- l4_kernel_info_t const * l4re_kip (void) L4_NOTHROW

  Get Kernel Info Page.
- l4_cap_idx_t l4re_env_get_cap (char const *name) L4_NOTHROW

  Get the capability index for the object named name.
- l4_cap_idx_t l4re_env_get_cap_e (char const *name, l4re_env_t const *e) L4_NOTHROW

  Get the capability index for the object named name.
- l4re_env_cap_entry_t const * l4re_env_get_cap_l (char const *name, unsigned l, l4re_env_t const *e) L4_NOTHROW

  Get the full l4re_env_cap_entry_t for the object named name.

13.9.15.1 Detailed Description

C interface of the initial environment that is provided to an L4 task.

Include File

```
#include <l4/re/env.h>
```

For an explanation of the default task capabilities see l4_default_caps_t.
For the C++ interface refer to L4Re::Env.

13.9.15.2 Function Documentation

13.9.15.2.1 l4re_env()

```
l4re_env_t * l4re_env (
            void )  [inline]
```

Get L4Re initial environment.

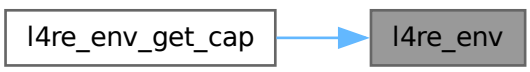
Returns

Pointer to L4Re initial environment.

Examples

examples/sys/aliens/main.c, examples/sys/isr/main.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 202 of file env.h.
References L4_NOTHROW.
Referenced by l4re_env_get_cap().
Here is the caller graph for this function:



13.9.15.2.2 l4re_env_get_cap()

```
l4_cap_idx_t l4re_env_get_cap (
             char const * name)  [inline]
```

Get the capability index for the object named *name*.

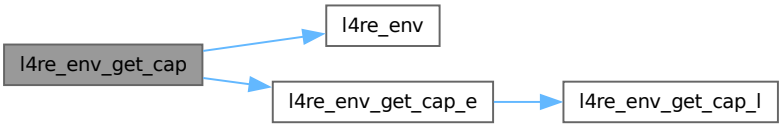
Parameters

name	is the name of the object to lookup in the initial objects.

Returns

A capability index if the object exists or an invalid capability selector if not (see l4_is_invalid_cap()).

Definition at line 241 of file env.h.
References L4_NOTHROW, l4re_env(), and l4re_env_get_cap_e().
Here is the call graph for this function:



13.9.15.2.3 l4re_env_get_cap_e()

```
l4_cap_idx_t l4re_env_get_cap_e (
             char const * name,
             l4re_env_t const * e)  [inline]
```

Get the capability index for the object named *name*.

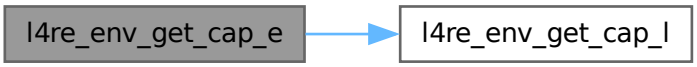
Parameters

name	is the name of the object to lookup in the initial objects.
e	is the environment structure to use for the operation.

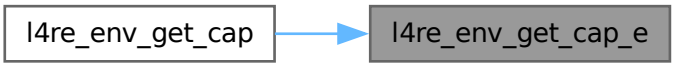
Returns

A capability index if the object exists or an invalid capability selector if not (see l4_is_invalid_cap()).

Definition at line 228 of file env.h.
References l4re_env_cap_entry_t::cap, L4_INVALID_CAP, L4_NOTHROW, and l4re_env_get_cap_l().
Referenced by l4re_env_get_cap().
Here is the call graph for this function:



Here is the caller graph for this function:



13.9.15.2.4 l4re_env_get_cap_l()

```
l4re_env_cap_entry_t const * l4re_env_get_cap_l (
            char const * name,
            unsigned l,
            l4re_env_t const * e)  [inline]
```

Get the full l4re_env_cap_entry_t for the object named *name*.

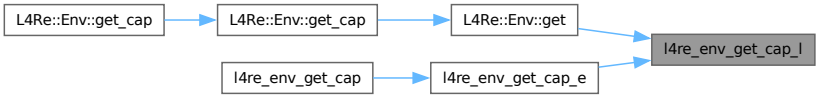
Parameters

name	is the name of the object to lookup in the initial objects.
l	is the length of the name string, thus *name* might not be zero terminated.
e	is the environment structure to use for the operation.

Returns

A pointer to an l4re_env_cap_entry_t if the object exists or NULL if not.

Definition at line 210 of file env.h.
References l4re_env_cap_entry_t::flags, L4_NOTHROW, and l4re_env_cap_entry_t::name.
Referenced by L4Re::Env::get(), and l4re_env_get_cap_e().
Here is the caller graph for this function:



13.9.15.2.5 l4re_kip()

```
l4_kernel_info_t const * l4re_kip (
            void )  [inline]
```

Get Kernel Info Page.

Returns

Pointer to Kernel Info Page (KIP) structure.

Examples

examples/libs/shmc/prodcons.c, and examples/sys/aliens/main.c.

Definition at line 206 of file env.h.
References l4_kip(), and L4_NOTHROW.
Referenced by L4::Poll_timeout_kipclock::set(), and L4::Poll_timeout_kipclock::test().

Documentation of the L4 Runtime Environment C++ API.

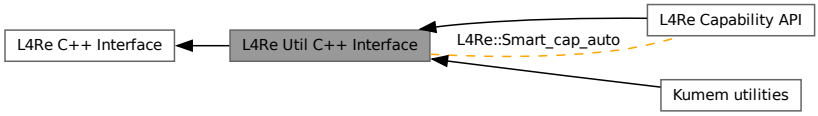
13.10.2 L4Re Util C++ Interface

Documentation of the L4 Runtime Environment utility functionality in C++.
Collaboration diagram for L4Re Util C++ Interface:



Topics

- L4Re Capability API 540
- Kumem utilities 542

Data Structures

- class L4Re::Smart_cap_auto< Unmap_flags >
  Helper for Unique_cap and Unique_del_cap.
- class L4Re::Util::Cap_alloc_base
  Capability allocator.
- class L4Re::Util::Br_manager
  Buffer-register (BR) manager for L4::Server.
- class L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >
  Internal reference-counting cap allocator.
- class L4Re::Util::Event_buffer_t< PAYLOAD >
  Event_buffer utility class.
- class L4Re::Util::Event_buffer_consumer_t< PAYLOAD >
  An event buffer consumer.
- class L4Re::Util::Vcon_svr< SVR >
  Console server template class.
- class L4Re::Util::Video::Goos_svr
  Goos server class.

13.10.2.1 Detailed Description

Documentation of the L4 Runtime Environment utility functionality in C++.

13.10.2.2 L4Re Capability API

Collaboration diagram for L4Re Capability API:

Data Structures

- class L4Re::Cap_alloc
  Capability allocator interface.
- class L4Re::Smart_cap_auto< Unmap_flags >
  Helper for Unique_cap and Unique_del_cap.
- class L4Re::Smart_count_cap< Unmap_flags >
  Helper for Ref_cap and Ref_del_cap.
- class L4Re::Util::Smart_cap_auto< Unmap_flags >
  Helper for Unique_cap and Unique_del_cap.
- class L4Re::Util::Smart_count_cap< Unmap_flags >

Helper for Ref_cap and Ref_del_cap.

- struct L4Re::Util::Ref_cap< T >

  Automatic capability that implements automatic free and unmap of the capability slot.

- struct L4Re::Util::Ref_del_cap< T >

  Automatic capability that implements automatic free and unmap+delete of the capability slot.

Functions

- template<typename T>
  Ref_cap< T >::Cap L4Re::Util::make_ref_cap ()

  Allocate a capability slot and wrap it in a Ref_cap.

- template<typename T>
  Ref_del_cap< T >::Cap L4Re::Util::make_ref_del_cap ()

  Allocate a capability slot and wrap it in a Ref_del_cap.

Variables

- _Cap_alloc L4Re::Util::cap_alloc

  Capability allocator.

- Def_reply_cap_alloc L4Re::Util::reply_cap_alloc

  Reply capability allocator.

13.10.2.2.1 Detailed Description

13.10.2.2.2 Function Documentation

13.10.2.2.2.1 make_ref_cap()

```
template<typename T>
Ref_cap< T >::Cap L4Re::Util::make_ref_cap ()
```

Allocate a capability slot and wrap it in a Ref_cap.

Template Parameters

T	Type of capability the slot is used for.

Definition at line 237 of file cap_alloc.
References cap_alloc.

13.10.2.2.2.2 make_ref_del_cap()

```
template<typename T>
Ref_del_cap< T >::Cap L4Re::Util::make_ref_del_cap ()
```

Allocate a capability slot and wrap it in a Ref_del_cap.

Template Parameters

T	Type of capability the slot is used for.

Definition at line 246 of file cap_alloc.
References cap_alloc.

13.10.2.2.3 Variable Documentation

13.10.2.2.3.1 cap_alloc

```
_Cap_alloc L4Re::Util::cap_alloc  [extern]
```

Capability allocator.
This is the instance of the capability allocator that is used by usual applications.
The capability allocator uses the Counting_cap_alloc, a reference-counting thread-safe capability allocator, that keeps a reference counter for each managed capability slot.

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, examples/libs/l4re/c++/shared_ds/ds_clnt.cc, examples/libs/l4re/c++/shared_ds/d and examples/libs/l4re/streammap/client.cc.

Referenced by L4Re::Util::Br_manager::alloc_buffer_demand(), L4Re::Util::Smart_count_cap< Unmap_flags >::copy(), L4Re::Util::Smart_cap_auto< Unmap_flags >::free(), L4Re::Util::Smart_count_cap< Unmap_flags >::free(), L4Re::Util::Event_t< Default_event_payload >::init(), L4Re::Util::Event_t< Default_event_payload >::init_poll(), make_ref_cap(), make_ref_del_cap(), make_shared_cap(), make_shared_del_cap(), make_unique_cap(), make_unique_del_cap(), L4Re::Util::Br_manager::realloc_rcv_cap(), and L4Re::Util::Object_registry::unregister_obj().

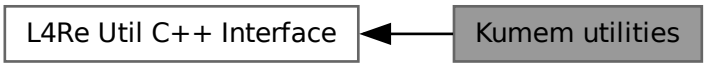
13.10.2.2.3.2 reply_cap_alloc

```
Def_reply_cap_alloc L4Re::Util::reply_cap_alloc  [extern]
```

Reply capability allocator.
This is the default reply capability allocator that is used by usual applications.

13.10.2.3 Kumem utilities

Collaboration diagram for Kumem utilities:



Functions

- int L4Re::Util::kumem_alloc (l4_addr_t *mem, unsigned pages_order, L4::Cap< L4::Task > task=L4Re::Env::env() ->task(), L4::Cap< L4Re::Rm > rm=L4Re::Env::env() ->rm()) noexcept

  Allocate state area.

13.10.2.3.1 Detailed Description

13.10.2.3.2 Function Documentation

13.10.2.3.2.1 kumem_alloc()

```
int L4Re::Util::kumem_alloc (
             l4_addr_t * mem,
             unsigned pages_order,
             L4::Cap< L4::Task > task = L4Re::Env::env() ->task(),
             L4::Cap< L4Re::Rm > rm = L4Re::Env::env() ->rm())  [noexcept]
```

Allocate state area.

Parameters

out	*mem*	Pointer to memory that has been allocated.
	pages_order	Size to allocate, in log2 pages.

	task	Task to use for allocation.
	rm	Region manager to use for allocation.

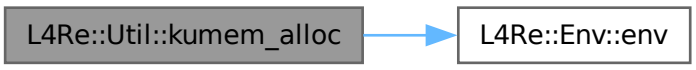
Return values

0	for success
<0	error code on failure

Note

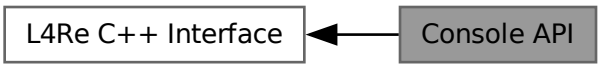
The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

References L4Re::Env::env().
Here is the call graph for this function:



13.10.3 Console API

Console interface.
Collaboration diagram for Console API:



Data Structures

- class L4Re::Console
  Console class.

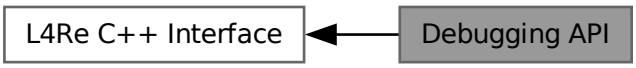
13.10.3.1 Detailed Description

Console interface.

13.10.4 Debugging API

Debugging Interface.

Collaboration diagram for Debugging API:



Data Structures

- class L4Re::Debug_obj
  Debug interface.

13.10.4.1 Detailed Description

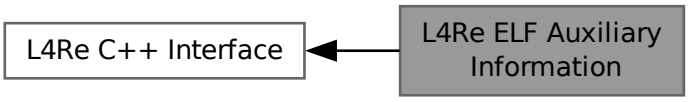
Debugging Interface.
The debugging interface can be provided to retrieve, or log debugging information for an object. Each class may realize the debug interface to provide debugging functionality. For example, the region map objects provide a facility to dump the currently established memory regions.

See also

L4::Debug_obj for more information.

13.10.5 L4Re ELF Auxiliary Information

API for embedding auxiliary information into binary programs.
Collaboration diagram for L4Re ELF Auxiliary Information:



Data Structures

- struct l4re_elf_aux_t
  Generic header for each auxiliary vector element.
- struct l4re_elf_aux_vma_t
  Auxiliary vector element for a reserved virtual memory area.
- struct l4re_elf_aux_mword_t
  Auxiliary vector element for a single unsigned data word.

Macros

- #define L4RE_ELF_AUX_ELEM const __attribute__((used, section(".rol4re_elf_aux"), aligned(sizeof(l4_umword_t))))
  Define an auxiliary vector element.
- #define L4RE_ELF_AUX_ELEM_T(type, id, tag, val...)
  Define an auxiliary vector element.

Typedefs

- typedef struct l4re_elf_aux_t **l4re_elf_aux_t**

  Generic header for each auxiliary vector element.
- typedef struct l4re_elf_aux_vma_t **l4re_elf_aux_vma_t**

  Auxiliary vector element for a reserved virtual memory area.
- typedef struct l4re_elf_aux_mword_t **l4re_elf_aux_mword_t**

  Auxiliary vector element for a single unsigned data word.

Enumerations

- enum {
  L4RE_ELF_AUX_T_NONE = 0 , L4RE_ELF_AUX_T_VMA , L4RE_ELF_AUX_T_STACK_SIZE ,
  L4RE_ELF_AUX_T_STACK_ADDR ,
  L4RE_ELF_AUX_T_KIP_ADDR , L4RE_ELF_AUX_T_EX_REGS_FLAGS }

13.10.5.1 Detailed Description

API for embedding auxiliary information into binary programs.
This API allows information for the binary loader to be embedded into a binary application. This information can be reserved areas in the virtual memory of an application and things such as the stack size to be allocated for the first application thread.

13.10.5.2 Macro Definition Documentation

13.10.5.2.1 L4RE_ELF_AUX_ELEM

```
#define L4RE_ELF_AUX_ELEM const __attribute__((used, section(".rol4re_elf_aux"), aligned(sizeof(l4_umword_t))))
```

Define an auxiliary vector element.
This is the generic method for defining auxiliary vector elements. A more convenient way is to use L4RE_ELF_↩ AUX_ELEM_T.
Usage:

```
L4RE_ELF_AUX_ELEM l4re_elf_aux_vma_t decl_name =
  { L4RE_ELF_AUX_T_VMA, sizeof(l4re_elf_aux_vma_t), 0x2000, 0x4000 };
```

Definition at line 41 of file elf_aux.h.

13.10.5.2.2 L4RE_ELF_AUX_ELEM_T

```
#define L4RE_ELF_AUX_ELEM_T(
              type,
              id,
              tag,
              val...)
```

Value:

```
  static L4RE_ELF_AUX_ELEM type id = {tag, sizeof(type), val}
```

Define an auxiliary vector element.

Parameters

type	is the data type for the element (e.g., l4re_elf_aux_vma_t)
id	is the identifier (variable name) for the declaration (the variable is defined with `static` storage class)
tag	is the tag value for the element e.g., L4RE_ELF_AUX_T_VMA
val	are the values to be set in the descriptor

Usage:

```
L4RE_ELF_AUX_ELEM_T(l4re_elf_aux_vma_t, decl_name, L4RE_ELF_AUX_T_VMA, 0x2000, 0x4000 };
```

Definition at line 56 of file elf_aux.h.

13.10.5.3 Enumeration Type Documentation

13.10.5.3.1 anonymous enum

```
anonymous enum
```

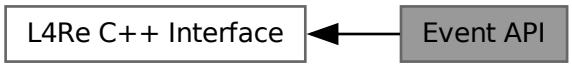
Enumerator

L4RE_ELF_AUX_T_NONE	Tag for an invalid element in the auxiliary vector.
L4RE_ELF_AUX_T_VMA	Tag for descriptor for a reserved virtual memory area.
L4RE_ELF_AUX_T_STACK_SIZE	Tag for descriptor that defines the stack size for the first application thread.
L4RE_ELF_AUX_T_STACK_ADDR	Tag for descriptor that defines the stack address for the first application thread.
L4RE_ELF_AUX_T_KIP_ADDR	Tag for descriptor that defines the KIP address for the binary's address space.
L4RE_ELF_AUX_T_EX_REGS_FLAGS	Tag for descriptor to override ex_regs() flags.

Definition at line 59 of file elf_aux.h.

13.10.6 Event API

Event API.
Collaboration diagram for Event API:



Data Structures

- class L4Re::Event

  Event class.
- struct L4Re::Default_event_payload

  Default event stream payload.
- class L4Re::Event_buffer_t< PAYLOAD >

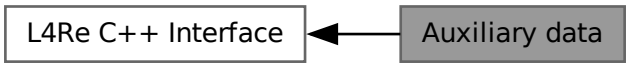
  Event buffer class.

13.10.6.1 Detailed Description

Event API.
On top of a shared L4Re::Dataspace (and optionally using L4::Triggerable), the event API implements asynchronous event transmission from an event provider (server) to an event receiver (client). Events are put into an Event_buffer_t residing on the shared L4Re::Dataspace.
This interface is usually not used directly. Instead use L4Re::Util::Event_t for clients. An example server portion is implemented in L4Re::Util::Event_svr.
This interface is usually used with L4Re::Default_event_payload which delivers HID events modeled on the Linux evdev API, and the interface's methods allow further querying of information about the HID event streams.

13.10.7 Auxiliary data

Collaboration diagram for Auxiliary data:



Data Structures

- struct l4re_aux_t

  Auxiliary descriptor.

Typedefs

- typedef struct l4re_aux_t **l4re_aux_t**

  Auxiliary descriptor.

Enumerations

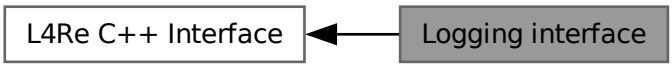
- enum l4re_aux_ldr_flags_t

  Flags for program loading.

13.10.7.1 Detailed Description

13.10.8 Logging interface

Interface for log output.
Collaboration diagram for Logging interface:



Data Structures

- class L4Re::Log

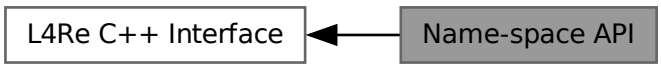
  Log interface class.

13.10.8.1 Detailed Description

Interface for log output.
The logging interface provides a facility sending log output. One purpose of the interface is to serialize the output and provide the possibility to tag output sent to a specific log object.

13.10.9 Name-space API

API for name spaces that store capabilities.
Collaboration diagram for Name-space API:



Data Structures

- class L4Re::Namespace

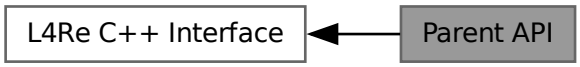
  Name-space interface.

13.10.9.1 Detailed Description

API for name spaces that store capabilities.
This is a basic abstraction for managing a mapping from human-readable names to capabilities. In particular, a name can also be mapped to a capability that refers to another name space object. By this means name spaces can be constructed hierarchically.
Name spaces play a central role in L4Re, because the implementation of the name space objects determines the policy which capabilities (which objects) are accessible to a client of a name space.

13.10.10 Parent API

Parent interface.
Collaboration diagram for Parent API:



Data Structures

- class L4Re::Parent

  Parent interface.

13.10.10.1 Detailed Description

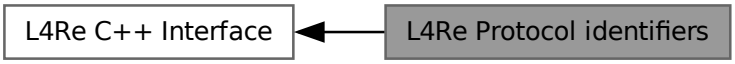
Parent interface.
The parent interface provides means for an L4 task to signal changes in its execution state. The main purpose is to signal program termination to the program that started it, so that its resources can be reclaimed. In a typical L4Re system, this program will be Moe or Ned.

See also

L4Re::Parent for information about the concrete interface.

13.10.11 L4Re Protocol identifiers

Fix L4Re Protocol Constants.
Collaboration diagram for L4Re Protocol identifiers:



Enumerations

- enum L4re_protocols {
  L4RE_PROTO_DATASPACE = 0x4000 , L4RE_PROTO_NAMESPACE , L4RE_PROTO_PARENT ,
  L4RE_PROTO_GOOS ,
  L4RE_PROTO_RSVD_1 , L4RE_PROTO_RM , L4RE_PROTO_EVENT , L4RE_PROTO_INHIBITOR ,
  L4RE_PROTO_DMA_SPACE , L4RE_PROTO_MMIO_SPACE , L4RE_PROTO_ITAS , L4RE_PROTO_MEM_ALLOC
  ,
  L4RE_PROTO_REMOTE_ACCESS , L4RE_PROTO_DEBUG = ∼0x7fffL }

  Common L4Re Protocol Constants.
- enum L4Re::Video::Goos_::Opcodes

  Frame buffer communication-protocol opcodes.

13.10.11.1 Detailed Description

Fix L4Re Protocol Constants.

13.10.11.2 Enumeration Type Documentation

13.10.11.2.1 L4re_protocols

`enum L4re_protocols`
Common L4Re Protocol Constants.

Enumerator

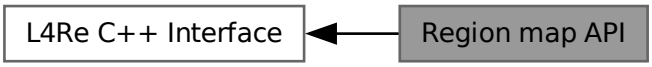
L4RE_PROTO_DATASPACE	ID for L4Re::Dataspace RPCs.
L4RE_PROTO_NAMESPACE	ID for L4Re::Namespace RPCs.
L4RE_PROTO_PARENT	ID for L4Re::Parent RPCs.
L4RE_PROTO_GOOS	ID for L4Re::Video::Goos RPCs.
L4RE_PROTO_RSVD_1	Reserved ID.
L4RE_PROTO_RM	ID for L4Re::Rm RPCs.
L4RE_PROTO_EVENT	ID for L4Re::Event RPCs.
L4RE_PROTO_INHIBITOR	ID for L4Re::Inhibitor RPCs.
L4RE_PROTO_DMA_SPACE	ID for L4Re::Dma_space RPCs.

L4RE_PROTO_MMIO_SPACE	ID for L4Re::Mmio_space.
L4RE_PROTO_ITAS	ID for L4Re::Itas.
L4RE_PROTO_MEM_ALLOC	ID for L4Re::Mem_alloc.
L4RE_PROTO_REMOTE_ACCESS	ID for L4Re::Remote_access.
L4RE_PROTO_DEBUG	ID for debugging RPCs.

Definition at line 24 of file protocols.h.

13.10.12 Region map API

Virtual address-space management.
Collaboration diagram for Region map API:



Data Structures

- class L4Re::Rm

  Region map.

13.10.12.1 Detailed Description

Virtual address-space management.
A region map object implements two protocols. The first protocol is the kernel page-fault protocol, to resolve page faults for threads running in an L4 task. The second protocol is the region map protocol itself, which allows managing the virtual memory address space of an L4 task.
There are two basic concepts provided by the region map abstraction:

- **Areas** are reserved ranges in the virtual memory address space.
- **Regions** are ranges that are backed by (part of) a dataspace, i.e. accessing them results in access to the physical memory the dataspace manages.

Note that regions may live outside of areas and that an area does not necessarily contain any region.
Areas can be reserved for special use or for attaching a dataspace at a later time. When attaching a dataspace, the user can instruct the region map to search for an appropriate range to attach to. Regions are skipped in this search since they already have dataspaces attached to them, and, depending on L4Re::Rm::F::In_area, areas are skipped because they are reserved. Amongst others, areas can be used to attach several dataspaces inside a certain range of addresses without interference from other threads.
When a region map receives a page fault IPC, the region map will check if the faulting virtual address lies in a region. If yes, it will answer the page fault IPC with a mapping from the backing dataspace. If not, an error is returned.
Depending on the system type, an attached dataspace might or might not be mapped eagerly. MMU-based systems resort to lazy mapping while systems without MMU do eager mappings by default. The L4Re::Rm::F::Eager_map and L4Re::Rm::F::No_eager_map flags can be used to force the respective behaviour, independent of the underlying system. In case both flags are given, the L4Re::Rm::F::No_eager_map flag wins.

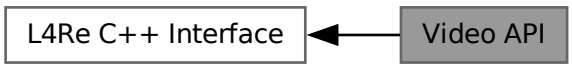
Memory management - Data Spaces and the Region Map

13.10.13 Video API

API for framebuffer based graphics.
Collaboration diagram for Video API:



Data Structures

- class L4Re::Video::Color_component

  A color component.
- class L4Re::Video::Pixel_info

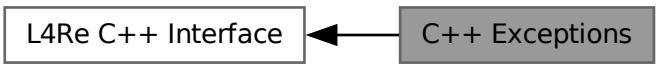
  Pixel information.

13.10.13.1 Detailed Description

API for framebuffer based graphics.
Contains the basic APIs that abstract framebuffers and views into them for L4Re applications.

13.10.14 C++ Exceptions

Collaboration diagram for C++ Exceptions:



Files

- file exceptions

  Base exceptions.

Data Structures

- class L4::Exception_tracer

  Back-trace support for exceptions.
- class L4::Base_exception

  Base class for all exceptions, thrown by the L4Re framework.
- class L4::Runtime_error

  Exception for an abstract runtime error.
- class L4::Out_of_memory

  Exception signalling insufficient memory.

- class L4::Element_already_exists

  Exception for duplicate element insertions.
- class L4::Unknown_error

  Exception for an unknown condition.
- class L4::Element_not_found

  Exception for a failed lookup (element not found).
- class L4::Invalid_capability

  Indicates that an invalid object was invoked.
- class L4::Com_error

  Error conditions during IPC.
- class L4::Bounds_error

  Access out of bounds.

Macros

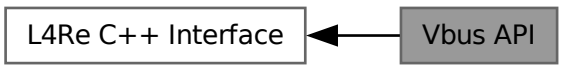
- #define **L4_CXX_EXCEPTION_BACKTRACE** 20

  Number of instruction pointers in backtrace.

13.10.14.1 Detailed Description

13.10.15 Vbus API

C++ interface of the Vbus API.
Collaboration diagram for Vbus API:



Data Structures

- class L4vbus::Pm< DEC >

  Power-management API mixin.
- class L4vbus::Device

  Device on a L4vbus::Vbus.
- class L4vbus::Icu

  Vbus Interrupt controller API.
- class L4vbus::Vbus

  The virtual bus (Vbus) interface.
- class L4vbus::Gpio_pin

  A GPIO pin.
- class L4vbus::Gpio_module

  A Gpio_module groups multiple GPIO pins together.
- class L4vbus::Pci_host_bridge

  A Pci host bridge.
- class L4vbus::Pci_dev

  A PCI device.

13.10.15.1 Detailed Description

C++ interface of the Vbus API.
The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an Icu (Interrupt controller) for interrupt handling.
The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.
Refer to L4 Vbus functions for the C API.

Include File

```
#include <l4/vbus/vbus>
```

Include File

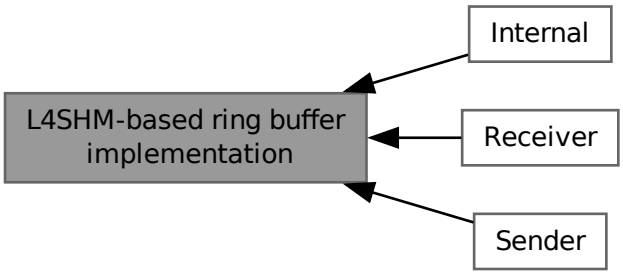
```
#include <l4/vbus/vbus_gpio>
```

Include File

```
#include <l4/vbus/vbus_pci>
```

13.11 L4SHM-based ring buffer implementation

The library provides a non-locking (strictly 1:1) shared-memory-based ring buffer implementation based on the L4SHM library.
Collaboration diagram for L4SHM-based ring buffer implementation:



Topics

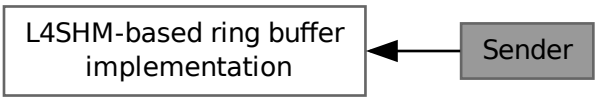
- Sender • 554
- Receiver 554
- Internal • 554

13.11.1 Detailed Description

The library provides a non-locking (strictly 1:1) shared-memory-based ring buffer implementation based on the L4SHM library.
It requires an already allocated L4SHM area to be attached to sender and receiver. It will allocate an SHM chunk within this area and provides functions to produce data and consume data in FIFO order from the ring buffer.
The sender side of the buffer needs to be initialized *before* the receiver side, because allocation of the SHM chunk and the necessary signals is done on the sender side and the receiver initialization tries to attach to these objects.

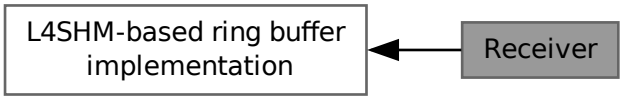
13.11.2 Sender

Collaboration diagram for Sender:



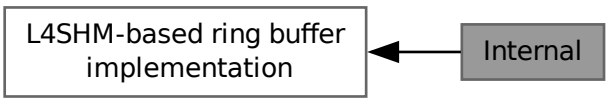
13.11.3 Receiver

Collaboration diagram for Receiver:



13.11.4 Internal

Collaboration diagram for Internal:



Data Structures

- struct l4shmc_ringbuf_head_t

  Head field of a ring buffer.
- struct l4shmc_ringbuf_t

  Ring buffer.

Macros

- #define L4SHMC_RINGBUF_HEAD(ringbuf)

  Get ring buffer head pointer.

- #define L4SHMC_RINGBUF_DATA(ringbuf)

  Get ring buffer data pointer.
- #define L4SHMC_RINGBUF_DATA_SIZE(ringbuf)

  Get size of data area.

13.11.4.1 Detailed Description

13.11.4.2 Macro Definition Documentation

13.11.4.2.1 L4SHMC_RINGBUF_DATA

```
#define L4SHMC_RINGBUF_DATA(
              ringbuf)
```

Value:

```
(L4SHMC_RINGBUF_HEAD(ringbuf)->data)
```

Get ring buffer data pointer.

Parameters

ringbuf	l4shmc_ringbuf_t struct

Definition at line 114 of file ringbuf.h.

13.11.4.2.2 L4SHMC_RINGBUF_DATA_SIZE

```
#define L4SHMC_RINGBUF_DATA_SIZE(
              ringbuf)
```

Value:

```
((ringbuf)->_size - sizeof(l4shmc_ringbuf_head_t))
```

Get size of data area.

Parameters

ringbuf	l4shmc_ringbuf_t struct

Definition at line 123 of file ringbuf.h.

13.11.4.2.3 L4SHMC_RINGBUF_HEAD

```
#define L4SHMC_RINGBUF_HEAD(
              ringbuf)
```

Value:

```
((l4shmc_ringbuf_head_t*)((ringbuf)->_addr))
```

Get ring buffer head pointer.

Parameters

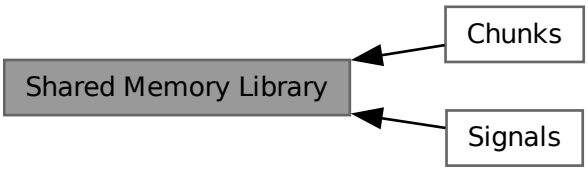
ringbuf	l4shmc_ringbuf_t struct

Definition at line 105 of file ringbuf.h.

13.12 Shared Memory Library

L4SHM provides a shared memory infrastructure that establishes a shared memory area between multiple parties and uses a fast notification mechanism.

Collaboration diagram for Shared Memory Library:



Topics

- Chunks• 561
- Signals• 571

Functions

- L4_BEGIN_DECLS long l4shmc_create (char const ∗shmc_name)

  Create a shared memory area.
- long l4shmc_attach (char const ∗shmc_name, l4shmc_area_t ∗shmarea)

  Attach to a shared memory area.
- long l4shmc_get_client_nr (l4shmc_area_t const ∗shmarea)

  Determine the client number of the shared memory region.
- long l4shmc_mark_client_initialized (l4shmc_area_t ∗shmarea)

  Mark this shared memory client as 'initialized'.
- long l4shmc_get_initialized_clients (l4shmc_area_t ∗shmarea, l4_umword_t ∗bitmask)

  Fetch the `_clients_init_done` bitmask of the shared memory area.
- long l4shmc_connect_chunk_signal (l4shmc_chunk_t ∗chunk, l4shmc_signal_t ∗signal)

  Connect a signal with a chunk.
- long l4shmc_area_size (l4shmc_area_t const ∗shmarea)

  Get size of shared memory area.
- long l4shmc_area_size_free (l4shmc_area_t const ∗shmarea)

  Get free size of shared memory area.
- long l4shmc_area_overhead (void)

  Get memory overhead per area that is not available for chunks.
- long l4shmc_chunk_overhead (void)

  Get memory overhead required in addition to the chunk capacity for adding one chunk.

13.12.1 Detailed Description

L4SHM provides a shared memory infrastructure that establishes a shared memory area between multiple parties and uses a fast notification mechanism.
A shared memory area consists of chunks and signals. A chunk is a defined chunk of memory within the memory area with a maximum size. A chunk is filled (written) by a producer and read by a consumer. When a producer has finished writing to the chunk it signals a data ready notification to the consumer.
A consumer attaches to a chunk and waits for the producer to fill the chunk. After reading out the chunk it marks the chunk free again.
A shared memory area can have multiple chunks.
The interface is divided in three roles.

- The master role, responsible for setting up a shared memory area.
- A producer, generating data into a chunk
- A consumer, receiving data.

A signal can be connected with a chunk or can be used independently (e.g. for multiple chunks).

13.12.2 Function Documentation

13.12.2.1 l4shmc_area_overhead()

```
long l4shmc_area_overhead (
            void )
```

Get memory overhead per area that is not available for chunks.

Returns

Size of the overhead in bytes.

References L4_CV.

13.12.2.2 l4shmc_area_size()

```
long l4shmc_area_size (
            l4shmc_area_t const * shmarea)
```

Get size of shared memory area.

Parameters

shmarea	Shared memory area.

Return values

>0	Size of the shared memory area.
<0	Error.

References L4_CV.

13.12.2.3 l4shmc_area_size_free()

```
long l4shmc_area_size_free (
            l4shmc_area_t const * shmarea)
```

Get free size of shared memory area.
To get the max size to pass to l4shmc_add_chunk, subtract l4shmc_chunk_overhead().

Parameters

shmarea	Shared memory area.

Returns

Size of the shared memory area.

References L4_CV.

13.12.2.4 l4shmc_attach()

```
long l4shmc_attach (
            char const * shmc_name,
            l4shmc_area_t * shmarea)
```

Attach to a shared memory area.

Parameters

	shmc_name	Name of the shared memory area.
out	*shmarea*	Pointer to shared memory area descriptor to be filled with information for the shared memory area.

On success, the data in 'shmarea' contains a client number which can be used to mutual agree about client initialization:

- l4shmc_get_client_nr() returns the client number stored in 'shmarea'. The first attached client will get 0 and this number is increased for each attached client.
- l4shmc_mark_client_initialized() tells other clients that this client has finished its initialization.
- l4shmc_get_initialized_clients() returns the bitmap of initialized clients attached to this shared memory.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.2.5 l4shmc_chunk_overhead()

```
long l4shmc_chunk_overhead (
            void )
```

Get memory overhead required in addition to the chunk capacity for adding one chunk.

Returns

Size of the overhead in bytes.

References L4_END_DECLS.

13.12.2.6 l4shmc_connect_chunk_signal()

```
long l4shmc_connect_chunk_signal (
            l4shmc_chunk_t * chunk,
            l4shmc_signal_t * signal)
```

Connect a signal with a chunk.

Parameters

chunk	Chunk to attach the signal to.
signal	Signal to attach.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.2.7 l4shmc_create()

```
L4_BEGIN_DECLS long l4shmc_create (
            char const * shmc_name)
```

Create a shared memory area.

Parameters

shmc_name	Name of the shared memory area.

Return values

0	Success.
-L4_ENOMEM	The requested size is too big.
-L4_ENOENT	No valid capability with the name of the shared memory area found.
<0	Errors from l4re_rm_attach or l4re_ns_register_obj_srv.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.2.8 l4shmc_get_client_nr()

```
long l4shmc_get_client_nr (
            l4shmc_area_t const * shmarea)
```

Determine the client number of the shared memory region.

Parameters

shmarea	The shared memory area.

Returns

client number.

References L4_CV.

13.12.2.9 l4shmc_get_initialized_clients()

```
long l4shmc_get_initialized_clients (
            l4shmc_area_t * shmarea,
            l4_umword_t * bitmask)
```

Fetch the _clients_init_done bitmask of the shared memory area.

Parameters

	shmarea	The shared memory area.
out	*bitmask*	The bitmask describing which clients are initialized.

Return values

0	Success.
<0	Error.

See also

l4shmc_mark_client_initialized(), l4shmc_get_client_nr()

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.2.10 l4shmc_mark_client_initialized()

```
long l4shmc_mark_client_initialized (
            l4shmc_area_t * shmarea)
```

Mark this shared memory client as 'initialized'.
The corresponding bit is set in the _clients_init_done bitmask. The bitmask can be fetched with l4shmc_get_initialized_clients().

Parameters

shmarea	The shared memory area.

Return values

0	Success.
<0	Error.

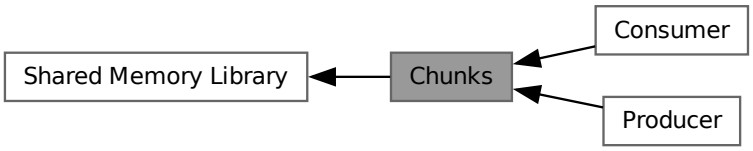
Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.3 Chunks

Collaboration diagram for Chunks:



Topics

- Producer 564
- Consumer 567

Functions

- long l4shmc_add_chunk (l4shmc_area_t ∗shmarea, char const ∗chunk_name, l4_umword_t chunk_capacity, l4shmc_chunk_t ∗chunk)

  Add a chunk in the shared memory area.
- long l4shmc_get_chunk (l4shmc_area_t ∗shmarea, char const ∗chunk_name, l4shmc_chunk_t ∗chunk)

  Get chunk out of shared memory area.
- long l4shmc_get_chunk_to (l4shmc_area_t ∗shmarea, char const ∗chunk_name, l4_umword_t timeout_ms, l4shmc_chunk_t ∗chunk)

  Get chunk out of shared memory area, with timeout.
- long l4shmc_iterate_chunk (l4shmc_area_t const ∗shmarea, char const ∗∗chunk_name, long offs)

  Iterate over names of all existing chunks.
- void ∗ l4shmc_chunk_ptr (l4shmc_chunk_t const ∗chunk)

  Get data pointer to chunk.
- long l4shmc_chunk_capacity (l4shmc_chunk_t const ∗chunk)

  Get capacity of a chunk.
- l4shmc_signal_t ∗ l4shmc_chunk_signal (l4shmc_chunk_t const ∗chunk)

  Get the registered signal of a chunk.

13.12.3.1 Detailed Description

13.12.3.2 Function Documentation

13.12.3.2.1 l4shmc_add_chunk()

```
long l4shmc_add_chunk (
             l4shmc_area_t * shmarea,
             char const * chunk_name,
             l4_umword_t chunk_capacity,
             l4shmc_chunk_t * chunk)
```

Add a chunk in the shared memory area.

Parameters

	shmarea	The shared memory area to put the chunk in.
	chunk_name	Name of the chunk.
	chunk_capacity	Capacity for payload of the chunk in bytes.
out	*chunk*	Chunk structure to fill in.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.3.2.2 l4shmc_chunk_capacity()

```
long l4shmc_chunk_capacity (
            l4shmc_chunk_t const * chunk)  [inline]
```

Get capacity of a chunk.

Parameters

chunk	Chunk.

Returns

Capacity of the chunk in bytes.

References L4_CV, and L4_INLINE.

13.12.3.2.3 l4shmc_chunk_ptr()

```
void * l4shmc_chunk_ptr (
            l4shmc_chunk_t const * chunk)  [inline]
```

Get data pointer to chunk.

Parameters

chunk	Chunk.

Returns

Chunk pointer.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.3.2.4 l4shmc_chunk_signal()

```
l4shmc_signal_t * l4shmc_chunk_signal (
            l4shmc_chunk_t const * chunk)  [inline]
```

Get the registered signal of a chunk.

Parameters

chunk	Chunk.

Return values

0	No signal has been registered with this chunk.
!=0	Pointer to signal otherwise.

References L4_CV, and L4_INLINE.

13.12.3.2.5 l4shmc_get_chunk()

```
long l4shmc_get_chunk (
            l4shmc_area_t * shmarea,
            char const * chunk_name,
            l4shmc_chunk_t * chunk)  [inline]
```

Get chunk out of shared memory area.

Parameters

	shmarea	Shared memory area.
	chunk_name	Name of the chunk.
out	*chunk*	Chunk data structure to fill.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.3.2.6 l4shmc_get_chunk_to()

```
long l4shmc_get_chunk_to (
            l4shmc_area_t * shmarea,
            char const * chunk_name,
            l4_umword_t timeout_ms,
            l4shmc_chunk_t * chunk)
```

Get chunk out of shared memory area, with timeout.

Parameters

	shmarea	Shared memory area.
	chunk_name	Name of the chunk.
	timeout_ms	Timeout in milliseconds to wait for the chunk to appear in the shared memory area.
out	*chunk*	Chunk data structure to fill.

Return values

0	Success.
<0	Error.

References L4_CV.

13.12.3.2.7 l4shmc_iterate_chunk()

```
long l4shmc_iterate_chunk (
             l4shmc_area_t const * shmarea,
             char const ** chunk_name,
             long offs)
```

Iterate over names of all existing chunks.

Parameters

shmarea	Shared memory area.
chunk_name	Where the name of the current chunk will be stored
offs	0 to start iteration, return value of previous call to l4shmc_iterate_chunk() to get next chunk

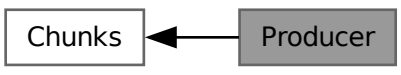
Return values

0	No more chunks available.
<0	Error.
>0	Iterator value for the next call.

References L4_CV.

13.12.3.3 Producer

Collaboration diagram for Producer:



Functions

- long l4shmc_chunk_try_to_take (l4shmc_chunk_t ∗chunk)

  Try to mark chunk busy.
- long l4shmc_chunk_try_to_take_for_writing (l4shmc_chunk_t ∗chunk)

  Try to mark chunk busy writing.
- long l4shmc_chunk_try_to_take_for_overwriting (l4shmc_chunk_t ∗chunk)

  Try to mark the chunk busy writing after it was ready for reading.
- long l4shmc_chunk_ready (l4shmc_chunk_t ∗chunk, l4_umword_t size)

  Mark chunk as filled (ready).
- long l4shmc_chunk_ready_sig (l4shmc_chunk_t ∗chunk, l4_umword_t size)

  Mark chunk as filled (ready) and signal consumer.
- long l4shmc_is_chunk_clear (l4shmc_chunk_t const ∗chunk)

  Check whether chunk is free.

13.12.3.3.1 Detailed Description

13.12.3.3.2 Function Documentation

13.12.3.3.2.1 l4shmc_chunk_ready()

```
long l4shmc_chunk_ready (
             l4shmc_chunk_t * chunk,
             l4_umword_t size)  [inline]
```

Mark chunk as filled (ready).

Parameters

chunk	chunk.
size	Size of data in the chunk, in bytes.

Return values

0	Success.
<0	Error.

References L4_CV, and L4_INLINE.

13.12.3.3.2.2 l4shmc_chunk_ready_sig()

```
long l4shmc_chunk_ready_sig (
             l4shmc_chunk_t * chunk,
             l4_umword_t size)  [inline]
```

Mark chunk as filled (ready) and signal consumer.

Parameters

chunk	chunk.
size	Size of data in the chunk, in bytes.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.3.3.2.3 l4shmc_chunk_try_to_take()

```
long l4shmc_chunk_try_to_take (
            l4shmc_chunk_t * chunk)  [inline]
```

Try to mark chunk busy.

Parameters

chunk	chunk to mark.

Return values

0	Chunk could be taken.
<0	Chunk could not be taken, try again.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.3.3.2.4 l4shmc_chunk_try_to_take_for_overwriting()

```
long l4shmc_chunk_try_to_take_for_overwriting (
            l4shmc_chunk_t * chunk)  [inline]
```

Try to mark the chunk busy writing after it was ready for reading.

Parameters

chunk	chunk to mark busy writing.

This function is used by the producer to overwrite a message if the consumer did not read the message within an expected time. This function can only be used if the consumer uses l4shmc_chunk_try_to_take_for_reading() before reading the chunk.

Return values

0	Chunk could be taken and can be written.
<0	Chunk could not be taken, try again.

References L4_CV, and L4_INLINE.

13.12.3.3.2.5 l4shmc_chunk_try_to_take_for_writing()

```
long l4shmc_chunk_try_to_take_for_writing (
            l4shmc_chunk_t * chunk)  [inline]
```

Try to mark chunk busy writing.
This function is actually an alias for l4shmc_chunk_try_to_take().

Parameters

chunk	chunk to mark busy writing.

Return values

0	Chunk could be taken and can be written.
<0	Chunk could not be taken, try again.

References L4_CV, and L4_INLINE.

13.12.3.3.2.6 l4shmc_is_chunk_clear()

```
long l4shmc_is_chunk_clear (
            l4shmc_chunk_t const * chunk)  [inline]
```

Check whether chunk is free.

Parameters

chunk	Chunk to check.

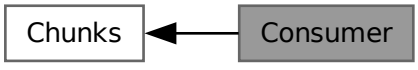
Return values

!=0	Chunk is clear.
0	Chunk is not clear.

References L4_CV, and L4_INLINE.

13.12.3.4 Consumer

Collaboration diagram for Consumer:



Functions

- long l4shmc_chunk_try_to_take_for_reading (l4shmc_chunk_t ∗chunk)

Try to mark chunk busy reading.

- long l4shmc_enable_chunk (l4shmc_chunk_t ∗chunk)

  Enable a signal connected with a chunk.
- long l4shmc_wait_chunk (l4shmc_chunk_t ∗chunk)

  Wait on a specific chunk.
- long l4shmc_wait_chunk_to (l4shmc_chunk_t ∗chunk, l4_timeout_t timeout)

  Check whether a specific chunk has an event pending, with timeout.
- long l4shmc_wait_chunk_try (l4shmc_chunk_t ∗chunk)

  Check whether a specific chunk has an event pending.
- long l4shmc_chunk_consumed (l4shmc_chunk_t ∗chunk)

  Mark a chunk as free.
- long l4shmc_is_chunk_ready (l4shmc_chunk_t const ∗chunk)

  Check whether data is available.
- long l4shmc_chunk_size (l4shmc_chunk_t const ∗chunk)

  Get current size of a chunk.

13.12.3.4.1 Detailed Description

13.12.3.4.2 Function Documentation

13.12.3.4.2.1 l4shmc_chunk_consumed()

```
long l4shmc_chunk_consumed (
            l4shmc_chunk_t * chunk)  [inline]
```

Mark a chunk as free.

Parameters

chunk	Chunk to mark as free.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.3.4.2.2 l4shmc_chunk_size()

```
long l4shmc_chunk_size (
            l4shmc_chunk_t const * chunk)  [inline]
```

Get current size of a chunk.

Parameters

chunk	Chunk.

Returns

Current size of the chunk in bytes.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.3.4.2.3 l4shmc_chunk_try_to_take_for_reading()

```
long l4shmc_chunk_try_to_take_for_reading (
             l4shmc_chunk_t * chunk)  [inline]
```

Try to mark chunk busy reading.

Parameters

chunk	chunk to mark busy reading.

Return values

0	Chunk could be taken and can be read.
<0	Chunk could not be taken, try again.

References L4_CV, and L4_INLINE.

13.12.3.4.2.4 l4shmc_enable_chunk()

```
long l4shmc_enable_chunk (
             l4shmc_chunk_t * chunk)
```

Enable a signal connected with a chunk.

Parameters

chunk	Chunk to enable.

Return values

0	Success.
<0	Error.

A signal must be enabled before waiting when the consumer waits on any signal. Enabling is not needed if the consumer waits for a specific signal or chunk.
References L4_CV, and L4_INLINE.

13.12.3.4.2.5 l4shmc_is_chunk_ready()

```
long l4shmc_is_chunk_ready (
             l4shmc_chunk_t const * chunk)  [inline]
```

Check whether data is available.

Parameters

chunk	Chunk to check.

Return values

!=0	Data is available.
0	No data available.

References L4_CV, and L4_INLINE.

13.12.3.4.2.6 l4shmc_wait_chunk()

```
long l4shmc_wait_chunk (
            l4shmc_chunk_t * chunk)  [inline]
```

Wait on a specific chunk.

Parameters

chunk	Chunk to wait for.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.3.4.2.7 l4shmc_wait_chunk_to()

```
long l4shmc_wait_chunk_to (
            l4shmc_chunk_t * chunk,
            l4_timeout_t timeout)
```

Check whether a specific chunk has an event pending, with timeout.

Parameters

chunk	Chunk to check.
timeout	Timeout.

Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.
References L4_CV, and L4_INLINE.

13.12.3.4.2.8 l4shmc_wait_chunk_try()

```
long l4shmc_wait_chunk_try (
             l4shmc_chunk_t * chunk)  [inline]
```

Check whether a specific chunk has an event pending.

Parameters

chunk	Chunk to check.

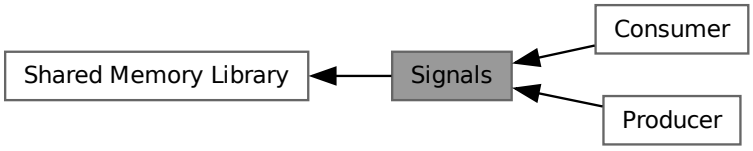
Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.
References L4_CV, and L4_INLINE.

13.12.4 Signals

Collaboration diagram for Signals:



Topics

- Producer 574
- Consumer 575

Functions

- long l4shmc_add_signal (l4shmc_area_t *shmarea, char const *signal_name, l4shmc_signal_t *signal)

  Add a signal for the shared memory area.
- long l4shmc_attach_signal (l4shmc_area_t *shmarea, char const *signal_name, l4_cap_idx_t thread, l4shmc_signal_t *signal)

  Attach to signal.
- long l4shmc_get_signal (l4shmc_area_t *shmarea, char const *signal_name, l4shmc_signal_t *signal)

Get signal object from the shared memory area.

- l4_cap_idx_t l4shmc_signal_cap (l4shmc_signal_t const *signal)

  Get the signal capability of a signal.

- long l4shmc_check_magic (l4shmc_chunk_t const *chunk)

  Check magic value of a chunk.

13.12.4.1 Detailed Description

13.12.4.2 Function Documentation

13.12.4.2.1 l4shmc_add_signal()

```
long l4shmc_add_signal (
             l4shmc_area_t * shmarea,
             char const * signal_name,
             l4shmc_signal_t * signal)
```

Add a signal for the shared memory area.

Parameters

	shmarea	The shared memory area.
	signal_name	Name of the signal.
out	*signal*	Signal structure to fill in.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.4.2.2 l4shmc_attach_signal()

```
long l4shmc_attach_signal (
             l4shmc_area_t * shmarea,
             char const * signal_name,
             l4_cap_idx_t thread,
             l4shmc_signal_t * signal)
```

Attach to signal.

Parameters

	shmarea	Shared memory area.
	signal_name	Name of the signal.
	thread	Thread capability index to attach the signal to.
out	*signal*	Signal data structure to fill.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.4.2.3 l4shmc_check_magic()

```
long l4shmc_check_magic (
            l4shmc_chunk_t const * chunk)  [inline]
```

Check magic value of a chunk.

Parameters

chunk	Chunk.

Return values

0	Magic value is not valid.
>0	Chunk is OK, the magic value is valid.

References L4_CV.

13.12.4.2.4 l4shmc_get_signal()

```
long l4shmc_get_signal (
            l4shmc_area_t * shmarea,
            char const * signal_name,
            l4shmc_signal_t * signal)
```

Get signal object from the shared memory area.

Parameters

	shmarea	Shared memory area.
	signal_name	Name of the signal.
out	*signal*	Signal data structure to fill.

Return values

0	Success.
<0	Error.

References L4_CV.

13.12.4.2.5 l4shmc_signal_cap()

```
l4_cap_idx_t l4shmc_signal_cap (
```

```
            l4shmc_signal_t const * signal)  [inline]
```

Get the signal capability of a signal.

Parameters

signal	Signal.

Returns

Capability of the signal object.

References L4_CV, and L4_INLINE.

13.12.4.3 Producer

Collaboration diagram for Producer:

Functions

- long l4shmc_trigger (l4shmc_signal_t *signal)

  Trigger a signal.

13.12.4.3.1 Detailed Description

13.12.4.3.2 Function Documentation

13.12.4.3.2.1 l4shmc_trigger()

```
long l4shmc_trigger (
            l4shmc_signal_t * signal)  [inline]
```

Trigger a signal.

Parameters

signal	Signal to trigger.

Return values

0	Success.
<0	Error.

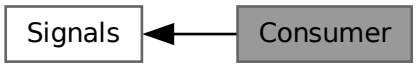
Examples

examples/libs/shmc/prodcons.c.

References L4_CV, and L4_INLINE.

13.12.4.4 Consumer

Collaboration diagram for Consumer:



Functions

- long l4shmc_enable_signal (l4shmc_signal_t ∗signal)

  Enable a signal.
- long l4shmc_wait_any (l4shmc_signal_t ∗∗retsignal)

  Wait on any signal.
- long l4shmc_wait_any_try (l4shmc_signal_t ∗∗retsignal)

  Check whether any waited signal has an event pending.
- long l4shmc_wait_any_to (l4_timeout_t timeout, l4shmc_signal_t ∗∗retsignal)

  Wait for any signal with timeout.
- long l4shmc_wait_signal (l4shmc_signal_t ∗signal)

  Wait on a specific signal.
- long l4shmc_wait_signal_to (l4shmc_signal_t ∗signal, l4_timeout_t timeout)

  Wait on a specific signal, with timeout.
- long l4shmc_wait_signal_try (l4shmc_signal_t ∗signal)

  Check whether a specific signal has an event pending.

13.12.4.4.1 Detailed Description

13.12.4.4.2 Function Documentation

13.12.4.4.2.1 l4shmc_enable_signal()

```
long l4shmc_enable_signal (
            l4shmc_signal_t * signal)
```

Enable a signal.

Parameters

signal	Signal to enable.

Return values

0	Success.
<0	Error.

A signal must be enabled before waiting when the consumer waits on any signal. Enabling is not needed if the consumer waits for a specific signal or chunk.
References L4_CV.

13.12.4.4.2.2 l4shmc_wait_any()

```
long l4shmc_wait_any (
            l4shmc_signal_t ** retsignal)  [inline]
```

Wait on any signal.

Parameters

out	*retsignal*	Signal received.

Return values

0	Success.
<0	Error.

References L4_CV, and L4_INLINE.

13.12.4.4.2.3 l4shmc_wait_any_to()

```
long l4shmc_wait_any_to (
            l4_timeout_t timeout,
            l4shmc_signal_t ** retsignal)
```

Wait for any signal with timeout.

Parameters

	timeout	Timeout.
out	*retsignal*	Signal that has the event pending if any.

Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.
References L4_CV, and L4_INLINE.

13.12.4.4.2.4 l4shmc_wait_any_try()

```
long l4shmc_wait_any_try (
            l4shmc_signal_t ** retsignal)  [inline]
```

Check whether any waited signal has an event pending.

Parameters

out	*retsignal*	Signal that has the event pending if any.

Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.
References L4_CV.

13.12.4.4.2.5 l4shmc_wait_signal()

```
long l4shmc_wait_signal (
            l4shmc_signal_t * signal)  [inline]
```

Wait on a specific signal.

Parameters

signal	Signal to wait for.

Return values

0	Success.
<0	Error.

Examples

examples/libs/shmc/prodcons.c.

References L4_CV.

13.12.4.4.2.6 l4shmc_wait_signal_to()

```
long l4shmc_wait_signal_to (
            l4shmc_signal_t * signal,
            l4_timeout_t timeout)
```

Wait on a specific signal, with timeout.

Parameters

signal	Signal to wait for.
timeout	Timeout.

Return values

0	Success.
<0	Error.

References L4_CV, and L4_INLINE.

13.12.4.4.2.7 l4shmc_wait_signal_try()

```
long l4shmc_wait_signal_try (
```

```
l4shmc_signal_t * signal)  [inline]
```

Check whether a specific signal has an event pending.

Parameters

signal	Signal to check.

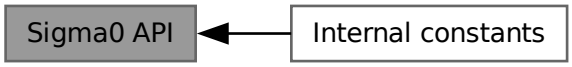
Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.
References L4_CV, and L4_INLINE.

13.13 Sigma0 API

Sigma0 API bindings.
Collaboration diagram for Sigma0 API:



Topics

- Internal•constants 582
  Internal sigma0 definitions.

Files

- file sigma0.h
  Sigma0 interface.

Enumerations

- enum l4sigma0_return_flags_t { L4SIGMA0_OK , L4SIGMA0_NOTALIGNED , L4SIGMA0_IPCERROR , L4SIGMA0_NOFPAGE , **L4SIGMA0_4** , **L4SIGMA0_5** , L4SIGMA0_SMALLERFPAGE }
  Return flags of libsigma0 functions.

Functions

- L4_BEGIN_DECLS l4_kernel_info_t ∗ l4sigma0_map_kip (l4_cap_idx_t sigma0, void ∗addr, unsigned log2↩ _size)

Map the kernel info page from sigma0 to addr.

- int l4sigma0_map_mem (l4_cap_idx_t sigma0, l4_addr_t phys, l4_addr_t virt, l4_addr_t size)

  Request a memory mapping from sigma0.
- int l4sigma0_map_iomem (l4_cap_idx_t sigma0, l4_addr_t phys, l4_addr_t virt, l4_addr_t size, int cached)

  Request IO memory from sigma0.
- int l4sigma0_map_anypage (l4_cap_idx_t sigma0, l4_addr_t map_area, unsigned log2_map_size, l4_addr_t *base, unsigned sz)

  Request an arbitrary free page of RAM.
- void l4sigma0_debug_dump (l4_cap_idx_t sigma0)

  Request sigma0 to dump internal debug information.
- char const * l4sigma0_map_errstr (int err)

  Get user readable error messages for the return codes.

13.13.1 Detailed Description

Sigma0 API bindings.
Convenience bindings for the Sigma0 protocol.

13.13.2 Enumeration Type Documentation

13.13.2.1 l4sigma0_return_flags_t

```
enum l4sigma0_return_flags_t
```

Return flags of libsigma0 functions.

Enumerator

L4SIGMA0_OK	Ok.
L4SIGMA0_NOTALIGNED	Phys, virt or size not aligned.
L4SIGMA0_IPCERROR	IPC error.
L4SIGMA0_NOFPAGE	No fpage received.
L4SIGMA0_SMALLERFPAGE	Superpage requested but smaller flexpage received.

Definition at line 76 of file sigma0.h.

13.13.3 Function Documentation

13.13.3.1 l4sigma0_debug_dump()

```
void l4sigma0_debug_dump (
            l4_cap_idx_t sigma0)
```

Request sigma0 to dump internal debug information.

Parameters

sigma0	Capability index for the sigma0 gate.

The debug information, such as internal memory maps, as well as statistics about the internal allocators is dumped to the kernel debugger.
References L4_CV, and L4_INLINE.

13.13.3.2 l4sigma0_map_anypage()

```
int l4sigma0_map_anypage (
            l4_cap_idx_t sigma0,
            l4_addr_t map_area,
            unsigned log2_map_size,
            l4_addr_t * base,
            unsigned sz)
```

Request an arbitrary free page of RAM.

Parameters

	sigma0	Capability index for the sigma0 gate.
	map_area	The base address of the local virtual memory area where the page should be mapped.
	log2_map_size	The size of the requested page log 2 (the size in bytes is 2^log2_map_size). This must be at least the minimal page size. By specifing larger sizes the largest possible hardware page size will be used.
out	*base*	Physical address of the page received (i.e. the send base of the received mapping if any).
	sz	Size to map by the server in 2^sz bytes.

Return values

0	Success.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function requests arbitrary free memory from sigma0. It should be used whenever spare memory is needed, instead of requesting specific physical memory with l4sigma0_map_mem().
See l4sigma0_map_errstr() to get a description of the return value.
References L4_CV.

13.13.3.3 l4sigma0_map_errstr()

```
char const * l4sigma0_map_errstr (
            int err)  [inline]
```

Get user readable error messages for the return codes.

Parameters

err	The error code reported by the *map* functions.

Returns

A string containing the error message.

Definition at line 213 of file sigma0.h.
References L4_INLINE.

13.13.3.4 l4sigma0_map_iomem()

```
int l4sigma0_map_iomem (
            l4_cap_idx_t sigma0,
```

```
              l4_addr_t phys,
              l4_addr_t virt,
              l4_addr_t size,
              int cached)
```

Request IO memory from sigma0.

Parameters

sigma0	Capability index for the sigma0 gate.
phys	The physical address to be requested (page aligned).
virt	The virtual address where the memory should be mapped to (page aligned).
size	The size of the IO memory area to be mapped (multiple of page size)
cached	Requests cacheable IO memory if 1 and uncached if 0.

Return values

0	Success.
-L4SIGMA0_NOTALIGNED	`phys`, `virt`, or `size` are not aligned.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function is similar to l4sigma0_map_mem(), the difference is that it requests IO memory. IO memory is everything that is not known to be normal RAM. Also ACPI tables or the BIOS memory is treated as IO memory.
See l4sigma0_map_errstr() to get a description of the return value.
References L4_CV.

13.13.3.5 l4sigma0_map_kip()

```
L4_BEGIN_DECLS l4_kernel_info_t * l4sigma0_map_kip (
              l4_cap_idx_t sigma0,
              void * addr,
              unsigned log2_size)
```

Map the kernel info page from sigma0 to addr.

Parameters

sigma0	Capability index for the sigma0 gate.
addr	Start of the receive window to receive KIP in.
log2_size	Size of the receive window to receive KIP in.

Returns

Address KIP was mapped to, 0 indicates an error.

Note

On systems without MMU, the parameters `addr` and `log2_size` are ignored.

13.13.3.6 l4sigma0_map_mem()

```
int l4sigma0_map_mem (
              l4_cap_idx_t sigma0,
```

```
l4_addr_t phys,
l4_addr_t virt,
l4_addr_t size)
```

Request a memory mapping from sigma0.

Parameters

sigma0	Capability index for the sigma0 gate.
phys	The physical address of the requested page (must be at least aligned to the minimum page size).
virt	The virtual address where the paged should be mapped in the local address space (must be at least aligned to the minimum page size).
size	The size of the requested page, this must be a multiple of the minimum page size.

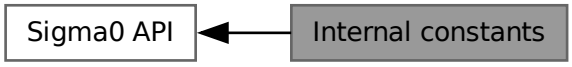
Return values

0	Success.
-L4SIGMA0_NOTALIGNED	`phys`, `virt`, or `size` are not aligned.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function only maps normal RAM. To map other memory, use l4sigma0_map_iomem(). See also there for the distinction between both memory types.
This is the direct method to request memory from sigma0. There is also the indirect method where sigma0 will answer page faults with a mapping that is one-to-one between the faulting virtual page and the backing physical page. See L4::Pager::page_fault(). For an overview of the memory hierarchy, see Memory management - Data Spaces and the Region Map.
See l4sigma0_map_errstr() to get a description of the return value.
References L4_CV.

13.13.4 Internal constants

Internal sigma0 definitions.
Collaboration diagram for Internal constants:



Macros

- #define **SIGMA0_REQ_MAGIC** ~0xFFUL

  Request magic.
- #define **SIGMA0_REQ_MASK** ~0xFFUL

  Request mask.
- #define **SIGMA0_REQ_ID_MASK** 0xF0

  ID mask.

- #define **SIGMA0_REQ_ID_FPAGE_RAM** 0x60

  RAM.
- #define **SIGMA0_REQ_ID_FPAGE_IOMEM** 0x70

  I/O memory.
- #define **SIGMA0_REQ_ID_FPAGE_IOMEM_CACHED** 0x80

  Cached I/O memory.
- #define **SIGMA0_REQ_ID_FPAGE_ANY** 0x90

  Any.
- #define **SIGMA0_REQ_ID_KIP** 0xA0

  KIP.
- #define **SIGMA0_REQ_ID_DEBUG_DUMP** 0xC0

  Debug dump.
- #define **SIGMA0_REQ_ID_COV** 0xE0

  Trigger cov dump.
- #define **SIGMA0_IS_MAGIC_REQ**(d1)

  Check if magic.
- #define **SIGMA0_REQ**(x)

  Construct.
- #define **SIGMA0_REQ_FPAGE_RAM** (SIGMA0_REQ(FPAGE_RAM))

  RAM.
- #define **SIGMA0_REQ_FPAGE_IOMEM** (SIGMA0_REQ(FPAGE_IOMEM))

  I/O memory.
- #define **SIGMA0_REQ_FPAGE_IOMEM_CACHED** (SIGMA0_REQ(FPAGE_IOMEM_CACHED))

  Cache I/O memory.
- #define **SIGMA0_REQ_FPAGE_ANY** (SIGMA0_REQ(FPAGE_ANY))

  Any.
- #define **SIGMA0_REQ_KIP** (SIGMA0_REQ(KIP))

  KIP.
- #define **SIGMA0_REQ_DEBUG_DUMP** (SIGMA0_REQ(DEBUG_DUMP))

  Debug dump.
- #define **SIGMA0_REQ_COV** (SIGMA0_REQ(COV))

  Cov.

13.13.4.1 Detailed Description

Internal sigma0 definitions.

13.14 Small C++ Template Library

Namespaces

- namespace cxx

  Our C++ library.

Data Structures

- class L4::Alloc_list

  A simple list-based allocator.
- class cxx::List_item

  Basic list item.
- struct cxx::Pair< First, Second >

  Pair of two values.

- class cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >

  Basic slab allocator.
- class cxx::Slab< Type, Slab_size, Max_free, Alloc >

  Slab allocator for object of type `Type`.
- class cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >

  Merged slab allocator (allocators for objects of the same size are merged together).
- class cxx::Slab_static< Type, Slab_size, Max_free, Alloc >

  Merged slab allocator (allocators for objects of the same size are merged together).
- class cxx::Nothrow

  Helper type to distinguish the `operator new` version that does not throw exceptions.
- class cxx::New_allocator< _Type >

  Standard allocator based on `operator new ()` .
- class L4::String

  A null-terminated string container class.

Functions

- template<typename A, typename ... ARGS>
  constexpr A const & cxx::min (A const &a1, A const &a2, ARGS const &...a)

  Get the minimum of `a1` and `a2` upt to `aN`.
- template<typename A, typename ... ARGS>
  constexpr A const & cxx::min (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)

  Get the minimum of `a1` and `a2` upt to `aN`.
- template<typename A, typename ... ARGS>
  constexpr A const & cxx::max (A const &a1, A const &a2, ARGS const &...a)

  Get the maximum of `a1` and `a2` upt to `aN`.
- template<typename A, typename ... ARGS>
  constexpr A const & cxx::max (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)

  Get the maximum of `a1` and `a2` upt to `aN`.
- template<typename T1>
  T1 cxx::clamp (T1 v, T1 lo, T1 hi)

  Limit v to the range given by lo and hi.
- void * operator new (size_t, void *mem, cxx::Nothrow const &) noexcept

  Simple placement new operator.
- void * **operator new** (size_t, cxx::Nothrow const &) noexcept

  New operator that does not throw exceptions.
- void **operator delete** (void *, cxx::Nothrow const &) noexcept

  Delete operator complementing the new operator not throwing exceptions.

13.14.1 Detailed Description

13.14.2 Function Documentation

13.14.2.1 clamp()

```
template<typename T1>
T1 cxx::clamp (
            T1 v,
            T1 lo,
            T1 hi)  [inline]
```

Limit *v* to the range given by *lo* and *hi*.

Parameters

v	The value to clamp.
lo	The lower boundary to clamp *v* to.
hi	The upper boundary to clamp *v* to.

Definition at line 109 of file minmax.

13.14.2.2 max() [1/2]

```
template<typename A, typename ...  ARGS>
A const & cxx::max (
             A const & a1,
             A const & a2,
             ARGS const &...  a)  [constexpr]
```

Get the maximum of `a1` and `a2` upt to `aN`.

Parameters

a1	The first value.
a2	The second value.
...↩ a	Arbitrary number of additional parameters.

Matches with automatic argument type deduction.
Definition at line 78 of file minmax.

13.14.2.3 max() [2/2]

```
template<typename A, typename ...  ARGS>
A const & cxx::max (
             cxx::identity_t< A > const & a1,
             cxx::identity_t< A > const & a2,
             ARGS const &...  a)  [constexpr]
```

Get the maximum of `a1` and `a2` upt to `aN`.

Parameters

a1	The first value.
a2	The second value.
...↩ a	Arbitrary number of additional parameters.

Matches with explicit template type A.
Definition at line 93 of file minmax.

13.14.2.4 min() [1/2]

```
template<typename A, typename ...  ARGS>
A const & cxx::min (
             A const & a1,
             A const & a2,
             ARGS const &...  a)  [constexpr]
```

Get the minimum of `a1` and `a2` upt to `aN`.

Parameters

a1	The first value.
a2	The second value.
...↩ a	Arbitrary number of additional parameters.

Matches with automatic argument type deduction.
Definition at line 36 of file minmax.

13.14.2.5 min() [2/2]

```
template<typename A, typename ...  ARGS>
A const & cxx::min (
             cxx::identity_t< A > const & a1,
             cxx::identity_t< A > const & a2,
             ARGS const &...  a)  [constexpr]
```

Get the minimum of `a1` and `a2` upt to `aN`.

Parameters

a1	The first value.
a2	The second value.
...↩ a	Arbitrary number of additional parameters.

Matches with explicit template type A.
Definition at line 53 of file minmax.

13.14.2.6 operator new()

```
void * operator new (
             size_t ,
             void * mem,
             cxx::Nothrow const & )  [inline], [noexcept]
```

Simple placement new operator.

Parameters

mem	the address of the memory block to place the new object.

Returns

the address given by *mem*.

Definition at line 28 of file std_alloc.

13.15 The L4Re IPC Framework

The mechanisms for IPC communication between L4Re applications.

Collaboration diagram for The L4Re IPC Framework:

Topics

- Server-Side IPC framework 587
  Server-Side framework for implementing object-oriented servers.

13.15.1 Detailed Description

The mechanisms for IPC communication between L4Re applications.

13.15.2 Server-Side IPC framework

Server-Side framework for implementing object-oriented servers.
Collaboration diagram for Server-Side IPC framework:

Namespaces

- namespace L4::Ipc_svr
  Helper classes for L4::Server instantiation.

Data Structures

- class L4::Ipc_svr::Server_iface
  Interface for server-loop related functions.
- class L4::Basic_registry
  This registry returns the corresponding server object based on the label of an Ipc_gate.
- struct L4::Ipc_svr::Ignore_errors
  Mix in for LOOP_HOOKS to ignore IPC errors.
- struct L4::Ipc_svr::Default_timeout
  Mix in for LOOP_HOOKS to use a 0 send and an infinite receive timeout.
- struct L4::Ipc_svr::Compound_reply
  Mix in for LOOP_HOOKS to always use compound reply and wait.
- struct L4::Ipc_svr::Default_setup_wait
  Mix in for LOOP_HOOKS for setup_wait no op.
- class L4::Ipc_svr::Br_manager_no_buffers

Empty implementation of Server_iface.

- struct L4::Ipc_svr::Default_loop_hooks

  Default LOOP_HOOKS.
- class L4::Server< LOOP_HOOKS >

  Basic server loop for handling client requests.
- class L4::Server_object

  Abstract server object to be used with L4::Server and L4::Basic_registry.
- struct L4::Server_object_t< IFACE, BASE >

  Base class (template) for server implementing server objects.
- struct L4::Server_object_x< Derived, IFACE, BASE >

  Helper class to implement p_dispatch based server objects.
- struct L4::Irq_handler_object

  Server object base class for handling IRQ messages.
- class L4::Ipc_svr::Timeout

  Callback interface for Timeout_queue.
- class L4::Ipc_svr::Timeout_queue

  Timeout queue to be used in l4re server loop.
- class L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >

  Loop hooks mixin for integrating a timeout queue into the server loop.

Enumerations

- enum L4::Ipc_svr::Reply_mode { L4::Ipc_svr::Reply_compound , L4::Ipc_svr::Reply_separate }

  Reply mode for server loop.

13.15.2.1 Detailed Description

Server-Side framework for implementing object-oriented servers.

13.15.2.2 Enumeration Type Documentation

13.15.2.2.1 Reply_mode

`enum L4::Ipc_svr::Reply_mode`

Reply mode for server loop.

The reply mode specifies if the server loop shall do a compound reply and wait operation (Reply_compound), which is the most performant method. Note, setup_wait() is called before the reply. The other way is to call reply and wait separately and call setup_wait in between.

The actual mode is determined by the return value of the before_reply() hook in the LOOP_HOOKS of L4::Server.

Enumerator

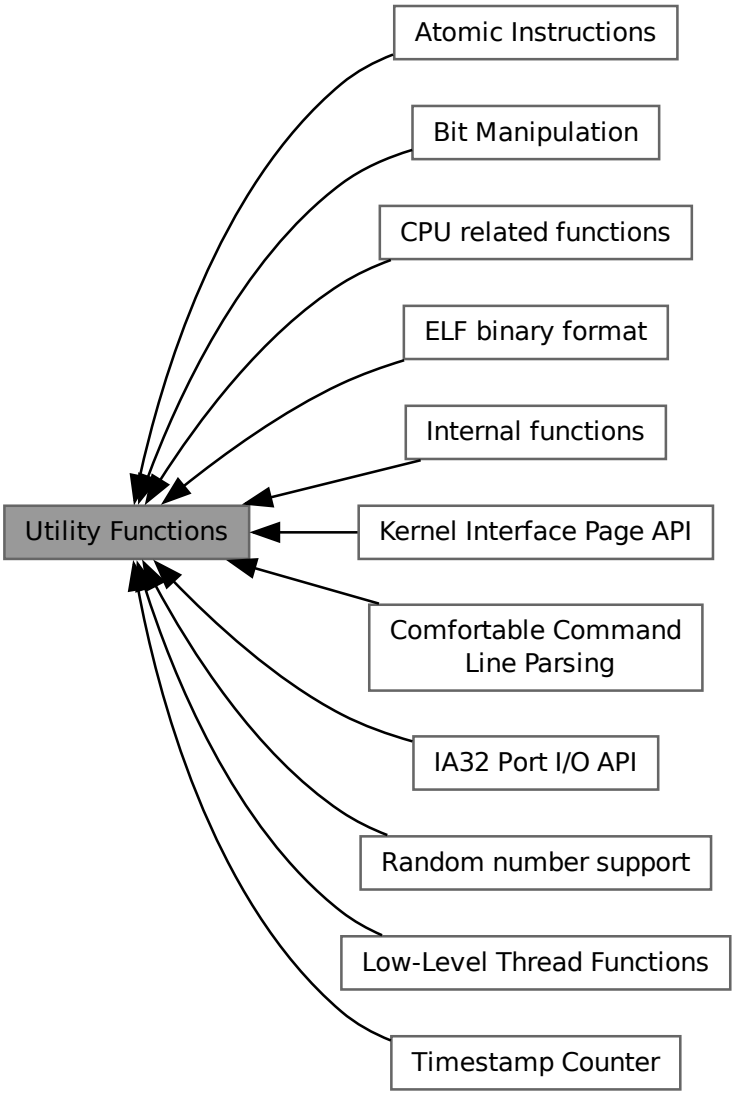
Reply_compound	Server shall use a compound reply and wait (fast).
Reply_separate	Server shall call reply and wait separately.

Definition at line 46 of file ipc_server_loop.

13.16 Utility Functions

Utilities, generic file.

Collaboration diagram for Utility Functions:



Topics

- CPU related functions 594
- IA32 Port I/O API 596
- Timestamp Counter 601
- Atomic Instructions 608

- Internal functions . . . 623
- Bit Manipulation . . . 624
- ELF binary format . . . 630

  Functions and types related to ELF binaries.
- Kernel Interface Page API . . . 651
- Comfortable Command Line Parsing . . . 653
- Random number support . . . 655
- Low-Level Thread Functions . . . 656

Files

- file rand.h

  Simple Pseudo-Random Number Generator.

Functions

- L4_BEGIN_DECLS long l4util_splitlog2_hdl (l4_addr_t start, l4_addr_t end, long(*handler)(l4_addr_t s, l4_addr_t e, int log2size))

  Split a range into log2 base and size aligned chunks.
- l4_addr_t l4util_splitlog2_size (l4_addr_t start, l4_addr_t end)

  Return log2 base and size aligned length of a range.
- L4_BEGIN_DECLS l4_timeout_s l4util_micros2l4to (l4_uint64_t us) L4_NOTHROW

  Calculate l4 timeouts.
- void l4_sleep (l4_uint32_t ms) L4_NOTHROW

  Suspend thread for a period of ms milliseconds.
- void l4_usleep (l4_uint64_t us) L4_NOTHROW

  Suspend thread for a period of us microseconds.
- void **l4_sleep_forever** (void) L4_NOTHROW L4_NORETURN

  Go sleep and never wake up.
- void l4_touch_ro (const void *addr, unsigned size) L4_NOTHROW

  Touch data area to force mapping (read-only).
- void l4_touch_rw (const void *addr, unsigned size) L4_NOTHROW

  Touch data areas to force mapping (read-write).

13.16.1 Detailed Description

Utilities, generic file.

13.16.2 Function Documentation

13.16.2.1 l4_sleep()

```
void l4_sleep (
            l4_uint32_t ms)
```

Suspend thread for a period of *ms* milliseconds.

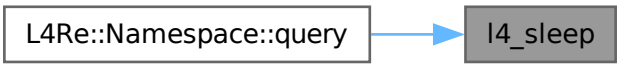
Parameters

ms	Time in milliseconds

Examples

examples/libs/libirq/async_isr.c, examples/sys/aliens/main.c, examples/sys/singlestep/main.c, and examples/sys/start-with-exc/r

References L4_CV, and L4_NOTHROW.
Referenced by L4Re::Namespace::query().
Here is the caller graph for this function:



13.16.2.2 l4_touch_ro()

```
void l4_touch_ro (
            const void * addr,
            unsigned size)  [inline]
```

Touch data area to force mapping (read-only).

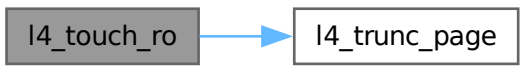
Parameters

addr	Start of memory area to touch.
size	Size of area to touch.

Examples

examples/sys/singlestep/main.c.

Definition at line 92 of file util.h.
References L4_NOTHROW, L4_PAGESIZE, and l4_trunc_page().
Here is the call graph for this function:



13.16.2.3 l4_touch_rw()

```
void l4_touch_rw (
            const void * addr,
            unsigned size)  [inline]
```

Touch data areas to force mapping (read-write).

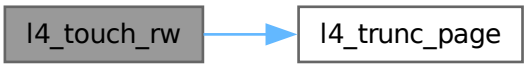
Parameters

addr	Start of memory area to touch.
size	Size of area to touch.

Examples

examples/sys/aliens/main.c, and examples/sys/singlestep/main.c.

Definition at line 105 of file util.h.
References L4_NOTHROW, L4_PAGESIZE, and l4_trunc_page().
Here is the call graph for this function:



13.16.2.4 l4_usleep()

```
void l4_usleep (
            l4_uint64_t us)
```

Suspend thread for a period of *us* microseconds.

Parameters

us	Time in microseconds

Note

The timer resolution of L4 kernels is usually 1ms.

References L4_CV, L4_INLINE, L4_NORETURN, and L4_NOTHROW.

13.16.2.5 l4util_micros2l4to()

```
L4_BEGIN_DECLS l4_timeout_s l4util_micros2l4to (
            l4_uint64_t us)
```

Calculate l4 timeouts.

Parameters

us	time in microseconds. Special cases: • 0 - > timeout 0 • ~0U -> timeout NEVER

Returns

the corresponding l4_timeout value

Deprecated Use l4_timeout_from_us().

References L4_CV, and L4_NOTHROW.

13.16.2.6 l4util_splitlog2_hdl()

```
L4_END_DECLS long l4util_splitlog2_hdl (
              l4_addr_t start,
              l4_addr_t end,
              long(* handler )(l4_addr_t s, l4_addr_t e, int log2size))  [inline]
```

Split a range into log2 base and size aligned chunks.

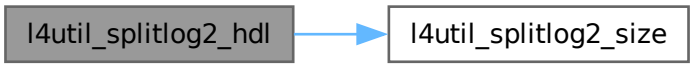
Parameters

start	Start of range
end	End of range (inclusive) (e.g. 2-4 is len 3)
handler	Handler function that is called with start and end (both inclusive) of the chunk. On success, the handler must return 0, if it returns !=0 the function will immediately return with the return code of the handler.

Returns

0 on success, != 0 otherwise

Definition at line 51 of file splitlog2.h.
References L4_EINVAL, and l4util_splitlog2_size().
Here is the call graph for this function:



13.16.2.7 l4util_splitlog2_size()

```
l4_addr_t l4util_splitlog2_size (
              l4_addr_t start,
              l4_addr_t end)  [inline]
```

Return log2 base and size aligned length of a range.

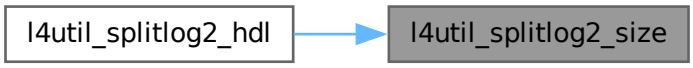
Parameters

start	Start of range
end	End of range (inclusive) (e.g. 2-4 is len 3)

Returns

length of elements in log2size (length is 1 << log2size)

Definition at line 72 of file splitlog2.h.
Referenced by l4util_splitlog2_hdl().
Here is the caller graph for this function:



13.16.3 CPU related functions

Collaboration diagram for CPU related functions:

Functions

- int l4util_cpu_has_cpuid (void)

  Check whether the CPU supports the "cpuid" instruction.
- unsigned int l4util_cpu_capabilities (void)

  Returns the CPU capabilities if the "cpuid" instruction is available.
- unsigned int l4util_cpu_capabilities_nocheck (void)

  Returns the CPU capabilities.
- void **l4util_cpu_cpuid** (unsigned long mode, unsigned long *eax, unsigned long *ebx, unsigned long *ecx, unsigned long *edx)

  Generic CPUID access function.

13.16.3.1 Detailed Description

13.16.3.2 Function Documentation

13.16.3.2.1 l4util_cpu_capabilities()

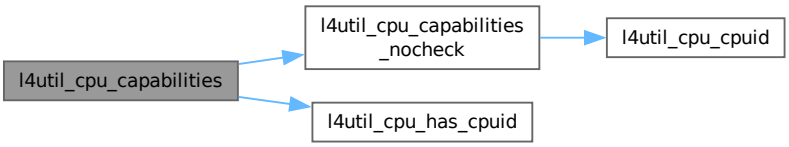
```
unsigned int l4util_cpu_capabilities (
             void )  [inline]
```

Returns the CPU capabilities if the "cpuid" instruction is available.

Returns

CPU capabilities if the "cpuid" instruction is available, 0 if the "cpuid" instruction is not supported.

Definition at line 95 of file cpu.h.
References l4util_cpu_capabilities_nocheck(), and l4util_cpu_has_cpuid().
Here is the call graph for this function:



13.16.3.2.2 l4util_cpu_capabilities_nocheck()

```
unsigned int l4util_cpu_capabilities_nocheck (
            void )  [inline]
```

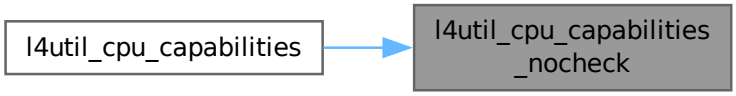
Returns the CPU capabilities.

Returns

CPU capabilities.

Definition at line 84 of file cpu.h.
References l4util_cpu_cpuid().
Referenced by l4util_cpu_capabilities().
Here is the call graph for this function:

Here is the caller graph for this function:



13.16.3.2.3 l4util_cpu_has_cpuid()

```
int l4util_cpu_has_cpuid (
            void )  [inline]
```

Check whether the CPU supports the "cpuid" instruction.

Returns

1 if it has, 0 if it has not

Definition at line 64 of file cpu.h.
Referenced by l4util_cpu_capabilities().
Here is the caller graph for this function:

13.16.4 IA32 Port I/O API

Collaboration diagram for IA32 Port I/O API:

Functions

- l4_uint8_t l4util_in8 (l4_uint16_t port)
  Read byte from I/O port.
- l4_uint16_t l4util_in16 (l4_uint16_t port)
  Read 16-bit-value from I/O port.
- l4_uint32_t l4util_in32 (l4_uint16_t port)
  Read 32-bit-value from I/O port.
- void l4util_ins8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)
  Read a block of 8-bit-values from I/O ports.
- void l4util_ins16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)
  Read a block of 16-bit-values from I/O ports.
- void l4util_ins32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)
  Read a block of 32-bit-values from I/O ports.
- void l4util_out8 (l4_uint8_t value, l4_uint16_t port)
  Write byte to I/O port.
- void l4util_out16 (l4_uint16_t value, l4_uint16_t port)
  Write 16-bit-value to I/O port.
- void l4util_out32 (l4_uint32_t value, l4_uint16_t port)

Write 32-bit-value to I/O port.

- void l4util_outs8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write a block of bytes to I/O port.
- void l4util_outs16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write a block of 16-bit-values to I/O port.
- void l4util_outs32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write block of 32-bit-values to I/O port.
- void **l4util_iodelay** (void)

  delay I/O port access by writing to port 0x80
- int l4util_ioport_map (l4_cap_idx_t sigma0id, unsigned port_start, unsigned log2size)

  Map a range of I/O ports.

13.16.4.1 Detailed Description

13.16.4.2 Function Documentation

13.16.4.2.1 l4util_in16()

```
l4_uint16_t l4util_in16 (
            l4_uint16_t port)  [inline]
```

Read 16-bit-value from I/O port.

Parameters

port	I/O port address

Returns

value

Definition at line 195 of file port_io.h.

13.16.4.2.2 l4util_in32()

```
l4_uint32_t l4util_in32 (
            l4_uint16_t port)  [inline]
```

Read 32-bit-value from I/O port.

Parameters

port	I/O port address

Returns

value

Definition at line 203 of file port_io.h.

13.16.4.2.3 l4util_in8()

```
l4_uint8_t l4util_in8 (
            l4_uint16_t port)  [inline]
```

Read byte from I/O port.

Parameters

port	I/O port address

Returns

value

Definition at line 187 of file port_io.h.

13.16.4.2.4 l4util_ins16()

```
void l4util_ins16 (
              l4_uint16_t port,
              l4_umword_t addr,
              l4_umword_t count)  [inline]
```

Read a block of 16-bit-values from I/O ports.

Parameters

port	I/O port address
addr	address of buffer
count	number of I/O operations

Definition at line 220 of file port_io.h.

13.16.4.2.5 l4util_ins32()

```
void l4util_ins32 (
              l4_uint16_t port,
              l4_umword_t addr,
              l4_umword_t count)  [inline]
```

Read a block of 32-bit-values from I/O ports.

Parameters

port	I/O port address
addr	address of buffer
count	number of I/O operations

Definition at line 229 of file port_io.h.

13.16.4.2.6 l4util_ins8()

```
void l4util_ins8 (
              l4_uint16_t port,
              l4_umword_t addr,
              l4_umword_t count)  [inline]
```

Read a block of 8-bit-values from I/O ports.

Parameters

port	I/O port address
addr	address of buffer

count	number of I/O operations

Definition at line 211 of file port_io.h.

13.16.4.2.7 l4util_ioport_map()

```
int l4util_ioport_map (
            l4_cap_idx_t sigma0id,
            unsigned port_start,
            unsigned log2size)  [inline]
```

Map a range of I/O ports.

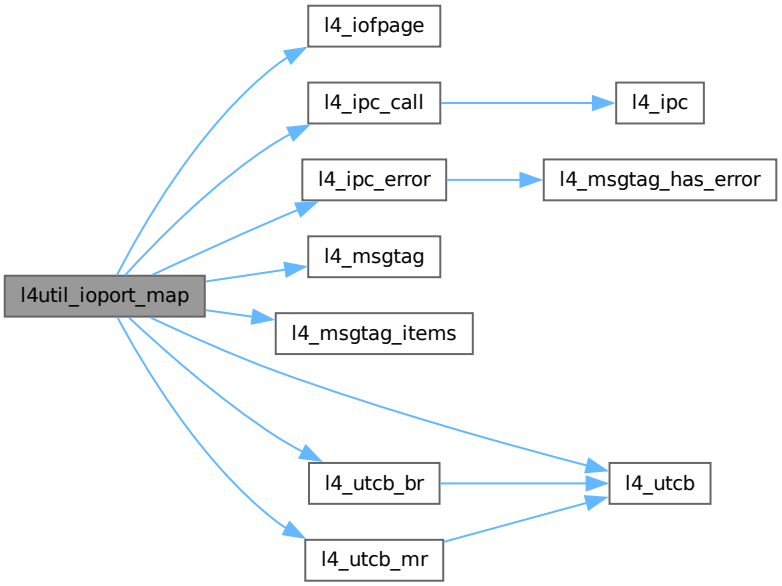
Parameters

sigma0id	I/O port service (sigma0).
port_start	(Start) Port to request.
log2size	Log2size of range to request.

Returns

IPC result: 0 if the range could be successfully mapped on error: IPC failure, or -L4_ENOENT if nothing mapped

Definition at line 289 of file port_io.h.
References l4_buf_regs_t::bdr, l4_buf_regs_t::br, L4_ENOENT, l4_iofpage(), l4_ipc_call(), l4_ipc_error(), L4_IPC_NEVER, L4_ITEM_MAP, l4_msgtag(), l4_msgtag_items(), L4_PROTO_IO_PAGE_FAULT, l4_utcb(), l4_utcb_br(), l4_utcb_mr(), l4_msg_regs_t::mr, and l4_fpage_t::raw.
Here is the call graph for this function:



13.16.4.2.8 l4util_out16()

```
void l4util_out16 (
             l4_uint16_t value,
             l4_uint16_t port)  [inline]
```

Write 16-bit-value to I/O port.

Parameters

port	I/O port address
value	value to write

Definition at line 244 of file port_io.h.

13.16.4.2.9 l4util_out32()

```
void l4util_out32 (
             l4_uint32_t value,
             l4_uint16_t port)  [inline]
```

Write 32-bit-value to I/O port.

Parameters

port	I/O port address
value	value to write

Definition at line 250 of file port_io.h.

13.16.4.2.10 l4util_out8()

```
void l4util_out8 (
             l4_uint8_t value,
             l4_uint16_t port)  [inline]
```

Write byte to I/O port.

Parameters

port	I/O port address
value	value to write

Definition at line 238 of file port_io.h.

13.16.4.2.11 l4util_outs16()

```
void l4util_outs16 (
             l4_uint16_t port,
             l4_umword_t addr,
             l4_umword_t count)  [inline]
```

Write a block of 16-bit-values to I/O port.

Parameters

port	I/O port address
addr	address of buffer

count	number of I/O operations

Definition at line 265 of file port_io.h.

13.16.4.2.12 l4util_outs32()

```
void l4util_outs32 (
              l4_uint16_t port,
              l4_umword_t addr,
              l4_umword_t count)  [inline]
```

Write block of 32-bit-values to I/O port.

Parameters

port	I/O port address
addr	address of buffer
count	number of I/O operations

Definition at line 274 of file port_io.h.

13.16.4.2.13 l4util_outs8()

```
void l4util_outs8 (
              l4_uint16_t port,
              l4_umword_t addr,
              l4_umword_t count)  [inline]
```

Write a block of bytes to I/O port.

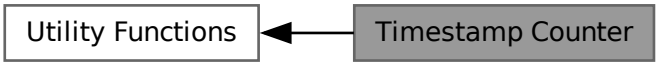
Parameters

port	I/O port address
addr	address of buffer
count	number of I/O operations

Definition at line 256 of file port_io.h.

13.16.5 Timestamp Counter

Collaboration diagram for Timestamp Counter:



Files

- file rdtsc.h

  Timestamp counter related functions.

- file rdtsc.h

  Timestamp counter related functions.

Functions

- l4_cpu_time_t l4_rdtsc (void)

  Read current value of CPU-internal timestamp counter.
- l4_uint32_t l4_rdtsc_32 (void)

  Read the lest significant 32 bit of the TSC.
- l4_uint64_t l4_rdpmc (int ecx)

  Return current value of CPU-internal performance measurement counter.
- l4_uint32_t l4_rdpmc_32 (int ecx)

  Return the least significant 32 bit of a performance counter.
- l4_uint64_t l4_tsc_to_ns (l4_cpu_time_t tsc)

  Convert timestamp to ns value.
- l4_uint64_t l4_tsc_to_us (l4_cpu_time_t tsc)

  Convert timestamp into micro seconds value.
- void l4_tsc_to_s_and_ns (l4_cpu_time_t tsc, l4_uint32_t *s, l4_uint32_t *ns)

  Convert timestamp to s.ns value.
- l4_cpu_time_t l4_ns_to_tsc (l4_uint64_t ns)

  Convert nano seconds into CPU ticks.
- void l4_busy_wait_ns (l4_uint64_t ns)

  Wait busy for a small amount of time.
- void l4_busy_wait_us (l4_uint64_t us)

  Wait busy for a small amount of time.
- l4_uint32_t l4_calibrate_tsc (l4_kernel_info_t const *kip)

  Determine scalers for timestamp calculations.
- l4_uint32_t l4_tsc_init (l4_kernel_info_t const *kip)

  Initialize scaler for TSC calibrations from the kernel.
- l4_uint32_t l4_get_hz (void)

  Get CPU frequency in Hz.

13.16.5.1 Detailed Description

13.16.5.2 Function Documentation

13.16.5.2.1 l4_busy_wait_ns()

```
void l4_busy_wait_ns (
             l4_uint64_t ns)  [inline]
```

Wait busy for a small amount of time.

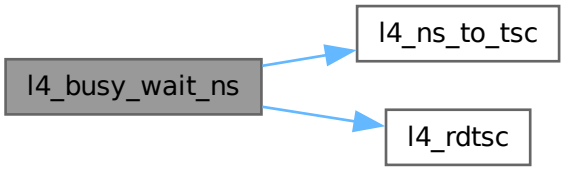
Parameters

ns	nano seconds to wait

Attention

Not intended for any use!

Definition at line 262 of file rdtsc.h.
References l4_ns_to_tsc(), and l4_rdtsc().
Here is the call graph for this function:



13.16.5.2.2 l4_busy_wait_us()

```
void l4_busy_wait_us (
             l4_uint64_t us)  [inline]
```

Wait busy for a small amount of time.

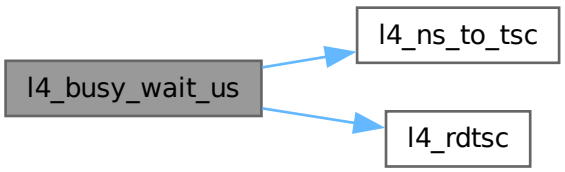
Parameters

us	micro seconds to wait

Attention

Not intended for any use!

Definition at line 272 of file rdtsc.h.
References l4_ns_to_tsc(), and l4_rdtsc().
Here is the call graph for this function:



13.16.5.2.3 l4_calibrate_tsc()

```
l4_uint32_t l4_calibrate_tsc (
             l4_kernel_info_t const * kip)  [inline]
```

Determine scalers for timestamp calculations.
Determine some scalers to be able to convert between real time and CPU ticks. Just calls l4_tsc_init().

Examples

examples/sys/aliens/main.c.

Definition at line 159 of file rdtsc.h.
References l4_tsc_init().
Here is the call graph for this function:

13.16.5.2.4 l4_get_hz()

```
l4_uint32_t l4_get_hz (
            void )
```

Get CPU frequency in Hz.

Returns

frequency in Hz

References L4_END_DECLS, and L4_INLINE.

13.16.5.2.5 l4_ns_to_tsc()

```
l4_cpu_time_t l4_ns_to_tsc (
            l4_uint64_t ns)  [inline]
```

Convert nano seconds into CPU ticks.

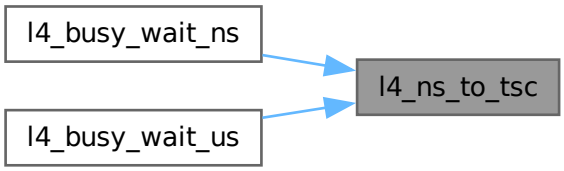
Parameters

ns	nano seconds

Returns

CPU ticks

Definition at line 248 of file rdtsc.h.
Referenced by l4_busy_wait_ns(), and l4_busy_wait_us().
Here is the caller graph for this function:



13.16.5.2.6 l4_rdpmc()

```
l4_uint64_t l4_rdpmc (
             int ecx)  [inline]
```

Return current value of CPU-internal performance measurement counter.

Parameters

ecx	ECX value for the rdpmc instruction. For details see the Intel IA-32 Architectures Software Developer's Manual.

Returns

64-bit PMC

Definition at line 175 of file rdtsc.h.

13.16.5.2.7 l4_rdpmc_32()

```
l4_uint32_t l4_rdpmc_32 (
             int ecx)  [inline]
```

Return the least significant 32 bit of a performance counter.
Useful for smaller differences, needs less cycles.
Definition at line 195 of file rdtsc.h.

13.16.5.2.8 l4_rdtsc()

```
l4_cpu_time_t l4_rdtsc (
             void )  [inline]
```

Read current value of CPU-internal timestamp counter.

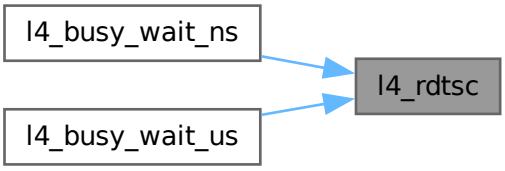
Returns

64-bit timestamp

Examples

examples/sys/aliens/main.c.

Definition at line 165 of file rdtsc.h.
Referenced by l4_busy_wait_ns(), and l4_busy_wait_us().
Here is the caller graph for this function:



13.16.5.2.9 l4_rdtsc_32()

```
l4_uint32_t l4_rdtsc_32 (
            void )  [inline]
```

Read the lest significant 32 bit of the TSC.
Useful for smaller differences, needs less cycles.
Definition at line 185 of file rdtsc.h.

13.16.5.2.10 l4_tsc_init()

```
l4_uint32_t l4_tsc_init (
            l4_kernel_info_t const * kip)
```

Initialize scaler for TSC calibrations from the kernel.
Initialize the scalers needed by l4_tsc_to_ns()/l4_ns_to_tsc() and so on. Use the kernel-provided frequency.

Parameters

kip	KIP pointer

Returns

0 on error (no scalers exported by kernel) otherwise returns (2^32 / (tsc per µsec)). This value has the same semantics as the value returned by the calibrate_delay_loop() function of the Linux kernel.

References L4_CV.
Referenced by l4_calibrate_tsc().
Here is the caller graph for this function:

13.16.5.2.11 l4_tsc_to_ns()

```
l4_uint64_t l4_tsc_to_ns (
            l4_cpu_time_t tsc)  [inline]
```

Convert timestamp to ns value.

Parameters

tsc	time value in CPU ticks

Returns

time value in ns

Examples

examples/sys/aliens/main.c.

Definition at line 205 of file rdtsc.h.

13.16.5.2.12 l4_tsc_to_s_and_ns()

```
void l4_tsc_to_s_and_ns (
            l4_cpu_time_t tsc,
            l4_uint32_t * s,
            l4_uint32_t * ns)  [inline]
```

Convert timestamp to s.ns value.

Parameters

	tsc	time value in CPU ticks
out	*s*	seconds
out	*ns*	nano seconds

Definition at line 233 of file rdtsc.h.

13.16.5.2.13 l4_tsc_to_us()

```
l4_uint64_t l4_tsc_to_us (
            l4_cpu_time_t tsc)  [inline]
```

Convert timestamp into micro seconds value.

Parameters

tsc	time value in CPU ticks

Returns

time value in micro seconds

Definition at line 219 of file rdtsc.h.

13.16.6 Atomic Instructions

Collaboration diagram for Atomic Instructions:

Files

- file atomic.h

  atomic operations header and generic implementations

Functions

- int l4util_cmpxchg32 (volatile l4_uint32_t *dest, l4_uint32_t cmp_val, l4_uint32_t new_val)

  Atomic compare and exchange (32 bit version).
- int l4util_cmpxchg16 (volatile l4_uint16_t *dest, l4_uint16_t cmp_val, l4_uint16_t new_val)

  Atomic compare and exchange (16 bit version).
- int l4util_cmpxchg8 (volatile l4_uint8_t *dest, l4_uint8_t cmp_val, l4_uint8_t new_val)

  Atomic compare and exchange (8 bit version).
- int l4util_cmpxchg (volatile l4_umword_t *dest, l4_umword_t cmp_val, l4_umword_t new_val)

  Atomic compare and exchange (machine wide fields).
- l4_uint32_t l4util_xchg32 (volatile l4_uint32_t *dest, l4_uint32_t val)

  Atomic exchange (32 bit version).
- l4_uint16_t l4util_xchg16 (volatile l4_uint16_t *dest, l4_uint16_t val)

  Atomic exchange (16 bit version).
- l4_uint8_t l4util_xchg8 (volatile l4_uint8_t *dest, l4_uint8_t val)

  Atomic exchange (8 bit version).
- l4_umword_t l4util_xchg (volatile l4_umword_t *dest, l4_umword_t val)

  Atomic exchange (machine wide fields).
- void l4util_atomic_add (volatile long *dest, long val)

  Atomic add.
- void l4util_atomic_inc (volatile long *dest)

  Atomic increment.

Atomic add/sub/and/or (8,16,32 bit version) without result

- void l4util_add8 (volatile l4_uint8_t *dest, l4_uint8_t val)
- void l4util_add16 (volatile l4_uint16_t *dest, l4_uint16_t val)
- void l4util_add32 (volatile l4_uint32_t *dest, l4_uint32_t val)
- void l4util_sub8 (volatile l4_uint8_t *dest, l4_uint8_t val)
- void l4util_sub16 (volatile l4_uint16_t *dest, l4_uint16_t val)
- void l4util_sub32 (volatile l4_uint32_t *dest, l4_uint32_t val)

- void l4util_and8 (volatile l4_uint8_t *dest, l4_uint8_t val)
- void l4util_and16 (volatile l4_uint16_t *dest, l4_uint16_t val)
- void l4util_and32 (volatile l4_uint32_t *dest, l4_uint32_t val)
- void l4util_or8 (volatile l4_uint8_t *dest, l4_uint8_t val)
- void l4util_or16 (volatile l4_uint16_t *dest, l4_uint16_t val)
- void l4util_or32 (volatile l4_uint32_t *dest, l4_uint32_t val)

Atomic add/sub/and/or operations (8,16,32 bit) with result

- l4_uint8_t l4util_add8_res (volatile l4_uint8_t *dest, l4_uint8_t val)
- l4_uint16_t l4util_add16_res (volatile l4_uint16_t *dest, l4_uint16_t val)
- l4_uint32_t l4util_add32_res (volatile l4_uint32_t *dest, l4_uint32_t val)
- l4_uint8_t l4util_sub8_res (volatile l4_uint8_t *dest, l4_uint8_t val)
- l4_uint16_t l4util_sub16_res (volatile l4_uint16_t *dest, l4_uint16_t val)
- l4_uint32_t l4util_sub32_res (volatile l4_uint32_t *dest, l4_uint32_t val)
- l4_uint8_t l4util_and8_res (volatile l4_uint8_t *dest, l4_uint8_t val)
- l4_uint16_t l4util_and16_res (volatile l4_uint16_t *dest, l4_uint16_t val)
- l4_uint32_t l4util_and32_res (volatile l4_uint32_t *dest, l4_uint32_t val)
- l4_uint8_t l4util_or8_res (volatile l4_uint8_t *dest, l4_uint8_t val)
- l4_uint16_t l4util_or16_res (volatile l4_uint16_t *dest, l4_uint16_t val)
- l4_uint32_t l4util_or32_res (volatile l4_uint32_t *dest, l4_uint32_t val)

Atomic inc/dec (8,16,32 bit) without result

- void l4util_inc8 (volatile l4_uint8_t *dest)
- void l4util_inc16 (volatile l4_uint16_t *dest)
- void l4util_inc32 (volatile l4_uint32_t *dest)
- void l4util_dec8 (volatile l4_uint8_t *dest)
- void l4util_dec16 (volatile l4_uint16_t *dest)
- void l4util_dec32 (volatile l4_uint32_t *dest)

Atomic inc/dec (8,16,32 bit) with result

- l4_uint8_t l4util_inc8_res (volatile l4_uint8_t *dest)
- l4_uint16_t l4util_inc16_res (volatile l4_uint16_t *dest)
- l4_uint32_t l4util_inc32_res (volatile l4_uint32_t *dest)
- l4_uint8_t l4util_dec8_res (volatile l4_uint8_t *dest)
- l4_uint16_t l4util_dec16_res (volatile l4_uint16_t *dest)
- l4_uint32_t l4util_dec32_res (volatile l4_uint32_t *dest)

13.16.6.1 Detailed Description

13.16.6.2 Function Documentation

13.16.6.2.1 l4util_add16()

```
void l4util_add16 (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 472 of file atomic.h.

13.16.6.2.2 l4util_add16_res()

```
l4_uint16_t l4util_add16_res (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 524 of file atomic.h.

13.16.6.2.3 l4util_add32()

```
void l4util_add32 (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 476 of file atomic.h.

13.16.6.2.4 l4util_add32_res()

```
l4_uint32_t l4util_add32_res (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 528 of file atomic.h.

13.16.6.2.5 l4util_add8()

```
void l4util_add8 (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 468 of file atomic.h.

13.16.6.2.6 l4util_add8_res()

```
l4_uint8_t l4util_add8_res (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 520 of file atomic.h.

13.16.6.2.7 l4util_and16()

```
void l4util_and16 (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 500 of file atomic.h.

13.16.6.2.8 l4util_and16_res()

```
l4_uint16_t l4util_and16_res (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 548 of file atomic.h.

13.16.6.2.9 l4util_and32()

```
void l4util_and32 (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 504 of file atomic.h.

13.16.6.2.10 l4util_and32_res()

```
l4_uint32_t l4util_and32_res (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 552 of file atomic.h.

13.16.6.2.11 l4util_and8()

```
void l4util_and8 (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 496 of file atomic.h.

13.16.6.2.12 l4util_and8_res()

```
l4_uint8_t l4util_and8_res (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 544 of file atomic.h.

13.16.6.2.13 l4util_atomic_add()

```
void l4util_atomic_add (
             volatile long * dest,
             long val)  [inline]
```

Atomic add.

Parameters

dest	destination operand
val	value to add

Definition at line 480 of file atomic.h.

13.16.6.2.14 l4util_atomic_inc()

```
void l4util_atomic_inc (
             volatile long * dest)  [inline]
```

Atomic increment.

Parameters

dest	destination operand

Definition at line 423 of file atomic.h.

13.16.6.2.15 l4util_cmpxchg()

```
int l4util_cmpxchg (
             volatile l4_umword_t * dest,
             l4_umword_t cmp_val,
             l4_umword_t new_val)  [inline]
```

Atomic compare and exchange (machine wide fields).

Parameters

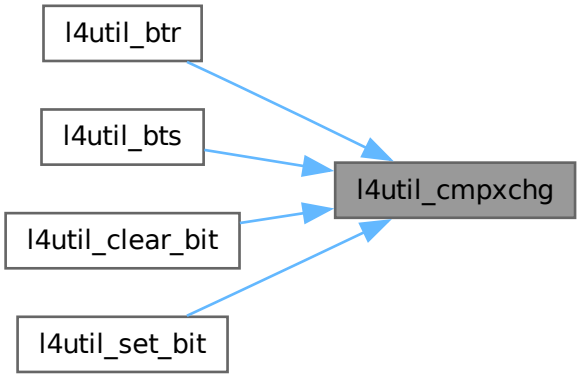
dest	destination operand
cmp_val	compare value
new_val	new value for dest

Returns

0 if comparison failed, 1 otherwise

Compare the value in *dest* with *cmp_val*, if equal set *dest* to *new_val*
Definition at line 379 of file atomic.h.
Referenced by l4util_btr(), l4util_bts(), l4util_clear_bit(), and l4util_set_bit().

Here is the caller graph for this function:



13.16.6.2.16 l4util_cmpxchg16()

```
int l4util_cmpxchg16 (
             volatile l4_uint16_t * dest,
             l4_uint16_t cmp_val,
             l4_uint16_t new_val)  [inline]
```

Atomic compare and exchange (16 bit version).

Parameters

dest	destination operand
cmp_val	compare value
new_val	new value for dest

Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp_val*, if equal set *dest* to *new_val*
Definition at line 363 of file atomic.h.

13.16.6.2.17 l4util_cmpxchg32()

```
L4_END_DECLS int l4util_cmpxchg32 (
             volatile l4_uint32_t * dest,
             l4_uint32_t cmp_val,
             l4_uint32_t new_val)  [inline]
```

Atomic compare and exchange (32 bit version).

Parameters

dest	destination operand

cmp_val	compare value
new_val	new value for dest

Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp_val*, if equal set *dest* to *new_val*
Definition at line 355 of file atomic.h.

13.16.6.2.18 l4util_cmpxchg8()

```
int l4util_cmpxchg8 (
             volatile l4_uint8_t * dest,
             l4_uint8_t cmp_val,
             l4_uint8_t new_val)  [inline]
```

Atomic compare and exchange (8 bit version).

Parameters

dest	destination operand
cmp_val	compare value
new_val	new value for dest

Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp_val*, if equal set *dest* to *new_val*
Definition at line 371 of file atomic.h.

13.16.6.2.19 l4util_dec16()

```
void l4util_dec16 (
             volatile l4_uint16_t * dest)  [inline]
```

Parameters

dest	destination operand

Definition at line 431 of file atomic.h.

13.16.6.2.20 l4util_dec16_res()

```
l4_uint16_t l4util_dec16_res (
             volatile l4_uint16_t * dest)  [inline]
```

Parameters

dest	destination operand

Returns

res

Definition at line 456 of file atomic.h.

13.16.6.2.21 l4util_dec32()

```
void l4util_dec32 (
            volatile l4_uint32_t * dest)  [inline]
```

Parameters

dest	destination operand

Definition at line 435 of file atomic.h.

13.16.6.2.22 l4util_dec32_res()

```
l4_uint32_t l4util_dec32_res (
            volatile l4_uint32_t * dest)  [inline]
```

Parameters

dest	destination operand

Returns

res

Definition at line 460 of file atomic.h.

13.16.6.2.23 l4util_dec8()

```
void l4util_dec8 (
            volatile l4_uint8_t * dest)  [inline]
```

Parameters

dest	destination operand

Definition at line 427 of file atomic.h.

13.16.6.2.24 l4util_dec8_res()

```
l4_uint8_t l4util_dec8_res (
            volatile l4_uint8_t * dest)  [inline]
```

Parameters

dest	destination operand

Returns

res

Definition at line 452 of file atomic.h.

13.16.6.2.25 l4util_inc16()

```
void l4util_inc16 (
            volatile l4_uint16_t * dest)  [inline]
```

Parameters

dest	destination operand

Definition at line 415 of file atomic.h.

13.16.6.2.26 l4util_inc16_res()

```
l4_uint16_t l4util_inc16_res (
             volatile l4_uint16_t * dest)  [inline]
```

Parameters

dest	destination operand

Returns

res

Definition at line 444 of file atomic.h.

13.16.6.2.27 l4util_inc32()

```
void l4util_inc32 (
             volatile l4_uint32_t * dest)  [inline]
```

Parameters

dest	destination operand

Definition at line 419 of file atomic.h.

13.16.6.2.28 l4util_inc32_res()

```
l4_uint32_t l4util_inc32_res (
             volatile l4_uint32_t * dest)  [inline]
```

Parameters

dest	destination operand

Returns

res

Definition at line 448 of file atomic.h.

13.16.6.2.29 l4util_inc8()

```
void l4util_inc8 (
             volatile l4_uint8_t * dest)  [inline]
```

Parameters

dest	destination operand

Definition at line 411 of file atomic.h.

13.16.6.2.30 l4util_inc8_res()

```
l4_uint8_t l4util_inc8_res (
            volatile l4_uint8_t * dest)  [inline]
```

Parameters

dest	destination operand

Returns

res

Definition at line 440 of file atomic.h.

13.16.6.2.31 l4util_or16()

```
void l4util_or16 (
            volatile l4_uint16_t * dest,
            l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 512 of file atomic.h.

13.16.6.2.32 l4util_or16_res()

```
l4_uint16_t l4util_or16_res (
            volatile l4_uint16_t * dest,
            l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 560 of file atomic.h.

13.16.6.2.33 l4util_or32()

```
void l4util_or32 (
            volatile l4_uint32_t * dest,
            l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 516 of file atomic.h.

13.16.6.2.34 l4util_or32_res()

```
l4_uint32_t l4util_or32_res (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 564 of file atomic.h.

13.16.6.2.35 l4util_or8()

```
void l4util_or8 (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 508 of file atomic.h.

13.16.6.2.36 l4util_or8_res()

```
l4_uint8_t l4util_or8_res (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 556 of file atomic.h.

13.16.6.2.37 l4util_sub16()

```
void l4util_sub16 (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 488 of file atomic.h.

13.16.6.2.38 l4util_sub16_res()

```
l4_uint16_t l4util_sub16_res (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 536 of file atomic.h.

13.16.6.2.39 l4util_sub32()

```
void l4util_sub32 (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 492 of file atomic.h.

13.16.6.2.40 l4util_sub32_res()

```
l4_uint32_t l4util_sub32_res (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 540 of file atomic.h.

13.16.6.2.41 l4util_sub8()

```
void l4util_sub8 (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Definition at line 484 of file atomic.h.

13.16.6.2.42 l4util_sub8_res()

```
l4_uint8_t l4util_sub8_res (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Parameters

dest	destination operand
val	value to add/sub/and/or

Returns

res

Definition at line 532 of file atomic.h.

13.16.6.2.43 l4util_xchg()

```
l4_umword_t l4util_xchg (
             volatile l4_umword_t * dest,
             l4_umword_t val)  [inline]
```

Atomic exchange (machine wide fields).

Parameters

dest	destination operand
val	new value for dest

Returns

old value at destination

Definition at line 405 of file atomic.h.

13.16.6.2.44 l4util_xchg16()

```
l4_uint16_t l4util_xchg16 (
             volatile l4_uint16_t * dest,
             l4_uint16_t val)  [inline]
```

Atomic exchange (16 bit version).

Parameters

dest	destination operand
val	new value for dest

Returns

old value at destination

Definition at line 393 of file atomic.h.

13.16.6.2.45 l4util_xchg32()

```
l4_uint32_t l4util_xchg32 (
             volatile l4_uint32_t * dest,
             l4_uint32_t val)  [inline]
```

Atomic exchange (32 bit version).

Parameters

dest	destination operand
val	new value for dest

Returns

old value at destination

Definition at line 387 of file atomic.h.

13.16.6.2.46 l4util_xchg8()

```
l4_uint8_t l4util_xchg8 (
             volatile l4_uint8_t * dest,
             l4_uint8_t val)  [inline]
```

Atomic exchange (8 bit version).

Parameters

dest	destination operand
val	new value for dest

Returns

old value at destination

Definition at line 399 of file atomic.h.

13.16.7 Internal functions

Collaboration diagram for Internal functions:

Functions

- void base64_encode (char const *in_data, size_t in_size, char **out_data, size_t *out_size)
- void base64_decode (char const *in_data, size_t in_size, char **out_data, size_t *out_size)

13.16.7.1 Detailed Description

13.16.7.2 Function Documentation

13.16.7.2.1 base64_decode()

```
void base64_decode (
            char const * in_data,
            size_t in_size,
            char ** out_data,
            size_t * out_size)
```

decode base-64-encoded string *in_data*.
References L4_CV, and L4_END_DECLS.

13.16.7.2.2 base64_encode()

```
void base64_encode (
            char const * in_data,
            size_t in_size,
            char ** out_data,
            size_t * out_size)
```

base-64-encode string *in_data*.
References L4_CV.

13.16.8 Bit Manipulation

Collaboration diagram for Bit Manipulation:

Files

- file bitops_arch.h

  amd64 bit manipulation functions
- file bitops.h

  bit manipulation functions
- file bitops_arch.h

  x86 bit manipulation functions

Functions

- void l4util_set_bit (int b, volatile l4_umword_t *dest)

  Set bit in memory.
- void l4util_clear_bit (int b, volatile l4_umword_t *dest)

  Clear bit in memory.
- void l4util_complement_bit (int b, volatile l4_umword_t *dest)

  Complement bit in memory.
- int l4util_test_bit (int b, const volatile l4_umword_t *dest)

  Test bit (return value of bit).
- int l4util_bts (int b, volatile l4_umword_t *dest)

  Bit test and set.
- int l4util_btr (int b, volatile l4_umword_t *dest)

  Bit test and reset.
- int l4util_btc (int b, volatile l4_umword_t *dest)

  Bit test and complement.
- int l4util_bsr (l4_umword_t word)

  Bit scan reverse.
- int l4util_bsf (l4_umword_t word)

  Bit scan forward.
- int l4util_find_first_set_bit (const void *dest, l4_size_t size)

  Find the first set bit in a memory region.
- int l4util_find_first_zero_bit (const void *dest, l4_size_t size)

  Find the first zero bit in a memory region.
- unsigned long l4util_next_power2 (unsigned long val)

  Find the next power of 2 for a given number.

13.16.8.1 Detailed Description

13.16.8.2 Function Documentation

13.16.8.2.1 l4util_bsf()

```
int l4util_bsf (
            l4_umword_t word)  [inline]
```

Bit scan forward.

Parameters

word	value (machine size)

Returns

index of least significant bit set in word, -1 if no bit is set (word == 0)

"bit scan forward", find least significant bit set in word.
Definition at line 316 of file bitops.h.

13.16.8.2.2 l4util_bsr()

```
int l4util_bsr (
            l4_umword_t word)  [inline]
```

Bit scan reverse.

Parameters

word	value (machine size)

Returns

index of most significant set bit in word, -1 if no bit is set (word == 0)

"bit scan reverse", find most significant set bit in word (-> LOG2(word))
Definition at line 299 of file bitops.h.

13.16.8.2.3 l4util_btc()

```
int l4util_btc (
            int b,
            volatile l4_umword_t * dest)  [inline]
```

Bit test and complement.

Parameters

b	bit position
dest	destination operand

Returns

Old value of bit *b*.

Complement bit *b* and return old value.
Definition at line 394 of file bitops.h.

13.16.8.2.4 l4util_btr()

```
int l4util_btr (
            int b,
            volatile l4_umword_t * dest)  [inline]
```

Bit test and reset.

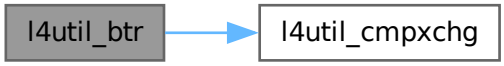
Parameters

b	bit position
dest	destination operand

Returns

Old value of bit *b*.

Reset bit *b* and return old value.
Definition at line 278 of file bitops.h.
References l4util_cmpxchg().
Here is the call graph for this function:



13.16.8.2.5 l4util_bts()

```
int l4util_bts (
            int b,
            volatile l4_umword_t * dest)  [inline]
```

Bit test and set.

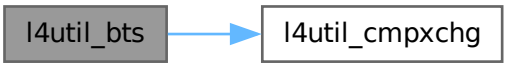
Parameters

b	bit position
dest	destination operand

Returns

Old value of bit *b*.

Set the *b* bit of *dest* to 1 and return the old value.
Definition at line 256 of file bitops.h.
References l4util_cmpxchg().
Here is the call graph for this function:



13.16.8.2.6 l4util_clear_bit()

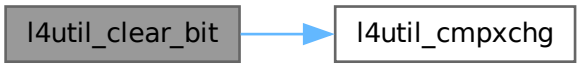
```
void l4util_clear_bit (
            int b,
            volatile l4_umword_t * dest)  [inline]
```

Clear bit in memory.

Parameters

b	bit position
dest	destination operand

Definition at line 226 of file bitops.h.
References l4util_cmpxchg().
Here is the call graph for this function:



13.16.8.2.7 l4util_complement_bit()

```
void l4util_complement_bit (
            int b,
            volatile l4_umword_t * dest)  [inline]
```

Complement bit in memory.

Parameters

b	bit position
dest	destination operand

Definition at line 359 of file bitops.h.

13.16.8.2.8 l4util_find_first_set_bit()

```
int l4util_find_first_set_bit (
            const void * dest,
            l4_size_t size)  [inline]
```

Find the first set bit in a memory region.

Parameters

dest	bit string
size	size of string in bits (must be a multiple of L4_MWORD_BITS!)

Returns

number of the first set bit, >= size if no bit is set

Definition at line 400 of file bitops.h.

13.16.8.2.9 l4util_find_first_zero_bit()

```
int l4util_find_first_zero_bit (
            const void * dest,
            l4_size_t size)  [inline]
```

Find the first zero bit in a memory region.

Parameters

dest	bit string
size	size of string in bits (must be a multiple of L4_MWORD_BITS!)

Returns

number of the first zero bit, >= size if no bit is set

Definition at line 333 of file bitops.h.

13.16.8.2.10 l4util_next_power2()

```
unsigned long l4util_next_power2 (
            unsigned long val)  [inline]
```

Find the next power of 2 for a given number.

Parameters

val	initial value

Returns

next-highest power of 2

Definition at line 373 of file bitops.h.

13.16.8.2.11 l4util_set_bit()

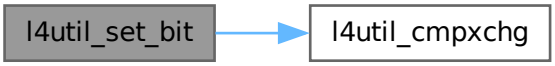
```
void l4util_set_bit (
             int b,
             volatile l4_umword_t * dest)  [inline]
```

Set bit in memory.

Parameters

b	bit position
dest	destination operand

Definition at line 207 of file bitops.h.
References l4util_cmpxchg().
Here is the call graph for this function:



13.16.8.2.12 l4util_test_bit()

```
int l4util_test_bit (
             int b,
             const volatile l4_umword_t * dest)  [inline]
```

Test bit (return value of bit).

Parameters

b	bit position
dest	destination operand

Returns

Value of bit *b*.

Definition at line 244 of file bitops.h.

13.16.9 ELF binary format

Functions and types related to ELF binaries.
Collaboration diagram for ELF binary format:

Files

- file elf.h

  ELF definition.

Data Structures

- struct Elf32_Ehdr

  ELF32 header.
- struct Elf64_Ehdr

  ELF64 header.
- struct Elf32_Shdr

  ELF32 section header.
- struct Elf64_Shdr

  ELF64 section header.
- struct Elf32_Phdr

  ELF32 program header.
- struct Elf64_Phdr

  ELF64 program header.
- struct Elf32_Dyn

  ELF32 dynamic entry.
- struct Elf64_Dyn

  ELF64 dynamic entry.
- struct Elf32_Rel

  ELF32 relocation entry w/o addend.
- struct Elf32_Rela

  ELF32 relocation entry w/ addend.
- struct Elf64_Rel

  ELF64 relocation entry w/o addend.
- struct Elf64_Rela

  ELF64 relocation entry w/ addend.
- struct Elf32_Sym

  ELF32 symbol table entry.
- struct Elf64_Sym

ELF64 symbol table entry.

- struct Elf32_Auxv

  Auxiliary vector (32-bit).

- struct Elf64_Auxv

  Auxiliary vector (64-bit).

Macros

- #define **ElfW**(type)

  Use 64 or 32 bits types depending on the target architecture.

- #define **ELF32_R_SYM**(i)

  Symbol table index.

- #define ELF32_R_TYPE(i)
- #define **ELF32_R_INFO**(s, t)

  Create info from symbol table index + type.

- #define **ELF64_R_SYM**(i)

  Symbol table index.

- #define ELF64_R_TYPE(i)
- #define **ELF64_R_INFO**(s, t)

  Create info from symbol table index + type.

- #define ELF32_ST_BIND(i)
- #define ELF32_ST_TYPE(i)
- #define **ELF32_ST_INFO**(b, t)

  Make info from bind + type.

- #define ELF64_ST_BIND(i)
- #define ELF64_ST_TYPE(i)
- #define **ELF64_ST_INFO**(b, t)

  Make info from bind + type.

Typedefs

- typedef struct Elf32_Auxv **Elf32_Auxv**

  Auxiliary vector (32-bit).

- typedef struct Elf64_Auxv **Elf64_Auxv**

  Auxiliary vector (64-bit).

Enumerations

- enum { EI_NIDENT = 16 }
- enum Elf_ETs {

13.16.9.1 Detailed Description

Functions and types related to ELF binaries.

13.16.9.2 Macro Definition Documentation

13.16.9.2.1 ELF32_R_TYPE

```
#define ELF32_R_TYPE(
              i)
```

Value:

```
((unsigned char)(i))
```

See also

Elf_R_386s.

Definition at line 663 of file elf.h.

13.16.9.2.2 ELF32_ST_BIND

```
#define ELF32_ST_BIND(
              i)
```

Value:

```
((i)»4)
```

See also

Elf_STBs.

Definition at line 893 of file elf.h.

13.16.9.2.3 ELF32_ST_TYPE

```
#define ELF32_ST_TYPE(
              i)
```

Value:

```
((i)&0xf)
```

See also

Elf_STTs.

Definition at line 896 of file elf.h.

13.16.9.2.4 ELF64_R_TYPE

```
#define ELF64_R_TYPE(
              i)
```

Value:

```
((i)&0xffffffffL)
```

See also

Elf_R_386s.

Definition at line 671 of file elf.h.

13.16.9.2.5 ELF64_ST_BIND

```
#define ELF64_ST_BIND(
              i)
```

Value:

```
((i)»4)
```

See also

Elf_STBs

Definition at line 902 of file elf.h.

13.16.9.2.6 ELF64_ST_TYPE

```
#define ELF64_ST_TYPE(
              i)
```

Value:

```
((i)&0xf)
```

See also

Elf_STTs

Definition at line 905 of file elf.h.

13.16.9.3 Enumeration Type Documentation

13.16.9.3.1 anonymous enum

```
anonymous enum
```

Enumerator

EI_NIDENT	Number of characters.

Definition at line 117 of file elf.h.

13.16.9.3.2 Elf_ARM_SBs

```
enum Elf_ARM_SBs
```

ARM-specific program header flags.

Enumerator

PF_ARM_SB	Segment contains the location addressed by the static base.

Definition at line 770 of file elf.h.

13.16.9.3.3 Elf_ATs

```
enum Elf_ATs
```

Legal values for Elf32_Auxv.atype / Elf64_Auxv.atype.

Enumerator

AT_NULL	End of vector.
AT_IGNORE	Entry should be ignored.
AT_EXECFD	File descriptor of program.
AT_PHDR	Program headers for program.
AT_PHENT	Size of program header entry.
AT_PHNUM	Number of program headers.
AT_PAGESZ	System page size.
AT_BASE	Base address of interpreter.
AT_FLAGS	Flags.
AT_ENTRY	Entry point of program.
AT_NOTELF	Program is not ELF.
AT_UID	Real UID.
AT_EUID	Effective UID.
AT_GID	Real GID.
AT_EGID	Effective GID.
AT_L4_AUX	L4Re AUX section.
AT_L4_ENV	L4Re ENV section.
AT_L4_KIP	L4Re KIP section.

Definition at line 939 of file elf.h.

13.16.9.3.4 Elf_ClASSs

enum Elf_ClASSs
File class or capacity.

Enumerator

ELFCLASSNONE	Invalid class.
ELFCLASS32	32-bit object
ELFCLASS64	64-bit object
ELFCLASSNUM	Mask for 32-bit or 64-bit class.

Definition at line 298 of file elf.h.

13.16.9.3.5 Elf_DATAs

enum Elf_DATAs
Data encoding.

Enumerator

ELFDATANONE	invalid data encoding
ELFDATA2LSB	0x01020304 => [0x04|0x03|0x02|0x01]
ELFDATA2MSB	0x01020304 => [0x01|0x02|0x03|0x04]
ELFDATANUM	Mask for valid data encoding.

Definition at line 307 of file elf.h.

13.16.9.3.6 Elf_DF_1s

enum Elf_DF_1s
State flags selectable in the Elf32_Dyn.d_un.d_val / Elf64_Dyn.d_un.d_val element of the DT_FLAGS_1 entry in the dynamic section.

Enumerator

DF_1_NOW	Set RTLD_NOW for this object.
DF_1_GLOBAL	Set RTLD_GLOBAL for this object.
DF_1_GROUP	Set RTLD_GROUP for this object.
DF_1_NODELETE	Set RTLD_NODELETE for this object.
DF_1_LOADFLTR	Trigger filtee loading at runtime.
DF_1_INITFIRST	Set RTLD_INITFIRST for this object.
DF_1_NOOPEN	Set RTLD_NOOPEN for this object.
DF_1_ORIGIN	$ORIGIN must be handled.
DF_1_DIRECT	Direct binding enabled.
DF_1_INTERPOSE	Object is used to interpose.
DF_1_NODEFLIB	Ignore default lib search path.
DF_1_NODUMP	Object can't be dldump'ed.
DF_1_CONFALT	Configuration alternative created.

DF_1_ENDFILTEE	Filtee terminates filters search.
DF_1_DISPRELDNE	Disp reloc applied at build time.
DF_1_DISPRELPND	Disp reloc applied at run-time.

Definition at line 594 of file elf.h.

13.16.9.3.7 Elf_DF_P1s

`enum Elf_DF_P1s`
Flags in the DT_POSFLAG_1 entry effecting only the next DT_∗ entry.

Enumerator

DF_P1_LAZYLOAD	Lazyload following object.
DF_P1_GROUPPERM	Symbols from next object are not generally available.

Definition at line 623 of file elf.h.

13.16.9.3.8 Elf_DFs

`enum Elf_DFs`
Values of Elf32_Dyn.d_un.d_val, Elf64_Dyn.d_un.d_val in the DT_FLAGS entry.

Enumerator

DF_ORIGIN	Object may use DF_ORIGIN.
DF_SYMBOLIC	Symbol resolutions starts here.
DF_TEXTREL	Object contains text relocations.
DF_BIND_NOW	No lazy binding for this object.
DF_STATIC_TLS	Module uses the static TLS model.

Definition at line 581 of file elf.h.

13.16.9.3.9 Elf_DTs

`enum Elf_DTs`
Dynamic Array Tags.

See also

Elf32_Dyn.d_tag, Elf64_Dyn.d_tag.

Enumerator

DT_NULL	end of _DYNAMIC array
DT_NEEDED	name of a needed library
DT_PLTRELSZ	total size of relocation entry
DT_PLTGOT	address assoc with prog link table
DT_HASH	address of symbol hash table
DT_STRTAB	address of string table
DT_SYMTAB	address of symbol table

DT_RELA	address of relocation table
DT_RELASZ	total size of relocation table
DT_RELAENT	size of DT_RELA relocation entry
DT_STRSZ	size of the string table
DT_SYMENT	size of a symbol table entry
DT_INIT	address of initialization function
DT_FINI	address of termination function
DT_SONAME	name of the shared object
DT_RPATH	search library path
DT_SYMBOLIC	alter symbol resolution algorithm
DT_REL	address of relocation table
DT_RELSZ	total size of DT_REL relocation table
DT_RELENT	size of the DT_REL relocation entry
DT_PTRREL	type of relocation entry
DT_DEBUG	for debugging purposes
DT_TEXTREL	at least on entry changes r/o section
DT_JMPREL	address of relocation entries
DT_BIND_NOW	Process relocations of object.
DT_INIT_ARRAY	Array with addresses of init fct.
DT_FINI_ARRAY	Array with addresses of fini fct.
DT_INIT_ARRAYSZ	Size in bytes of DT_INIT_ARRAY.
DT_FINI_ARRAYSZ	Size in bytes of DT_FINI_ARRAY.
DT_RUNPATH	Library search path.
DT_FLAGS	Flags for the object being loaded.
DT_ENCODING	Start of encoded range.
DT_PREINIT_ARRAY	Array with addresses of preinit fct.
DT_PREINIT_ARRAYSZ	size in bytes of DT_PREINIT_ARRAY
DT_NUM	Number used.
DT_LOOS	Start of OS-specific.
DT_HIOS	End of OS-specific.
DT_LOPROC	processor-specific
DT_HIPROC	processor-specific

Definition at line 535 of file elf.h.

13.16.9.3.10 Elf_EF_ARM_s

`enum Elf_EF_ARM_s`

ARM specific declarations.
Processor specific flags for the ELF header e_flags field.

Enumerator

EF_ARM_ALIGN8	8-bit structure alignment is in use

Definition at line 730 of file elf.h.

13.16.9.3.11 Elf_EIs

enum Elf_EIs
Identification Indices.

See also

Elf32_Ehdr.e_ident, Elf64_Ehdr.e_ident

Enumerator

EI_MAG0	file id 0
EI_MAG1	file id 1
EI_MAG2	file id 2
EI_MAG3	file id 3
EI_CLASS	file class
EI_DATA	data encoding
EI_VERSION	file version
EI_OSABI	Operating system / ABI identification.
EI_ABIVERSION	ABI version.
EI_PAD	start of padding bytes

Definition at line 274 of file elf.h.

13.16.9.3.12 Elf_EMs

enum Elf_EMs
Required architecture.

See also

Elf32_Ehdr.e_machine, Elf64_Ehdr.e_machine

Enumerator

EM_NONE	no machine
EM_M32	AT&T WE 32100.
EM_SPARC	SPARC.
EM_386	Intel 80386.
EM_68K	Motorola 68000.
EM_88K	Motorola 88000.
EM_860	Intel 80860.

`enum Elf_MAGs`
Magic number.

Enumerator

ELFMAG0	e_ident[EI_MAG0]
ELFMAG1	e_ident[EI_MAG1]
ELFMAG2	e_ident[EI_MAG2]
ELFMAG3	e_ident[EI_MAG3]

Definition at line 289 of file elf.h.

13.16.9.3.16 Elf_NTs_core

`enum Elf_NTs_core`
Legal values for note segment descriptor types for core files.

Enumerator

NT_PRSTATUS	Contains copy of prstatus struct.
NT_FPREGSET	Contains copy of fpregset struct.
NT_PRPSINFO	Contains copy of prpsinfo struct.
NT_PRXREG	Contains copy of prxregset struct.
NT_TASKSTRUCT	Contains copy of task structure.
NT_PLATFORM	String from sysinfo(SI_PLATFORM).
NT_AUXV	Contains copy of auxv array.
NT_GWINDOWS	Contains copy of gwindows struct.
NT_ASRS	Contains copy of asrset struct.
NT_PSTATUS	Contains copy of pstatus struct.
NT_PSINFO	Contains copy of psinfo struct.
NT_PRCRED	Contains copy of prcred struct.
NT_UTSNAME	Contains copy of utsname struct.
NT_LWPSTATUS	Contains copy of lwpstatus struct.
NT_LWPSINFO	Contains copy of lwpinfo struct.
NT_PRFPXREG	Contains copy of fprxregset struct.

Definition at line 486 of file elf.h.

13.16.9.3.17 Elf_NTs_obj

`enum Elf_NTs_obj`
Legal values for the note segment descriptor types for object files.

Enumerator

NT_VERSION	Contains a version string.

Definition at line 507 of file elf.h.

13.16.9.3.18 Elf_OSABIs

`enum Elf_OSABIs`
Identify operating system and ABI to which the object is targeted.

Enumerator

ELFOSABI_NONE	UNIX System V ABI.
ELFOSABI_SYSV	Alias.
ELFOSABI_HPUX	HP-UX.
ELFOSABI_NETBSD	NetBSD.
ELFOSABI_LINUX	Linux.
ELFOSABI_SOLARIS	Sun Solaris.
ELFOSABI_AIX	IBM AIX.
ELFOSABI_IRIX	SGI Irix.
ELFOSABI_FREEBSD	FreeBSD.
ELFOSABI_TRU64	Compaq TRU64 UNIX.
ELFOSABI_MODESTO	Novell Modesto.

ELFOSABI_ARM	ARM.
ELFOSABI_STANDALONE	Standalone (embedded) application.

Definition at line 316 of file elf.h.

13.16.9.3.19 ELF_PFs

`enum ELF_PFs`
Segment permissions.

Enumerator

PF_X	Executable.
PF_W	Write.
PF_R	Read.
PF_MASKOS	OS-specific.
PF_MASKPROC	Processor-specific.

Definition at line 476 of file elf.h.

13.16.9.3.20 Elf_PTs

`enum Elf_PTs`

Segment types.

Enumerator

PT_NULL	array is unused
PT_LOAD	loadable
PT_DYNAMIC	dynamic linking information
PT_INTERP	path to interpreter
PT_NOTE	auxiliary information
PT_SHLIB	reserved
PT_PHDR	location of the pht itself
PT_TLS	Thread-local storage segment.
PT_NUM	Number of defined types.
PT_LOOS	OS-specific.
PT_HIOS	OS-specific.
PT_LOPROC	processor-specific
PT_HIPROC	processor-specific
PT_GNU_EH_FRAME	EH frame information.
PT_GNU_STACK	Flags for stack.
PT_GNU_RELRO	Read only after reloc.
PT_L4_STACK	Address of the stack.
PT_L4_AUX	Address of the AUX structures.

Definition at line 451 of file elf.h.

13.16.9.3.21 Elf_R_386_s

`enum Elf_R_386_s`

Relocation types (processor specific).

Enumerator

R_386_NONE	none
R_386_32	S + A.
R_386_PC32	S + A - P.
R_386_GOT32	G + A - P.
R_386_PLT32	L + A - P.
R_386_COPY	none
R_386_GLOB_DAT	S.
R_386_JMP_SLOT	S.
R_386_RELATIVE	B + A.
R_386_GOTOFF	S + A - GOT.
R_386_GOTPC	GOT + A - P.
R_386_TLS_TPOFF	Offset in static TLS block.
R_386_TLS_IE	Address of GOT entry for static TLS block offset.
R_386_TLS_GOTIE	GOT entry for static TLS block offset.

R_386_TLS_LE	Offset relative to static TLS block.
R_386_TLS_GD	Direct 32 bit for GNU version of general dynamic thread local data.
R_386_TLS_LDM	Direct 32 bit for GNU version of local dynamic thread local data in LE code.
R_386_TLS_GD_32	Direct 32 bit for general dynamic thread local data.
R_386_TLS_GD_PUSH	Tag for pushl in GD TLS code.
R_386_TLS_GD_CALL	Relocation for call to __tls_get_addr().
R_386_TLS_GD_POP	Tag for popl in GD TLS code.
R_386_TLS_LDM_32	Direct 32 bit for local dynamic thread local data in LE code.
R_386_TLS_LDM_PUSH	Tag for pushl in LDM TLS code.
R_386_TLS_LDM_CALL	Relocation for call to __tls_get_addr() in LDM code.
R_386_TLS_LDM_POP	Tag for popl in LDM TLS code.
R_386_TLS_LDO_32	Offset relative to TLS block.
R_386_TLS_IE_32	GOT entry for negated static TLS block offset.
R_386_TLS_LE_32	Negated offset relative to static TLS block.
R_386_TLS_DTPMOD32	ID of module containing symbol.
R_386_TLS_DTPOFF32	Offset in TLS block.
R_386_TLS_TPOFF32	Negated offset in static TLS block.
R_386_NUM	Keep this the last entry.

Definition at line 677 of file elf.h.

13.16.9.3.22 Elf_R_AARCH64_s

`enum Elf_R_AARCH64_s`
AARCH64 relocations.

Enumerator

R_AARCH64_NONE	No reloc.

Definition at line 825 of file elf.h.

13.16.9.3.23 Elf_R_ARM_s

`enum Elf_R_ARM_s`
ARM relocations.

Enumerator

R_ARM_NONE	No reloc.
R_ARM_PC24	PC relative 26 bit branch.
R_ARM_ABS32	Direct 32 bit.
R_ARM_REL32	PC relative 32 bit.
R_ARM_ABS16	Direct 16 bit.
R_ARM_ABS12	Direct 12 bit.
R_ARM_ABS8	Direct 8 bit.
R_ARM_COPY	Copy symbol at runtime.

R_ARM_GLOB_DAT	Create GOT entry.
R_ARM_JUMP_SLOT	Create PLT entry.
R_ARM_RELATIVE	Adjust by program base.
R_ARM_GOTOFF	32 bit offset to GOT
R_ARM_GOTPC	32 bit PC relative offset to GOT
R_ARM_GOT32	32 bit GOT entry
R_ARM_PLT32	32 bit PLT address
R_ARM_THM_PC11	thumb unconditional branch
R_ARM_THM_PC9	thumb conditional branch
R_ARM_NUM	Keep this the last entry.

Definition at line 777 of file elf.h.

13.16.9.3.24 Elf_R_X86_64_s

`enum Elf_R_X86_64_s`
AMD x86-64 relocations.

Enumerator

R_X86_64_NONE	No reloc.
R_X86_64_64	Direct 64 bit.
R_X86_64_PC32	PC relative 32 bit signed.
R_X86_64_GOT32	32 bit GOT entry
R_X86_64_PLT32	32 bit PLT address
R_X86_64_COPY	Copy symbol at runtime.
R_X86_64_GLOB_DAT	Create GOT entry.
R_X86_64_JUMP_SLOT	Create PLT entry.
R_X86_64_RELATIVE	Adjust by program base.
R_X86_64_GOTPCREL	32 bit signed PC relative offset to GOT
R_X86_64_32	Direct 32 bit zero extended.
R_X86_64_32S	Direct 32 bit sign extended.
R_X86_64_16	Direct 16 bit zero extended.
R_X86_64_PC16	16 bit sign extended pc relative
R_X86_64_8	Direct 8 bit sign extended.
R_X86_64_PC8	8 bit sign extended pc relative
R_X86_64_DTPMOD64	ID of module containing symbol.
R_X86_64_DTPOFF64	Offset in module's TLS block.
R_X86_64_TPOFF64	Offset in initial TLS block.
R_X86_64_TLSGD	32 bit signed PC relative offset to two GOT entries for GD symbol
R_X86_64_TLSLD	32 bit signed PC relative offset to two GOT entries for LD symbol
R_X86_64_DTPOFF32	Offset in TLS block.
R_X86_64_GOTTPOFF	32 bit signed PC relative offset to GOT entry for IE symbol
R_X86_64_TPOFF32	Offset in initial TLS block.

Definition at line 832 of file elf.h.

13.16.9.3.25 Elf_SHF_s_ARM

`enum Elf_SHF_s_ARM`
ARM-specific values for Elf32_Shdr.sh_flags / Elf64_Shdr.sh_flags.

Enumerator

SHF_ARM_ENTRYSECT	Section contains an entry point.
SHF_ARM_COMDEF	Section may be multiply defined in the input to a link step.

Definition at line 762 of file elf.h.

13.16.9.3.26 Elf_SHFs

`enum Elf_SHFs`
Section attribute flags.

Enumerator

SHF_WRITE	writeable during execution
SHF_ALLOC	section occupies virt memory
SHF_EXECINSTR	code section
SHF_MERGE	Might be merged.
SHF_STRINGS	Contains nul-terminated strings.
SHF_INFO_LINK	'sh_info' contains SHT index
SHF_LINK_ORDER	Preserve order after combining.
SHF_OS_NONCONFORMING	Non-standard OS-specific handling required.
SHF_GROUP	Section is member of a group.
SHF_TLS	Section hold thread-local data.
SHF_MASKOS	OS-specific.
SHF_MASKPROC	processor-specific mask

Definition at line 406 of file elf.h.

13.16.9.3.27 Elf_SHNs

`enum Elf_SHNs`
Special section indexes.

Enumerator

SHN_UNDEF	undefined section header entry
SHN_LORESERVE	lower bound of reserved indexes
SHN_LOPROC	lower bound of proc spec entr
SHN_HIPROC	upper bound of proc spec entr
SHN_ABS	absolute values for ref
SHN_COMMON	common symbols
SHN_HIRESERVE	upper bound of reserved indexes

Definition at line 335 of file elf.h.

13.16.9.3.28 Elf_SHTs

enum Elf_SHTs
Section type.

Enumerator

SHT_NULL	inactive section header
SHT_PROGBITS	information defined by program
SHT_SYMTAB	symbol table
SHT_STRTAB	string table
SHT_RELA	reloc entries w/ explicit addens
SHT_HASH	symbol hash table
SHT_DYNAMIC	information for dynamic linking
SHT_NOTE	information that marks the file
SHT_NOBITS	occupies no space in the file
SHT_REL	reloc entries w/o explicit addens
SHT_SHLIB	reserved + unspecified semantics
SHT_DYNSYM	symbol table (dynamic
SHT_INIT_ARRAY	Array of constructors.
SHT_FINI_ARRAY	Array of destructors.
SHT_PREINIT_ARRAY	Array of pre-constructors.
SHT_GROUP	Section group.
SHT_SYMTAB_SHNDX	Extended section indices.
SHT_NUM	Number of defined types.
SHT_LOOS	Start OS-specific.
SHT_HIOS	End OS-specific.
SHT_LOPROC	Start processor-specific.
SHT_HIPROC	End processor-specific.
SHT_LOUSER	Start application-specific.
SHT_HIUSER	End application-specific.

Definition at line 377 of file elf.h.

13.16.9.3.29 Elf_STBs

enum Elf_STBs
Symbol Binding.

See also

ELF32_ST_BIND, ELF64_ST_BIND

Enumerator

STB_LOCAL	not visible outside object file

STB_GLOBAL	visible to all objects being combined
STB_WEAK	resemble global symbols
STB_LOOS	OS-specific.
STB_HIOS	OS-specific.
STB_LOPROC	Processor-specific.
STB_HIPROC	Processor-specific.

Definition at line 912 of file elf.h.

13.16.9.3.30 Elf_STTs

`enum Elf_STTs`
Symbol Types.

See also

ELF32_ST_TYPE, ELF64_ST_TYPE

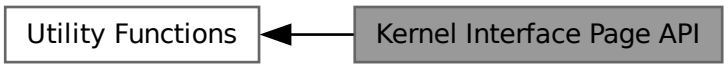
Enumerator

STT_NOTYPE	symbol's type not specified
STT_OBJECT	associated with a data object
STT_FUNC	associated with a function or other code
STT_SECTION	associated with a section
STT_FILE	source file name associated with object
STT_LOOS	OS-specific.
STT_HIOS	OS-specific.
STT_LOPROC	processor-specific
STT_HIPROC	processor-specific

Definition at line 925 of file elf.h.

13.16.10 Kernel Interface Page API

Collaboration diagram for Kernel Interface Page API:



Files

- file kip.h

Macros

- #define l4util_kip_for_each_feature(s)

Cycle through kernel features given in the KIP.

Functions

- L4_BEGIN_DECLS int l4util_kip_kernel_has_feature (l4_kernel_info_t const *k, char const *str)

  Check if kernel supports a feature.
- unsigned long l4util_kip_kernel_abi_version (l4_kernel_info_t const *k)

  Return kernel ABI version.

13.16.10.1 Detailed Description

13.16.10.2 Macro Definition Documentation

13.16.10.2.1 l4util_kip_for_each_feature

```
#define l4util_kip_for_each_feature(
            s)
```

Value:

```
l4_kip_for_each_feature(s)
```

Cycle through kernel features given in the KIP.
Cycles through all KIP kernel feature strings. s must be a character pointer (char const *) initialized with l4_kip_version_string().

Deprecated Use l4_kip_for_each_feature().

Definition at line 58 of file kip.h.

13.16.10.3 Function Documentation

13.16.10.3.1 l4util_kip_kernel_abi_version()

```
unsigned long l4util_kip_kernel_abi_version (
            l4_kernel_info_t const * k)
```

Return kernel ABI version.

Parameters

k	Pointer to the kernel info page (KIP).

Returns

Kernel ABI version.

References L4_CV, and L4_END_DECLS.

13.16.10.3.2 l4util_kip_kernel_has_feature()

```
L4_BEGIN_DECLS int l4util_kip_kernel_has_feature (
            l4_kernel_info_t const * k,
            char const * str)
```

Check if kernel supports a feature.

Parameters

k	Pointer to the kernel info page (KIP).
str	Feature name to check.

Returns

1 if the kernel supports the feature, 0 if not.

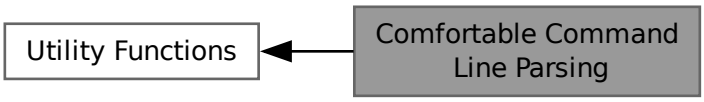
Checks the feature field in the KIP for the given string.

Deprecated Use l4_kip_kernel_has_feature().

References L4_CV.

13.16.11 Comfortable Command Line Parsing

Collaboration diagram for Comfortable Command Line Parsing:



Typedefs

- typedef void(∗ **parse_cmd_fn_t**) (int)
  Function type for PARSE_CMD_FN.
- typedef void(∗ **parse_cmd_fn_arg_t**) (int, const char ∗, int)
  Function type for PARSE_CMD_FN_ARG.

Enumerations

- enum parse_cmd_type
  Types for parsing.

Functions

- L4_BEGIN_DECLS int parse_cmdline (int ∗argc, const char ∗∗∗argv, int arg0,...)
  Parse the command-line for specified arguments and store the values into variables.

13.16.11.1 Detailed Description

13.16.11.2 Function Documentation

13.16.11.2.1 parse_cmdline()

```
L4_BEGIN_DECLS int parse_cmdline (
             int * argc,
             const char *** argv,
             int arg0,
              ...)
```

Parse the command-line for specified arguments and store the values into variables.
This Functions gets the command-line, and a list of command-descriptors. Then, the command-line is parsed according to the given descriptors, storing strings, switches and numeric arguments at given addresses, and possibly calling specified functions. A default help descriptor is added. Its purpose is to present a short command overview in the case the given command-line does not fit to the descriptors.
Each command-descriptor has the following form:
short option char, *long option name*, *comment*, *type*, *val*, *addr*.

The *short option char* specifies the short form of the described option. The short form will be recognized after a single dash, or in a group of short options preceeded by a single dash. Specify ' ' if no short form should be used.
The *long option name* specifies the long form of the described option. The long form will be recognized after two dashes. Specify 0 if no long form should be used for this option.
The *comment* is a string that will be used when presenting the short command-line help.
The *type* specifies, if the option should be recognized as

- a number (`PARSE_CMD_INT`),
- a switch (`PARSE_CMD_SWITCH`),
- a string (`PARSE_CMD_STRING`),
- a function call (`PARSE_CMD_FN`, `PARSE_CMD_FN_ARG`),
- an increment/decrement operator (`PARSE_CMD_INC`, `PARSE_CMD_DEC`).

If type is `PARSE_CMD_INT`, the option requires a second argument on the command-line after the option. This argument is parsed as a number. It can be preceeded by 0x to present a hex-value or by 0 to present an octal form. *addr* is interpreted as an int-pointer. The scanned argument from the command-line is stored in this pointer.
If *type* is `PARSE_CMD_SWITCH`, *addr* must be a pointer to int, and the value from *val* is stored at this pointer.
With `PARSE_CMD_STRING`, an additional argument is expected at the cmdline. *addr* must be a pointer to const char*, and a pointer to the argument on the command line is stored at this pointer. The value in *val* is a default value, which is stored at *addr* if the corresponding option is not given on the command line.
With `PARSE_CMD_FN_ARG`, *addr* is interpreted as a function pointer of type parse_cmd_fn_t. It will be called with *val* as argument if the corresponding option is found.
If *type* is `PARSE_CMD_FN_ARG`, *addr* is as a function pointer of type parse_cmd_fn_arg_t, and handled similar to `PARSE_CMD_FN`. An additional argument is expected at the command line, however. It is given to the called function as 2nd argument, and parsed as an integer as with `PARSE_CMD_INT` as a third argument.
If *type* is `PARSE_CMD_INC` or `PARSE_CMD_DEC`, *addr* is interpreted as an int-pointer. The value of *val* is stored to this pointer first. For every occurence of the option in the command line, the integer referenced by *addr* is incremented or decremented, respectively.
The list of command-descriptors is terminated by specifying a binary 0 for the short option char.
Note: The short option char 'h' and the long option name "help" must not be specified. They are used for the default help descriptor and produce a short command-options help when specified on the command-line.

Parameters

argc	pointer to number of command line parameters as passed to main
argv	pointer to array of command line parameters as passed to main
arg0	format list describing the command line options to parse for

Returns

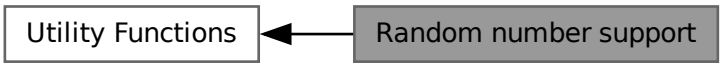
0 if the command-line was successfully parsed, otherwise:

- -1 if the given descriptors are somehow wrong.
- -2 if not enough memory was available to hold temporary structs.
- -3 if the given command-line args did not meet the specified set.
- -4 if the help-option was given.

Upon return, argc and argv point to a list of arguments that were not scanned as arguments. See `getoptlong` for details on scanning.
References L4_CV, and L4_END_DECLS.

13.16.12 Random number support

Collaboration diagram for Random number support:



Functions

- l4_uint32_t l4util_rand (void)

  Deliver next random number.
- void l4util_srand (l4_uint32_t seed)

  Initialize random number generator.

13.16.12.1 Detailed Description

13.16.12.2 Function Documentation

13.16.12.2.1 l4util_rand()

```
l4_uint32_t l4util_rand (
            void )
```

Deliver next random number.

Returns

A new random number

References L4_CV.

13.16.12.2.2 l4util_srand()

```
void l4util_srand (
            l4_uint32_t seed)
```

Initialize random number generator.

Parameters

seed	Value to initialize

References L4_END_DECLS.

13.16.13 Low-Level Thread Functions

Collaboration diagram for Low-Level Thread Functions:

13.17 Virtio Net Switch

A virtual network switch that can be used as defined in the virtio protocol.

Files

- file stats.h

  Client interface for port statistics.

Data Structures

- class Mac_addr

  A wrapper class around the value of a MAC address.
- class Mac_table< Size >

  Mac_table manages a 1:n association between ports and MAC addresses.
- class Switch_factory

  The IPC interface for creating ports.
- class L4virtio_port

  A Port on the Virtio Net Switch.
- class Net_transfer

  A network request to only a single destination.
- class Virtio_net_request

  Abstraction for a network request.
- class Virtio_switch

  The Virtio switch contains all ports and processes network requests.
- struct Buffer

  Data buffer used to transfer packets.
- class Virtio_vlan_mangle

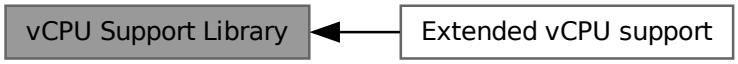
  Class for VLAN packet rewriting.

13.17.1 Detailed Description

A virtual network switch that can be used as defined in the virtio protocol.
The abstraction of a single connection with a network device (also called client) from the switch's perspective is a port. A client can register multiple ports on the switch. The communication between a client and the switch happens via IRQs, MMIO and shared memory as defined by the Virtio protocol. The switch supports VLANs and ports can be either 'access' or 'trunk' ports. The optionally available monitor port receives network traffic from all ports, and the monitor can not send.

13.18 vCPU Support Library

vCPU handling functionality.
Collaboration diagram for vCPU Support Library:



Topics

- Extended vCPU support 663
  Extended vCPU handling functionality.

Data Structures

- class L4vcpu::State
  C++ implementation of state word in the vCPU area.
- class L4vcpu::Vcpu
  C++ implementation of the vCPU save state area.

Functions

- void l4vcpu_irq_disable (l4_vcpu_state_t *vcpu) L4_NOTHROW
  Disable a vCPU for event delivery.
- unsigned l4vcpu_irq_disable_save (l4_vcpu_state_t *vcpu) L4_NOTHROW
  Disable a vCPU for event delivery and return previous state.
- void l4vcpu_irq_enable (l4_vcpu_state_t *vcpu, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) L4_NOTHROW
  Enable a vCPU for event delivery.
- void l4vcpu_irq_restore (l4_vcpu_state_t *vcpu, unsigned s, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) L4_NOTHROW
  Restore a previously saved IRQ/event state.
- void l4vcpu_wait_for_event (l4_vcpu_state_t *vcpu, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) L4_NOTHROW
  Wait for event.
- void l4vcpu_print_state (const l4_vcpu_state_t *vcpu, const char *prefix) L4_NOTHROW
  Print the state of a vCPU.
- int l4vcpu_is_irq_entry (l4_vcpu_state_t const *vcpu) L4_NOTHROW
  Return whether the entry reason was an IRQ/IPC message.
- int l4vcpu_is_page_fault_entry (l4_vcpu_state_t const *vcpu) L4_NOTHROW
  Return whether the entry reason was a page fault.

13.18.1 Detailed Description

vCPU handling functionality.
This library provides convenience functionality on top of the l4sys vCPU interface to ease programming. It wraps commonly used code and abstracts architecture depends parts as far as reasonable.

13.18.2 Function Documentation

13.18.2.1 l4vcpu_irq_disable()

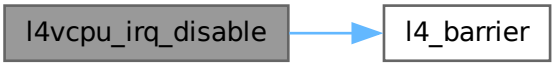
```
void l4vcpu_irq_disable (
            l4_vcpu_state_t * vcpu)  [inline]
```

Disable a vCPU for event delivery.

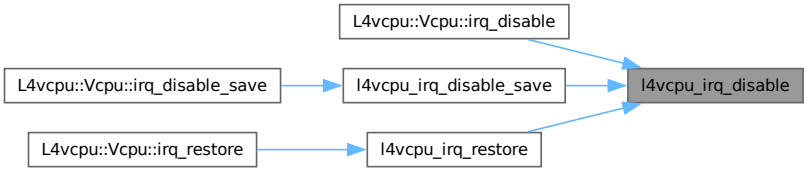
Parameters

vcpu	Pointer to vCPU area.

Definition at line 201 of file vcpu.h.
References l4_barrier(), L4_NOTHROW, and L4_VCPU_F_IRQ.
Referenced by L4vcpu::Vcpu::irq_disable(), l4vcpu_irq_disable_save(), and l4vcpu_irq_restore().
Here is the call graph for this function:



Here is the caller graph for this function:



13.18.2.2 l4vcpu_irq_disable_save()

```
unsigned l4vcpu_irq_disable_save (
            l4_vcpu_state_t * vcpu)  [inline]
```

Disable a vCPU for event delivery and return previous state.

Parameters

vcpu	Pointer to vCPU area.

Returns

IRQ state before disabling IRQs.

Definition at line 209 of file vcpu.h.
References L4_NOTHROW, and l4vcpu_irq_disable().

Referenced by L4vcpu::Vcpu::irq_disable_save().
Here is the call graph for this function:

Here is the caller graph for this function:

13.18.2.3 l4vcpu_irq_enable()

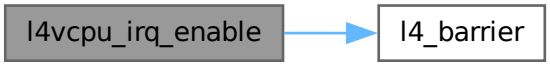
```
void l4vcpu_irq_enable (
             l4_vcpu_state_t * vcpu,
             l4_utcb_t * utcb,
             l4vcpu_event_hndl_t do_event_work_cb,
             l4vcpu_setup_ipc_t setup_ipc)  [inline]
```

Enable a vCPU for event delivery.

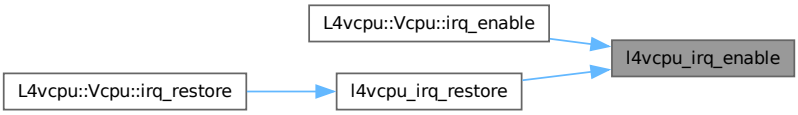
Parameters

vcpu	Pointer to vCPU area.
utcb	Utcb pointer of the calling vCPU.
do_event_work_cb	Call-back function that is called in case an event (such as an interrupt) is pending.
setup_ipc	Function call-back that is called right before any IPC operation, and before event delivery is enabled.

Definition at line 232 of file vcpu.h.
References l4_barrier(), L4_IPC_BOTH_TIMEOUT_0, L4_LIKELY, L4_NOTHROW, L4_VCPU_F_IRQ, and L4_VCPU_SF_IRQ_PENDING.
Referenced by L4vcpu::Vcpu::irq_enable(), and l4vcpu_irq_restore().
Here is the call graph for this function:



Here is the caller graph for this function:



13.18.2.4 l4vcpu_irq_restore()

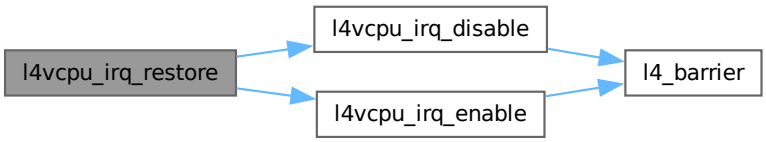
```
void l4vcpu_irq_restore (
            l4_vcpu_state_t * vcpu,
            unsigned s,
            l4_utcb_t * utcb,
            l4vcpu_event_hndl_t do_event_work_cb,
            l4vcpu_setup_ipc_t setup_ipc)  [inline]
```

Restore a previously saved IRQ/event state.

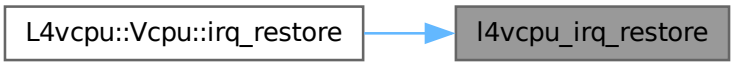
Parameters

vcpu	Pointer to vCPU area.
s	IRQ state to be restored.
utcb	Utcb pointer of the calling vCPU.
do_event_work_cb	Call-back function that is called in case an event (such as an interrupt) is pending after enabling.
setup_ipc	Function call-back that is called right before any IPC operation, and before event delivery is enabled.

Definition at line 257 of file vcpu.h.
References L4_NOTHROW, L4_VCPU_F_IRQ, l4vcpu_irq_disable(), and l4vcpu_irq_enable().
Referenced by L4vcpu::Vcpu::irq_restore().
Here is the call graph for this function:



Here is the caller graph for this function:



13.18.2.5 l4vcpu_is_irq_entry()

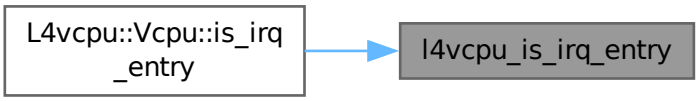
```
int l4vcpu_is_irq_entry (
            l4_vcpu_state_t const * vcpu)  [inline]
```

Return whether the entry reason was an IRQ/IPC message.

Parameters

vcpu	Pointer to vCPU area.

return 0 if not, !=0 otherwise.
References L4_CV, L4_INLINE, and L4_NOTHROW.
Referenced by L4vcpu::Vcpu::is_irq_entry().
Here is the caller graph for this function:



13.18.2.6 l4vcpu_is_page_fault_entry()

```
int l4vcpu_is_page_fault_entry (
            l4_vcpu_state_t const * vcpu)  [inline]
```

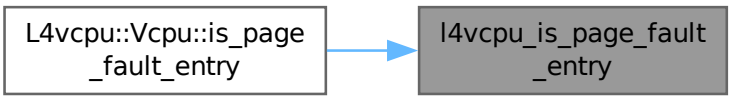
Return whether the entry reason was a page fault.

Parameters

vcpu	Pointer to vCPU area.

return 0 if not, !=0 otherwise.
References L4_CV, and L4_NOTHROW.
Referenced by L4vcpu::Vcpu::is_page_fault_entry().

Here is the caller graph for this function:



13.18.2.7 l4vcpu_print_state()

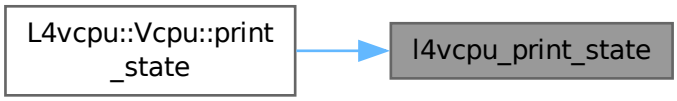
```
void l4vcpu_print_state (
            const l4_vcpu_state_t * vcpu,
            const char * prefix)
```

Print the state of a vCPU.

Parameters

vcpu	Pointer to vCPU area.
prefix	A prefix for each line printed.

References L4_CV, L4_INLINE, and L4_NOTHROW.
Referenced by L4vcpu::Vcpu::print_state().
Here is the caller graph for this function:



13.18.2.8 l4vcpu_wait_for_event()

```
void l4vcpu_wait_for_event (
            l4_vcpu_state_t * vcpu,
            l4_utcb_t * utcb,
            l4vcpu_event_hndl_t do_event_work_cb,
            l4vcpu_setup_ipc_t setup_ipc)  [inline]
```

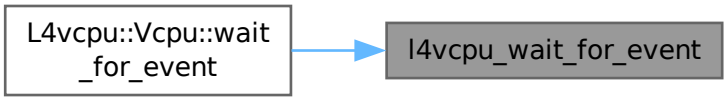
Wait for event.

Parameters

vcpu	Pointer to vCPU area.
utcb	Utcb pointer of the calling vCPU.

do_event_work_cb	Call-back function that is called when the vCPU awakes and needs to handle an event/↩ IRQ.
setup_ipc	Function call-back that is called right before any IPC operation.

Note that event delivery remains disabled after this function returns.
Definition at line 270 of file vcpu.h.
References L4_IPC_NEVER, and L4_NOTHROW.
Referenced by L4vcpu::Vcpu::wait_for_event().
Here is the caller graph for this function:



13.18.3 Extended vCPU support

Extended vCPU handling functionality.
Collaboration diagram for Extended vCPU support:

Functions

- int l4vcpu_ext_alloc (l4_vcpu_state_t **vcpu, l4_addr_t *ext_state, l4_cap_idx_t task, l4_cap_idx_t regmgr) L4_NOTHROW

  Allocate state area for an extended vCPU.

13.18.3.1 Detailed Description

Extended vCPU handling functionality.

13.18.3.2 Function Documentation

13.18.3.2.1 l4vcpu_ext_alloc()

```
int l4vcpu_ext_alloc (
             l4_vcpu_state_t ** vcpu,
             l4_addr_t * ext_state,
             l4_cap_idx_t task,
             l4_cap_idx_t regmgr)
```

Allocate state area for an extended vCPU.

Parameters

out	*vcpu*	Allocated vcpu-state area.
out	*ext_state*	Allocated extended vcpu-state area.
	task	Task to use for allocation.
	regmgr	Region manager to use for allocation.

Returns

0 for success, error code otherwise

References L4_CV, L4_INLINE, and L4_NOTHROW.

Chapter 14

Namespace Documentation

14.1 cxx Namespace Reference

Our C++ library.

Namespaces

- namespace Bits

  Internal helpers for the cxx package.

Data Structures

- class Avl_map

  AVL tree based associative container.
- class Avl_set

  AVL set for simple comparable items.
- class Avl_tree_node

  Node of an AVL tree.
- class Avl_tree

  A generic AVL tree.
- class Bitfield

  Definition for a member (part) of a bit field.
- class Bitmap_base

  Basic bitmap abstraction.
- class Bitmap

  A static bitmap.
- class Buddy_alloc

  Buddy allocator backed by a perfect binary tree.
- class Elide_dtor

  Wrapper class to remove destructor calls.
- class H_list_item_t

  Basic element type for a double-linked H_list.
- class H_list

  General double-linked list of unspecified cxx::H_list_item elements.
- struct H_list_t

  Double-linked list of typed H_list_item_t elements.
- class List_item

  Basic list item.
- class List

  Doubly linked list, with internal allocation.

- class List_alloc

  Standard list-based allocator.
- struct Pair

  Pair of two values.
- class Pair_first_compare

  Comparison functor for Pair.
- class Ref_ptr

  A reference-counting pointer with automatic cleanup.
- struct Ref_obj_list_item

  Item for list linked via cxx::Ref_ptr with default refence counting.
- class Error

  Error value.
- class Result

  A result of a function call.
- class Base_slab

  Basic slab allocator.
- class Slab

  Slab allocator for object of type `Type`.
- class Base_slab_static

  Merged slab allocator (allocators for objects of the same size are merged together).
- class Slab_static

  Merged slab allocator (allocators for objects of the same size are merged together).
- class S_list

  Simple single-linked list.
- class static_vector

  Simple encapsulation for a dynamically allocated array.
- class Nothrow

  Helper type to distinguish the `operator new` version that does not throw exceptions.
- class New_allocator

  Standard allocator based on `operator new ()` .
- struct Lt_functor

  Generic comparator class that defaults to the less-than operator.
- class String

  Allocation free string class with explicit length field.
- class Tree_alloc

  Standard tree-based allocator.
- class Weak_ref_base

  Generic (base) weak reference to some object.
- class Weak_ref

  Typed weak reference to an object of type `T`.

Typedefs

- typedef H_list_item_t< void > **H_list_item**

  Untyped list item.
- template<typename T>
  using **Ref_ptr_list_item** = Bits::Smart_ptr_list_item<T, cxx::Ref_ptr<T> >

  Item for list linked with cxx::Ref_ptr.
- template<typename T>
  using **Ref_ptr_list** = Bits::Smart_ptr_list<Ref_ptr_list_item<T> >

  Single-linked list where elements are connected via a cxx::Ref_ptr.

- template<typename T>
  using **Unique_ptr_list_item** = Bits::Smart_ptr_list_item<T, cxx::unique_ptr<T> >

  Item for list linked with cxx::unique_ptr.
- template<typename T>
  using **Unique_ptr_list** = Bits::Smart_ptr_list<Unique_ptr_list_item<T> >

  Single-linked list where elements are connected with a cxx::unique_ptr.

Functions

- template<typename A, typename ... ARGS>
  constexpr A const & min (A const &a1, A const &a2, ARGS const &...a)

  Get the minimum of `a1` and `a2` upt to `aN`.
- template<typename A, typename ... ARGS>
  constexpr A const & min (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)

  Get the minimum of `a1` and `a2` upt to `aN`.
- template<typename A, typename ... ARGS>
  constexpr A const & max (A const &a1, A const &a2, ARGS const &...a)

  Get the maximum of `a1` and `a2` upt to `aN`.
- template<typename A, typename ... ARGS>
  constexpr A const & max (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)

  Get the maximum of `a1` and `a2` upt to `aN`.
- template<typename T1>
  T1 clamp (T1 v, T1 lo, T1 hi)

  Limit v to the range given by lo and hi.
- template<typename T>
  constexpr T gcd (T a, T b)

  Compute the greatest common divisor of two unsigned values.
- template<typename T>
  constexpr T lcm (T a, T b)

  Compute the least common multiple of two unsigned values.
- template<typename T>
  T access_once (T const *a)

  Read the value at an address at most once.
- template<typename T, typename VAL>
  void write_now (T *a, VAL &&val)

  Write a value at an address exactly once.

14.1.1 Detailed Description

Our C++ library.
Small Low-Level C++ Library.
Strings.
Various kinds of C++ utilities.

14.1.2 Function Documentation

14.1.2.1 access_once()

```
template<typename T>
T cxx::access_once (
            T const * a)  [inline]
```

Read the value at an address at most once.
The read might be omitted if the result is not used by any code unless `typename` contains `volatile`. If the read operation has side effects and must not be omitted, use different means like L4drivers::Mmio_register_block or similar.
The compiler is disallowed to reuse a previous read at the same address, for example:

```
val1 = *a;
val2 = access_once(a);  // compiler may not replace this by val2 = val1;
```

The compiler is also disallowed to repeat the read, for example:

```
val1 = access_once(a);
val2 = val1;  // compiler may not replace this by val2 = *a;
```

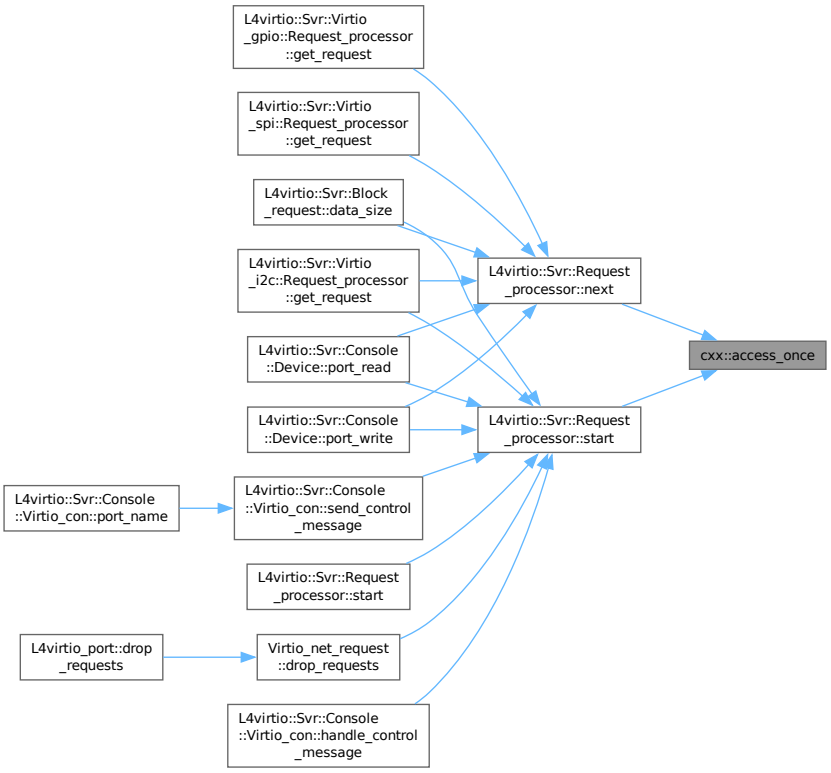
The above implies that the compiler is also disallowed to move the read out of or into loops.

Note

The read might still be moved relative to other code.

The value might be read from a hardware cache, not from RAM.

Definition at line 40 of file utils.
Referenced by L4virtio::Svr::Request_processor::next(), and L4virtio::Svr::Request_processor::start().
Here is the caller graph for this function:



14.1.2.2 gcd()

```
template<typename T>
T cxx::gcd (
            T a,
            T b)  [constexpr]
```

Compute the greatest common divisor of two unsigned values.
This uses the Euclidean modulo algorithm.

Note

Contrary to the C++17 specification, this implementation requires the same unsigned type of both arguments and returns the same type (not a common type). This should be fine for most practical use cases.

Contrary to the C++17 specification, this implementation does not accept signed arguments and negative literals.

Template Parameters

T	Unsigned integer type of the values.

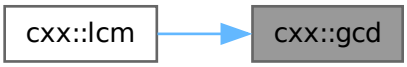
Parameters

a	First input.
b	Second input.

Returns

Greatest common divisor of the input values.

Definition at line 34 of file numeric.
Referenced by lcm().
Here is the caller graph for this function:



14.1.2.3 lcm()

```
template<typename T>
T cxx::lcm (
            T a,
            T b)  [constexpr]
```

Compute the least common multiple of two unsigned values.
This uses the greatest common divisor to compute the least common multiple.

Note

Contrary to the C++17 specification, this implementation requires the same unsigned type of both arguments and returns the same type (not a common type). This should be fine for most practical use cases.

Contrary to the C++17 specification, this implementation does not accept signed arguments and negative literals.

Template Parameters

T	Unsigned integer type of the values.

Parameters

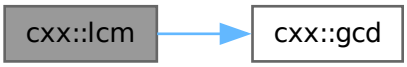
a	First input.

b	Second input.

Returns

Least common multiple of the input values.

Definition at line 68 of file numeric.
References gcd().
Here is the call graph for this function:



14.1.2.4 write_now()

```
template<typename T, typename VAL>
void cxx::write_now (
            T * a,
            VAL && val)  [inline]
```

Write a value at an address exactly once.
The compiler is disallowed to skip the write, for example:

```
*a = val;
write_now(a, val);  // compiler may not skip this line
```

The compiler is also disallowed to repeat the write.
The above implies that the compiler is also disallowed to move the write out of or into loops.

Note

The write might still be moved relative to other code.

The value might be written just to a hardware cache for the moment, not immediately to RAM.

Definition at line 71 of file utils.

14.2 cxx::Bits Namespace Reference

Internal helpers for the cxx package.

Data Structures

- struct Avl_map_get_key

  Key-getter for Avl_map.
- class Avl_set_iter

  Generic iterator for the AVL-tree based set.
- struct Avl_set_get_key

  Internal, key-getter for Avl_set nodes.
- class Base_avl_set

  AVL set with internally managed nodes.
- class Bst

Basic binary search tree (BST).

- struct Direction

  The direction to go in a binary search tree.
- class Bst_node

  Basic type of a node in a binary search tree (BST).
- class Basic_list

  Internal: Common functions for all head-based list implementations.
- class Smart_ptr_list_item

  List item for an arbitrary item in a Smart_ptr_list.
- class Smart_ptr_list

  List of smart-pointer-managed objects.

14.2.1 Detailed Description

Internal helpers for the cxx package.

14.3 Enum_bitops Namespace Reference

Mechanism to opt-in for enum bitwise operators.

Data Structures

- struct Has_marker

  Marker for the opt-in ADL function.
- struct Has_marker< T, Void< decltype(enum_bitops_enable(declval< T >()))> >

  Marker for the opt-in ADL function.
- struct Enable

  Check whether the given enum type opts in for the bitwise operators.

14.3.1 Detailed Description

Mechanism to opt-in for enum bitwise operators.
For an enumeration type T to opt-in for bitwise operators, there needs to be a declaration of a function
void enum_bitops_enable(T)
available for the argument-dependent lookup (the function is never actually called, thus no definition is required and no code is generated).

14.4 Enum_bitops_impl Namespace Reference

Bitwise operators on enumeration types.

Functions

- template<typename T, typename = L4::Types::Enable_if_t<L4::Types::Is_enum<T>::value>>
  constexpr L4::Types::Underlying_type_t< T > **to_underlying** (T const arg) noexcept

  Convert enum value to its underlying type value.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **operator~** (T const a) noexcept

  Negate enum value.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **operator&** (T l, T r) noexcept

  Intersect enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T & **operator&=** (T &a, T const b) noexcept

Intersect and assign enum values.

- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **operator|** (T l, T r) noexcept

  Union enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T & **operator|=** (T &a, T const b) noexcept

  Union and assign enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **operator-** (T l, T r) noexcept

  Difference (intersect with negation, clear bits) enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T & **operator-=** (T &a, T const b) noexcept

  Difference (intersect with negation, clear bits) and assign enum values.

14.4.1 Detailed Description

Bitwise operators on enumeration types.
These operators allow to use the enum type as a bitmask type with '∼', '&' and '|' operators that keep the enum type as result. The compound assignment operators '&=' and '|=' are also provided.
The set-difference '-' and '-=' operators (a shorthand for intersection with a negated second argument) can be used to clear specific bits from the enum value. There is also the to_underlying() helper function.

14.5 L4 Namespace Reference

L4 low-level kernel interface.

Namespaces

- namespace Typeid

  Definition of interface data-type helpers.
- namespace Ipc

  IPC related functionality.
- namespace Ipc_svr

  Helper classes for L4::Server instantiation.
- namespace Types

  L4 basic type helpers for C++.

Data Structures

- struct Type_info

  Dynamic Type Information for L4Re Interfaces.
- struct Kobject_typeid

  Meta object for handling access to type information of Kobjects.
- struct Kobject_typeid< void >

  Minimalistic ID for `void` interface.
- class Kobject_t

  Helper class to create an L4Re interface class that is derived from a single base class.
- class Kobject_2t

  Helper class to create an L4Re interface class that is derived from two base classes (see `L4::Kobject_t`).
- struct Kobject_3t

  Helper class to create an L4Re interface class that is derived from three base classes (see `L4::Kobject_t`).
- struct Kobject_demand

  Get the combined server-side resource requirements for all type T...

- struct Proto_t

  Data type for defining protocol numbers.
- struct Kobject_x

  Generic Kobject inheritance template.
- class Arm_smccc

  Wrapper for function calls that follow the ARM SMC/HVC calling convention.
- class Cap

  C++ interface for capabilities.
- class Cap_base

  Base class for all kinds of capabilities.
- class Reply_cap_idx

  Value class for optional reply capability index.
- class Reply_cap_alloc

  Interface to a reply capability allocator.
- class Reply_cap

  An explicit reply capability.
- struct Epiface

  Base class for interface implementations.
- struct Epiface_t0

  Epiface mixin for generic Kobject-based interfaces.
- struct Irqep_t

  Epiface implementation for interrupt handlers.
- class Registry_iface

  Abstract interface for object registries.
- struct Epiface_t

  Epiface implementation for Kobject-based interface implementations.
- class Basic_registry

  This registry returns the corresponding server object based on the label of an Ipc_gate.
- class Server

  Basic server loop for handling client requests.
- class Debugger

  C++ kernel debugger API.
- class Exception

  Exception interface.
- class Factory

  C++ Factory interface, see Factory for the C interface.
- class Iommu

  Interface for IO-MMUs used for DMA remapping.
- class Ipc_gate

  The C++ IPC gate interface, see IPC-Gate API for the C interface.
- class Irq_eoi

  Interface for sending an unmask message to an object.
- struct Triggerable

  Interface that allows an object to be triggered by some source.
- class Irq

  C++ Irq interface, see IRQs for the C interface.
- class Icu

  C++ Icu interface, see Interrupt controller for the C interface.
- class Kobject

  Base class for all kinds of kernel objects and remote objects, referenced by capabilities.
- class Meta

Meta interface that shall be implemented by each L4Re object and gives access to the dynamic type information for L4Re objects.

- class Io_pager

  Io_pager interface.
- class Pager

  Pager interface including the Io_pager interface.
- class Platform_control

  L4 C++ interface for controlling platform-wide properties, see Platform Control C API for the C interface.
- class Rcv_endpoint

  Interface for kernel objects that allow to receive IPC from them.
- class Scheduler

  C++ interface of the Scheduler kernel object, see Scheduler for the C interface.
- struct Semaphore

  C++ Kernel-provided semaphore interface, see Kernel-provided semaphore for the C interface.
- class Smart_cap

  Smart capability class.
- class Task

  C++ interface of the Task kernel object, see Task for the C interface.
- class Thread

  C++ L4 kernel thread interface, see Thread for the C interface.
- class Thread_group

  C++ L4 kernel thread group interface, see Thread groups for the C interface.
- class Vcon

  C++ L4 Vcon interface, see Virtual Console for the C interface.
- class Vm

  Virtual machine host address space.
- class Poll_timeout_kipclock

  A polling timeout based on the L4Re clock.
- class Alloc_list

  A simple list-based allocator.
- class IOModifier

  Modifier class for the IO stream.
- class Exception_tracer

  Back-trace support for exceptions.
- class Base_exception

  Base class for all exceptions, thrown by the L4Re framework.
- class Runtime_error

  Exception for an abstract runtime error.
- class Out_of_memory

  Exception signalling insufficient memory.
- class Element_already_exists

  Exception for duplicate element insertions.
- class Unknown_error

  Exception for an unknown condition.
- class Element_not_found

  Exception for a failed lookup (element not found).
- class Invalid_capability

  Indicates that an invalid object was invoked.
- class Com_error

  Error conditions during IPC.
- class Bounds_error

Access out of bounds.

- class Server_object

  Abstract server object to be used with L4::Server and L4::Basic_registry.
- struct Server_object_t

  Base class (template) for server implementing server objects.
- struct Server_object_x

  Helper class to implement p_dispatch based server objects.
- struct Irq_handler_object

  Server object base class for handling IRQ messages.
- class Lock_guard

  Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code.
- class String

  A null-terminated string container class.
- class Poll_timeout_counter

  Evaluate an expression for a maximum number of times.
- class Uart_apb

  Driver for the Advanced Peripheral Bus (APB) UART from the Cortex-M System Design Kit (CMSDK).
- class Uart

  Uart driver abstraction.

Typedefs

- typedef int **Opcode**

  Data type for RPC opcodes.

Enumerations

- enum : l4_proto_t { PROTO_ANY = 0 , PROTO_EMPTY = -19 }

Functions

- template<typename T>
  Type_info const * kobject_typeid () noexcept

  Get the L4::Type_info for the L4Re interface given in `T`.
- template<typename T, typename F>
  Cap< T > cap_dynamic_cast (Cap< F > const &c) noexcept

  `dynamic_cast` for capabilities.
- template<typename T, typename F>
  Cap< T > cap_cast (Cap< F > const &c) noexcept

  static_cast for capabilities.
- template<typename T, typename F>
  Cap< T > cap_reinterpret_cast (Cap< F > const &c) noexcept

  reinterpret_cast for capabilities.
- template<typename T>
  constexpr T trunc_order (T val, unsigned char order)

  Round a value down so the given number of lsb is zero.
- template<typename T>
  constexpr T round_order (T val, unsigned char order)

  Round a value up so the given number of lsb is zero.
- template<typename T, typename F, typename SMART>
  Smart_cap< T, SMART > cap_cast (Smart_cap< F, SMART > const &c) noexcept

  `static_cast` for (smart) capabilities.
- template<typename T, typename F, typename SMART>
  Smart_cap< T, SMART > cap_reinterpret_cast (Smart_cap< F, SMART > const &c) noexcept

reinterpret_cast for (smart) capabilities.

- void throw_ipc_exception (L4::Cap< void > const &o, l4_msgtag_t const &err, l4_utcb_t *utcb)

  Throw an L4 IPC error as exception.
- void throw_ipc_exception (void const *o, l4_msgtag_t const &err, l4_utcb_t *utcb)

  Throw an L4 IPC error as exception.

Variables

- IOModifier const **hex**

  Modifies the stream to print numbers as hexadecimal values.
- IOModifier const **dec**

  Modifies the stream to print numbers as decimal values.
- BasicOStream **cout**

  Standard output stream.
- BasicOStream **cerr**

  Standard error stream.

14.5.1 Detailed Description

L4 low-level kernel interface.

14.5.2 Enumeration Type Documentation

14.5.2.1 anonymous enum

```
anonymous enum :  l4_proto_t
```

Enumerator

PROTO_ANY	Default protocol used by Kobject_t and Kobject_x.
PROTO_EMPTY	Empty protocol for empty APIs.

Definition at line 44 of file __typeinfo.h.

14.5.3 Function Documentation

14.5.3.1 cap_cast() [1/2]

```
template<typename T, typename F>
Cap< T > L4::cap_cast (
            Cap< F > const & c)  [inline], [noexcept]
```

static_cast for capabilities.

Template Parameters

T	The target type of the capability
F	The source type (and is usually implicitly set)

Parameters

c	The source capability that shall be casted

Returns

A capability typed to the interface `T`.

The use of this cast operator is similar to the `static_cast<>()` for C++ pointers. It does the same type checking and adjustments like C++ does on pointers.
Example code:

```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_cast<L4::Icu>(obj);
```

Definition at line 437 of file capability.h.
Referenced by L4Re::Cap_alloc::alloc(), L4Re::Util::_Cap_alloc::alloc(), L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::a

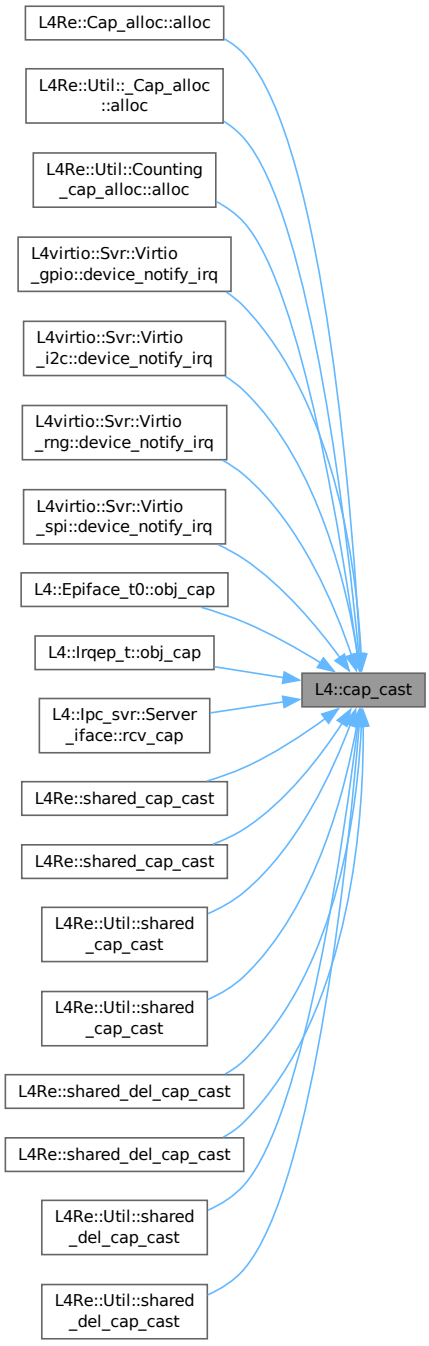
L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >::device_notify_irq(), L4virtio::Svr::Virtio_spi< Spi_request_handler, Epiface >::device
L4::Epiface_t0< RPC_IFACE, BASE >::obj_cap(), L4::Irqep_t< Derived, BASE, bool >::obj_cap(), L4::Ipc_svr::Server_iface::rcv_ca
L4Re::shared_cap_cast(), L4Re::shared_cap_cast(), L4Re::Util::shared_cap_cast(), L4Re::Util::shared_cap_cast(),
L4Re::shared_del_cap_cast(), L4Re::shared_del_cap_cast(), L4Re::Util::shared_del_cap_cast(), and L4Re::Util::shared_del_cap_cas

Here is the caller graph for this function:



14.5.3.2 cap_cast() [2/2]

```
template<typename T, typename F, typename SMART>
Smart_cap< T, SMART > L4::cap_cast (
            Smart_cap< F, SMART > const & c)  [inline], [noexcept]
```

`static_cast` for (smart) capabilities.

Template Parameters

T	Type to cast the capability to.
F	(implicit) Type of the passed capability.
SMART	(implicit) Class implementing the Smart_cap interface.

Parameters

c	Capability to be casted.

Returns

A smart capability with new type `T`.

Definition at line 192 of file smart_capability.

14.5.3.3 cap_dynamic_cast()

```
template<typename T, typename F>
Cap< T > L4::cap_dynamic_cast (
            Cap< F > const & c)  [inline], [noexcept]
```

`dynamic_cast` for capabilities.

Template Parameters

T	The target type of the capability.
F	The source type (is usually implicitly set).

Parameters

c	The source capability that shall be casted.

Return values

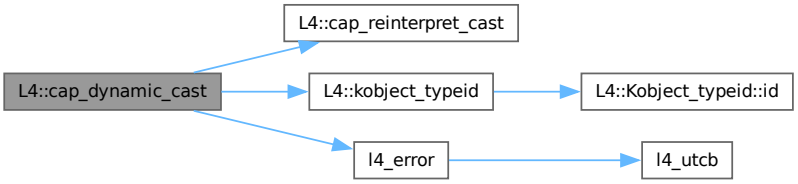
Cap<T>	Capability of target interface `T`.
L4_INVALID_CAP	`c` does not support the target interface `T` or the L4::Meta interface.

The use of this cast operator is similar to the `dynamic_cast<>()` for C++ pointers. It also induces overhead, because it uses the meta interface (L4::Meta) to do runtime type checking.
Example code:

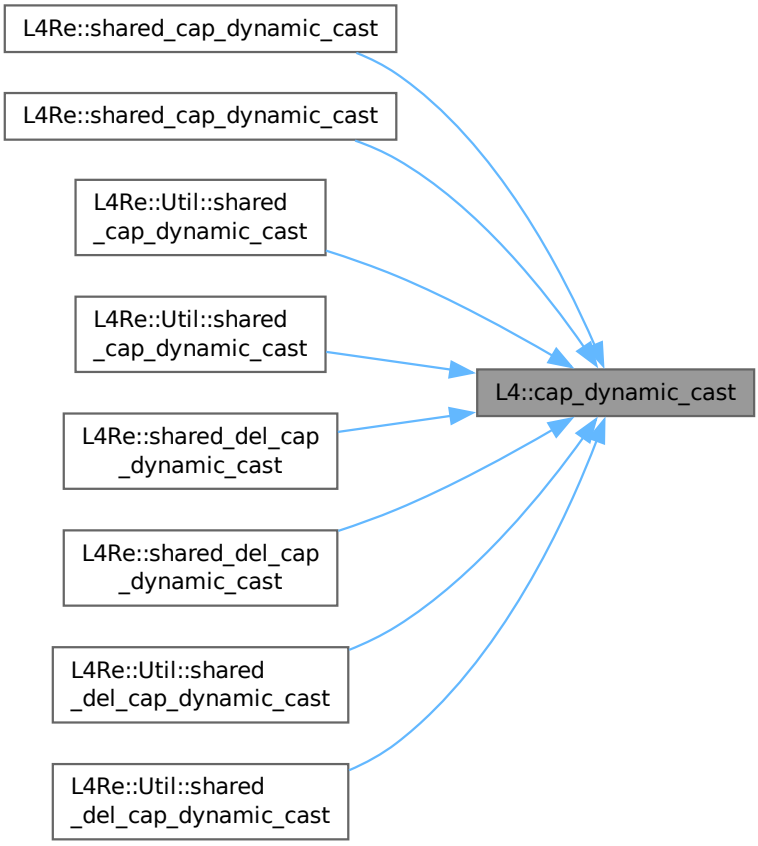
```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_dynamic_cast<L4::Icu>(obj);
```

Definition at line 116 of file capability.
References cap_reinterpret_cast(), L4::Cap_base::Invalid, kobject_typeid(), and l4_error().
Referenced by L4Re::shared_cap_dynamic_cast(), L4Re::shared_cap_dynamic_cast(), L4Re::Util::shared_cap_dynamic_cast(), L4Re::Util::shared_cap_dynamic_cast(), L4Re::shared_del_cap_dynamic_cast(), L4Re::shared_del_cap_dynamic_cast(), L4Re::Util::shared_del_cap_dynamic_cast(), and L4Re::Util::shared_del_cap_dynamic_cast().

Here is the call graph for this function:



Here is the caller graph for this function:



14.5.3.4 cap_reinterpret_cast() [1/2]

```
template<typename T, typename F>
Cap< T > L4::cap_reinterpret_cast (
            Cap< F > const & c)  [inline], [noexcept]
```

reinterpret_cast for capabilities.

Template Parameters

T	The target type of the capability
F	The source type (and is usually implicitly set)

Parameters

c	The source capability that shall be casted

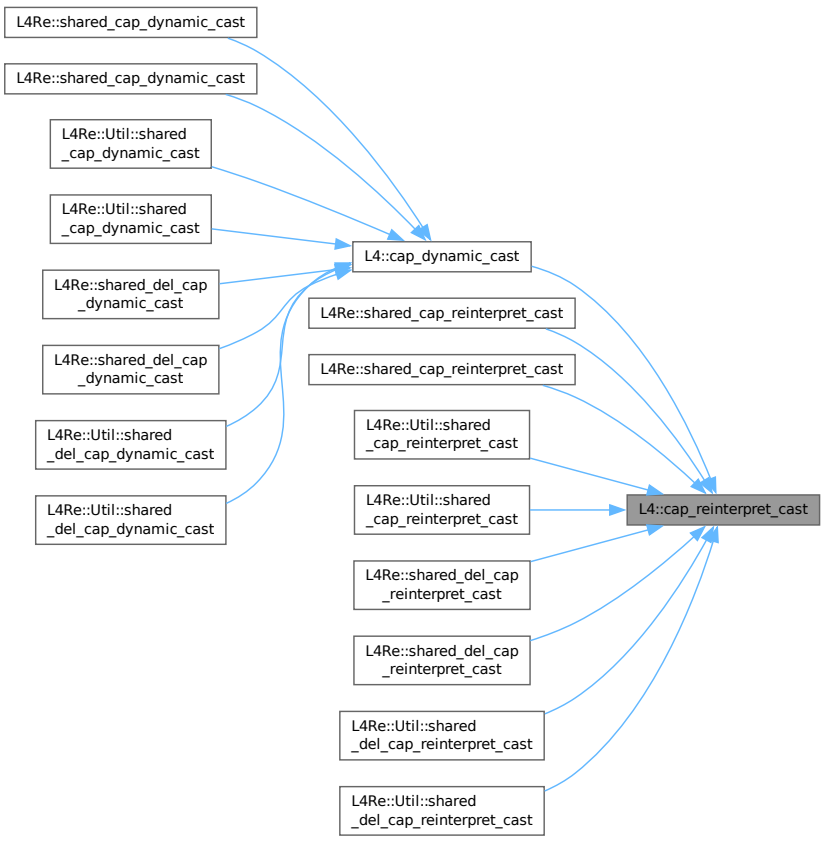
Returns

A capability typed to the interface `T`.

The use of this cast operator is similar to the `reinterpret_cast<>()` for C++ pointers. It does not do any type checking or type adjustment.
Example code:

```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_reinterpret_cast<L4::Icu>(obj);
```

Definition at line 468 of file capability.h.
Referenced by cap_dynamic_cast(), L4Re::shared_cap_reinterpret_cast(), L4Re::shared_cap_reinterpret_cast(), L4Re::Util::shared_cap_reinterpret_cast(), L4Re::Util::shared_cap_reinterpret_cast(), L4Re::shared_del_cap_reinterpret_cast(), L4Re::shared_del_cap_reinterpret_cast(), L4Re::Util::shared_del_cap_reinterpret_cast(), and L4Re::Util::shared_del_cap_reinterpret
Here is the caller graph for this function:



14.5.3.5 cap_reinterpret_cast() [2/2]

```
template<typename T, typename F, typename SMART>
Smart_cap< T, SMART > L4::cap_reinterpret_cast (
            Smart_cap< F, SMART > const & c)  [inline], [noexcept]
```

`reinterpret_cast` for (smart) capabilities.

Template Parameters

T	Type to cast the capability to.
F	(implicit) Type of the passed capability.
SMART	(implicit) Class implementing the Smart_cap interface.

Parameters

c	Capability to be casted.

Returns

A smart capability with new type `T`.

Definition at line 211 of file smart_capability.

14.5.3.6 round_order()

```
template<typename T>
T L4::round_order (
            T val,
            unsigned char order)  [constexpr]
```

Round a value up so the given number of lsb is zero.

Template Parameters

T	The type of the value (shall be some integral type.

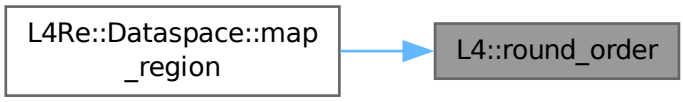
Parameters

val	The value to round up to the next multiple of 2^order.
order	order (2^order) to round up to.

Returns

val rounded up to the next 2^order.

Definition at line 32 of file consts.
Referenced by L4Re::Dataspace::map_region().
Here is the caller graph for this function:



14.5.3.7 trunc_order()

```
template<typename T>
T L4::trunc_order (
            T val,
            unsigned char order)  [constexpr]
```

Round a value down so the given number of lsb is zero.

Template Parameters

T	The type of the value (shall be some integral type.

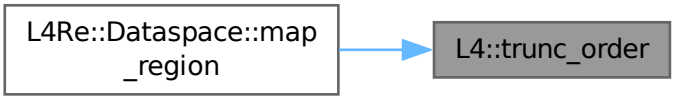
Parameters

val	The value where the given lsb shall be masked.
order	the number of least significant bits (lsb) to mask.

Returns

val with order lsb masked to zero.

Definition at line 18 of file consts.
Referenced by L4Re::Dataspace::map_region().
Here is the caller graph for this function:



14.6 L4::Ipc Namespace Reference

IPC related functionality.

Namespaces

- namespace Msg

  IPC Message related functionality.

Data Structures

- struct Array_ref

  Array reference data type for arrays located in the message.
- struct Array

  Array data type for dynamically sized arrays in RPCs.
- struct Array_in_buf

  Server-side copy in buffer for Array.
- struct Call

  RPC attribute for a standard RPC call.
- struct Call_zero_send_timeout

  RPC attribute for an RPC call, with zero send timeout.
- struct Call_t

  RPC attribute for an RPC call with required rights.
- struct Send_only

  RPC attribute for a send-only RPC.
- struct Out

  Mark an argument as a output value in an RPC signature.
- struct In_out

  Mark an argument as in-out argument.
- struct Opt

  Attribute for defining an optional RPC argument.
- class Small_buf

  A receive item for receiving a single object capability.
- class Gen_fpage

  Generic RPC base for typed message items.
- class Snd_fpage

  Send item or return item.
- class Rcv_fpage

  Non-small receive item.
- class Cap

  Capability type for RPC interfaces (see `L4::Cap<T>`).
- class Varg

  Variably sized RPC argument.
- class Varg_list

  Self-contained list of variable-sized RPC parameters.
- class Varg_list_ref

  List of variable-sized RPC parameters as received by the server.
- class Str_cp_in

  Abstraction for extracting a zero-terminated string from an Ipc::Istream.
- class Msg_ptr

  Pointer to an element of type T in an Ipc::Istream.
- class Istream

Input stream for IPC unmarshalling.

- class Ostream

  Output stream for IPC marshalling.

- class Iostream

  Input/Output stream for IPC [un]marshalling.

Typedefs

- using **Array_len_default** = unsigned short

  Default type for passing length of an array.

Functions

- template<typename T>
  Cap< T > make_cap (L4::Cap< T > cap, unsigned rights) noexcept

  Make an L4::Ipc::Cap<T> for the given capability and rights.

- template<typename T>
  Cap< T > make_cap_rw (L4::Cap< T > cap) noexcept

  Make an L4::Ipc::Cap<T> for the given capability with L4_CAP_FPAGE_RW rights.

- template<typename T>
  Cap< T > make_cap_rws (L4::Cap< T > cap) noexcept

  Make an L4::Ipc::Cap<T> for the given capability with L4_CAP_FPAGE_RWS rights.

- template<typename T>
  Cap< T > make_cap_full (L4::Cap< T > cap) noexcept

  Make an L4::IPC::Cap<T> for the given capability with full fpage and object-specific rights.

- template<typename T>
  Cap< T > make_cap_grant (L4::Cap< T > cap) noexcept

  Make an L4::IPC::Cap<T> for the given capability that shall be granted with full rights.

- template<typename T>
  Internal::Buf_cp_out< T > buf_cp_out (T const *v, unsigned long size)

  Insert an array into an Ipc::Ostream.

- template<typename T>
  Internal::Buf_cp_in< T > buf_cp_in (T *v, unsigned long &size)

  Extract an array from an Ipc::Istream.

- template<typename T>
  Str_cp_in< T > str_cp_in (T *v, unsigned long &size)

  Create a Str_cp_in for the given values.

- template<typename T>
  Msg_ptr< T > msg_ptr (T *&p)

  Create an Msg_ptr to adjust the given pointer.

- template<typename T>
  Internal::Buf_in< T > buf_in (T *&v, unsigned long &size)

  Return a pointer to stream array data.

- template<typename T>
  T read (Istream &s)

  Read a value out of a stream.

14.6.1 Detailed Description

IPC related functionality.

14.6.2 Function Documentation

14.6.2.1 buf_cp_in()

```
template<typename T>
Internal::Buf_cp_in< T > L4::Ipc::buf_cp_in (
            T * v,
            unsigned long & size)
```

Extract an array from an Ipc::Istream.

Parameters

	v	Pointer to the array that shall receive the values from the Ipc::Istream.
in,out	*size*	Input: the number of elements the array can take at most Output: the number of elements found in the stream.

buf_cp_in() can be used to extract an array from an Ipc::Istream. This is the counterpart buf_cp_out(). The data from the received message is thereby copied to the given buffer and size is set to the number of elements found in the stream. To avoid the copy operation buf_in() may be used instead.

See also

buf_in() and buf_cp_out().

Definition at line 159 of file ipc_stream.

14.6.2.2 buf_cp_out()

```
template<typename T>
Internal::Buf_cp_out< T > L4::Ipc::buf_cp_out (
            T const * v,
            unsigned long size)
```

Insert an array into an Ipc::Ostream.

Parameters

v	Pointer to the array that shall be inserted into an Ipc::Ostream.
size	Number of elements in the array.

This function inserts an array (e.g. a string) into an Ipc::Ostream. The data is copied to the stream. On insertion into the Ipc::Ostream exactly the given number of elements of type T are copied to the message buffer, this means the source buffer is no longer referenced after insertion into the stream.

See also

The counterpart is either buf_cp_in() or buf_in().

Definition at line 100 of file ipc_stream.

14.6.2.3 buf_in()

```
template<typename T>
Internal::Buf_in< T > L4::Ipc::buf_in (
            T *& v,
            unsigned long & size)
```

Return a pointer to stream array data.

Parameters

out	*v*	Pointer to the array within the Ipc::Istream.
out	*size*	The number of elements found in the stream.

This routine provides a possibility to extract an array from an Ipc::Istream, without extra copy overhead. In contrast to buf_cp_in() the data is not copied to a buffer, but a pointer to the array is returned. The user must make sure the UTCB is not used for other purposes while the returned pointer is still in use.
The mechanism is comparable to that of Msg_ptr, however it handles arrays inserted with buf_cp_out().

See also

buf_cp_in() and buf_cp_out().

Definition at line 310 of file ipc_stream.

14.6.2.4 make_cap()

```
template<typename T>
Cap< T > L4::Ipc::make_cap (
             L4::Cap< T > cap,
             unsigned rights)  [noexcept]
```

Make an L4::Ipc::Cap<T> for the given capability and rights.

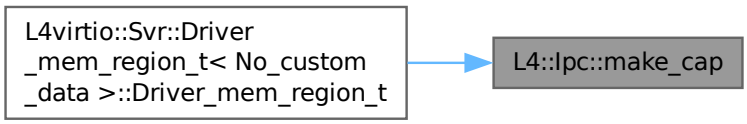
Template Parameters

T	(IMPLICIT) type of the referenced interface

Parameters

cap	source capability (L4::Cap<T>)
rights	rights mask that shall be applied on transfer.

Definition at line 845 of file ipc_types.
Referenced by L4virtio::Svr::Driver_mem_region_t< No_custom_data >::Driver_mem_region_t().
Here is the caller graph for this function:



14.6.2.5 make_cap_full()

```
template<typename T>
Cap< T > L4::Ipc::make_cap_full (
             L4::Cap< T > cap)  [noexcept]
```

Make an L4::IPC::Cap<T> for the given capability with full fpage and object-specific rights.

Template Parameters

T	(implicit) type of the referenced interface

Parameters

cap	source capability (L4::Cap<T>)

See also

L4_cap_fpage_rights

Attributes and additional permissions for object send items

Note

Full rights (including object-specific rights) are required when mapping an IPC gate where the receiver should become the server, i.e. where the receiver wants to call L4::Ipc_gate::bind_thread() or L4::Ipc_gate::bind_snd_destination().

Definition at line 884 of file ipc_types.
References L4_CAP_FPAGE_RWSD, and L4_FPAGE_C_OBJ_RIGHTS.

14.6.2.6 make_cap_grant()

```
template<typename T>
Cap< T > L4::Ipc::make_cap_grant (
            L4::Cap< T > cap)  [noexcept]
```

Make an L4::IPC::Cap<T> for the given capability that shall be granted with full rights.

Template Parameters

T	(implicit) type of the referenced interface

Parameters

cap	source capability (L4::Cap<T>)

See also

L4_MAP_ITEM_GRANT

Definition at line 897 of file ipc_types.
References L4::Ipc::Cap< T >::Grant, L4_CAP_FPAGE_RWSD, and L4_FPAGE_C_OBJ_RIGHTS.

14.6.2.7 make_cap_rw()

```
template<typename T>
Cap< T > L4::Ipc::make_cap_rw (
            L4::Cap< T > cap)  [noexcept]
```

Make an L4::Ipc::Cap<T> for the given capability with L4_CAP_FPAGE_RW rights.

Template Parameters

T	(IMPLICIT) type of the referenced interface

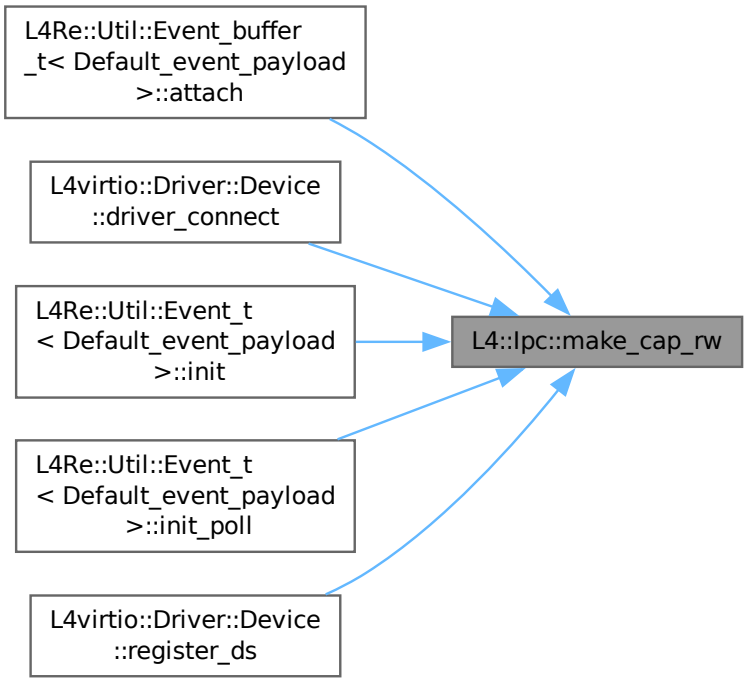
Parameters

cap	source capability (L4::Cap<T>)

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, examples/libs/l4re/c++/shared_ds/ds_clnt.cc, and examples/libs/l4re/c++/shared_

Definition at line 855 of file ipc_types.
References L4_CAP_FPAGE_RW.
Referenced by L4Re::Util::Event_buffer_t< Default_event_payload >::attach(), L4virtio::Driver::Device::driver_connect(), L4Re::Util::Event_t< Default_event_payload >::init(), L4Re::Util::Event_t< Default_event_payload >::init_poll(), and L4virtio::Driver::Device::register_ds().
Here is the caller graph for this function:



14.6.2.8 make_cap_rws()

```
template<typename T>
Cap< T > L4::Ipc::make_cap_rws (
            L4::Cap< T > cap)  [noexcept]
```

Make an L4::Ipc::Cap<T> for the given capability with L4_CAP_FPAGE_RWS rights.

Template Parameters

T	(IMPLICIT) type of the referenced interface

Parameters

cap	source capability (L4::Cap<T>)

Definition at line 865 of file ipc_types.
References L4_CAP_FPAGE_RWS.

14.6.2.9 msg_ptr()

```
template<typename T>
Msg_ptr< T > L4::Ipc::msg_ptr (
            T *& p)
```

Create an Msg_ptr to adjust the given pointer.
This function makes it more convenient to extract pointers to data in the message buffer itself from an Ipc::Istream.
This may be used to avoid copy out of large data structures. (See Msg_ptr.)
Definition at line 252 of file ipc_stream.

14.6.2.10 read()

```
template<typename T>
T L4::Ipc::read (
            Istream & s)  [inline]
```

Read a value out of a stream.

Parameters

s	An Istream.

Returns

The value of type `T`.

The stream position is progressed accordingly.
Definition at line 1289 of file ipc_stream.

14.6.2.11 str_cp_in()

```
template<typename T>
Str_cp_in< T > L4::Ipc::str_cp_in (
            T * v,
            unsigned long & size)
```

Create a Str_cp_in for the given values.

Parameters

	v	Pointer to the array that shall receive the values from the Ipc::Istream.
`in,out`	*size*	Input: the number of elements the array can take at most Output: the number of elements found in the stream.

This function makes it more convenient to extract arrays from an Ipc::Istream (

See also

Str_cp_in.)

Definition at line 213 of file ipc_stream.

14.7 L4::Ipc::Msg Namespace Reference

IPC Message related functionality.

Data Structures

- struct Elem< Array< A, LEN > >

  Array as input arguments.
- struct Elem< Array< A, LEN > & >

  Array as output argument.
- struct Elem< Array_ref< A, LEN > & >

  Array_ref as output argument.
- struct Clnt_noops

  Empty client side marshalling code.
- struct Svr_noops

  Empty server side marshalling code.
- struct Clnt_val_ops

  Defines client-side handling of 'MTYPE' as RPC argument.
- struct Svr_val_ops

  Defines server-side handling of 'MTYPE' as RPC argument.
- struct Elem

  Helper struct to describe various aspects of an IPC argument.
- struct Is_valid_rpc_type

  Type trait defining a valid RPC parameter type.
- struct Svr_arg_pack

  Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function.

Enumerations

- enum {
  Word_bytes = sizeof(l4_umword_t) , Item_words = 2 , Item_bytes = Word_bytes ∗ Item_words , Mr_words = L4_UTCB_GENERIC_DATA_SIZE ,
  Mr_bytes = Word_bytes ∗ Mr_words , Br_bytes = Word_bytes ∗ L4_UTCB_GENERIC_BUFFERS_SIZE }
- enum class Phase { }

  Phase during IPC argument mashalling.

Functions

- constexpr unsigned long align_to (unsigned long bytes, unsigned long align) noexcept

  Pad bytes to the given alignment align (in bytes).
- template<typename T>
  constexpr unsigned long align_to (unsigned long bytes) noexcept

  Pad bytes to the alignment of the type T.
- template<typename T>
  constexpr bool check_size (unsigned offset, unsigned limit) noexcept

  Check if there is enough space for T from offset to limit.
- template<typename T, typename CTYPE>
  bool check_size (unsigned offset, unsigned limit, CTYPE cnt) noexcept

Check if there is enough space for an array of T from offset to limit.

- template<typename T>
  int msg_add (char *msg, unsigned offs, unsigned limit, T v) noexcept

  Add some data to a message at offs.
- template<typename T>
  int msg_get (char *msg, unsigned offs, unsigned limit, T &v) noexcept

  Get some data from a message at offs.

14.7.1 Detailed Description

IPC Message related functionality.

14.7.2 Enumeration Type Documentation

14.7.2.1 anonymous enum

```
anonymous enum
```

Enumerator

Word_bytes	number of bytes for one message word
Item_words	number of message words for one message item
Item_bytes	number of bytes for one message item
Mr_words	number of message words available in the UTCB
Mr_bytes	number of bytes available in the UTCB message registers
Br_bytes	number of bytes available in the UTCB buffer registers

Definition at line 82 of file ipc_basics.

14.7.2.2 Phase

```
enum class L4::Ipc::Msg::Phase  [strong]
```

Phase during IPC argument mashalling.

Enumerator

Items	First phase: copy bytes to/from MRs.
Buffers	Second phase: place/read items into/from MRs.

Definition at line 142 of file ipc_basics.

14.7.3 Function Documentation

14.7.3.1 align_to() [1/2]

```
template<typename T>
unsigned long L4::Ipc::Msg::align_to (
            unsigned long bytes)  [constexpr], [noexcept]
```

Pad *bytes* to the alignment of the type *T*.

Template Parameters

T	The data type used for the alignment

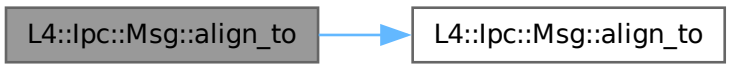
Parameters

bytes	The value to add the padding to

Returns

bytes padded to achieve the alignment of *T*.

Definition at line 37 of file ipc_basics.
References align_to().
Here is the call graph for this function:



14.7.3.2 align_to() [2/2]

```
unsigned long L4::Ipc::Msg::align_to (
            unsigned long bytes,
            unsigned long align)  [constexpr], [noexcept]
```

Pad bytes to the given alignment *align* (in bytes).

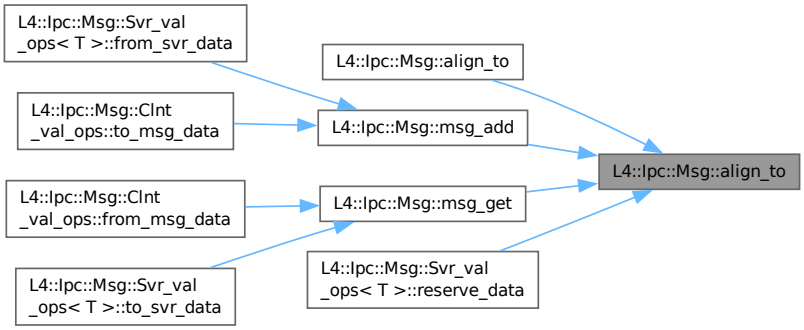
Parameters

bytes	The input value in bytes
align	The alignment value in bytes

Returns

the result after padding *bytes* to *align*.

Definition at line 27 of file ipc_basics.
Referenced by align_to(), msg_add(), msg_get(), and L4::Ipc::Msg::Svr_val_ops< T >::reserve_data().
Here is the caller graph for this function:



14.7.3.3 check_size() [1/2]

```
template<typename T>
bool L4::Ipc::Msg::check_size (
            unsigned offset,
            unsigned limit)  [constexpr], [noexcept]
```

Check if there is enough space for T from offset to limit.

Template Parameters

T	The data type that shall be fitted at *offset*

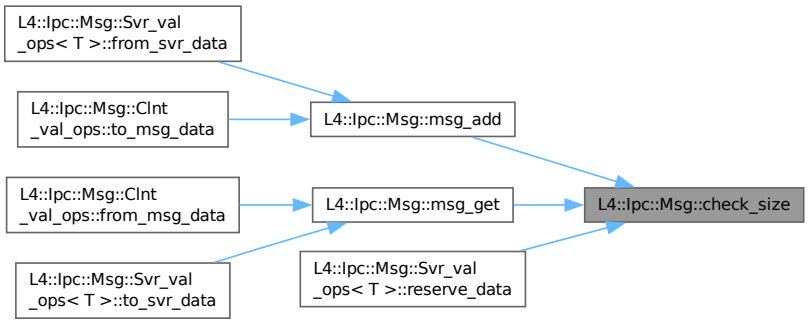
Parameters

offset	The current offset in bytes (must already be padded if desired).
limit	The limit in bytes that must not be exceeded after adding the size of *T*.

Returns

true if the limit will not be exceeded, false else.

Definition at line 50 of file ipc_basics.
Referenced by msg_add(), msg_get(), and L4::Ipc::Msg::Svr_val_ops< T >::reserve_data().
Here is the caller graph for this function:



14.7.3.4 check_size() [2/2]

```
template<typename T, typename CTYPE>
bool L4::Ipc::Msg::check_size (
            unsigned offset,
            unsigned limit,
            CTYPE cnt)  [inline], [noexcept]
```

Check if there is enough space for an array of T from offset to limit.

Template Parameters

T	The data type that shall be fitted at *offset*

CTYPE	Type of the *cnt* parameter

Parameters

offset	The current offset in bytes (must already be padded if desired).
limit	The limit in bytes that must not be exceeded after adding *cnt* times the size of *T*.
cnt	The number of elements of type *T* that shall be put at *offset*.

Returns

true if the limit will not be exceeded, false else.

Definition at line 68 of file ipc_basics.
References L4_UNLIKELY.

14.7.3.5 msg_add()

```
template<typename T>
int L4::Ipc::Msg::msg_add (
             char * msg,
             unsigned offs,
             unsigned limit,
             T v)  [inline], [noexcept]
```

Add some data to a message at offs.

Template Parameters

T	The type of the data to add

Parameters

msg	pointer to the start of the message
offs	The current offset within the message, this shall be padded to the alignment of *T* if *v* is added.
limit	The size limit in bytes that offset must not exceed.
v	The value to add to the message

Returns

The new offset when successful, a negative value if the given limit will be exceeded.

14.7.3.6 msg_get()

```
template<typename T>
int L4::Ipc::Msg::msg_get (
             char * msg,
             unsigned offs,
             unsigned limit,
             T & v)  [inline], [noexcept]
```

Get some data from a message at offs.

Template Parameters

T	The type of the data to read

Parameters

msg	Pointer to the start of the message

offs	The current offset within the message, this shall be padded to the alignment of *T* if a *v* can be read.
limit	The size limit in bytes that offset must not exceed.
v	A reference to receive the value from the message

Returns

The new offset when successful, a negative value if the given limit will be exceeded.

14.8 L4::Ipc_svr Namespace Reference

Helper classes for L4::Server instantiation.

Data Structures

- class Server_iface

  Interface for server-loop related functions.
- struct Ignore_errors

  Mix in for LOOP_HOOKS to ignore IPC errors.
- struct Default_timeout

  Mix in for LOOP_HOOKS to use a 0 send and an infinite receive timeout.
- struct Compound_reply

Mix in for LOOP_HOOKS to always use compound reply and wait.

- struct Default_setup_wait

  Mix in for LOOP_HOOKS for setup_wait no op.
- struct Direct_dispatch

  Direct dispatch helper, for forwarding dispatch calls to a registry R.
- struct Direct_dispatch< R * >

  Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry R.
- struct Exc_dispatch

  Dispatch helper wrapping try {} catch {} around the dispatch call.
- struct Dbg_dispatch

  Dispatch helper that, in addition to what Exc_dispatch does, prints exception messages.
- class Br_manager_no_buffers

  Empty implementation of Server_iface.
- struct Default_loop_hooks

  Default LOOP_HOOKS.
- class Timeout

  Callback interface for Timeout_queue.
- class Timeout_queue

  Timeout queue to be used in l4re server loop.
- class Timeout_queue_hooks

  Loop hooks mixin for integrating a timeout queue into the server loop.

Enumerations

- enum Reply_mode { Reply_compound , Reply_separate }

  Reply mode for server loop.

14.8.1 Detailed Description

Helper classes for L4::Server instantiation.

14.9 L4::Typeid Namespace Reference

Definition of interface data-type helpers.

Data Structures

- struct P_dispatch

  Use for protocol based dispatch stage.
- struct Raw_ipc

  RPCs list for passing raw incoming IPC to the server object.
- struct Rpcs

  Standard list of RPCs of an interface.
- struct Rpcs_code

  List of RPCs of an interface using a special opcode type.
- struct Rpc_nocode

  List of RPCs of an interface using a single operation without an opcode.
- struct Rpcs_sys

  List of RPCs typically used for kernel interfaces.

14.9.1 Detailed Description

Definition of interface data-type helpers.

Note

These type helpers are intended for internal use, if you look for standard C++ type traits use the <type_traits> header for the standard C++ library or use <l4/cxx/type_traits>.

14.10 L4::Types Namespace Reference

L4 basic type helpers for C++.

Data Structures

- class Flags

  Template for defining typical Flags bitmaps.
- struct Int_for_size

  Metafunction to get an unsigned integral type for the given size.
- struct Int_for_type

  Metafunction to get an integral type of the same size as T.
- struct Flags_ops_t

  Mixin class to define a set of friend bitwise operators on DT.
- struct Flags_t

  Template type to define a flags type with bitwise operations.
- struct __Add_rvalue_reference_helper

  Helper template for Add_rvalue_reference.
- struct __Add_rvalue_reference_helper< T, Void< T && > >

  Helper template for Add_rvalue_reference.
- struct Add_rvalue_reference

  Create an rvalue reference of the given type.
- struct Bool

  Boolean meta type.
- struct False

  False meta value.
- struct True

  True meta value.
- struct Integral_constant

  Wrapper for a static constant of the given type.
- struct Is_enum

  Check whether the given type is an enumeration type.
- struct Is_trivially_copyable

  Check whether the given type is trivially copyable.
- struct __Underlying_type_helper

  Helper template for Underlying_type.
- struct __Underlying_type_helper< T, false >

  Helper template for Underlying_type.
- struct Underlying_type

  Get an underlying type of an enumeration type.
- struct Same

  Compare two data types for equality.
- struct Same_template

  Check if a type T is an instantiation of a given template.

Typedefs

- template<typename...>
  using **Void** = void

  Map a sequence of any types to the void type.
- template<typename T>
  using **Add_rvalue_reference_t** = typename Add_rvalue_reference<T>::type

  Helper type for the Add_rvalue_reference.
- template<typename T>
  using **Underlying_type_t** = typename Underlying_type<T>::type

  Helper type for Underlying_type.
- template<bool Condition, typename T = void>
  using **Enable_if_t** = typename Enable_if<Condition, T>::type

  Helper type for Enable_if.

Functions

- template<typename T>
  Add_rvalue_reference_t< T > declval () noexcept

  Template for writing typed expressions in unevaluated contexts.

14.10.1 Detailed Description

L4 basic type helpers for C++.

14.10.2 Function Documentation

14.10.2.1 declval()

```
template<typename T>
Add_rvalue_reference_t< T > L4::Types::declval ()  [noexcept]
```

Template for writing typed expressions in unevaluated contexts.
In unevaluated contexts, the template converts a type (possibly an incomplete type) to an expression of that type.

Template Parameters

T	Type to be converted to an expression of that type.

14.11 L4Re Namespace Reference

L4Re C++ Interfaces.

Namespaces

- namespace Vfs

  Virtual file system for interfaces in POSIX libc.
- namespace Util

  Documentation of the L4 Runtime Environment utility functionality in C++.

Data Structures

- class Cap_alloc

  Capability allocator interface.
- class Smart_cap_auto

  Helper for Unique_cap and Unique_del_cap.
- class Smart_count_cap

Helper for Ref_cap and Ref_del_cap.

- class Console

  Console class.
- class Dataspace

  Interface for memory-like objects.
- class Debug_obj

  Debug interface.
- class Dma_space

  Managed DMA Address Space.
- class Dma_space_mgr

  A privileged interface to manage Dma_space associations for the clients.
- class Env

  C++ interface of the initial environment that is provided to an L4 task.
- class Event

  Event class.
- struct Default_event_payload

  Default event stream payload.
- class Event_buffer_t

  Event buffer class.
- class Inhibitor

  Set of inhibitor locks, which inhibit specific actions when held.
- class Itas

  Interface to the ITAS.
- class Log

  Log interface class.
- class Mem_alloc

  Memory allocation interface.
- struct Mmio_space

  Interface for memory-like address space accessible via IPC.
- class Namespace

  Name-space interface.
- class Parent

  Parent interface.
- struct Random

  Low-bandwidth interface for random number generators.
- class Rm

  Region map.

Typedefs

- template<typename T>
  using Shared_cap = L4::Detail::Shared_cap_impl<T, L4Re::Smart_count_cap<L4_FP_ALL_SPACES>>

  Shared capability that implements automatic free and unmap of the capability slot.
- template<typename T>
  using Shared_del_cap = L4::Detail::Shared_cap_impl<T, L4Re::Smart_count_cap<L4_FP_DELETE_OBJ>>

  Shared capability that implements automatic free and unmap+delete of the capability slot.
- template<typename T>
  using Unique_cap = L4::Detail::Unique_cap_impl<T, L4Re::Smart_cap_auto<L4_FP_ALL_SPACES>>

  Unique capability that implements automatic free and unmap of the capability slot.
- template<typename T>
  using Unique_del_cap = L4::Detail::Unique_cap_impl<T, L4Re::Smart_cap_auto<L4_FP_DELETE_OBJ>>

  Unique capability that implements automatic free and unmap+delete of the capability slot.

Functions

- void throw_error (long err, char const *extra="")

  Generate C++ exception.
- l4_ret_t chksys (l4_ret_t err, char const *extra="", l4_ret_t ret=0)

  Generate C++ exception on error.
- l4_ret_t chksys (l4_msgtag_t const &t, char const *extra="", l4_utcb_t *utcb=l4_utcb(), l4_ret_t ret=0)

  Generate C++ exception on error.
- l4_ret_t chksys (l4_msgtag_t const &t, l4_utcb_t *utcb, char const *extra="")

  Generate C++ exception on error.
- template<typename T>
  T chkcap (T &&cap, char const *extra="", l4_ret_t err=-L4_ENOMEM)

  Check for valid capability or raise C++ exception.
- l4_msgtag_t chkipc (l4_msgtag_t tag, char const *extra="", l4_utcb_t *utcb=l4_utcb())

  Test a message tag for IPC errors.
- template<typename T>
  Shared_cap< T > make_shared_cap (L4Re::Cap_alloc *ca)

  Allocate a capability slot and wrap it in a Shared_cap.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_cast (Shared_cap< U > const &from) noexcept

  Create a new shared capability by an explicit cast from another shared capability.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_cast (Shared_cap< U > &&from) noexcept

  Create a new shared capability by an explicit cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_reinterpret_cast (Shared_cap< U > const &from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_reinterpret_cast (Shared_cap< U > &&from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_dynamic_cast (Shared_cap< U > const &from) noexcept

  Create a new shared capability by a dynamic cast from another shared capability.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_dynamic_cast (Shared_cap< U > &&from) noexcept

  Create a new shared capability by an dynamic cast from another shared capability with move semantics.
- template<typename T>
  Shared_del_cap< T > make_shared_del_cap (L4Re::Cap_alloc *ca)

  Allocate a capability slot and wrap it in a Shared_del_cap.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_cast (Shared_del_cap< U > const &from) noexcept

  Create a new shared capability by an explicit cast from another shared capability.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_cast (Shared_del_cap< U > &&from) noexcept

  Create a new shared capability by an explicit cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_reinterpret_cast (Shared_del_cap< U > const &from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_reinterpret_cast (Shared_del_cap< U > &&from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_dynamic_cast (Shared_del_cap< U > const &from) noexcept

Create a new shared capability by a dynamic cast from another shared capability.

- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_dynamic_cast (Shared_del_cap< U > &&from) noexcept

  Create a new shared capability by an dynamic cast from another shared capability with move semantics.
- template<typename T>
  Unique_cap< T > make_unique_cap (L4Re::Cap_alloc *ca)

  Allocate a capability slot and wrap it in an Unique_cap.
- template<typename T>
  Unique_del_cap< T > make_unique_del_cap (L4Re::Cap_alloc *ca)

  Allocate a capability slot and wrap it in an Unique_del_cap.

14.11.1 Detailed Description

L4Re C++ Interfaces.
L4 Runtime Environment.

14.11.2 Typedef Documentation

14.11.2.1 Shared_cap

```
template<typename T>
using L4Re::Shared_cap = L4::Detail::Shared_cap_impl<T, L4Re::Smart_count_cap<L4_FP_ALL_SPACES>>
```

Shared capability that implements automatic free and unmap of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

This shared capability implements a counted reference to a capability slot. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

Note

This type is intended for users who implement a custom capability allocator; otherwise use L4Re::Util::Shared_cap.

Definition at line 34 of file shared_cap.

14.11.2.2 Shared_del_cap

```
template<typename T>
using L4Re::Shared_del_cap = L4::Detail::Shared_cap_impl<T, L4Re::Smart_count_cap<L4_FP_DELETE_OBJ>>
```

Shared capability that implements automatic free and unmap+delete of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

This shared capability implements a counted reference to a capability slot. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to Shared_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

Note

This type is intended for users who implement a custom capability allocator; otherwise use L4Re::Util::Shared_del_cap.

Definition at line 185 of file shared_cap.

14.11.2.3 Unique_cap

```
template<typename T>
using L4Re::Unique_cap = L4::Detail::Unique_cap_impl<T, L4Re::Smart_cap_auto<L4_FP_ALL_SPACES>>
```

Unique capability that implements automatic free and unmap of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

The ownership of the capability is managed in the same way as unique_ptr.

Note

This type is intended for users who implement a custom capability allocator; otherwise use L4Re::Util::Unique_cap.

Definition at line 31 of file unique_cap.

14.11.2.4 Unique_del_cap

```
template<typename T>
using L4Re::Unique_del_cap = L4::Detail::Unique_cap_impl<T, L4Re::Smart_cap_auto<L4_FP_DELETE_OBJ>>
```

Unique capability that implements automatic free and unmap+delete of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

The main difference to Unique_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

Note

This type is intended for users who implement a custom capability allocator; otherwise use L4Re::Util::Unique_del_cap.

Definition at line 65 of file unique_cap.

14.11.3 Function Documentation

14.11.3.1 chkcap()

```
template<typename T>
T L4Re::chkcap (
            T && cap,
            char const * extra = "",
            l4_ret_t err = -L4_ENOMEM)  [inline]
```

Check for valid capability or raise C++ exception.

Template Parameters

T	Type of object to check, must be capability-like (L4::Cap, L4Re::Util::Unique_cap etc.)

Parameters

cap	Capability value to check.
extra	Optional text for exception.

err	Error value for exception or 0 if the error code stored in the invalid capability should be used.

This function checks whether the capability is valid. If the capability is invalid, a C++ exception is generated, using err if err is not zero, otherwise the capability value is used. A valid capability will just be returned.
Definition at line 149 of file error_helper.
References L4_ENOMEM, L4_UNLIKELY, and throw_error().
Referenced by L4virtio::Svr::Dev_config::Dev_config(), L4virtio::Driver::Device::driver_connect(), L4virtio::Svr::Console::Device::regist

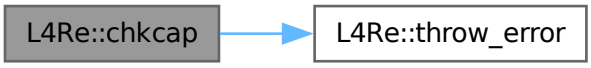
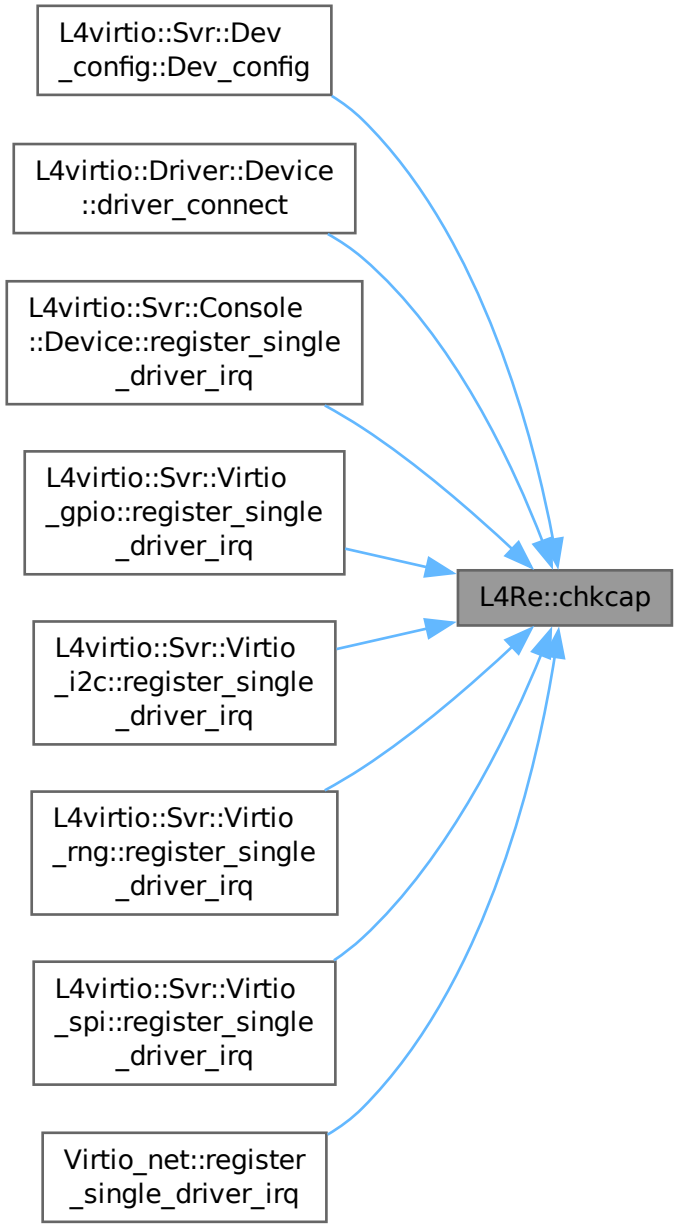
and Virtio_net::register_single_driver_irq().
Here is the call graph for this function:



Here is the caller graph for this function:



14.11.3.2 chkipc()

```
l4_msgtag_t L4Re::chkipc (
            l4_msgtag_t tag,
            char const * extra = "",
            l4_utcb_t * utcb = l4_utcb())  [inline]
```

Test a message tag for IPC errors.

Parameters

tag	Message tag returned by the IPC.
extra	Exception message in case of error.
utcb	The UTCB used in the IPC operation.

Returns

On IPC error an exception is thrown, otherwise `tag` is returned.

Exceptions

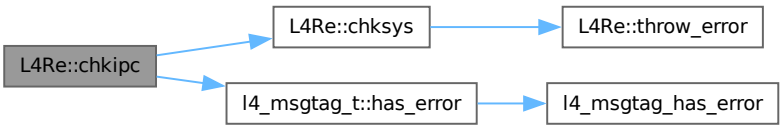
L4::Runtime_exception	with the translated IPC error code

This function does not check the message tag's label value.

Note

This must be called on a message tag before the UTCB is changed.

Definition at line 180 of file error_helper.
References chksys(), l4_msgtag_t::has_error(), and L4_UNLIKELY.
Here is the call graph for this function:



14.11.3.3 chksys() [1/3]

```
l4_ret_t L4Re::chksys (
             l4_msgtag_t const & t,
             char const * extra = "",
             l4_utcb_t * utcb = l4_utcb(),
             l4_ret_t ret = 0)  [inline]
```

Generate C++ exception on error.

Parameters

t	Message tag.
extra	Optional text for exception (default "")
utcb	Option UTCB
ret	Optional value for exception, default is error value (err)

This function throws an exception if the message tag contains an error or the label in the message tag is negative.
Otherwise the label in the message tag is returned.
Definition at line 93 of file error_helper.

References l4_msgtag_t::has_error(), L4_UNLIKELY, l4_msgtag_t::label(), and throw_error().

            l4_utcb_t * utcb,
            char const * extra = "")  [inline]
```

Generate C++ exception on error.

Parameters

t	Message tag.
utcb	UTCB.
extra	Optional text for exception (default "")

This function throws an exception if the message tag contains an error or the label in the message tag is negative.
Otherwise the label in the message tag is returned.
Definition at line 116 of file error_helper.
References chksys().
Here is the call graph for this function:

            char const * extra = "",
            l4_ret_t ret = 0)  [inline]
```

Generate C++ exception on error.

Parameters

err	Error value, if negative exception will be thrown
extra	Optional text for exception (default "")
ret	Optional value for exception, default is error value (err)

This function throws an exception if the err is negative and otherwise returns err.

14.12 L4Re::Util Namespace Reference

Documentation of the L4 Runtime Environment utility functionality in C++.

Data Structures

- class Cap_alloc_base

  Capability allocator.

- class Br_manager

  Buffer-register (BR) manager for L4::Server.
- struct Br_manager_hooks

  Predefined server-loop hooks for a server loop using the Br_manager.
- struct Br_manager_timeout_hooks

  Predefined server-loop hooks for a server with using the Br_manager and a timeout queue.
- class Smart_cap_auto

  Helper for Unique_cap and Unique_del_cap.
- class Smart_count_cap

  Helper for Ref_cap and Ref_del_cap.
- struct Ref_cap

  Automatic capability that implements automatic free and unmap of the capability slot.
- struct Ref_del_cap

  Automatic capability that implements automatic free and unmap+delete of the capability slot.
- class _Cap_alloc

  Adapter to expose the cap allocator implementation as L4Re::Cap_alloc compatible class.
- struct Counter

  Counter for Counting_cap_alloc with variable data width.
- struct Counter_atomic

  Thread safe version of counter for Counting_cap_alloc.
- class Counting_cap_alloc

  Internal reference-counting cap allocator.
- class Dataspace_svr

  Dataspace server class.
- class Event_t

  Convenience wrapper for getting access to an event object.
- class Event_buffer_t

  Event_buffer utility class.
- class Event_buffer_consumer_t

  An event buffer consumer.
- class Event_svr

  Convenience wrapper for implementing an event server.
- class Item_alloc_base

  Item allocator.
- class Object_registry

  A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread.
- class Registry_server

  A server loop object which has a Object_registry included.
- class Vcon_svr

  Console server template class.
- class Bitmap_base

  Basic bitmap abstraction.
- class Bitmap

  A static bitmap.

Typedefs

- template<typename T>
  using Shared_cap = L4::Detail::Shared_cap_impl<T, L4Re::Util::Smart_count_cap<L4_FP_ALL_SPACES>>

  Shared capability that implements automatic free and unmap of the capability slot.
- template<typename T>
  using Shared_del_cap = L4::Detail::Shared_cap_impl<T, L4Re::Util::Smart_count_cap<L4_FP_DELETE_OBJ>>

  Shared capability that implements automatic free and unmap+delete of the capability slot.
- template<typename T>
  using Unique_cap = L4::Detail::Unique_cap_impl<T, L4Re::Util::Smart_cap_auto<L4_FP_ALL_SPACES>>

  Unique capability that implements automatic free and unmap of the capability slot.
- template<typename T>
  using Unique_del_cap = L4::Detail::Unique_cap_impl<T, L4Re::Util::Smart_cap_auto<L4_FP_DELETE_OBJ>>

  Unique capability that implements automatic free and unmap+delete of the capability slot.

Functions

- template<typename T>
  Ref_cap< T >::Cap make_ref_cap ()

  Allocate a capability slot and wrap it in a Ref_cap.
- template<typename T>
  Ref_del_cap< T >::Cap make_ref_del_cap ()

  Allocate a capability slot and wrap it in a Ref_del_cap.
- int kumem_alloc (l4_addr_t *mem, unsigned pages_order, L4::Cap< L4::Task > task=L4Re::Env::env() ->task(), L4::Cap< L4Re::Rm > rm=L4Re::Env::env() ->rm()) noexcept

  Allocate state area.
- template<typename T>
  Shared_cap< T > make_shared_cap ()

  Allocate a capability slot and wrap it in a Shared_cap.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_cast (Shared_cap< U > const &from) noexcept

  Create a new shared capability by an explicit cast from another shared capability.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_cast (Shared_cap< U > &&from) noexcept

  Create a new shared capability by an explicit cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_reinterpret_cast (Shared_cap< U > const &from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_reinterpret_cast (Shared_cap< U > &&from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_dynamic_cast (Shared_cap< U > const &from) noexcept

  Create a new shared capability by a dynamic cast from another shared capability.
- template<typename T, typename U>
  Shared_cap< T > shared_cap_dynamic_cast (Shared_cap< U > &&from) noexcept

  Create a new shared capability by an dynamic cast from another shared capability with move semantics.
- template<typename T>
  Shared_del_cap< T > make_shared_del_cap ()

  Allocate a capability slot and wrap it in a Shared_del_cap.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_cast (Shared_del_cap< U > const &from) noexcept

  Create a new shared capability by an explicit cast from another shared capability.

- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_cast (Shared_del_cap< U > &&from) noexcept

  Create a new shared capability by an explicit cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_reinterpret_cast (Shared_del_cap< U > const &from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_reinterpret_cast (Shared_del_cap< U > &&from) noexcept

  Create a new shared capability by a reinterpret cast from another shared capability with move semantics.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_dynamic_cast (Shared_del_cap< U > const &from) noexcept

  Create a new shared capability by a dynamic cast from another shared capability.
- template<typename T, typename U>
  Shared_del_cap< T > shared_del_cap_dynamic_cast (Shared_del_cap< U > &&from) noexcept

  Create a new shared capability by an dynamic cast from another shared capability with move semantics.
- template<typename T>
  Unique_cap< T > make_unique_cap ()

  Allocate a capability slot and wrap it in an Unique_cap.
- template<typename T>
  Unique_del_cap< T > make_unique_del_cap ()

  Allocate a capability slot and wrap it in an Unique_del_cap.

Variables

- _Cap_alloc cap_alloc

  Capability allocator.
- Def_reply_cap_alloc reply_cap_alloc

  Reply capability allocator.

14.12.1 Detailed Description

Documentation of the L4 Runtime Environment utility functionality in C++.

14.12.2 Typedef Documentation

14.12.2.1 Shared_cap

```
template<typename T>
using L4Re::Util::Shared_cap = L4::Detail::Shared_cap_impl<T, L4Re::Util::Smart_count_cap<L4_FP_ALL_SPACES>>
```

Shared capability that implements automatic free and unmap of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

This shared capability implements a counted reference to a capability slot. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.
Usage:

```
L4Re::Util::Shared_cap<L4Re::Dataspace> global_ds_cap;

{
  L4Re::Util::Shared_cap<L4Re::Dataspace>
    ds_cap = make_shared_cap<L4Re::Dataspace>();
  // reference count for the allocated capability slot is now 1

  // use the dataspace cap
```

```
  L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

  global_ds_cap = ds_cap;
  // reference count is now 2
  ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
```

Definition at line 49 of file shared_cap.

14.12.2.2 Shared_del_cap

```
template<typename T>
using L4Re::Util::Shared_del_cap = L4::Detail::Shared_cap_impl<T, L4Re::Util::Smart_count_cap<L4_FP_DELETE_OB
```

Shared capability that implements automatic free and unmap+delete of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

This shared capability implements a counted reference to a capability slot. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to Shared_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.
Usage:

```
L4Re::Util::Shared_del_cap<L4Re::Dataspace> global_ds_cap;

{
  L4Re::Util::Shared_del_cap<L4Re::Dataspace>
    ds_cap = make_shared_del_cap<L4Re::Dataspace>();
  // reference count for the allocated capability slot is now 1

  // use the dataspace cap
  L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

  global_ds_cap = ds_cap;
  // reference count is now 2
  ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
...
global_ds_cap = L4_INVALID_CAP;
// reference count dropped to 0 (data space shall be deleted).
```

Definition at line 214 of file shared_cap.

14.12.2.3 Unique_cap

```
template<typename T>
using L4Re::Util::Unique_cap = L4::Detail::Unique_cap_impl<T, L4Re::Util::Smart_cap_auto<L4_FP_ALL_SPACES>>
```

Unique capability that implements automatic free and unmap of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

The ownership of the capability is managed in the same way as unique_ptr.
Usage:

```
{
  L4Re::Util::Unique_cap<L4Re::Dataspace>
    ds_cap = L4Re::Util::make_unique_cap<L4Re::Dataspace>();
```

```
  // use the dataspace cap
  L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

  ...

  // At the end of the scope ds_cap is unmapped and the capability
  // slot is freed.
}
```

Definition at line 43 of file unique_cap.

14.12.2.4 Unique_del_cap

```
template<typename T>
using L4Re::Util::Unique_del_cap = L4::Detail::Unique_cap_impl<T, L4Re::Util::Smart_cap_auto<L4_FP_DELETE_OBJ
```

Unique capability that implements automatic free and unmap+delete of the capability slot.

Template Parameters

T	Type of the object the capability refers to.

The main difference to Unique_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.
Usage:

```
{
  L4Re::Util::Unique_del_cap<L4Re::Dataspace>
    ds_cap = make_unique_del_cap<L4Re::Dataspace>());

  // use the dataspace cap
  L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

  ...

  // At the end of the scope ds_cap is unmapped and the capability
  // slot is freed. Because the deletion flag is set the data space
  // shall also be deleted (even if there are other references to this
  // data space).
}
```

Definition at line 87 of file unique_cap.

14.12.3 Function Documentation

14.12.3.1 make_shared_cap()

```
template<typename T>
Shared_cap< T > L4Re::Util::make_shared_cap ()
```

Allocate a capability slot and wrap it in a Shared_cap.

Template Parameters

T	Type of the object the capability refers to.

Definition at line 62 of file shared_cap.
References cap_alloc.
Referenced by L4virtio::Svr::Dev_config::Dev_config().

template<typename T, typename U>
Shared_del_cap< T > L4Re::Util::shared_del_cap_reinterpret_cast (
            Shared_del_cap< U > && from)  [noexcept]
```

Create a new shared capability by a reinterpret cast from another shared capability with move semantics.
After the call, `from` is empty.

See also

L4::cap_reinterpret_cast

Template Parameters

T	Type of the object the capability refers to.
U	Type of the source shared capability.

Parameters

from	Source shared capability.

Definition at line 300 of file shared_cap.
References L4::cap_reinterpret_cast().

14.13 L4Re::Vfs Namespace Reference

Virtual file system for interfaces in POSIX libc.

Data Structures

- class Be_file
  Boiler plate class for implementing an open file for L4Re::Vfs.
- class Be_file_system
  Boilerplate class for implementing a L4Re::Vfs::File_system.
- class Generic_file
  The common interface for an open POSIX file.
- class Directory
  Interface for a POSIX file that is a directory.
- class Regular_file
  Interface for a POSIX file that provides regular file semantics.
- class Special_file
  Interface for a POSIX file that provides special file semantics.
- class File
  The basic interface for an open POSIX file.
- class Mman
  Interface for POSIX memory management.
- class File_system
  Basic interface for an L4Re::Vfs file system.
- class Fs
  POSIX File-system related functionality.
- class Ops
  Interface for the POSIX backends of an application.

Functions

- L4Re::Vfs::Ops *vfs_ops **asm** ("l4re_env_posix_vfs_ops")
  Reference to the applications L4Re::Vfs::Ops singleton.

14.13.1 Detailed Description

Virtual file system for interfaces in POSIX libc.

14.14 L4vbus Namespace Reference

C++ interface of the Vbus API.

Data Structures

- class Pm

  Power-management API mixin.
- class Device

  Device on a L4vbus::Vbus.
- class Icu

  Vbus Interrupt controller API.
- class Vbus

  The virtual bus (Vbus) interface.
- class Gpio_pin

  A GPIO pin.
- class Gpio_module

  A Gpio_module groups multiple GPIO pins together.
- class Pci_host_bridge

  A Pci host bridge.
- class Pci_dev

  A PCI device.

14.14.1 Detailed Description

C++ interface of the Vbus API.
The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an Icu (Interrupt controller) for interrupt handling.
The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.
Refer to L4 Vbus functions for the C API.

Include File

```
#include <l4/vbus/vbus>
```

Include File

```
#include <l4/vbus/vbus_gpio>
```

Include File

```
#include <l4/vbus/vbus_pci>
```

14.15 L4virtio Namespace Reference

L4-VIRTIO Transport C++ API.

Data Structures

- class Device

  IPC interface for virtio over L4 IPC.
- class Ptr

  Pointer used in virtio descriptors.
- class Virtqueue

  Low-level Virtqueue.

14.15.1 Detailed Description

L4-VIRTIO Transport C++ API.

Chapter 15

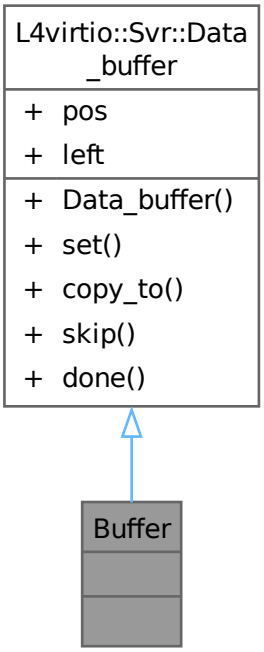
Data Structure Documentation

15.1 Buffer Struct Reference

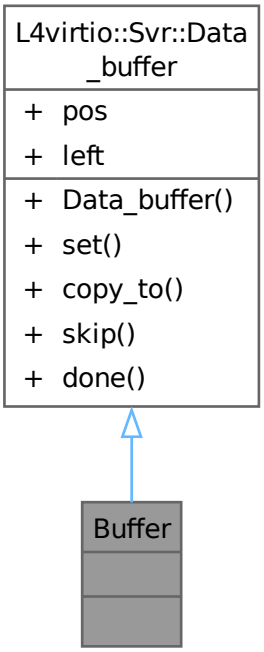
Data buffer used to transfer packets.

`#include <virtio_net_buffer.h>`

Inheritance diagram for Buffer:



Collaboration diagram for Buffer:



Additional Inherited Members

Public Member Functions inherited from L4virtio::Svr::Data_buffer

- template<typename T>
  Data_buffer (T *p)

  Create buffer for object p.
- template<typename T>
  void set (T *p)

  Set buffer for object p.
- l4_uint32_t copy_to (Data_buffer *dst, l4_uint32_t max=UINT_MAX)

  Copy contents from this buffer to the destination buffer.
- l4_uint32_t skip (l4_uint32_t bytes)

  Skip given number of bytes in this buffer.
- bool done () const

  Check if there are no more bytes left in the buffer.

Data Fields inherited from L4virtio::Svr::Data_buffer

- char * **pos**

  Current buffer position.
- l4_uint32_t **left**

  Bytes left in buffer.

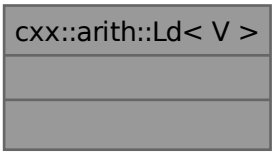
15.1.1 Detailed Description

Data buffer used to transfer packets.
Definition at line 19 of file virtio_net_buffer.h.
The documentation for this struct was generated from the following file:

- pkg/virtio-net-switch/server/switch/virtio_net_buffer.h

15.2 cxx::arith::Ld< V > Struct Template Reference

Computes the binary logarithm of the given number at compile time.
`#include <arith>`
Collaboration diagram for cxx::arith::Ld< V >:



15.2.1 Detailed Description

template<unsigned long V>
struct cxx::arith::Ld< V >

Computes the binary logarithm of the given number at compile time.

Parameters

val	Number whose logarithm to compute, must be greater than zero.

Returns

The binary logarithm of `val`.

Definition at line 48 of file arith.
The documentation for this struct was generated from the following file:

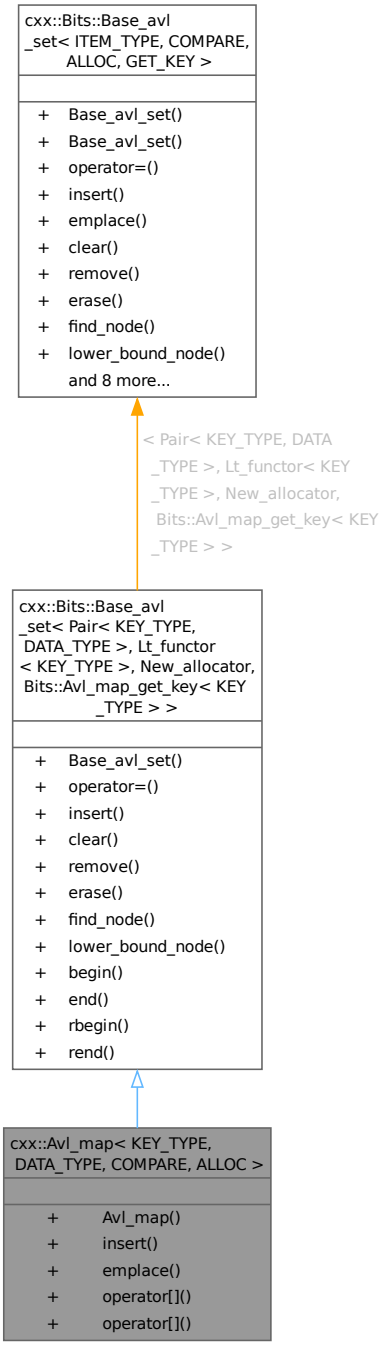
- l4/cxx/arith

15.3 cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC > Class Template Reference

AVL tree based associative container.
`#include <avl_map>`

Inheritance diagram for cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >:

Collaboration diagram for cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >:



Public Types

- typedef COMPARE< KEY_TYPE > **Key_compare**

  Type of the comparison functor.
- typedef KEY_TYPE **Key_type**

  Type of the key values.
- typedef DATA_TYPE **Data_type**

  Type of the data values.

- typedef Base_type::Node **Node**

  Return type for find.
- typedef Base_type::Node_allocator **Node_allocator**

  Type of the allocator.

Public Types inherited from cxx::Bits::Base_avl_set< Pair< KEY_TYPE, DATA_TYPE >, Lt_functor< KEY_TYPE >, New_allocator,

- enum

  Return status constants.
- typedef Pair< KEY_TYPE, DATA_TYPE > **Item_type**

  Type for the items store in the set.
- typedef Bits::Avl_map_get_key< KEY_TYPE > **Get_key**

  Key-getter type to derive the sort key of an internal node.
- typedef Bits::Avl_map_get_key< KEY_TYPE >::Key_type **Key_type**

  Type of the sort key used for the items.
- typedef Type_traits< Item_type >::Const_type **Const_item_type**

  Type used for const items within the set.
- typedef Lt_functor< KEY_TYPE > **Item_compare**

  Type for the comparison functor.
- typedef New_allocator< _Node > **Node_allocator**

  Type for the node allocator.
- typedef Avl_set_iter< _Node, Item_type, Fwd > **Iterator**

  Forward iterator for the set.
- typedef Avl_set_iter< _Node, Const_item_type, Fwd > **Const_iterator**

  Constant forward iterator for the set.
- typedef Avl_set_iter< _Node, Item_type, Rev > **Rev_iterator**

  Backward iterator for the set.
- typedef Avl_set_iter< _Node, Const_item_type, Rev > **Const_rev_iterator**

  Constant backward iterator for the set.

Public Member Functions

- Avl_map (Node_allocator const &alloc=Node_allocator())

  Create an empty AVL-tree based map.
- cxx::Pair< Iterator, int > insert (Key_type const &key, Data_type const &data)

  Insert a <key, data> pair into the map.
- template<typename... Args>
  cxx::Pair< Iterator, int > emplace (Args &&...args)

  Emplace a pair into the map.
- Data_type const & operator[ ] (Key_type const &key) const &

  Get the data for the given key.
- Data_type & operator[ ] (Key_type const &key) &

  Get or insert data for the given key.

Public Member Functions inherited from cxx::Bits::Base_avl_set< Pair< KEY_TYPE, DATA_TYPE >, Lt_functor< KEY_TYPE >, New_allocator,

- Base_avl_set (Node_allocator const &alloc=Node_allocator())

  Create a AVL-tree based set.
- Base_avl_set & operator= (Base_avl_set const &o)

  Copy assignment operator of an AVL-tree based set.

- cxx::Pair< Iterator, int > insert (Item_type const &item)

  Insert an item into the set.
- void **clear** () noexcept

  Remove all items from the set.
- int remove (Key_type const &item)

  Remove an item from the set.
- int erase (Key_type const &item)

  Erase the item with the given key.
- Node find_node (Key_type const &item) const

  Lookup a node equal to `item`.
- Node lower_bound_node (Key_type const &key) const

  Find the first node greater or equal to `key`.
- Const_iterator begin () const

  Get the constant forward iterator for the first element in the set.
- Const_iterator end () const

  Get the end marker for the constant forward iterator.
- Const_rev_iterator rbegin () const

  Get the constant backward iterator for the last element in the set.
- Const_rev_iterator rend () const

  Get the end marker for the constant backward iterator.

15.3.1 Detailed Description

template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↩ functor, template< typename B > class ALLOC = New_allocator>
class cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >

AVL tree based associative container.

Template Parameters

KEY_TYPE	Type of the key values.
DATA_TYPE	Type of the data values.
COMPARE	Type comparison functor for the key values.
ALLOC	Type of the allocator used for the nodes.

Definition at line 45 of file avl_map.

15.3.2 Constructor & Destructor Documentation

15.3.2.1 Avl_map()

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↩
functor, template< typename B > class ALLOC = New_allocator>
cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::Avl_map (
            Node_allocator const & alloc = Node_allocator())  [inline]
```

Create an empty AVL-tree based map.

Parameters

alloc	The node allocator.

Definition at line 80 of file avl_map.

15.3.3 Member Function Documentation

15.3.3.1 emplace()

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↩
functor, template< typename B > class ALLOC = New_allocator>
template<typename...  Args>
cxx::Pair< Iterator, int > cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::emplace (
            Args &&...  args)  [inline]
```

Emplace a pair into the map.

Parameters

args	The cxx::Pair constructor arguments for key & value.

Returns

A pair of iterator (`first`) and return value (`second`). `second` will be 0 if the element was inserted into the set and -#`E_exist` if the key was already in the set and the set was therefore not updated. In both cases, `first` contains an iterator that points to the element. `second` may also be -#`E_nomem` when memory for the new node could not be allocated. `first` is then invalid.

Definition at line 117 of file avl_map.

15.3.3.2 insert()

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↩
functor, template< typename B > class ALLOC = New_allocator>
cxx::Pair< Iterator, int > cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::insert (
            Key_type const & key,
            Data_type const & data)  [inline]
```

Insert a <key, data> pair into the map.

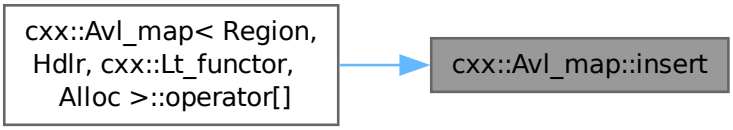
Parameters

key	The key value.
data	The data value to insert.

Returns

A pair of iterator (`first`) and return value (`second`). `second` will be 0 if the element was inserted into the set and `-#E_exist` if the key was already in the set and the set was therefore not updated. In both cases, `first` contains an iterator that points to the element. `second` may also be `-#E_nomem` when memory for the new node could not be allocated. `first` is then invalid.

Definition at line 99 of file avl_map.
Referenced by cxx::Avl_map< Region, Hdlr, cxx::Lt_functor, Alloc >::operator[]().
Here is the caller graph for this function:



15.3.3.3 operator[]() [1/2]

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↩
functor, template< typename B > class ALLOC = New_allocator>
Data_type & cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::operator[] (
            Key_type const & key) &  [inline]
```

Get or insert data for the given key.

Parameters

key	The key value to use for lookup.

Returns

If the item already exists, a reference to the data item. Otherwise a new data item is default-constructed and inserted under the given key before a reference is returned.

Definition at line 139 of file avl_map.

15.3.3.4 operator[]() [2/2]

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↩
functor, template< typename B > class ALLOC = New_allocator>
Data_type const & cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::operator[] (
            Key_type const & key) const &  [inline]
```

Get the data for the given key.

Parameters

key	The key value to use for lookup.

Precondition

A <key, data> pair for the given key value must exist.

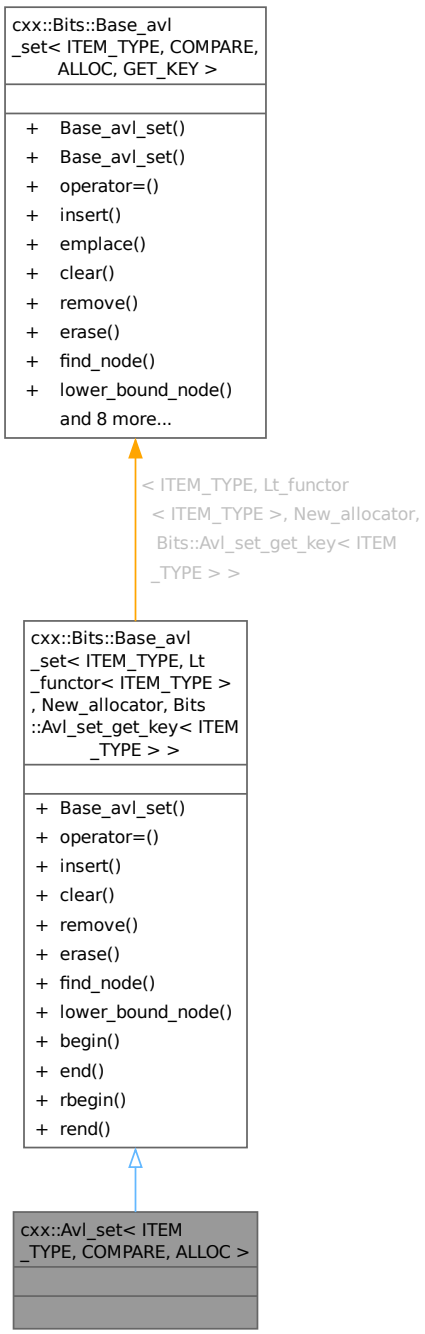
Definition at line 125 of file avl_map.
The documentation for this class was generated from the following file:

- l4/cxx/avl_map

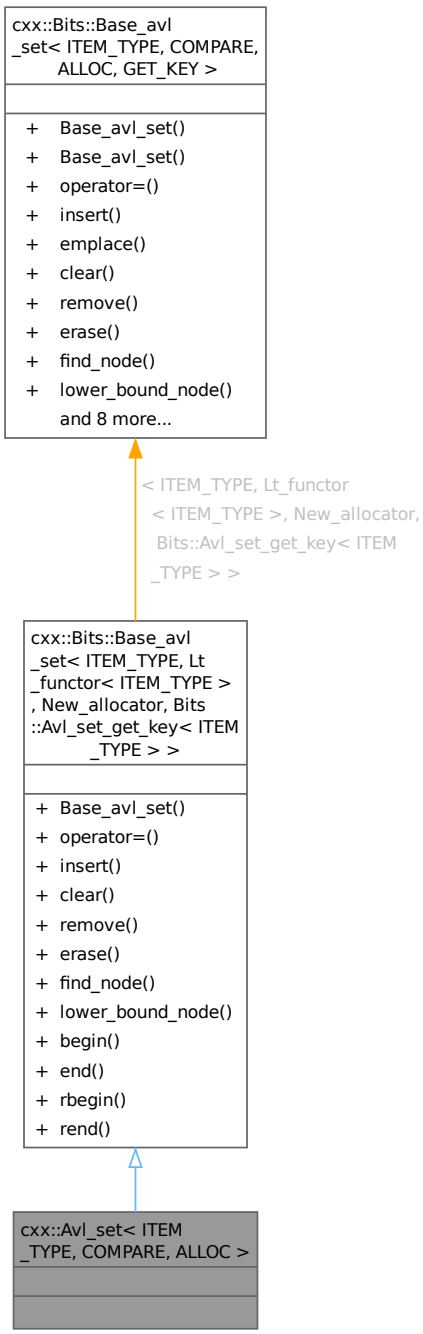
15.4 cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC > Class Template Reference

AVL set for simple comparable items.
`#include <avl_set>`

Inheritance diagram for cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >:



Collaboration diagram for cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >:



Additional Inherited Members

Public Types inherited from cxx::Bits::Base_avl_set< ITEM_TYPE, Lt_functor< ITEM_TYPE >, New_allocator, Bits::Avl_set_get_ke

- enum

  Return status constants.
- typedef ITEM_TYPE **Item_type**

Type for the items store in the set.

- typedef Bits::Avl_set_get_key< ITEM_TYPE > **Get_key**

  Key-getter type to derive the sort key of an internal node.
- typedef Bits::Avl_set_get_key< ITEM_TYPE >::Key_type **Key_type**

  Type of the sort key used for the items.
- typedef Type_traits< Item_type >::Const_type **Const_item_type**

  Type used for const items within the set.
- typedef Lt_functor< ITEM_TYPE > **Item_compare**

  Type for the comparison functor.
- typedef New_allocator< _Node > **Node_allocator**

  Type for the node allocator.
- typedef Avl_set_iter< _Node, Item_type, Fwd > **Iterator**

  Forward iterator for the set.
- typedef Avl_set_iter< _Node, Const_item_type, Fwd > **Const_iterator**

  Constant forward iterator for the set.
- typedef Avl_set_iter< _Node, Item_type, Rev > **Rev_iterator**

  Backward iterator for the set.
- typedef Avl_set_iter< _Node, Const_item_type, Rev > **Const_rev_iterator**

  Constant backward iterator for the set.

Public Member Functions inherited from cxx::Bits::Base_avl_set< ITEM_TYPE, Lt_functor< ITEM_TYPE >, New_allocator, Bits::Avl_set_get_ke

- Base_avl_set (Node_allocator const &alloc=Node_allocator())

  Create a AVL-tree based set.
- Base_avl_set & operator= (Base_avl_set const &o)

  Copy assignment operator of an AVL-tree based set.
- cxx::Pair< Iterator, int > insert (Item_type const &item)

  Insert an item into the set.
- void **clear** () noexcept

  Remove all items from the set.
- int remove (Key_type const &item)

  Remove an item from the set.
- int erase (Key_type const &item)

  Erase the item with the given key.
- Node find_node (Key_type const &item) const

  Lookup a node equal to `item`.
- Node lower_bound_node (Key_type const &key) const

  Find the first node greater or equal to `key`.
- Const_iterator begin () const

  Get the constant forward iterator for the first element in the set.
- Const_iterator end () const

  Get the end marker for the constant forward iterator.
- Const_rev_iterator rbegin () const

  Get the constant backward iterator for the last element in the set.
- Const_rev_iterator rend () const

  Get the end marker for the constant backward iterator.

15.4.1 Detailed Description

template<typename ITEM_TYPE, template< typename T > class COMPARE = Lt_functor, template< typename A > class ALLOC = New_allocator>
class cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >

AVL set for simple comparable items.
The AVL set can store any kind of items where a partial order is defined. The default relation is defined by the '<' operator.

Template Parameters

ITEM_TYPE	The type of the items to be stored in the set.
COMPARE	The relation to define the partial order, default is to use operator '<'.
ALLOC	The allocator to use for the nodes of the AVL set.

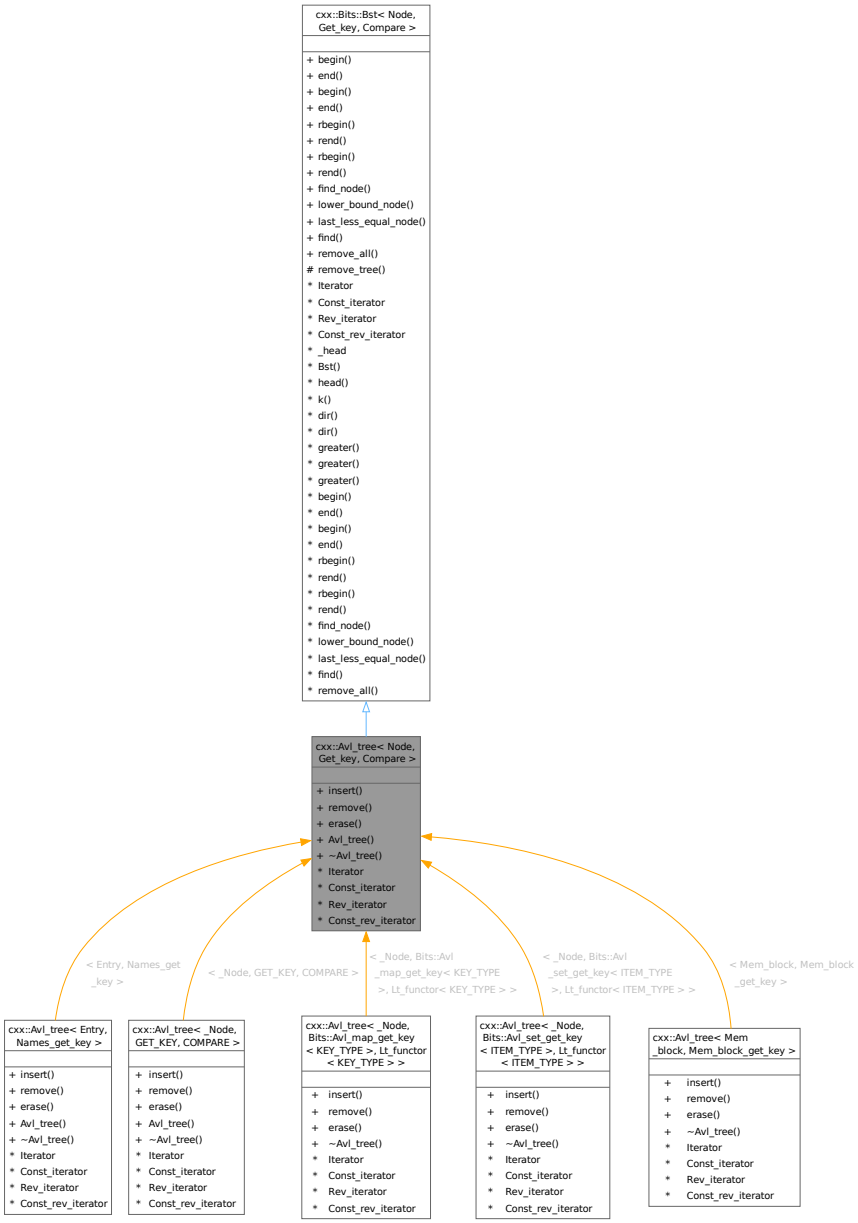
Definition at line 538 of file avl_set.
The documentation for this class was generated from the following file:

- l4/cxx/avl_set

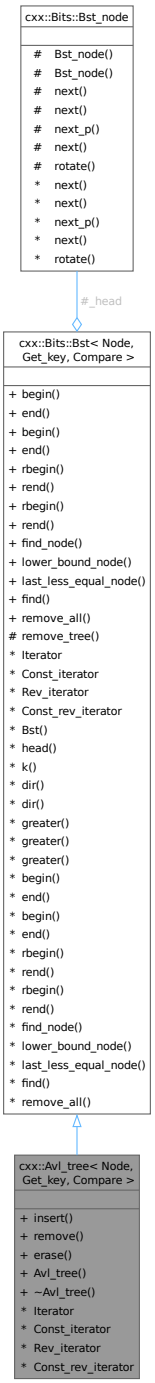
15.5 cxx::Avl_tree< Node, Get_key, Compare > Class Template Reference

A generic AVL tree.
`#include <avl_tree>`

Inheritance diagram for cxx::Avl_tree< Node, Get_key, Compare >:



Collaboration diagram for cxx::Avl_tree< Node, Get_key, Compare >:



Public Types

- typedef Bst::Iterator Iterator
- typedef Bst::Const_iterator **Const_iterator**

  Constant forward iterator for the tree.
- typedef Bst::Rev_iterator **Rev_iterator**

Backward iterator for the tree.

- typedef Bst::Const_rev_iterator **Const_rev_iterator**

  Constant backward iterator for the tree.

Public Types inherited from cxx::Bits::Bst< Node, Get_key, Compare >

- typedef Get_key::Key_type **Key_type**

  The type of key values used to generate the total order of the elements.
- typedef Type_traits< Key_type >::Param_type **Key_param_type**

  The type for key parameters.
- typedef Fwd **Fwd_iter_ops**

  Helper for building forward iterators for different wrapper classes.
- typedef Rev **Rev_iter_ops**

  Helper for building reverse iterators for different wrapper classes.
- typedef __Bst_iter< Node, Node, Fwd > **Iterator**

  Forward iterator.
- typedef __Bst_iter< Node, Node const, Fwd > **Const_iterator**

  Constant forward iterator.
- typedef __Bst_iter< Node, Node, Rev > **Rev_iterator**

  Backward iterator.
- typedef __Bst_iter< Node, Node const, Rev > **Const_rev_iterator**

  Constant backward.

Public Member Functions

- Pair< Node *, bool > insert (Node *new_node)

  Insert a new node into this AVL tree.
- Node * remove (Key_param_type key)

  Remove the node with key from the tree.
- Node * **erase** (Key_param_type key)

  An alias for remove().
- **Avl_tree** ()=default

  Create an empty AVL tree.
- ~**Avl_tree** () noexcept

  Destroy the tree.

Public Member Functions inherited from cxx::Bits::Bst< Node, Get_key, Compare >

- Const_iterator begin () const

  Get the constant forward iterator for the first element in the set.
- Const_iterator end () const

  Get the end marker for the constant forward iterator.
- Iterator begin ()

  Get the mutable forward iterator for the first element of the set.
- Iterator end ()

  Get the end marker for the mutable forward iterator.
- Const_rev_iterator rbegin () const

  Get the constant backward iterator for the last element in the set.
- Const_rev_iterator rend () const

  Get the end marker for the constant backward iterator.
- Rev_iterator rbegin ()

Get the mutable backward iterator for the last element of the set.

- Rev_iterator rend ()

  Get the end marker for the mutable backward iterator.

- Node * find_node (Key_param_type key) const

  find the node with the given key.

- Node * lower_bound_node (Key_param_type key) const

  Find the first node with a key not less than the given `key`.

- Node * last_less_equal_node (Key_param_type key) const

  Find the last node with a key less than or equal to the given `key`.

- Const_iterator find (Key_param_type key) const

  find the node with the given key.

- template<typename FUNC>
  void remove_all (FUNC &&callback)

  Clear the tree.

Additional Inherited Members

- **Bst** ()

  Create an empty tree.

- Node * **head** () const

  Access the head node as object of type Node.

Static Protected Member Functions inherited from cxx::Bits::Bst< Node, Get_key, Compare >

- template<typename FUNC>
  static void remove_tree (Bst_node *head, FUNC &&callback)

  Remove all elements in the subtree of head.

- static Key_type **k** (Bst_node const *n)

  Get the key value of n.

- static Dir dir (Key_param_type l, Key_param_type r)

  Get the direction to go from `l` to search for `r`.

- static Dir dir (Key_param_type l, Bst_node const *r)

  Get the direction to go from `l` to search for `r`.

- static bool **greater** (Key_param_type l, Key_param_type r)

  Is l greater than r.

- static bool **greater** (Key_param_type l, Bst_node const *r)

  Is l greater than r.

- static bool **greater** (Bst_node const *l, Bst_node const *r)

  Is l greater than r.

- Bst_node * **_head**

  The head pointer of the tree.

15.5.1 Detailed Description

template<typename Node, typename Get_key, typename Compare = Lt_functor<typename Get_key::Key_type>>
class cxx::Avl_tree< Node, Get_key, Compare >

A generic AVL tree.

Template Parameters

Node	The data type of the nodes (must inherit from Avl_tree_node).
Get_key	The meta function to get the key value from a node. The implementation uses `Get_key::key_of(ptr_to_node)`. The type of the key values must be defined in `Get_key::Key_type`.
Compare	Binary relation to establish a total order for the nodes of the tree. `Compare()(l, r)` must return true if the key *l* is smaller than the key *r*.

This implementation does not provide any memory management. It is the responsibility of the caller to allocate nodes before inserting them and to free them when they are removed or when the tree is destroyed. Conversely, the caller must also ensure that nodes are removed from the tree before they are destroyed.

Examples

tmpfs/lib/src/fs.cc.

Definition at line 100 of file avl_tree.

15.5.2 Member Typedef Documentation

15.5.2.1 Iterator

```
template<typename Node, typename Get_key, typename Compare = Lt_functor<typename Get_key::Key_type>>
typedef Bst::Iterator cxx::Avl_tree< Node, Get_key, Compare >::Iterator
```

Forward iterator for the tree.
Definition at line 130 of file avl_tree.

15.5.3 Member Function Documentation

15.5.3.1 insert()

```
template<typename Node, typename Get_key, class Compare>
Pair< Node *, bool > cxx::Avl_tree< Node, Get_key, Compare >::insert (
            Node * new_node)
```

Insert a new node into this AVL tree.

Parameters

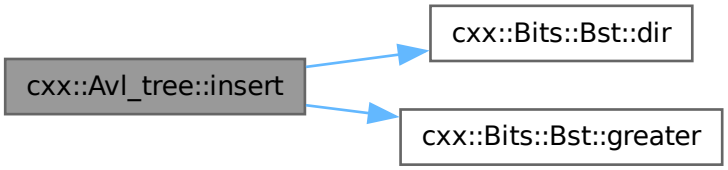
new_node	A pointer to the new node.

Returns

A pair, with *second* set to `true` and *first* pointing to *new_node*, on success. If there is already a node with the same key then *first* points to this node and *second* is 'false'.

Definition at line 220 of file avl_tree.
References cxx::Bits::Bst< Node, Get_key, Compare >::dir(), cxx::Bits::Bst< Node, Get_key, Compare >::greater(), and cxx::Bits::Direction::N.

Here is the call graph for this function:



15.5.3.2 remove()

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Avl_tree< Node, Get_key, Compare >::remove (
            Key_param_type key)  [inline]
```

Remove the node with *key* from the tree.

Parameters

key	The key to the node to remove.

Returns

The pointer to the removed node on success, or 0 if no node with the *key* exists.

Definition at line 282 of file avl_tree.
References cxx::Bits::Bst< Node, Get_key, Compare >::dir(), cxx::Bits::Bst< Node, Get_key, Compare >::greater(), cxx::Bits::Direction::L, and cxx::Bits::Direction::N.

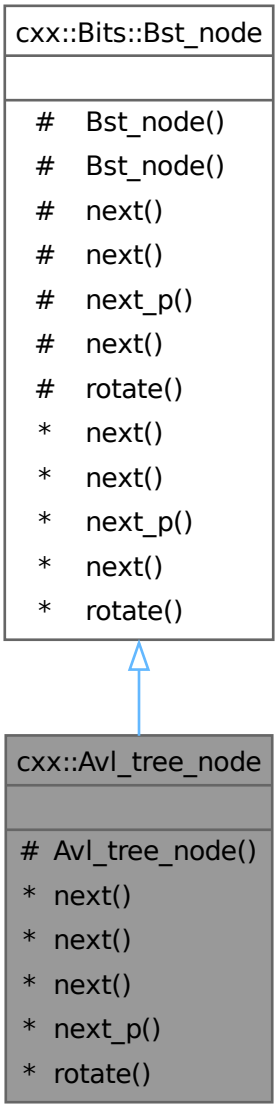
15.6 cxx::Avl_tree_node Class Reference

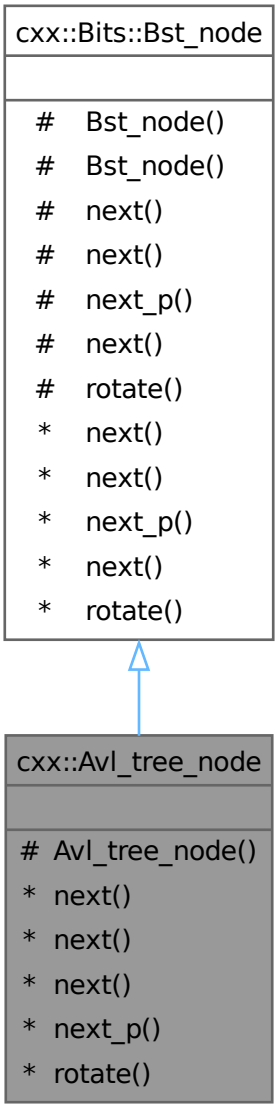
Node of an AVL tree.

`#include <avl_tree>`

Inheritance diagram for cxx::Avl_tree_node:



Collaboration diagram for cxx::Avl_tree_node:



Protected Member Functions

- **Avl_tree_node** ()=default

  Create an uninitialized node, this is what you should do.

Protected Member Functions inherited from cxx::Bits::Bst_node

- **Bst_node** ()

  Create uninitialized node.
- **Bst_node** (bool)

  Create initialized node.

Additional Inherited Members

Static Protected Member Functions inherited from cxx::Bits::Bst_node

- static Bst_node * **next** (Bst_node const *p, Direction d)

  Get next node in direction d.
- static void **next** (Bst_node *p, Direction d, Bst_node *n)

  Set next node of p in direction d to n.
- static Bst_node ** **next_p** (Bst_node *p, Direction d)

  Get pointer to link in direction d.
- template<typename Node>
  static Node * **next** (Bst_node const *p, Direction d)

  Get next node in direction d as type Node.
- static void **rotate** (Bst_node **t, Direction idir)

  Rotate subtree t in the opposite direction of idir.

15.6.1 Detailed Description

Node of an AVL tree.

Examples

tmpfs/lib/src/fs.cc.

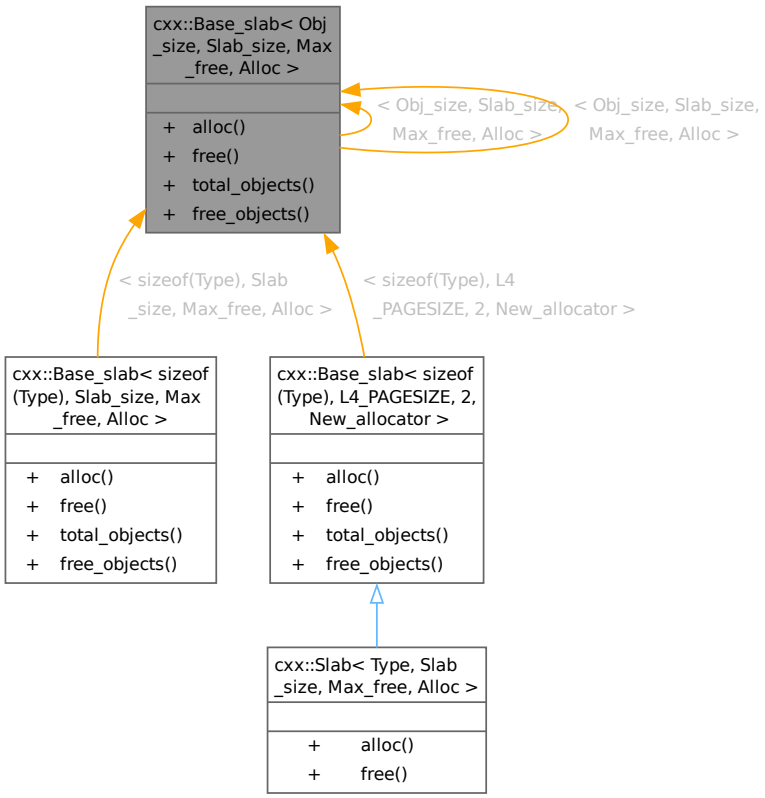
Definition at line 29 of file avl_tree.
The documentation for this class was generated from the following file:

- l4/cxx/avl_tree

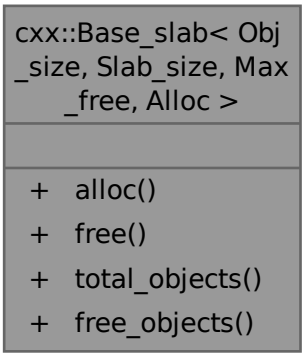
15.7 cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc > Class Template Reference

Basic slab allocator.
`#include <slab_alloc>`

Inheritance diagram for cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >:



Collaboration diagram for cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >:



Data Structures

- struct Slab_i

  Type of a slab.

Public Types

- enum { object_size = Obj_size , slab_size = Slab_size , objects_per_slab = (Slab_size - sizeof(Slab_head)) / object_size , max_free_slabs = Max_free }
- typedef Alloc< Slab_i > **Slab_alloc**

  Type of the backend allocator.

Public Member Functions

- void * alloc () noexcept

  Allocate a new object.
- void free (void *_o) noexcept

  Free the given object (_o).
- unsigned total_objects () const noexcept

  Get the total number of objects managed by the slab allocator.
- unsigned free_objects () const noexcept

  Get the number of objects which can be allocated before a new empty slab needs to be added to the slab allocator.

15.7.1 Detailed Description

template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc = New_allocator>
class cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >

Basic slab allocator.

Template Parameters

Obj_size	The size of the objects managed by the allocator (in bytes).
Slab_size	The size of a slab (in bytes).
Max_free	The maximum number of free slabs. When this limit is reached slabs are freed, provided that the backend allocator supports allocated memory to be freed.
Alloc	The backend allocator used to allocate slabs.

Definition at line 31 of file slab_alloc.

15.7.2 Member Enumeration Documentation

15.7.2.1 anonymous enum

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
anonymous enum
```

Enumerator

object_size	Size of an object.
slab_size	Size of a slab.
objects_per_slab	Objects per slab.
max_free_slabs	Maximum number of free slabs.

Definition at line 65 of file slab_alloc.

15.7.3 Member Function Documentation

15.7.3.1 alloc()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void * cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::alloc ()  [inline], [noexcept]
```

Allocate a new object.

Returns

A pointer to the new object if the allocation succeeds, or 0 on failure to acquire memory from the backend allocator when the slab cache memory is already exhausted.

Note

The user is responsible for initializing the object.

Definition at line 207 of file slab_alloc.

15.7.3.2 free()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::free (
            void * _o)  [inline], [noexcept]
```

Free the given object (_o).

Precondition

The object must have been allocated with this allocator.

Definition at line 246 of file slab_alloc.

15.7.3.3 free_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::free_objects () const  [inline],
[noexcept]
```

Get the number of objects which can be allocated before a new empty slab needs to be added to the slab allocator.

Returns

The number of free objects in the slab allocator.

Definition at line 308 of file slab_alloc.

15.7.3.4 total_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::total_objects () const  [inline],
[noexcept]
```

Get the total number of objects managed by the slab allocator.

Returns

The number of objects managed by the allocator (including the free objects).

Definition at line 299 of file slab_alloc.
The documentation for this class was generated from the following file:

- l4/cxx/slab_alloc

15.8 cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::Slab_i Struct Reference

Type of a slab.
`#include <slab_alloc>`

15.8.1 Detailed Description

template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc = New_allocator>
struct cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::Slab_i

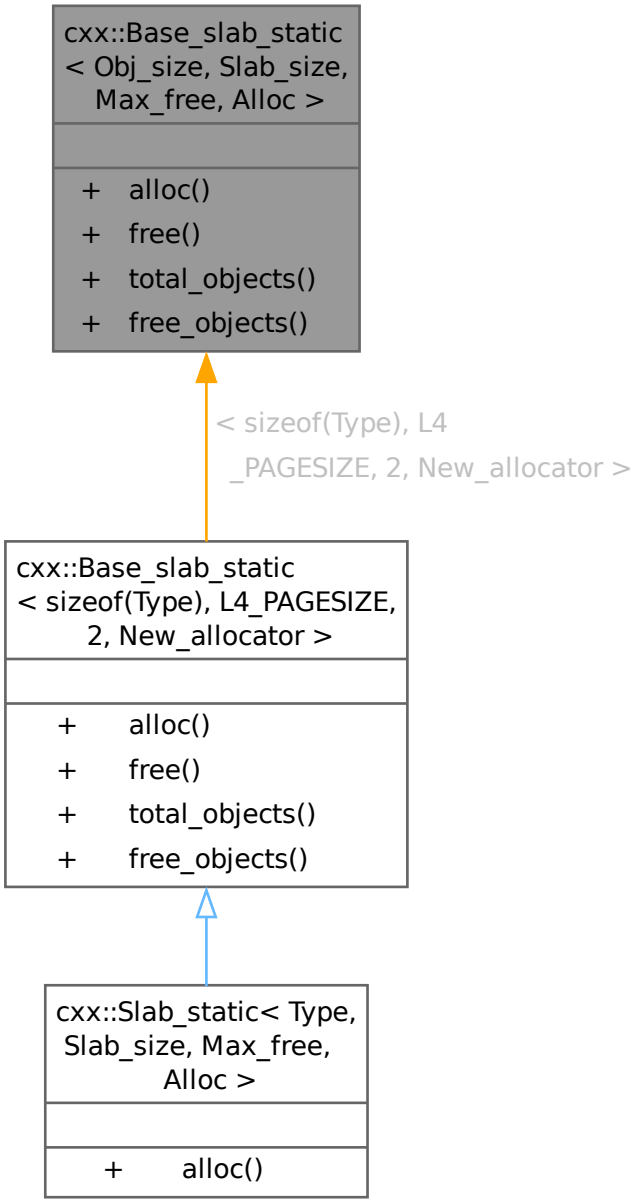
Type of a slab.
Definition at line 86 of file slab_alloc.
The documentation for this struct was generated from the following file:

- l4/cxx/slab_alloc

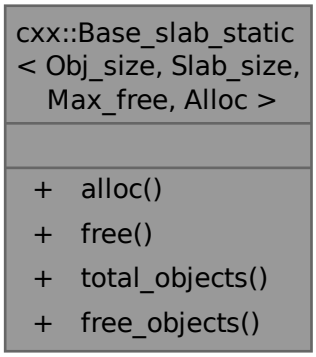
15.9 cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc > Class Template Reference

Merged slab allocator (allocators for objects of the same size are merged together).
`#include <slab_alloc>`

Inheritance diagram for cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >:



Collaboration diagram for cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >:



Public Types

- enum { object_size = Obj_size , slab_size = Slab_size , objects_per_slab = _A::objects_per_slab , max_free_slabs = Max_free }

Public Member Functions

- void * alloc () noexcept

  Allocate an object.
- void free (void *p) noexcept

  Free the given object (p).
- unsigned total_objects () const noexcept

  Get the total number of objects managed by the slab allocator.
- unsigned free_objects () const noexcept

  Get the number of free objects in the slab allocator.

15.9.1 Detailed Description

template< int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc = New_allocator >
class cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >

Merged slab allocator (allocators for objects of the same size are merged together).

Template Parameters

Obj_size	The size of an object managed by the slab allocator.
Slab_size	The size of a slab.
Max_free	The maximum number of free slabs.
Alloc	The allocator for the slabs.

This slab allocator class is useful for merging slab allocators with the same parameters (equal `Obj_size`, `Slab_size`, `Max_free`, and `Alloc` parameters) together and share the overhead for the slab caches among all equal-sized objects.
Definition at line 388 of file slab_alloc.

15.9.2 Member Enumeration Documentation

15.9.2.1 anonymous enum

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
anonymous enum
```

Enumerator

object_size	Size of an object.
slab_size	Size of a slab.
objects_per_slab	Number of objects per slab.
max_free_slabs	Maximum number of free slabs.

Definition at line 395 of file slab_alloc.

15.9.3 Member Function Documentation

15.9.3.1 alloc()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void * cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::alloc ()  [inline],
[noexcept]
```

Allocate an object.

Note

The user is responsible for initializing the object.

Definition at line 412 of file slab_alloc.

15.9.3.2 free()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::free (
            void * p)  [inline], [noexcept]
```

Free the given object (p).

Parameters

p	The pointer to the object to free.

Precondition

p must be a pointer to an object allocated by this allocator.

Definition at line 420 of file slab_alloc.

15.9.3.3 free_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::free_objects () const
[inline], [noexcept]
```

Get the number of free objects in the slab allocator.

Returns

The number of free objects in all free and partially used slabs managed by this allocator.

Note

The value is the merged value for all equal parameterized Base_slab_static instances.

Definition at line 440 of file slab_alloc.

15.9.3.4 total_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::total_objects () const
[inline], [noexcept]
```

Get the total number of objects managed by the slab allocator.

Returns

The number of objects managed by the allocator (including the free objects).

Note

The value is the merged value for all equal parameterized Base_slab_static instances.

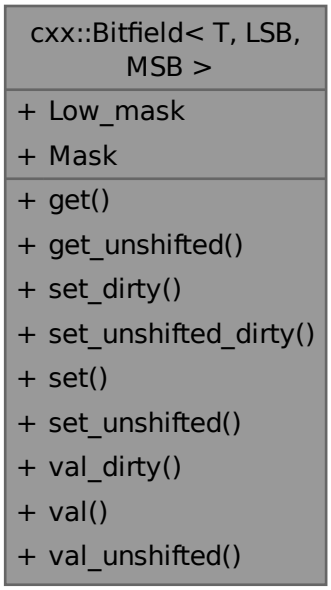
Definition at line 430 of file slab_alloc.
The documentation for this class was generated from the following file:

- l4/cxx/slab_alloc

15.10 cxx::Bitfield< T, LSB, MSB > Class Template Reference

Definition for a member (part) of a bit field.
`#include <bitfield>`
Inheritance diagram for cxx::Bitfield< T, LSB, MSB >:

Collaboration diagram for cxx::Bitfield< T, LSB, MSB >:



Data Structures

- class Value_base

  Internal helper type.
- class Value

  Internal helper type.
- class Value_unshifted

  Internal helper type.

Public Types

- enum { Bits = MSB + 1 - LSB , Lsb = LSB , Msb = MSB }
- typedef Best_type< Bits >::Type Bits_type

  Type to hold at least Bits bits.
- typedef Best_type< Bits+Lsb >::Type Shift_type

  Type to hold at least Bits + Lsb bits.
- typedef Value< Base_type & > **Ref**

  Reference type to access the bits inside a raw bit field.
- typedef Value< Base_type volatile & > **Ref_volatile**

  Volatile reference type to access the bits inside a raw bit field.
- typedef Value< Base_type const > **Val**

  Value type to access the bits inside a raw bit field.
- typedef Value_unshifted< Base_type & > **Ref_unshifted**

  Reference type to access the bits inside a raw bit field (in place).
- typedef Value_unshifted< Base_type volatile & > **Ref_unshifted_volatile**

  Volatile reference type to access the bits inside a raw bit field (in place).
- typedef Value_unshifted< Base_type const > **Val_unshifted**

  Value type to access the bits inside a raw bit field (in place).

Static Public Member Functions

- static constexpr Bits_type get (Shift_type val)

  Get the bits out of `val`.
- static constexpr Base_type get_unshifted (Shift_type val)

  Get the bits in place out of `val`.
- static constexpr Base_type set_dirty (Base_type dest, Shift_type val)

  Set the bits corresponding to `val`.
- static constexpr Base_type set_unshifted_dirty (Base_type dest, Shift_type val)

  Set the bits corresponding to `val`.
- static Base_type set (Base_type dest, Bits_type val)

  Set the bits corresponding to `val`.
- static Base_type set_unshifted (Base_type dest, Shift_type val)

  Set the bits corresponding to `val`.
- static constexpr Base_type val_dirty (Shift_type val)

  Get the shifted bits for `val`.
- static constexpr Base_type val (Bits_type val)

  Get the shifted bits for `val`.
- static constexpr Base_type val_unshifted (Shift_type val)

  Get the shifted bits for `val`.

Static Public Attributes

- static constexpr Base_type **Low_mask** = Base_type(~0ULL) >> (sizeof(Base_type) * 8 - Bits)

  Mask value to get Bits bits.
- static constexpr Base_type **Mask** = Low_mask << Lsb

  Mask value to the bits out of a `T`.

15.10.1 Detailed Description

template<typename T, unsigned LSB, unsigned MSB>
class cxx::Bitfield< T, LSB, MSB >

Definition for a member (part) of a bit field.

Parameters

T	The underlying type of the bit field.
LSB	The least significant bit of our bits.
MSB	The most significant bit of our bits.

Definition at line 24 of file bitfield.

15.10.2 Member Typedef Documentation

15.10.2.1 Bits_type

```
template<typename T, unsigned LSB, unsigned MSB>
typedef Best_type<Bits>::Type cxx::Bitfield< T, LSB, MSB >::Bits_type
```

Type to hold at least Bits bits.
This type can handle all values that can be stored in this part of the bit field.
Definition at line 71 of file bitfield.

15.10.2.2 Shift_type

```
template<typename T, unsigned LSB, unsigned MSB>
typedef Best_type<Bits+Lsb>::Type cxx::Bitfield< T, LSB, MSB >::Shift_type
```

Type to hold at least Bits + Lsb bits.
This type can handle all values that can be stored in this part of the bit field when they are at the target location (Lsb bits shifted to the left).
Definition at line 79 of file bitfield.

15.10.3 Member Enumeration Documentation

15.10.3.1 anonymous enum

```
template<typename T, unsigned LSB, unsigned MSB>
anonymous enum
```

Enumerator

Bits	Number of bits.
Lsb	index of the LSB
Msb	index of the MSB

Definition at line 52 of file bitfield.

15.10.4 Member Function Documentation

15.10.4.1 get()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Bits_type cxx::Bitfield< T, LSB, MSB >::get (
             Shift_type val)  [inline], [static], [constexpr]
```

Get the bits out of `val`.

Parameters

val	The raw value of the whole bit field.

Returns

The bits form Lsb to Msb shifted to the right.

Definition at line 96 of file bitfield.

15.10.4.2 get_unshifted()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::get_unshifted (
             Shift_type val)  [inline], [static], [constexpr]
```

Get the bits in place out of `val`.

Parameters

val	The raw value of the whole bit field.

Returns

The bits from Lsb to Msb (unshifted).

This means other bits are masked out, however the result is not shifted to the right.
Definition at line 109 of file bitfield.

15.10.4.3 set()

```
template<typename T, unsigned LSB, unsigned MSB>
Base_type cxx::Bitfield< T, LSB, MSB >::set (
             Base_type dest,
             Bits_type val)  [inline], [static]
```

Set the bits corresponding to `val`.

Parameters

dest	The current value of the whole bit field.
val	The value to set into the bits.

Returns

The new value of the whole bit field.

Definition at line 158 of file bitfield.

15.10.4.4 set_dirty()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::set_dirty (
             Base_type dest,
             Shift_type val)  [inline], [static], [constexpr]
```

Set the bits corresponding to `val`.

Parameters

dest	The current value of the whole bit field.
val	The value to set into the bits.

Returns

The new value of the whole bit field.

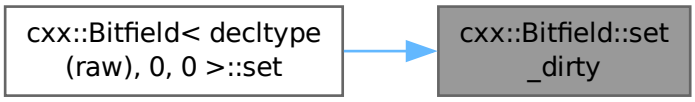
Precondition

`val` must not contain more than Bits bits.

Note

This function does not mask `val` to the right number of bits.

Definition at line 124 of file bitfield.
Referenced by cxx::Bitfield< decltype(raw), 0, 0 >::set().
Here is the caller graph for this function:



15.10.4.5 set_unshifted()

```
template<typename T, unsigned LSB, unsigned MSB>
Base_type cxx::Bitfield< T, LSB, MSB >::set_unshifted (
            Base_type dest,
            Shift_type val)  [inline], [static]
```

Set the bits corresponding to `val`.

Parameters

dest	The current value of the whole bit field.
val	The value shifted Lsb bits to the left that shall be set into the bit field.

Returns

the new value of the whole bit field.

Definition at line 170 of file bitfield.

15.10.4.6 set_unshifted_dirty()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::set_unshifted_dirty (
            Base_type dest,
            Shift_type val)  [inline], [static], [constexpr]
```

Set the bits corresponding to `val`.

Parameters

dest	The current value of the whole bit field.
val	The value shifted Lsb bits to the left that shall be set into the bits.

Returns

The new value of the whole bit field.

Precondition

`val` must not contain more than Bits bits shifted Lsb bits to the left.

Note

This function does not mask `val` to the right number of bits.

Definition at line 144 of file bitfield.
Referenced by cxx::Bitfield< decltype(raw), 0, 0 >::set_unshifted().
Here is the caller graph for this function:

15.10.4.7 val()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val (
            Bits_type val)  [inline], [static], [constexpr]
```

Get the shifted bits for `val`.

Parameters

val	The value to set into the bits.

Returns

The raw bit field value.

Definition at line 193 of file bitfield.

15.10.4.8 val_dirty()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val_dirty (
            Shift_type val)  [inline], [static], [constexpr]
```

Get the shifted bits for `val`.

Parameters

val	The value to set into the bits.

Returns

The raw bit field value.

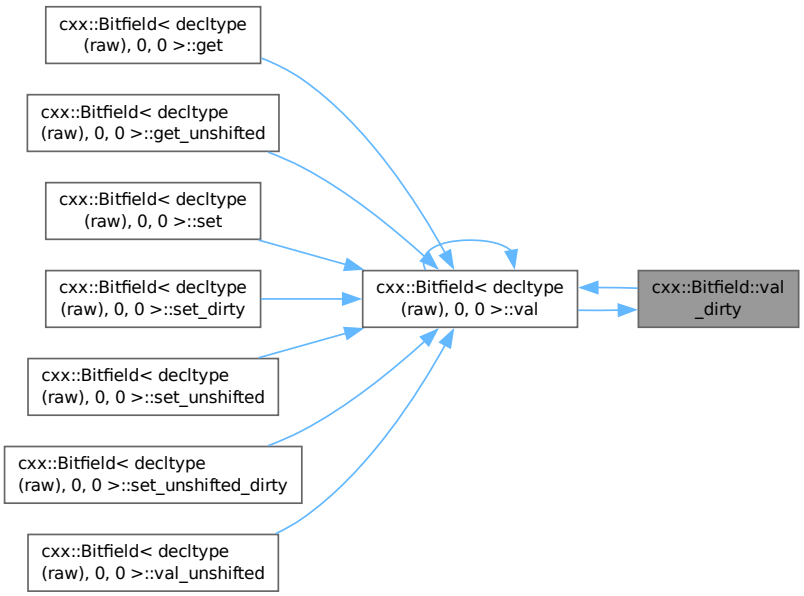
Precondition

`val` must not contain more than Bits bits.

Note

This function does not mask `val` to the right number of bits.

Definition at line 184 of file bitfield.
Referenced by cxx::Bitfield< decltype(raw), 0, 0 >::val().
Here is the caller graph for this function:



15.10.4.9 val_unshifted()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val_unshifted (
            Shift_type val)  [inline], [static], [constexpr]
```

Get the shifted bits for `val`.

Parameters

val	The value shifted Lsb bits to the left that shall be set into the bits.

Returns

The raw bit field value.

Definition at line 203 of file bitfield.

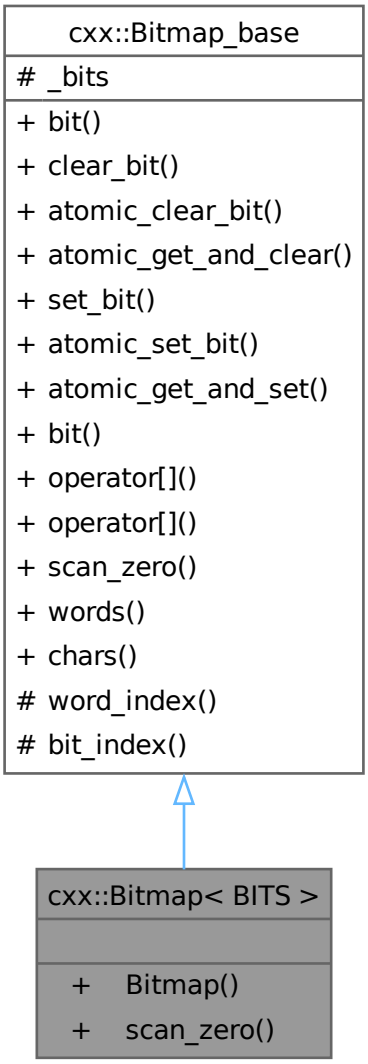
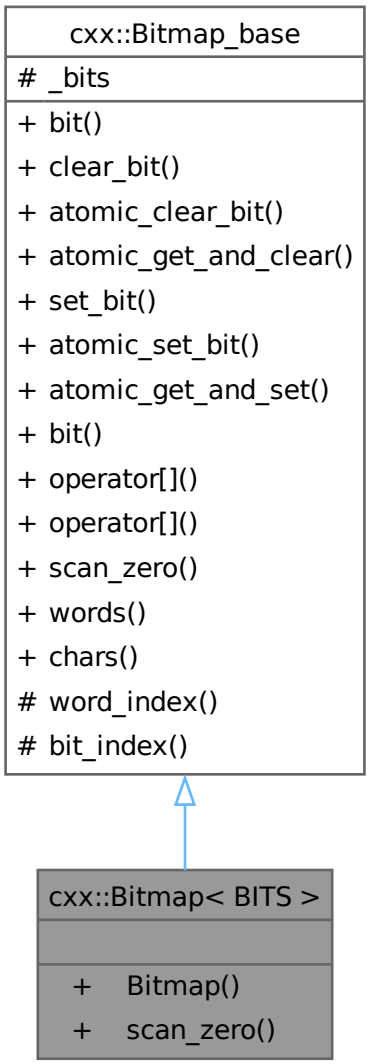
15.14 cxx::Bitmap< BITS > Class Template Reference

A static bitmap.
`#include <bitmap>`
Inheritance diagram for cxx::Bitmap< BITS >:



Collaboration diagram for cxx::Bitmap< BITS >:



Public Member Functions

- **Bitmap** () noexcept

  Create a bitmap with `BITS` bits.
- long scan_zero (long start_bit=0) const noexcept

  Scan for the first zero bit.

Public Member Functions inherited from cxx::Bitmap_base

- void bit (long bit, bool on) noexcept

  Set the value of bit `bit` to `on`.
- void clear_bit (long bit) noexcept

  Clear bit `bit`.
- void atomic_clear_bit (long bit) noexcept

Clear bit `bit` atomically.

- word_type atomic_get_and_clear (long bit) noexcept

  Clear bit `bit` atomically and return old state.
- void set_bit (long bit) noexcept

  Set bit `bit`.
- void atomic_set_bit (long bit) noexcept

  Set bit `bit` atomically.
- word_type atomic_get_and_set (long bit) noexcept

  Set bit `bit` atomically and return old state.
- word_type bit (long bit) const noexcept

  Get the truth value of a bit.
- word_type operator[ ] (long bit) const noexcept

  Get the bit at index `bit`.
- Bit operator[ ] (long bit) noexcept

  Get the lvalue for the bit at index `bit`.
- long scan_zero (long max_bit, long start_bit=0) const noexcept

  Scan for the first zero bit.

Additional Inherited Members

Static Public Member Functions inherited from cxx::Bitmap_base

- static long **words** (long bits) noexcept

  Get the number of `Words` that are used for the bitmap.
- static long **chars** (long bits) noexcept

  Get the number of chars that are used for the bitmap.

Protected Types inherited from cxx::Bitmap_base

- enum { W_bits = sizeof(word_type) * 8 , C_bits = 8 }
- typedef unsigned long **word_type**

  Data type for each element of the bit buffer.

Static Protected Member Functions inherited from cxx::Bitmap_base

- static unsigned word_index (unsigned bit)

  Get the word index for the given bit.
- static unsigned bit_index (unsigned bit)

  Get the bit index within word_type for the given bit.

Protected Attributes inherited from cxx::Bitmap_base

- word_type * **_bits**

  Pointer to the buffer storing the bits.

15.14.1 Detailed Description

template<int BITS>
class cxx::Bitmap< BITS >

A static bitmap.

Template Parameters

BITS	The number of bits that shall be in the bitmap.

Definition at line 220 of file bitmap.

15.14.2 Member Function Documentation

15.14.2.1 scan_zero()

```
template<int BITS>
long cxx::Bitmap< BITS >::scan_zero (
            long start_bit = 0) const  [inline], [noexcept]
```

Scan for the first zero bit.

Parameters

start_bit	Hint at the number of the first bit to look at. Zero bits below `start_bit` may or may not be taken into account by the implementation.

Return values

>=	0 Number of first zero bit found.
-1	All bits at `start_bit` or higher are set.

Compared to Bitmap_base::scan_zero(), the upper bound is set to BITS.
Definition at line 365 of file bitmap.
References cxx::Bitmap_base::scan_zero().
Here is the call graph for this function:

The documentation for this class was generated from the following file:

- void set_bit (long bit) noexcept

  Set bit `bit`*.*

- void atomic_set_bit (long bit) noexcept
  Set bit `bit` atomically.
- word_type atomic_get_and_set (long bit) noexcept
  Set bit `bit` atomically and return old state.
- word_type bit (long bit) const noexcept
  Get the truth value of a bit.
- word_type operator[ ] (long bit) const noexcept
  Get the bit at index `bit`.
- Bit operator[ ] (long bit) noexcept
  Get the lvalue for the bit at index `bit`.
- long scan_zero (long max_bit, long start_bit=0) const noexcept
  Scan for the first zero bit.

Static Public Member Functions

- static long **words** (long bits) noexcept
  Get the number of `Words` that are used for the bitmap.
- static long **chars** (long bits) noexcept
  Get the number of chars that are used for the bitmap.

Protected Types

- enum { W_bits = sizeof(word_type) * 8 , C_bits = 8 }
- typedef unsigned long **word_type**
  Data type for each element of the bit buffer.

Static Protected Member Functions

- static unsigned word_index (unsigned bit)
  Get the word index for the given bit.
- static unsigned bit_index (unsigned bit)
  Get the bit index within word_type for the given bit.

Protected Attributes

- word_type * **_bits**
  Pointer to the buffer storing the bits.

15.15.1 Detailed Description

Basic bitmap abstraction.
This abstraction keeps a pointer to a memory area that is used as bitmap.
Definition at line 18 of file bitmap.

15.15.2 Member Enumeration Documentation

15.15.2.1 anonymous enum

```
anonymous enum  [protected]
```

Enumerator

W_bits	number of bits in word_type
C_bits	number of bits in char

Definition at line 26 of file bitmap.

15.15.3 Member Function Documentation

15.15.3.1 atomic_clear_bit()

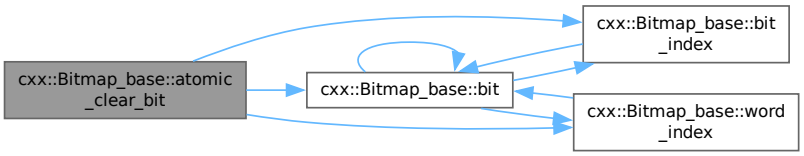
```
void cxx::Bitmap_base::atomic_clear_bit (
            long bit)  [inline], [noexcept]
```

Clear bit `bit` atomically.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to clear.

Definition at line 269 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Here is the call graph for this function:



15.15.3.2 atomic_get_and_clear()

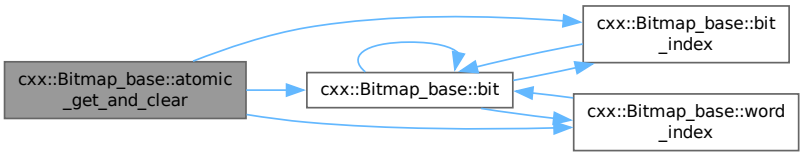
```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_clear (
            long bit)  [inline], [noexcept]
```

Clear bit `bit` atomically and return old state.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to clear.

Definition at line 279 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Here is the call graph for this function:



15.15.3.3 atomic_get_and_set()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_set (
```

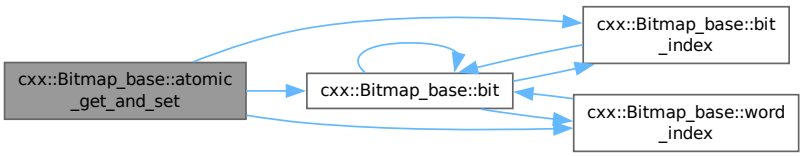
```
            long bit)  [inline], [noexcept]
```

Set bit `bit` atomically and return old state.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to set.

Definition at line 308 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Here is the call graph for this function:



15.15.3.4 atomic_set_bit()

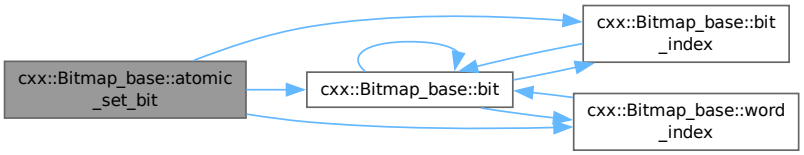
```
void cxx::Bitmap_base::atomic_set_bit (
            long bit)  [inline], [noexcept]
```

Set bit `bit` atomically.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to set.

Definition at line 298 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Here is the call graph for this function:



15.15.3.5 bit() [1/2]

```
Bitmap_base::word_type cxx::Bitmap_base::bit (
            long bit) const  [inline], [noexcept]
```

Get the truth value of a bit.

Parameters

bit	The number of the bit to read.

Return values

0	Bit is not set.
!=	0 Bit is set.

Definition at line 318 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Here is the call graph for this function:

15.15.3.6 bit() [2/2]

```
void cxx::Bitmap_base::bit (
            long bit,
            bool on)  [inline], [noexcept]
```

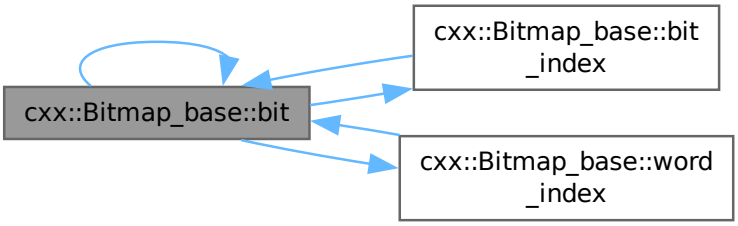
Set the value of bit `bit` to `on`.

Parameters

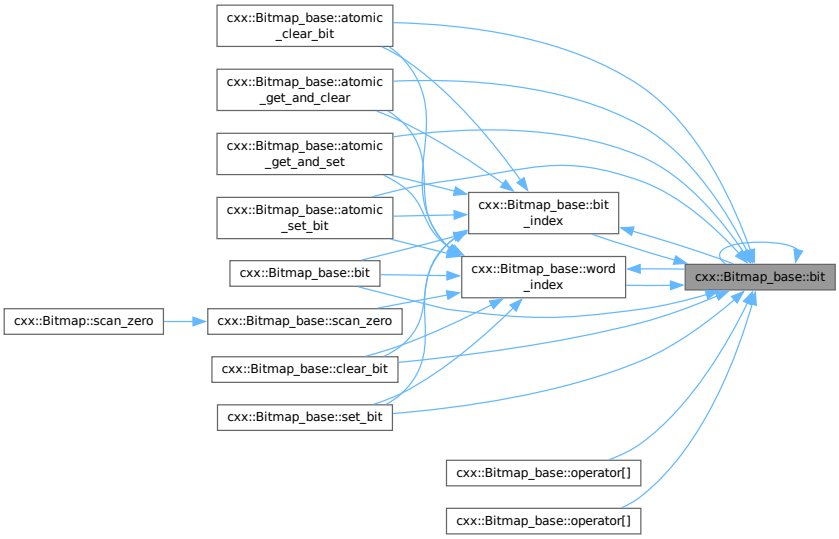
bit	The number of the bit.
on	The boolean value that shall be assigned to the bit.

Definition at line 251 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Referenced by atomic_clear_bit(), atomic_get_and_clear(), atomic_get_and_set(), atomic_set_bit(), bit(), bit(), bit_index(), clear_bit(), operator[ ](), operator[ ](), set_bit(), and word_index().

Here is the call graph for this function:



Here is the caller graph for this function:



15.15.3.7 bit_index()

```
unsigned cxx::Bitmap_base::bit_index (
            unsigned bit)  [inline], [static], [protected]
```

Get the bit index within word_type for the given bit.

Parameters

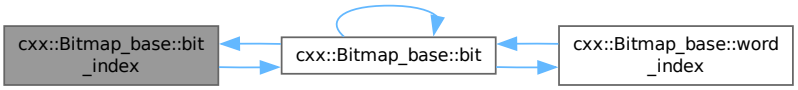
bit	The bit index in the bitmap.

Returns

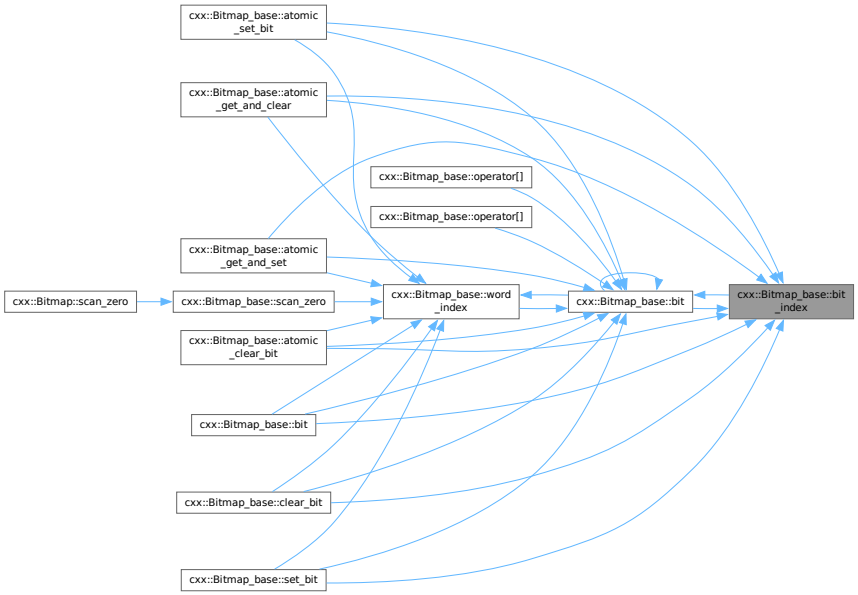
the bit index within word_type (bit % W_bits).

Definition at line 53 of file bitmap.
References bit(), and W_bits.

Referenced by atomic_clear_bit(), atomic_get_and_clear(), atomic_get_and_set(), atomic_set_bit(), bit(), bit(), clear_bit(), and set_bit().
Here is the call graph for this function:



Here is the caller graph for this function:



15.15.3.8 clear_bit()

```
void cxx::Bitmap_base::clear_bit (
            long bit)  [inline], [noexcept]
```

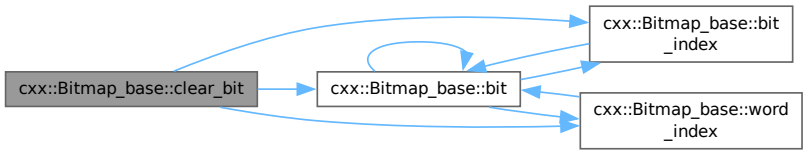
Clear bit `bit`.

Parameters

bit	The number of the bit to clear.

Definition at line 260 of file bitmap.
References _bits, bit(), bit_index(), and word_index().

Here is the call graph for this function:



15.15.3.9 operator[]() [1/2]

```
word_type cxx::Bitmap_base::operator[] (
            long bit) const  [inline], [noexcept]
```

Get the bit at index `bit`.

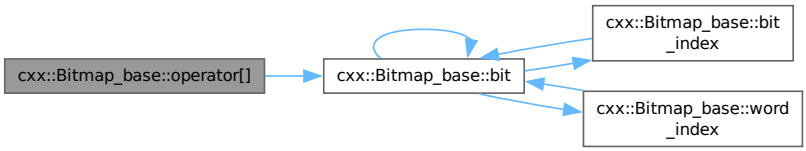
Parameters

bit	The number of the bit to read.

Return values

0	Bit is not set.
!=	0 Bit is set.

Definition at line 181 of file bitmap.
References bit().
Here is the call graph for this function:



15.15.3.10 operator[]() [2/2]

```
Bit cxx::Bitmap_base::operator[] (
            long bit)  [inline], [noexcept]
```

Get the lvalue for the bit at index `bit`.

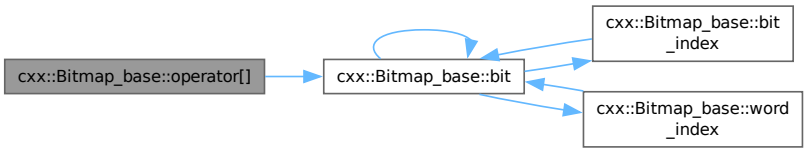
Parameters

bit	The number.

Returns

lvalue for `bit`

Definition at line 191 of file bitmap.
References bit().
Here is the call graph for this function:



15.15.3.11 scan_zero()

```
long cxx::Bitmap_base::scan_zero (
            long max_bit,
            long start_bit = 0) const  [inline], [noexcept]
```

Scan for the first zero bit.

Parameters

max_bit	Upper bound (exclusive) for the scanning operation.
start_bit	Hint at the number of the first bit to look at. Zero bits below `start_bit` may or may not be taken into account by the implementation.

Return values

>=	0 Number of first zero bit found.
-1	All bits between `start_bit` and `max_bit` are set.

Definition at line 339 of file bitmap.
References _bits, W_bits, and word_index().
Referenced by cxx::Bitmap< BITS >::scan_zero().
Here is the call graph for this function:

Here is the caller graph for this function:

15.15.3.12 set_bit()

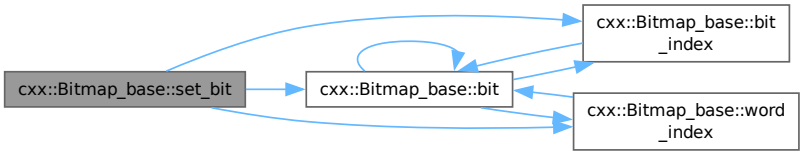
```
void cxx::Bitmap_base::set_bit (
            long bit)  [inline], [noexcept]
```

Set bit `bit`.

Parameters

bit	The number of the bit to set.

Definition at line 289 of file bitmap.
References _bits, bit(), bit_index(), and word_index().
Here is the call graph for this function:



15.15.3.13 word_index()

```
unsigned cxx::Bitmap_base::word_index (
            unsigned bit)  [inline], [static], [protected]
```

Get the word index for the given bit.

Parameters

bit	The index of the bit in question.

Returns

the index in Bitmap_base::_bits for the given bit (bit / W_bits).

Definition at line 44 of file bitmap.
References bit(), and W_bits.
Referenced by atomic_clear_bit(), atomic_get_and_clear(), atomic_get_and_set(), atomic_set_bit(), bit(), bit(), clear_bit(), scan_zero(), and set_bit().

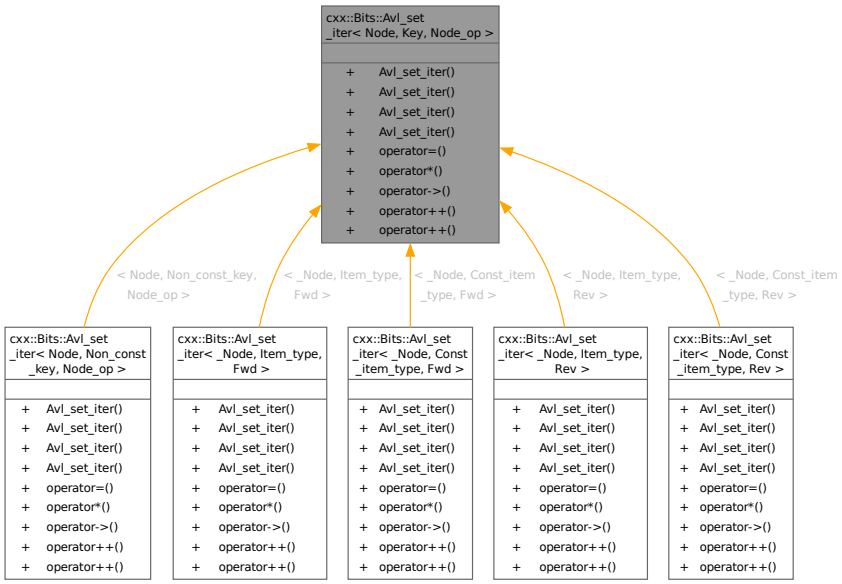
15.21 cxx::Bits::Avl_set_iter< Node, Key, Node_op > Class Template Reference

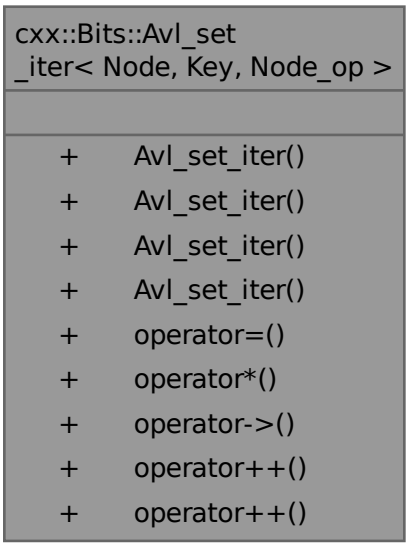
Generic iterator for the AVL-tree based set.

`#include <avl_set>`

Inheritance diagram for cxx::Bits::Avl_set_iter< Node, Key, Node_op >:



Collaboration diagram for cxx::Bits::Avl_set_iter< Node, Key, Node_op >:



Public Member Functions

- **Avl_set_iter** ()=default

  Create an invalid iterator (end marker).
- Avl_set_iter (Node const *t)

  Create an iterator for the given tree.
- Avl_set_iter (Base const &o)

  Create an iterator from a BST iterator.
- **Avl_set_iter** (Non_const_iter const &o)

  Allow copy of non-const iterator to const iterator versions.
- Avl_set_iter & **operator=** (Non_const_iter const &o)

  Allow assignment of non-const iterator to const iterator versions.
- Key & operator* () const

  Dereference the iterator and get the item out of the tree.
- Key * operator-> () const

  Member access to the item the iterator points to.
- Avl_set_iter & **operator++** ()

  Set the iterator to the next element (pre increment).
- Avl_set_iter **operator++** (int)

  Set the iterator to the next element (post increment).

15.21.1 Detailed Description

template<typename Node, typename Key, typename Node_op>
class cxx::Bits::Avl_set_iter< Node, Key, Node_op >

Generic iterator for the AVL-tree based set.
Definition at line 35 of file avl_set.

15.21.2 Constructor & Destructor Documentation

15.21.2.1 Avl_set_iter() [1/2]

```
template<typename Node, typename Key, typename Node_op>
cxx::Bits::Avl_set_iter< Node, Key, Node_op >::Avl_set_iter (
            Node const * t)  [inline]
```

Create an iterator for the given tree.

Parameters

t	the root node of the tree to iterate.

Definition at line 59 of file avl_set.

15.21.2.2 Avl_set_iter() [2/2]

```
template<typename Node, typename Key, typename Node_op>
cxx::Bits::Avl_set_iter< Node, Key, Node_op >::Avl_set_iter (
            Base const & o)  [inline]
```

Create an iterator from a BST iterator.

Parameters

o	The BST iterator that shall be copied.

Definition at line 65 of file avl_set.

15.21.3 Member Function Documentation

15.21.3.1 operator∗()

```
template<typename Node, typename Key, typename Node_op>
Key & cxx::Bits::Avl_set_iter< Node, Key, Node_op >::operator* () const  [inline]
```

Dereference the iterator and get the item out of the tree.

Returns

A reference to the data stored in the AVL tree.

Definition at line 80 of file avl_set.

15.21.3.2 operator->()

```
template<typename Node, typename Key, typename Node_op>
Key * cxx::Bits::Avl_set_iter< Node, Key, Node_op >::operator-> () const  [inline]
```

Member access to the item the iterator points to.

Returns

A pointer to the item in the node.

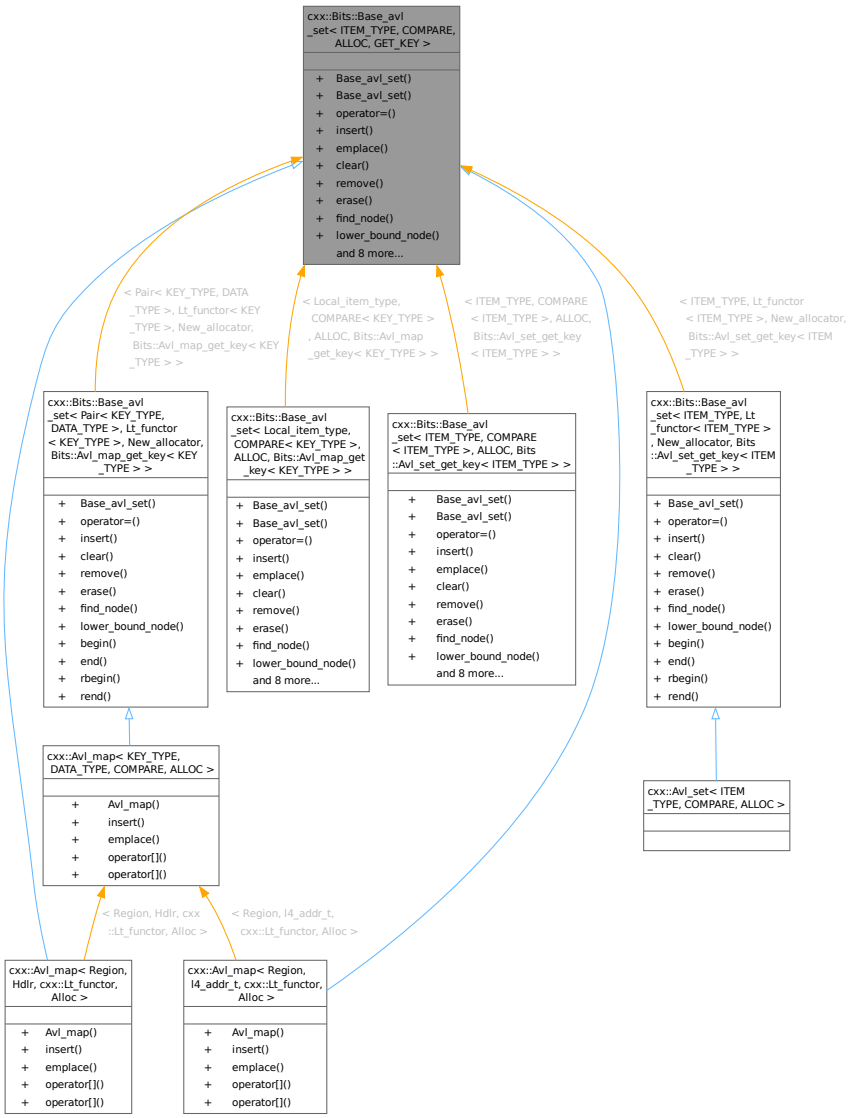
Definition at line 87 of file avl_set.
The documentation for this class was generated from the following file:

- l4/cxx/avl_set

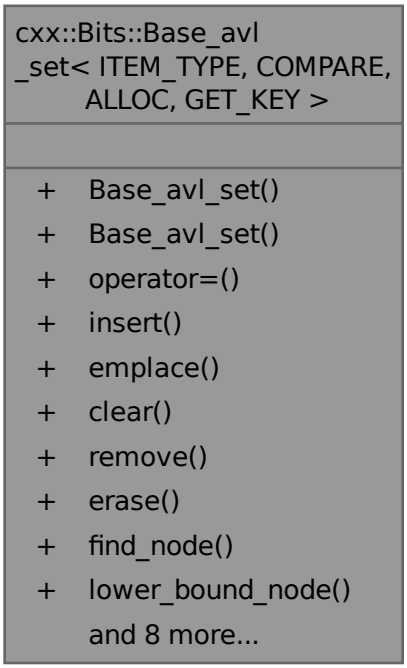
15.22 cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > Class Template Reference

AVL set with internally managed nodes.
`#include <avl_set>`

Inheritance diagram for cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >:



Collaboration diagram for cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >:



Data Structures

- class Node

  A smart pointer to a tree item.

Public Types

- enum { E_noent = 2 , E_exist = 17 , E_nomem = 12 , E_inval = 22 }

  Return status constants.
- typedef ITEM_TYPE **Item_type**

  Type for the items store in the set.
- typedef GET_KEY **Get_key**

  Key-getter type to derive the sort key of an internal node.
- typedef GET_KEY::Key_type **Key_type**

  Type of the sort key used for the items.
- typedef Type_traits< Item_type >::Const_type **Const_item_type**

  Type used for const items within the set.
- typedef COMPARE **Item_compare**

  Type for the comparison functor.
- typedef ALLOC< _Node > **Node_allocator**

  Type for the node allocator.
- typedef Avl_set_iter< _Node, Item_type, Fwd > **Iterator**

  Forward iterator for the set.
- typedef Avl_set_iter< _Node, Const_item_type, Fwd > **Const_iterator**

Constant forward iterator for the set.

- typedef Avl_set_iter< _Node, Item_type, Rev > **Rev_iterator**

  Backward iterator for the set.
- typedef Avl_set_iter< _Node, Const_item_type, Rev > **Const_rev_iterator**

  Constant backward iterator for the set.

Public Member Functions

- Base_avl_set (Node_allocator const &alloc=Node_allocator())

  Create a AVL-tree based set.
- Base_avl_set (Base_avl_set const &o, Node_allocator const &alloc=Node_allocator())

  Create a copy of an AVL-tree based set.
- Base_avl_set & operator= (Base_avl_set const &o)

  Copy assignment operator of an AVL-tree based set.
- cxx::Pair< Iterator, int > insert (Item_type const &item)

  Insert an item into the set.
- template<typename... Args>
  cxx::Pair< Iterator, int > emplace (Args &&... args)

  Emplace an item into the set.
- void **clear** () noexcept

  Remove all items from the set.
- int remove (Key_type const &item)

  Remove an item from the set.
- int erase (Key_type const &item)

  Erase the item with the given key.
- Node find_node (Key_type const &item) const

  Lookup a node equal to `item`.
- Node lower_bound_node (Key_type const &key) const

  Find the first node greater or equal to `key`.
- Const_iterator begin () const

  Get the constant forward iterator for the first element in the set.
- Const_iterator end () const

  Get the end marker for the constant forward iterator.
- Iterator begin ()

  Get the mutable forward iterator for the first element of the set.
- Iterator end ()

  Get the end marker for the mutable forward iterator.
- Const_rev_iterator rbegin () const

  Get the constant backward iterator for the last element in the set.
- Const_rev_iterator rend () const

  Get the end marker for the constant backward iterator.
- Rev_iterator rbegin ()

  Get the mutable backward iterator for the last element of the set.
- Rev_iterator rend ()

  Get the end marker for the mutable backward iterator.

15.22.1 Detailed Description

template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename GET_KEY>
class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >

AVL set with internally managed nodes.
Definition at line 127 of file avl_set.

15.22.2 Member Enumeration Documentation

15.22.2.1 anonymous enum

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
anonymous enum
```

Return status constants.
These constants are compatible with the L4 error codes, see l4_error_code_t.

Enumerator

E_noent	Item does not exist.
E_exist	Item exists already.
E_nomem	Memory allocation failed.
E_inval	Internal error.

Definition at line 138 of file avl_set.

15.22.3 Constructor & Destructor Documentation

15.22.3.1 Base_avl_set() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Base_avl_set (
            Node_allocator const & alloc = Node_allocator())  [inline], [explicit]
```

Create a AVL-tree based set.

Parameters

alloc	Node allocator.

Create an empty set (AVL-tree based).
Definition at line 268 of file avl_set.

15.22.3.2 Base_avl_set() [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Base_avl_set (
            Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > const & o,
            Node_allocator const & alloc = Node_allocator())  [inline]
```

Create a copy of an AVL-tree based set.

Parameters

o	The set to copy.
alloc	Node allocator.

Creates a deep copy of the set with all its items.
Definition at line 283 of file avl_set.

15.22.4 Member Function Documentation

15.22.4.1 begin() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::begin ()  [inline]
```

Get the mutable forward iterator for the first element of the set.

Returns

The mutable forward iterator for the first element of the set.

Definition at line 431 of file avl_set.

15.22.4.2 begin() [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::begin () const
[inline]
```

Get the constant forward iterator for the first element in the set.

Returns

Constant forward iterator for the first element in the set.

Definition at line 417 of file avl_set.

15.22.4.3 emplace()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
template<typename...  Args>
cxx::Pair< Iterator, int > cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >↩
::emplace (
            Args &&...  args)
```

Emplace an item into the set.

Parameters

args	Constructor arguments for the item constructor.

Returns

A pair of iterator (`first`) and return value (`second`). `second` will be 0 if the element was inserted into the set and `-#E_exist` if the element was already in the set and the set was therefore not updated. In both cases, `first` contains an iterator that points to the element. `second` may also be `-#E_nomem` when memory for the node could not be allocated. `first` is then invalid.

The element will always be constructed, even if there is already an existing element in the set. In case of such a collision the newly created element will then be immediately destructed.

15.22.4.4 end() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::end ()  [inline]
```

Get the end marker for the mutable forward iterator.

Returns

The end marker for mutable forward iterator.

Definition at line 438 of file avl_set.

15.22.4.5 end() [2/2]

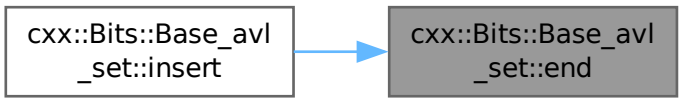
```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::end () const
[inline]
```

Get the end marker for the constant forward iterator.

Returns

The end marker for the constant forward iterator.

Definition at line 424 of file avl_set.
Referenced by insert().
Here is the caller graph for this function:



15.22.4.6 erase()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
int cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::erase (
            Key_type const & item)  [inline]
```

Erase the item with the given key.

Parameters

item	The key of the item to remove.

Definition at line 384 of file avl_set.

15.22.4.7 find_node()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Node cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::find_node (
            Key_type const & item) const  [inline]
```

Lookup a node equal to `item`.

Parameters

item	The value to search for.

Returns

A smart pointer to the element found. If no element was found the smart pointer will be invalid.

Definition at line 395 of file avl_set.

15.22.4.8 insert()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Pair< typename Base_avl_set< Item, Compare, Alloc, KEY_TYPE >::Iterator, int > cxx::Bits::Base_avl_set<
Item, Compare, Alloc, KEY_TYPE >::insert (
            Item_type const & item)
```

Insert an item into the set.

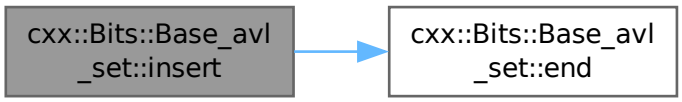
Parameters

item	The item to insert.

Returns

A pair of iterator (`first`) and return value (`second`). `second` will be 0 if the element was inserted into the set and -#E_exist if the element was already in the set and the set was therefore not updated. In both cases, `first` contains an iterator that points to the element. `second` may also be -#E_nomem when memory for the node could not be allocated. `first` is then invalid.

Insert a new item into the set, each item can only be once in the set.
Definition at line 485 of file avl_set.
References E_exist, E_nomem, end(), cxx::Pair< First, Second >::first, and cxx::Pair< First, Second >::second.
Here is the call graph for this function:



15.22.4.9 lower_bound_node()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Node cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::lower_bound_node (
            Key_type const & key) const  [inline]
```

Find the first node greater or equal to `key`.

Parameters

key	Minimum key to look for.

Returns

Smart pointer to the first node greater or equal to `key`. Will be invalid if no such element was found.

Definition at line 406 of file avl_set.

15.22.4.10 operator=()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Base_avl_set & cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::operator= (
            Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > const & o)  [inline]
```

Copy assignment operator of an AVL-tree based set.

Parameters

o	The set to copy-assign.

Creates a deep copy of the set with all its items.
Definition at line 295 of file avl_set.

15.22.4.11 rbegin() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin ()  [inline]
```

Get the mutable backward iterator for the last element of the set.

Returns

The mutable backward iterator for the last element of the set.

Definition at line 459 of file avl_set.

15.22.4.12 rbegin() [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin ()
const  [inline]
```

Get the constant backward iterator for the last element in the set.

Returns

The constant backward iterator for the last element in the set.

Definition at line 445 of file avl_set.

15.22.4.13 remove()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
int cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::remove (
            Key_type const & item)  [inline]
```

Remove an item from the set.

Parameters

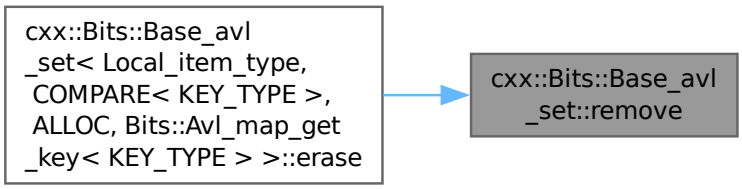
item	The item to remove.

Return values

0	Success

-E_noent	Item does not exist

Definition at line 366 of file avl_set.
Referenced by cxx::Bits::Base_avl_set< Local_item_type, COMPARE< KEY_TYPE >, ALLOC, Bits::Avl_map_get_key< KEY_TYPE
Here is the caller graph for this function:



15.22.4.14 rend() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend ()  [inline]
```

Get the end marker for the mutable backward iterator.

Returns

The end marker for mutable backward iterator.

Definition at line 466 of file avl_set.

15.22.4.15 rend() [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend ()
const  [inline]
```

Get the end marker for the constant backward iterator.

Returns

The end marker for the constant backward iterator.

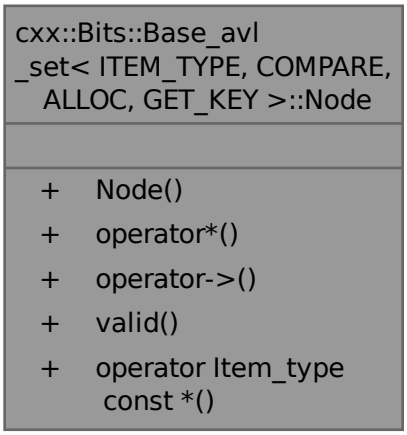
Definition at line 452 of file avl_set.
The documentation for this class was generated from the following file:

- l4/cxx/avl_set

15.23 cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node Class Reference

A smart pointer to a tree item.
`#include <avl_set>`

Collaboration diagram for cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node:



Public Member Functions

- **Node** ()

  Default construction for NIL pointer.
- Item_type const & operator∗ ()

  Dereference the pointer.
- Item_type const ∗ operator-> ()

  Dereferenced member access.
- bool valid () const

  Validity check.
- **operator Item_type const** ∗ ()

  Cast to a real item pointer.

15.23.1 Detailed Description

template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename GET_KEY>
class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node

A smart pointer to a tree item.
Definition at line 182 of file avl_set.

15.23.2 Member Function Documentation

15.23.2.1 operator∗()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Item_type const & cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::operator*
() [inline]
```

Dereference the pointer.

Precondition

Node is valid.

Definition at line 200 of file avl_set.

15.23.2.2 operator->()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Item_type const * cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::operator->
() [inline]
```

Dereferenced member access.

Precondition

Node is valid.

Definition at line 207 of file avl_set.

15.23.2.3 valid()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
bool cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::valid () const
[inline]
```

Validity check.

Returns

false if the pointer is NIL, true if valid.

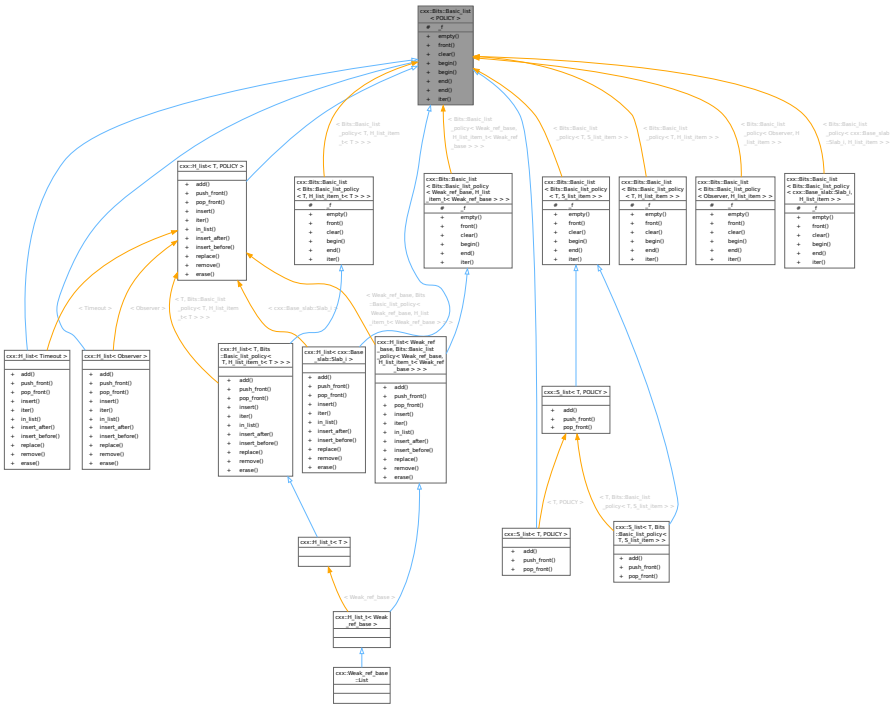
Definition at line 214 of file avl_set.
The documentation for this class was generated from the following file:

- l4/cxx/avl_set

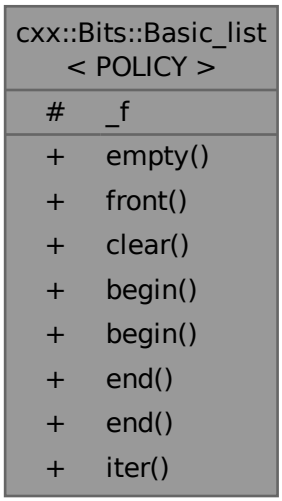
15.24 cxx::Bits::Basic_list< POLICY > Class Template Reference

Internal: Common functions for all head-based list implementations.
`#include <list_basics.h>`

Inheritance diagram for cxx::Bits::Basic_list< POLICY >:



Collaboration diagram for cxx::Bits::Basic_list< POLICY >:



Public Member Functions

- bool **empty** () const

  Check if the list is empty.
- Value_type **front** () const

Return the first element in the list.

- void clear ()

  Remove all elements from the list.

- Iterator **begin** ()

  Return an iterator to the beginning of the list.

- Const_iterator **begin** () const

  Return a const iterator to the beginning of the list.

- Const_iterator **end** () const

  Return a const iterator to the end of the list.

- Iterator **end** ()

  Return an iterator to the end of the list.

Static Public Member Functions

- static Const_iterator iter (Const_value_type c)

  Return a const iterator that begins at the given element.

Protected Attributes

- POLICY::Head_type **_f**

  Pointer to front of the list.

15.24.1 Detailed Description

template<typename POLICY>
class cxx::Bits::Basic_list< POLICY >

Internal: Common functions for all head-based list implementations.
Definition at line 39 of file list_basics.h.

15.24.2 Member Function Documentation

15.24.2.1 clear()

```
template<typename POLICY>
void cxx::Bits::Basic_list< POLICY >::clear ()  [inline]
```

Remove all elements from the list.
After the operation the state of the elements is undefined.
Definition at line 141 of file list_basics.h.
References _f.

15.24.2.2 iter()

```
template<typename POLICY>
Const_iterator cxx::Bits::Basic_list< POLICY >::iter (
            Const_value_type c)  [inline], [static]
```

Return a const iterator that begins at the given element.

Parameters

c	Element where the iterator should start.

Precondition

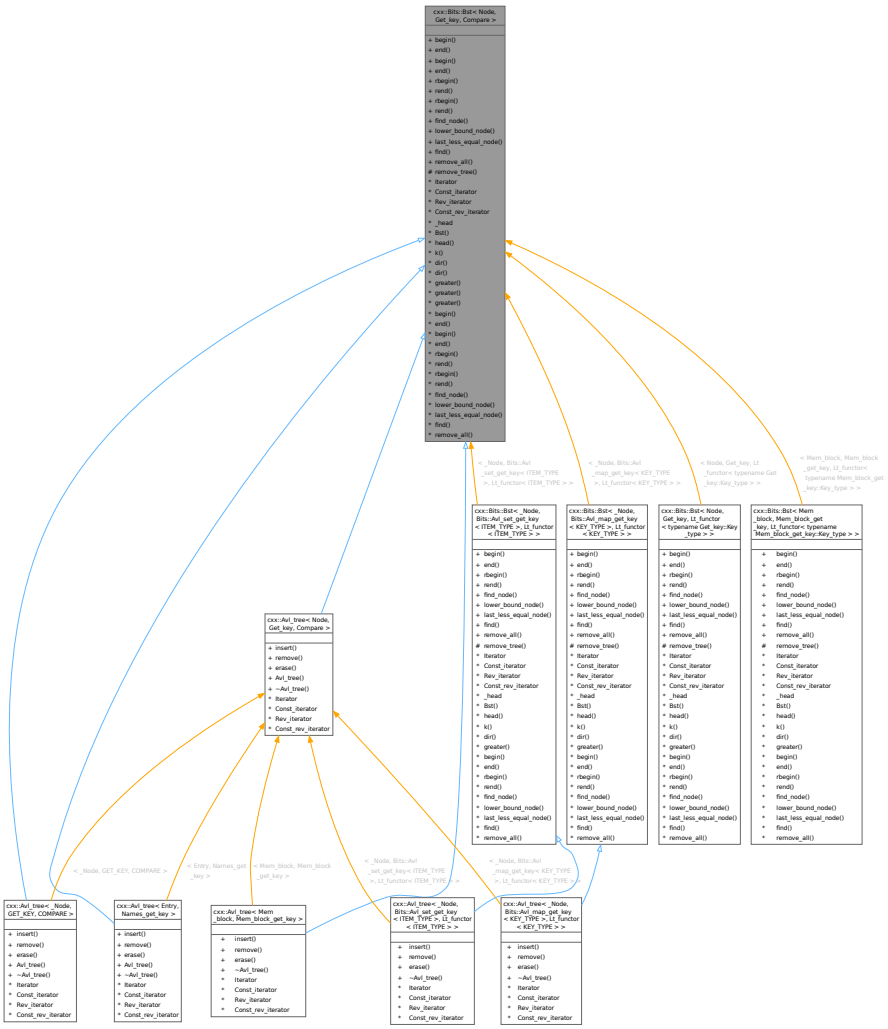
The element `c` must already be in a list.

Definition at line 154 of file list_basics.h.
The documentation for this class was generated from the following file:

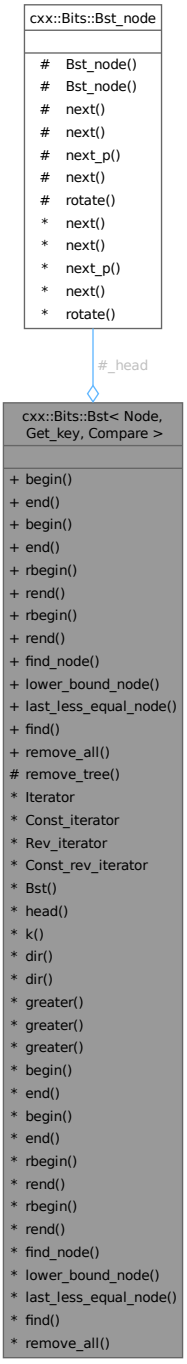
- l4/cxx/bits/list_basics.h

15.25 cxx::Bits::Bst< Node, Get_key, Compare > Class Template Reference

Basic binary search tree (BST).
`#include <bst.h>`
Inheritance diagram for cxx::Bits::Bst< Node, Get_key, Compare >:



Collaboration diagram for cxx::Bits::Bst< Node, Get_key, Compare >:



Public Types

- typedef Get_key::Key_type **Key_type**

  The type of key values used to generate the total order of the elements.
- typedef Type_traits< Key_type >::Param_type **Key_param_type**

  The type for key parameters.
- typedef Fwd **Fwd_iter_ops**

  Helper for building forward iterators for different wrapper classes.

- typedef Rev **Rev_iter_ops**

  Helper for building reverse iterators for different wrapper classes.

Iterators

- typedef __Bst_iter< Node, Node, Fwd > **Iterator**

  Forward iterator.
- typedef __Bst_iter< Node, Node const, Fwd > **Const_iterator**

  Constant forward iterator.
- typedef __Bst_iter< Node, Node, Rev > **Rev_iterator**

  Backward iterator.
- typedef __Bst_iter< Node, Node const, Rev > **Const_rev_iterator**

  Constant backward.

Public Member Functions

Get default iterators for the ordered tree.

- Const_iterator begin () const

  Get the constant forward iterator for the first element in the set.
- Const_iterator end () const

  Get the end marker for the constant forward iterator.
- Iterator begin ()

  Get the mutable forward iterator for the first element of the set.
- Iterator end ()

  Get the end marker for the mutable forward iterator.
- Const_rev_iterator rbegin () const

  Get the constant backward iterator for the last element in the set.
- Const_rev_iterator rend () const

  Get the end marker for the constant backward iterator.
- Rev_iterator rbegin ()

  Get the mutable backward iterator for the last element of the set.
- Rev_iterator rend ()

  Get the end marker for the mutable backward iterator.

Lookup functions.

- Node * find_node (Key_param_type key) const

  find the node with the given key.
- Node * lower_bound_node (Key_param_type key) const

  Find the first node with a key not less than the given `key`.
- Node * last_less_equal_node (Key_param_type key) const

  Find the last node with a key less than or equal to the given `key`.
- Const_iterator find (Key_param_type key) const

  find the node with the given key.
- template<typename FUNC>
  void remove_all (FUNC &&callback)

  Clear the tree.

Static Protected Member Functions

- template<typename FUNC>
  static void remove_tree (Bst_node *head, FUNC &&callback)

  Remove all elements in the subtree of head.

Interior access for descendants.

As this class is an intended base class we provide protected access to our interior, use 'using' to make this private in concrete implementations.

- Bst_node * **_head**

  The head pointer of the tree.
- **Bst** ()

  Create an empty tree.
- Node * **head** () const

  Access the head node as object of type Node.
- static Key_type **k** (Bst_node const *n)

  Get the key value of n.
- static Dir dir (Key_param_type l, Key_param_type r)

  Get the direction to go from `l` to search for `r`.
- static Dir dir (Key_param_type l, Bst_node const *r)

  Get the direction to go from `l` to search for `r`.
- static bool **greater** (Key_param_type l, Key_param_type r)

  Is l greater than r.
- static bool **greater** (Key_param_type l, Bst_node const *r)

  Is l greater than r.
- static bool **greater** (Bst_node const *l, Bst_node const *r)

  Is l greater than r.

15.25.1 Detailed Description

template<typename Node, typename Get_key, typename Compare>
class cxx::Bits::Bst< Node, Get_key, Compare >

Basic binary search tree (BST).
This class is intended as a base class for concrete binary search trees, such as an AVL tree. This class already provides the basic lookup methods and iterator definitions for a BST.
Definition at line 31 of file bst.h.

15.25.2 Member Function Documentation

15.25.2.1 begin() [1/2]

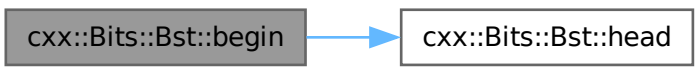
```
template<typename Node, typename Get_key, typename Compare>
Iterator cxx::Bits::Bst< Node, Get_key, Compare >::begin ()  [inline]
```

Get the mutable forward iterator for the first element of the set.

Returns

The mutable forward iterator for the first element of the set.

Definition at line 184 of file bst.h.
References head().
Here is the call graph for this function:



15.25.2.2 begin() [2/2]

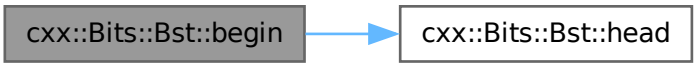
```
template<typename Node, typename Get_key, typename Compare>
Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::begin () const  [inline]
```

Get the constant forward iterator for the first element in the set.

Returns

Constant forward iterator for the first element in the set.

Definition at line 173 of file bst.h.
References head().
Here is the call graph for this function:



15.25.2.3 dir() [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Dir cxx::Bits::Bst< Node, Get_key, Compare >::dir (
            Key_param_type l,
            Bst_node const * r)  [inline], [static], [protected]
```

Get the direction to go from `l` to search for `r`.

Parameters

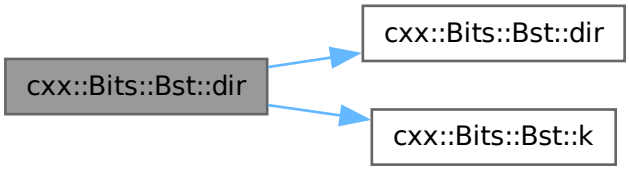
l	is the key to look for.
r	is the node at the current position.

Return values

Direction::L	For left.
Direction::R	For right.
Direction::N	If `l` is equal to `r`.

Definition at line 129 of file bst.h.
References dir(), and k().

Here is the call graph for this function:



15.25.2.4 dir() [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Dir cxx::Bits::Bst< Node, Get_key, Compare >::dir (
            Key_param_type l,
            Key_param_type r)  [inline], [static], [protected]
```

Get the direction to go from `l` to search for `r`.

Parameters

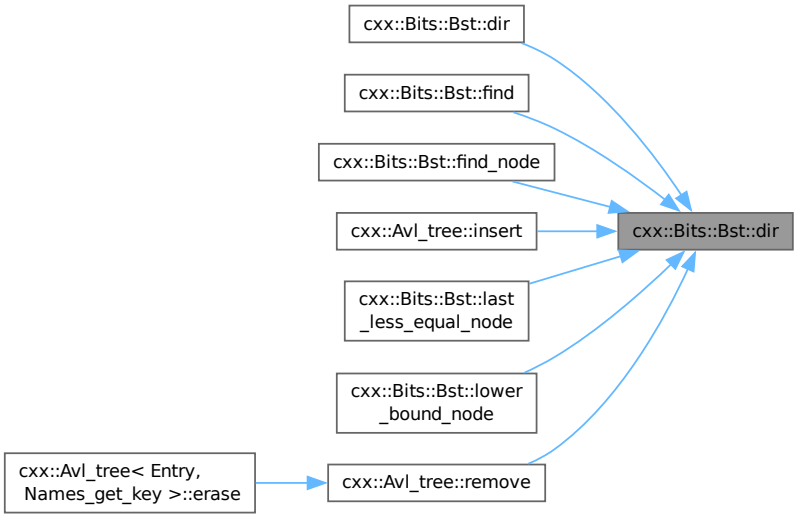
l	is the key to look for.
r	is the key at the current position.

Return values

Direction::L	for left
Direction::R	for right
Direction::N	if `l` is equal to `r`.

Definition at line 112 of file bst.h.
References cxx::Bits::Direction::L, and cxx::Bits::Direction::N.
Referenced by dir(), find(), find_node(), cxx::Avl_tree< Node, Get_key, Compare >::insert(), last_less_equal_node(), lower_bound_node(), and cxx::Avl_tree< Node, Get_key, Compare >::remove().

Here is the caller graph for this function:



15.25.2.5 end() [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Iterator cxx::Bits::Bst< Node, Get_key, Compare >::end ()  [inline]
```

Get the end marker for the mutable forward iterator.

Returns

The end marker for mutable forward iterator.

Definition at line 189 of file bst.h.

15.25.2.6 end() [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::end () const  [inline]
```

Get the end marker for the constant forward iterator.

Returns

The end marker for the constant forward iterator.

Definition at line 178 of file bst.h.

15.25.2.7 find()

```
template<typename Node, typename Get_key, class Compare>
Bst< Node, Get_key, Compare >::Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::find
(
            Key_param_type key) const  [inline]
```

find the node with the given *key*.

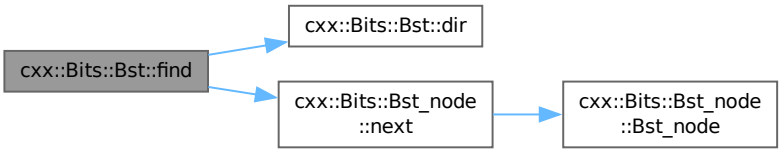
Parameters

key	The key value of the element to search.

Returns

A valid iterator for the node with the given *key*, or an invalid iterator if *key* was not found.

Definition at line 333 of file bst.h.
References _head, dir(), cxx::Bits::Direction::L, cxx::Bits::Direction::N, and cxx::Bits::Bst_node::next().
Here is the call graph for this function:



15.25.2.8 find_node()

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Bits::Bst< Node, Get_key, Compare >::find_node (
            Key_param_type key) const  [inline]
```

find the node with the given *key*.

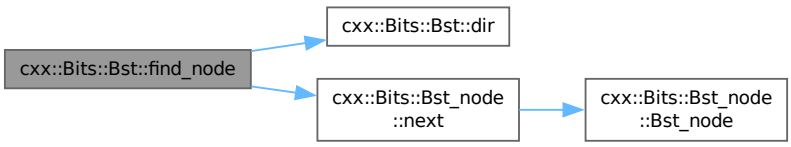
Parameters

key	The key value of the element to search.

Returns

A pointer to the node with the given *key*, or NULL if *key* was not found.

Definition at line 278 of file bst.h.
References _head, dir(), cxx::Bits::Direction::N, and cxx::Bits::Bst_node::next().
Here is the call graph for this function:



15.25.2.9 last_less_equal_node()

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Bits::Bst< Node, Get_key, Compare >::last_less_equal_node (
            Key_param_type key) const  [inline]
```

Find the last node with a key less than or equal to the given `key`.

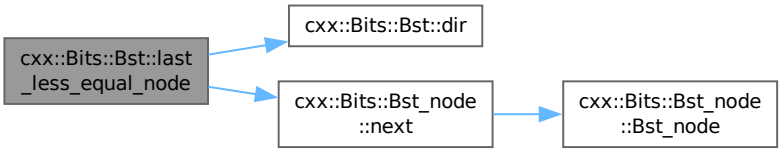
Parameters

key	The key used for the search.

Returns

A pointer to the found node, or `NULL` if no node was found.

Definition at line 313 of file bst.h.
References _head, dir(), cxx::Bits::Direction::N, cxx::Bits::Bst_node::next(), and cxx::Bits::Direction::R.
Here is the call graph for this function:



15.25.2.10 lower_bound_node()

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Bits::Bst< Node, Get_key, Compare >::lower_bound_node (
            Key_param_type key) const  [inline]
```

Find the first node with a key not less than the given `key`.

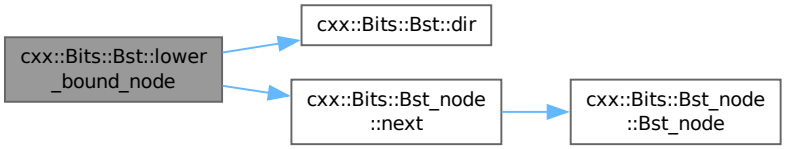
Parameters

key	The key used for the search.

Returns

A pointer to the found node, or `NULL` if no node was found.

Definition at line 294 of file bst.h.
References _head, dir(), cxx::Bits::Direction::L, cxx::Bits::Direction::N, and cxx::Bits::Bst_node::next().
Here is the call graph for this function:



15.25.2.11 rbegin() [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rbegin ()  [inline]
```

Get the mutable backward iterator for the last element of the set.

Returns

The mutable backward iterator for the last element of the set.

Definition at line 206 of file bst.h.
References head().
Here is the call graph for this function:

15.25.2.12 rbegin() [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Const_rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rbegin () const  [inline]
```

Get the constant backward iterator for the last element in the set.

Returns

The constant backward iterator for the last element in the set.

Definition at line 195 of file bst.h.
References head().
Here is the call graph for this function:

15.25.2.13 remove_all()

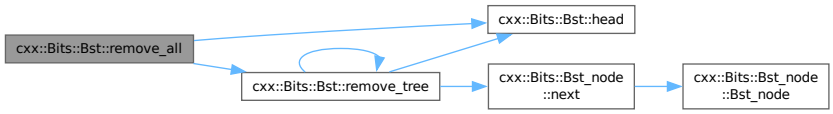
```
template<typename Node, typename Get_key, typename Compare>
template<typename FUNC>
void cxx::Bits::Bst< Node, Get_key, Compare >::remove_all (
            FUNC && callback)  [inline]
```

Clear the tree.

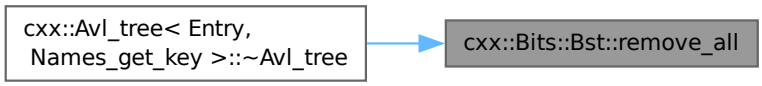
Parameters

callback	Optional function to be called on each removed element.

The callback may delete the elements. The function guarantees that the elements are no longer used after the callback has been called.
Definition at line 260 of file bst.h.
References _head, head(), and remove_tree().
Referenced by cxx::Avl_tree< Entry, Names_get_key >::~Avl_tree().
Here is the call graph for this function:



Here is the caller graph for this function:



15.25.2.14 remove_tree()

```
template<typename Node, typename Get_key, typename Compare>
template<typename FUNC>
void cxx::Bits::Bst< Node, Get_key, Compare >::remove_tree (
            Bst_node * head,
            FUNC && callback)  [inline], [static], [protected]
```

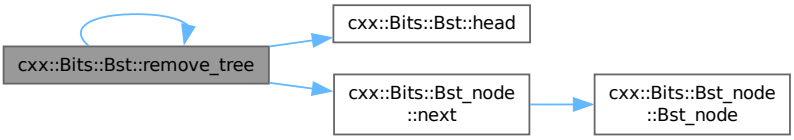
Remove all elements in the subtree of head.

Parameters

head	Head of the the subtree to remove
callback	Optional function called on each removed element.

Definition at line 152 of file bst.h.
References head(), cxx::Bits::Direction::L, cxx::Bits::Bst_node::next(), cxx::Bits::Direction::R, and remove_tree().
Referenced by remove_all(), and remove_tree().

Here is the call graph for this function:



Here is the caller graph for this function:

15.25.2.15 rend() [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rend ()  [inline]
```

Get the end marker for the mutable backward iterator.

Returns

The end marker for mutable backward iterator.

Definition at line 211 of file bst.h.

15.25.2.16 rend() [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Const_rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rend () const  [inline]
```

Get the end marker for the constant backward iterator.

Returns

The end marker for the constant backward iterator.

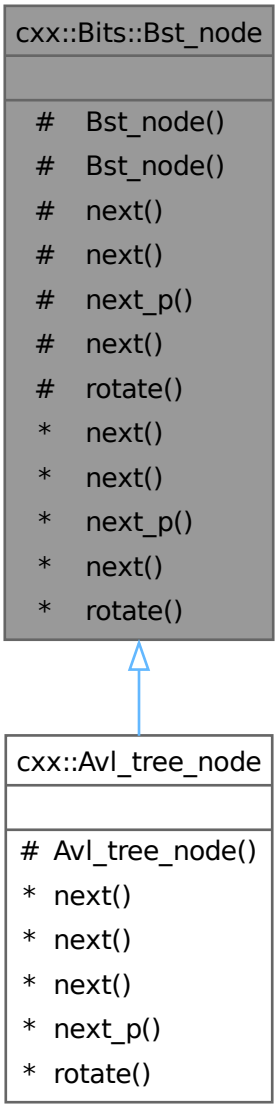
Definition at line 200 of file bst.h.
The documentation for this class was generated from the following file:

- l4/cxx/bits/bst.h

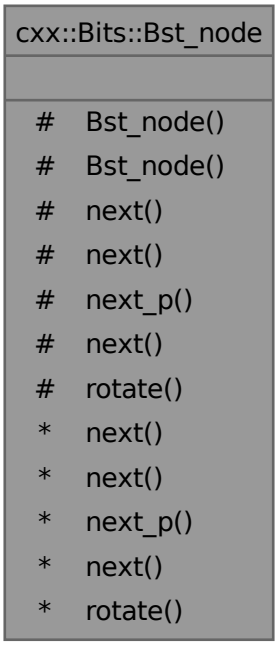
15.26 cxx::Bits::Bst_node Class Reference

Basic type of a node in a binary search tree (BST).
`#include <bst_base.h>`

Inheritance diagram for cxx::Bits::Bst_node:



Collaboration diagram for cxx::Bits::Bst_node:



Protected Member Functions

- **Bst_node** ()

  Create uninitialized node.
- **Bst_node** (bool)

  Create initialized node.

Static Protected Member Functions

Access to BST linkage.

Provide access to the tree linkage to inherited classes Inherited nodes, such as AVL nodes should make these methods private via 'using'

- static Bst_node * **next** (Bst_node const *p, Direction d)

  Get next node in direction d.
- static void **next** (Bst_node *p, Direction d, Bst_node *n)

  Set next node of p in direction d to n.
- static Bst_node ** **next_p** (Bst_node *p, Direction d)

  Get pointer to link in direction d.
- template<typename Node>
  static Node * **next** (Bst_node const *p, Direction d)

  Get next node in direction d as type Node.
- static void **rotate** (Bst_node **t, Direction idir)

  Rotate subtree t in the opposite direction of idir.

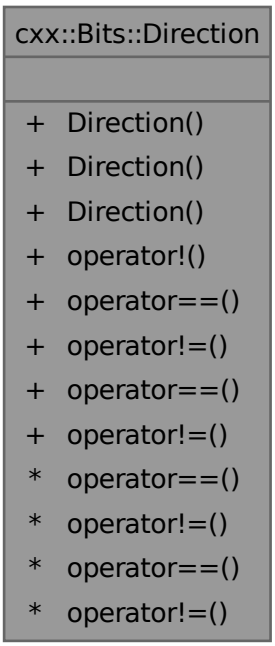
15.26.1 Detailed Description

Basic type of a node in a binary search tree (BST).
Definition at line 70 of file bst_base.h.
The documentation for this class was generated from the following file:

- l4/cxx/bits/bst_base.h

15.27 cxx::Bits::Direction Struct Reference

The direction to go in a binary search tree.
`#include <bst_base.h>`
Collaboration diagram for cxx::Bits::Direction:



Public Types

- enum Direction_e { L = 0 , R = 1 , N = 2 }

  The literal direction values.

Public Member Functions

- **Direction** ()=default

  Uninitialized direction.
- **Direction** (Direction_e d)

  Convert a literal direction (L, R, N) to an object.
- **Direction** (bool b)

  Convert a boolean to a direction (false == L, true == R).
- Direction operator! () const

  Negate the direction.

Comparison operators (equality and inequality)

- bool **operator==** (Direction_e o) const
  Compare for equality.
- bool **operator!=** (Direction_e o) const
  Compare for inequality.
- bool **operator==** (Direction o) const
  Compare for equality.
- bool **operator!=** (Direction o) const
  Compare for inequality.

15.27.1 Detailed Description

The direction to go in a binary search tree.
Definition at line 28 of file bst_base.h.

15.27.2 Member Enumeration Documentation

15.27.2.1 Direction_e

`enum cxx::Bits::Direction::Direction_e`
The literal direction values.

Enumerator

L	Go to the left child.
R	Go to the right child.
N	Stop.

Definition at line 31 of file bst_base.h.

15.27.3 Member Function Documentation

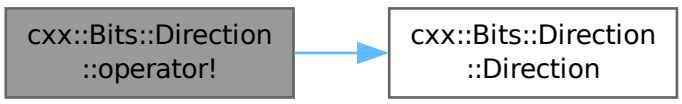
15.27.3.1 operator"!()

`Direction cxx::Bits::Direction::operator! () const [inline]`
Negate the direction.

Note

This is only defined for a current value of L or R

Definition at line 52 of file bst_base.h.
References Direction().
Here is the call graph for this function:



The documentation for this struct was generated from the following file:

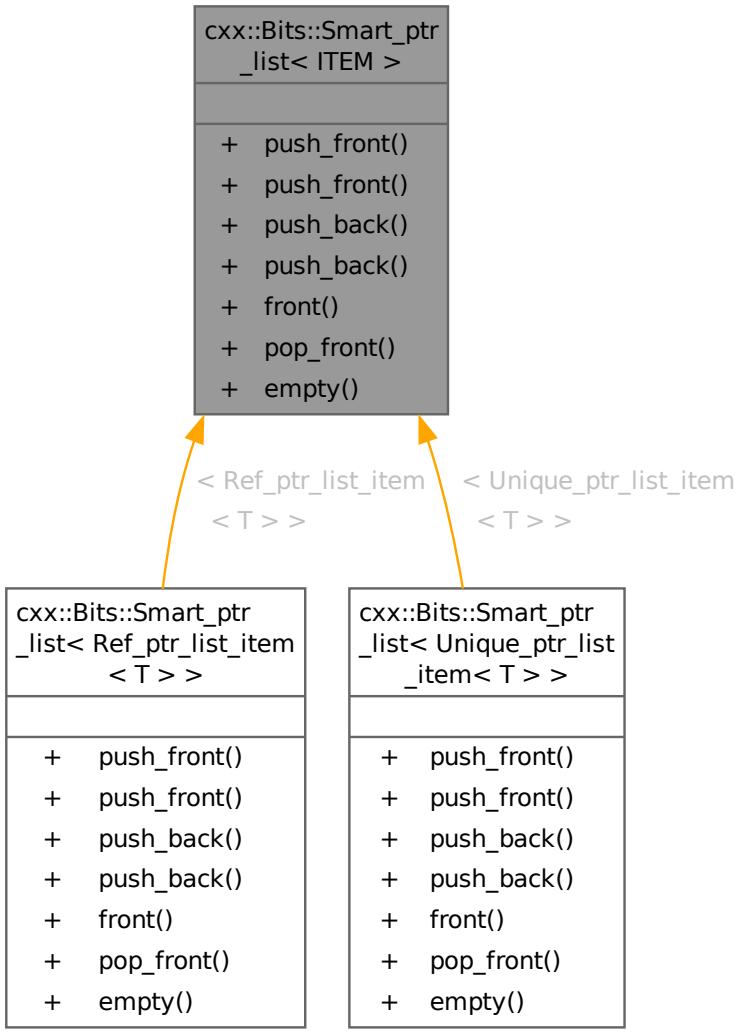
- l4/cxx/bits/bst_base.h

15.28 cxx::Bits::Smart_ptr_list< ITEM > Class Template Reference

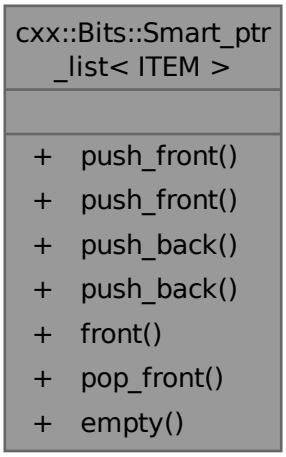
List of smart-pointer-managed objects.

`#include <smart_ptr_list.h>`

Inheritance diagram for cxx::Bits::Smart_ptr_list< ITEM >:



Collaboration diagram for cxx::Bits::Smart_ptr_list< ITEM >:



Public Member Functions

- void **push_front** (Next_type &&e)
  Add an element to the front of the list.
- void **push_front** (Next_type const &e)
  Add an element to the front of the list.
- void **push_back** (Next_type &&e)
  Add an element at the end of the list.
- void **push_back** (Next_type const &e)
  Add an element at the end of the list.
- Value_type * **front** () const
  Return a pointer to the first element in the list.
- Next_type pop_front ()
  Remove the element in front of the list and return it.
- bool **empty** () const
  Check if the list is empty.

15.28.1 Detailed Description

template<typename ITEM>
class cxx::Bits::Smart_ptr_list< ITEM >

List of smart-pointer-managed objects.

Template Parameters

ITEM	Type of the list items.

The list is implemented as a single-linked list connected via smart pointers, so that they are automatically cleaned up when they are removed from the list.
Definition at line 46 of file smart_ptr_list.h.

15.28.2 Member Function Documentation

15.28.2.1 pop_front()

```
template<typename ITEM>
Next_type cxx::Bits::Smart_ptr_list< ITEM >::pop_front ()  [inline]
```

Remove the element in front of the list and return it.

Returns

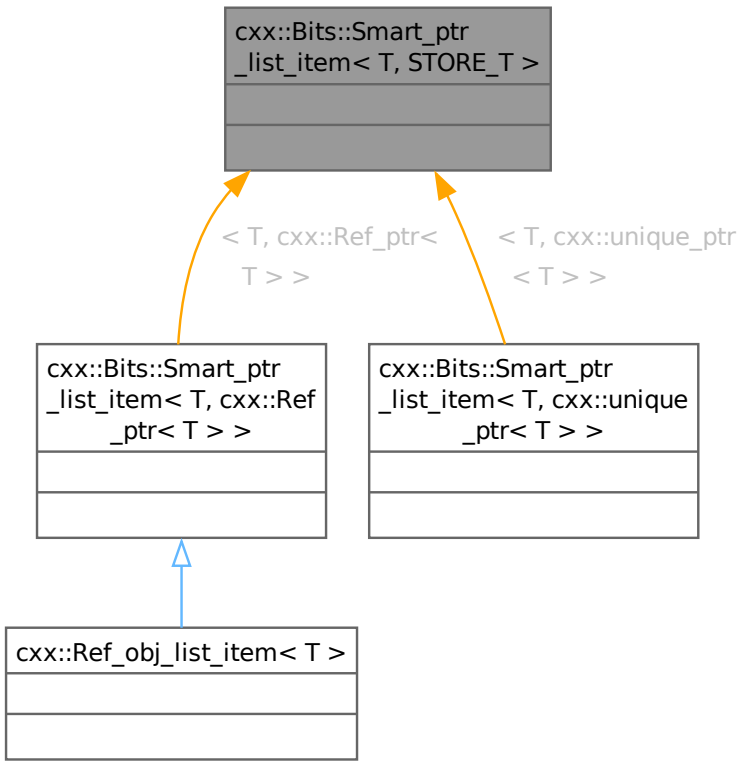
The element that was previously in front of the list as a managed pointer or a nullptr-equivalent when the list was already empty.

Definition at line 149 of file smart_ptr_list.h.
The documentation for this class was generated from the following file:

- l4/cxx/bits/smart_ptr_list.h

15.29 cxx::Bits::Smart_ptr_list_item< T, STORE_T > Class Template Reference

List item for an arbitrary item in a Smart_ptr_list.
`#include <smart_ptr_list.h>`
Inheritance diagram for cxx::Bits::Smart_ptr_list_item< T, STORE_T >:



Collaboration diagram for cxx::Bits::Smart_ptr_list_item< T, STORE_T >:

15.29.1 Detailed Description

template<typename T, typename STORE_T>
class cxx::Bits::Smart_ptr_list_item< T, STORE_T >

List item for an arbitrary item in a Smart_ptr_list.

Template Parameters

T	Type of object to be stored in the list.
STORE_T	Storage type for pointer to next item. The class must implement a get() function that returns a pointer to the stored object and destroy the stored object when the item goes out of scope.

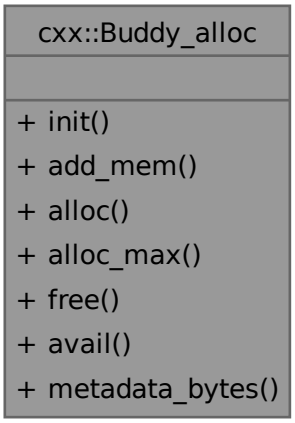
Definition at line 27 of file smart_ptr_list.h.
The documentation for this class was generated from the following file:

- l4/cxx/bits/smart_ptr_list.h

15.30 cxx::Buddy_alloc Class Reference

Buddy allocator backed by a perfect binary tree.
`#include <buddy_alloc>`

Collaboration diagram for cxx::Buddy_alloc:



Public Member Functions

- void init (l4_addr_t min_addr, l4_addr_t max_addr, unsigned char *metadata_addr, size_t metadata_size)

  Initialize the allocator.
- void add_mem (void *mem, size_t size)

  Add memory to the allocator.
- void * alloc (size_t size, size_t align, l4_addr_t lower=0, l4_addr_t upper=~0UL)

  Allocate a memory block.
- void * alloc_max (size_t min, size_t *max, size_t align, size_t granularity, l4_addr_t lower=0, l4_addr_t upper=~0UL)

  Allocate a memory block of `min` *<= size <=* `max`*.*
- void free (void *block, size_t size)

  Return a free memory block to the allocator.
- size_t avail () const

  Get the amount of available memory.

Static Public Member Functions

- static constexpr size_t metadata_bytes (l4_addr_t min_addr, l4_addr_t max_addr)

  Return metadata size in bytes required by the buddy allocator.

15.30.1 Detailed Description

Buddy allocator backed by a perfect binary tree.
The root node of the tree spans the entire memory area managed by the allocator and represents the largest block size supported by the allocator. Each subsequent level of the tree halves the block size until reaching the minimum block size.
Each node in the tree stores the largest order of block that can be allocated at or underneath it:

- A node with a value of 0 is allocated (used).
- A node with a value between 1 and level is split, i.e. has blocks allocated underneath it.
- A node with a value of level+1 is free.

An completely unallocated tree with four levels would look like:

```
        4
    3       3
 2    2   2   2
1 1 1 1 1 1 1 1
```

After allocating a block of `2 * Min_size`:

```
        3
    2       3
 0    2   2   2
1 1 1 1 1 1 1 1
```

Definition at line 56 of file buddy_alloc.

15.30.2 Member Function Documentation

15.30.2.1 add_mem()

```
void cxx::Buddy_alloc::add_mem (
             void * mem,
             size_t size)  [inline]
```

Add memory to the allocator.

Parameters

mem	Pointer to the memory.
size	Size of the memory.

Precondition

The memory must be within the memory range passed to init().

Definition at line 1307 of file buddy_alloc.
References L4_UNLIKELY.

15.30.2.2 alloc()

```
void * cxx::Buddy_alloc::alloc (
             size_t size,
             size_t align,
             l4_addr_t lower = 0,
             l4_addr_t upper = ~0UL)  [inline]
```

Allocate a memory block.

Parameters

size	Size of the memory block.
align	Alignment constraint (must be a power of two).
lower	Lower bound of the physical region the memory block should be allocated from.
upper	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

Return values

nullptr	Allocation failed.

Returns

Pointer to memory block.

Precondition

0 < size

align <= size

Definition at line 1351 of file buddy_alloc.
References L4_LIKELY, and L4_UNLIKELY.

15.30.2.3 alloc_max()

```
void * cxx::Buddy_alloc::alloc_max (
            size_t min,
            size_t * max,
            size_t align,
            size_t granularity,
            l4_addr_t lower = 0,
            l4_addr_t upper = ~0UL)  [inline]
```

Allocate a memory block of min <= size <= max.

Parameters

	min	Minimal size to allocate (in bytes).
in,out	*max*	Maximum size to allocate (in bytes). The actual allocated size is returned here.
	align	Alignment constraint (must be a power of two).
	granularity	Granularity to use for the allocation (power of 2).
	lower	Lower bound of the physical region the memory block should be allocated from.
	upper	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

Note

The allocated size is always a multiple of granularity, thus min is rounded up to a multiple of granularity internally.

Return values

nullptr	Allocation failed.

Returns

Pointer to memory block

Precondition

0 < min <= max

0 < max

align <= min

granularity <= align

Definition at line 1404 of file buddy_alloc.
References L4_LIKELY, and L4_UNLIKELY.

15.30.2.4 avail()

```
size_t cxx::Buddy_alloc::avail () const  [inline]
```

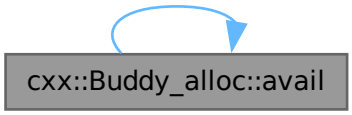
Get the amount of available memory.

Returns

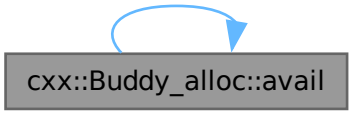
Available memory in bytes

Available memory in bytes.

Definition at line 1611 of file buddy_alloc.
References avail(), and L4_UNLIKELY.
Referenced by avail().
Here is the call graph for this function:



Here is the caller graph for this function:



15.30.2.5 free()

```
void cxx::Buddy_alloc::free (
            void * block,
            size_t size)  [inline]
```

Return a free memory block to the allocator.

Parameters

block	Pointer to memory block.
size	Size of memory block.

Precondition

`block` must not be NULL.

`block` must have been obtained through alloc() or alloc_max().

Definition at line 1500 of file buddy_alloc.
References L4_UNLIKELY.

15.30.2.6 init()

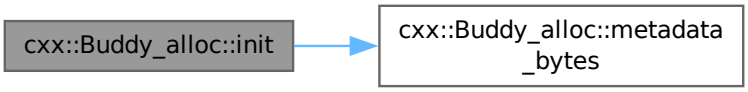
```
void cxx::Buddy_alloc::init (
            l4_addr_t min_addr,
            l4_addr_t max_addr,
            unsigned char * metadata_addr,
            size_t metadata_size)  [inline]
```

Initialize the allocator.

Parameters

min_addr	Minimum address covered by the allocator.
max_addr	Maximum address covered by the allocator (inclusive).
metadata_addr	Pointer to metadata memory chunk for the allocator.
metadata_size	Size of the metadata memory chunk.

Definition at line 139 of file buddy_alloc.
References metadata_bytes().
Here is the call graph for this function:



15.30.2.7 metadata_bytes()

```
constexpr size_t cxx::Buddy_alloc::metadata_bytes (
            l4_addr_t min_addr,
            l4_addr_t max_addr)  [inline], [static], [constexpr]
```

Return metadata size in bytes required by the buddy allocator.

Parameters

min_addr	Minimum address covered by the allocator.
max_addr	Maximum address covered by the allocator (inclusive).

Definition at line 124 of file buddy_alloc.
Referenced by init().

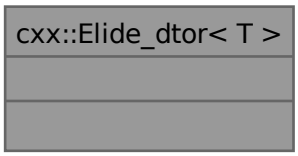
15.31 cxx::Elide_dtor< T > Class Template Reference

Wrapper class to remove destructor calls.
`#include <elide_dtor>`
Collaboration diagram for cxx::Elide_dtor< T >:



15.31.1 Detailed Description

template<typename T>
class cxx::Elide_dtor< T >

Wrapper class to remove destructor calls.
Use this class for global or static local objects that shall not be destructed. This can save some code size if the destructor of `T` is not trivial. It also prevents calls to atexit() at runtime.

Attention

Be careful if you use `Elide_dtor` in the global scope. Even if `T` is trivially constructible, the wrapper will force the compiler to emit a static initializer!

Definition at line 28 of file elide_dtor.
The documentation for this class was generated from the following file:

- l4/cxx/elide_dtor

15.32 cxx::Error Class Reference

Error value.
`#include <result>`

Collaboration diagram for cxx::Error:

15.32.1 Detailed Description

Error value.
Value class to make error value types explicit. Participates in the construction of Result objects.
Definition at line 19 of file result.
The documentation for this class was generated from the following file:

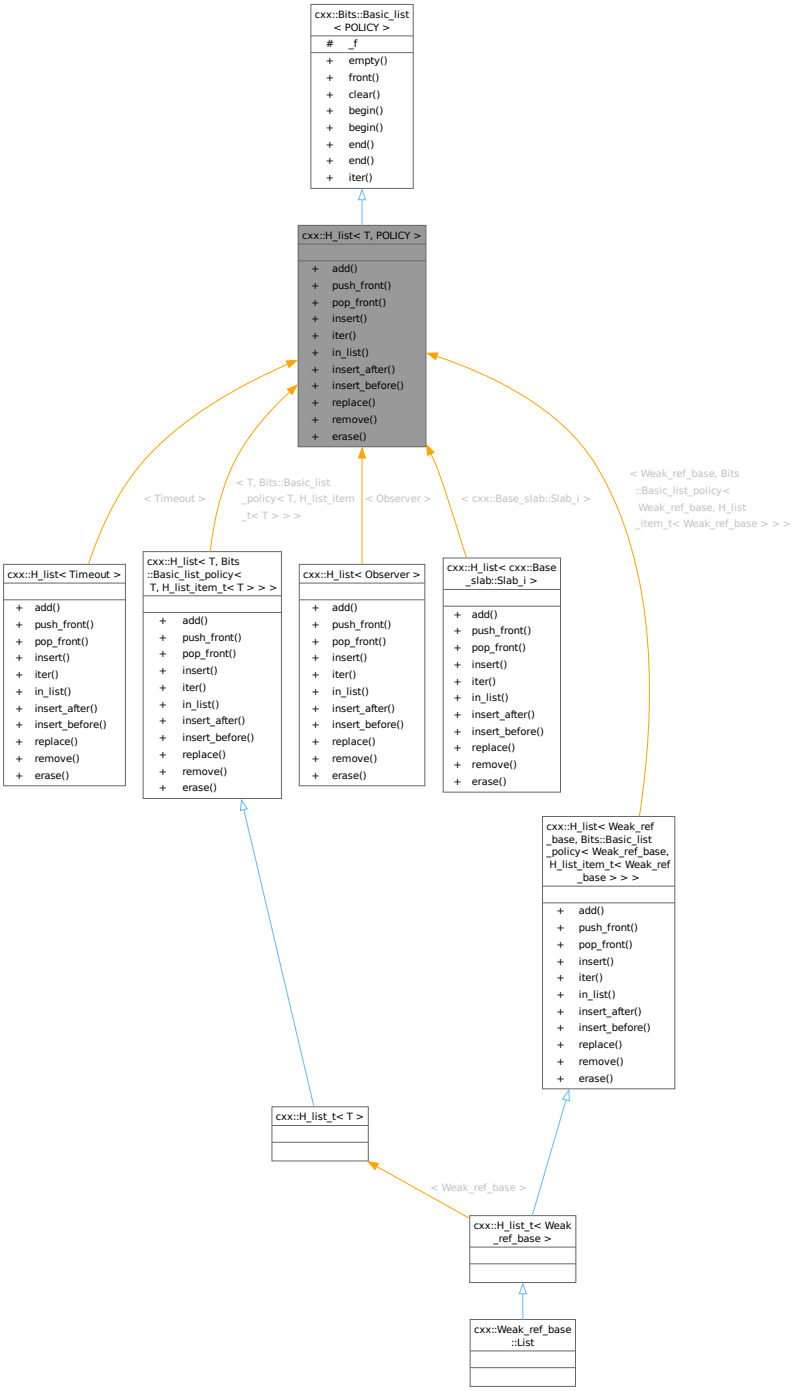
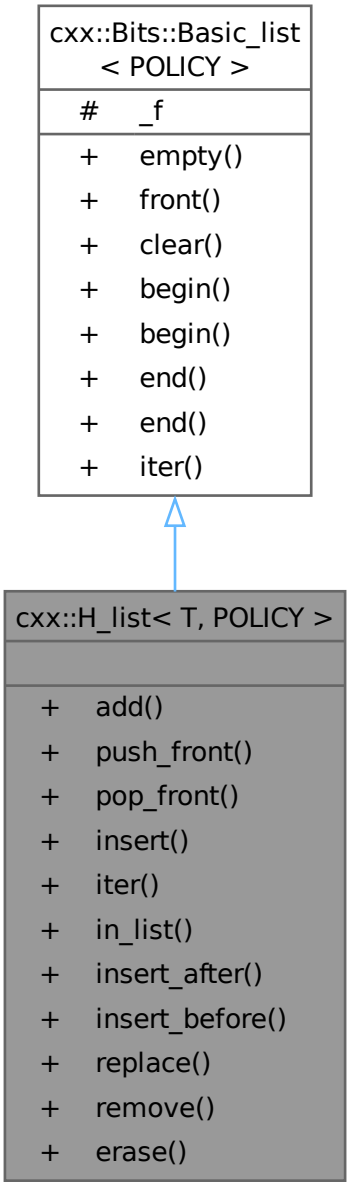
15.33 cxx::H_list< T, POLICY > Class Template Reference

General double-linked list of unspecified cxx::H_list_item elements.
`#include <hlist>`

Inheritance diagram for cxx::H_list< T, POLICY >:



Collaboration diagram for cxx::H_list< T, POLICY >:



Public Member Functions

- void **add** (T *e)

  Add element to the front of the list.
- void **push_front** (T *e)

  Add element to the front of the list.
- T * pop_front ()

  Remove and return the head element of the list.
- Iterator insert (T *e, Iterator const &pred)

  Insert an element at the iterator position.

Public Member Functions inherited from cxx::Bits::Basic_list< POLICY >

- bool **empty** () const

  Check if the list is empty.
- Value_type **front** () const

  Return the first element in the list.
- void clear ()

  Remove all elements from the list.
- Iterator **begin** ()

  Return an iterator to the beginning of the list.
- Const_iterator **begin** () const

  Return a const iterator to the beginning of the list.
- Const_iterator **end** () const

  Return a const iterator to the end of the list.
- Iterator **end** ()

  Return an iterator to the end of the list.

Static Public Member Functions

- static Iterator iter (T *c)

  Return an iterator for an arbitrary list element.
- static bool **in_list** (T const *e)

  Check if the given element is currently part of a list.
- static Iterator insert_after (T *e, Iterator const &pred)

  Insert an element after the iterator position.
- static void insert_before (T *e, Iterator const &succ)

  Insert an element before the iterator position.
- static void replace (T *p, T *e)

  Replace an element in a list with a new element.
- static void remove (T *e)

  Remove the given element from its list.
- static Iterator erase (Iterator const &e)

  Remove the element at the given iterator position.

Static Public Member Functions inherited from cxx::Bits::Basic_list< POLICY >

- static Const_iterator iter (Const_value_type c)

  Return a const iterator that begins at the given element.

Additional Inherited Members

Protected Attributes inherited from cxx::Bits::Basic_list< POLICY >

- POLICY::Head_type **_f**

  Pointer to front of the list.

15.33.1 Detailed Description

template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
class cxx::H_list< T, POLICY >

General double-linked list of unspecified cxx::H_list_item elements.
Most of the time, you want to use H_list_t.
Definition at line 69 of file hlist.

15.33.2 Member Function Documentation

15.33.2.1 erase()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::erase (
            Iterator const & e)  [inline], [static]
```

Remove the element at the given iterator position.

Parameters

e	Iterator pointing to the element to be removed. Must not point to end().

Returns

New iterator pointing to the element after the removed one.

Note

The hlist implementation guarantees that the original iterator is still valid after the element has been removed. In fact, the iterator returned is the same as the one supplied in the `e` parameter.

Definition at line 236 of file hlist.

15.33.2.2 insert()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::insert (
            T * e,
            Iterator const & pred)  [inline]
```

Insert an element at the iterator position.

Parameters

e	New Element to be inserted
pred	Iterator pointing to the element after which the element will be inserted. If end() is given, the element will be inserted at the beginning of the queue.

Returns

Iterator pointing to the newly inserted element.

Definition at line 133 of file hlist.

15.33.2.3 insert_after()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::insert_after (
            T * e,
            Iterator const & pred)  [inline], [static]
```

Insert an element after the iterator position.

Parameters

e	New element to be inserted.
pred	Iterator pointing to the element after which the element will be inserted. Must not be end().

Returns

Iterator pointing to the newly inserted element.

Precondition

The list must not be empty.

Definition at line 160 of file hlist.

15.33.2.4 insert_before()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
void cxx::H_list< T, POLICY >::insert_before (
            T * e,
            Iterator const & succ)  [inline], [static]
```

Insert an element before the iterator position.

Parameters

e	New element to be inserted.
succ	Iterator pointing to the element before which the element will be inserted. Must not be end().

Definition at line 180 of file hlist.

15.33.2.5 iter()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::iter (
            T * c)  [inline], [static]
```

Return an iterator for an arbitrary list element.

Parameters

c	List element to start the iteration.

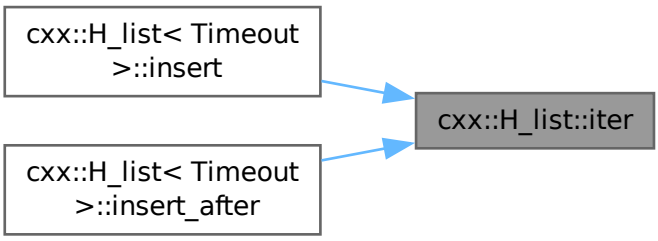
Returns

A mutable forward iterator.

Precondition

The element must be in a list.

Definition at line 93 of file hlist.
Referenced by cxx::H_list< Timeout >::insert(), and cxx::H_list< Timeout >::insert_after().
Here is the caller graph for this function:



15.33.2.6 pop_front()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
T * cxx::H_list< T, POLICY >::pop_front ()  [inline]
```

Remove and return the head element of the list.

Precondition

The list must not be empty or the behaviour will be undefined.

Definition at line 116 of file hlist.

15.33.2.7 remove()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
void cxx::H_list< T, POLICY >::remove (
            T * e)  [inline], [static]
```

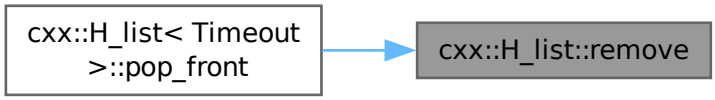
Remove the given element from its list.

Parameters

e	Element to be removed. Must be in a list.

Definition at line 220 of file hlist.
Referenced by cxx::H_list< Timeout >::pop_front().

Here is the caller graph for this function:



15.33.2.8 replace()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
void cxx::H_list< T, POLICY >::replace (
            T * p,
            T * e)  [inline], [static]
```

Replace an element in a list with a new element.

Parameters

p	Element in list to be replaced.
e	Replacement element, must not yet be in a list.

Precondition

p and e must not be NULL.

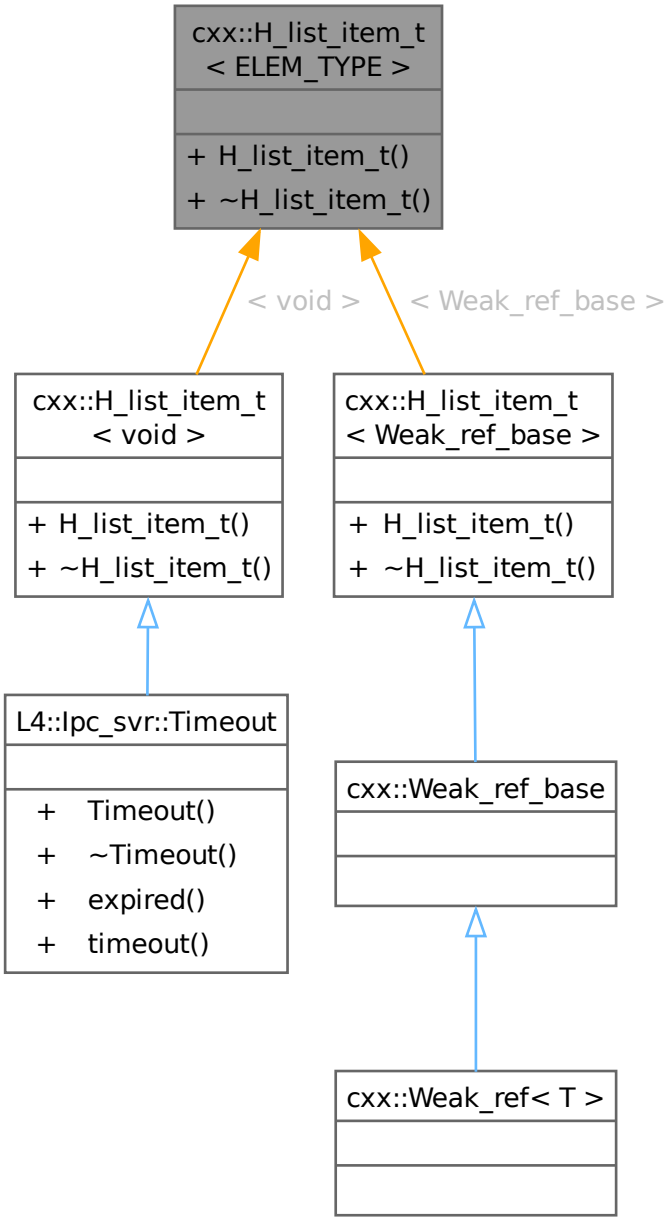
After the operation the p element is no longer in the list and may be reused.
Definition at line 204 of file hlist.
The documentation for this class was generated from the following file:

- l4/cxx/hlist

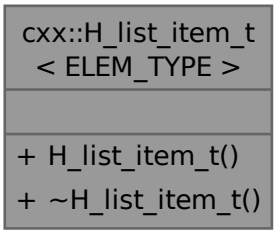
15.34 cxx::H_list_item_t< ELEM_TYPE > Class Template Reference

Basic element type for a double-linked H_list.
`#include <hlist>`

Inheritance diagram for cxx::H_list_item_t< ELEM_TYPE >:



Collaboration diagram for cxx::H_list_item_t< ELEM_TYPE >:



Public Member Functions

- constexpr H_list_item_t ()
  Constructor.
- ~H_list_item_t () noexcept
  Destructor.

15.34.1 Detailed Description

template<typename ELEM_TYPE>
class cxx::H_list_item_t< ELEM_TYPE >

Basic element type for a double-linked H_list.

Template Parameters

ELEM_TYPE	Base class of the list element.

Definition at line 22 of file hlist.

15.34.2 Constructor & Destructor Documentation

15.34.2.1 H_list_item_t()

```
template<typename ELEM_TYPE>
cxx::H_list_item_t< ELEM_TYPE >::H_list_item_t ()  [inline], [constexpr]
```

Constructor.
Creates an element that is not in any list.
Definition at line 30 of file hlist.

15.34.2.2 ~H_list_item_t()

```
template<typename ELEM_TYPE>
cxx::H_list_item_t< ELEM_TYPE >::~H_list_item_t ()  [inline], [noexcept]
```

Destructor.
Automatically removes the element from any list it still might be enchained in.
Definition at line 37 of file hlist.
The documentation for this class was generated from the following file:

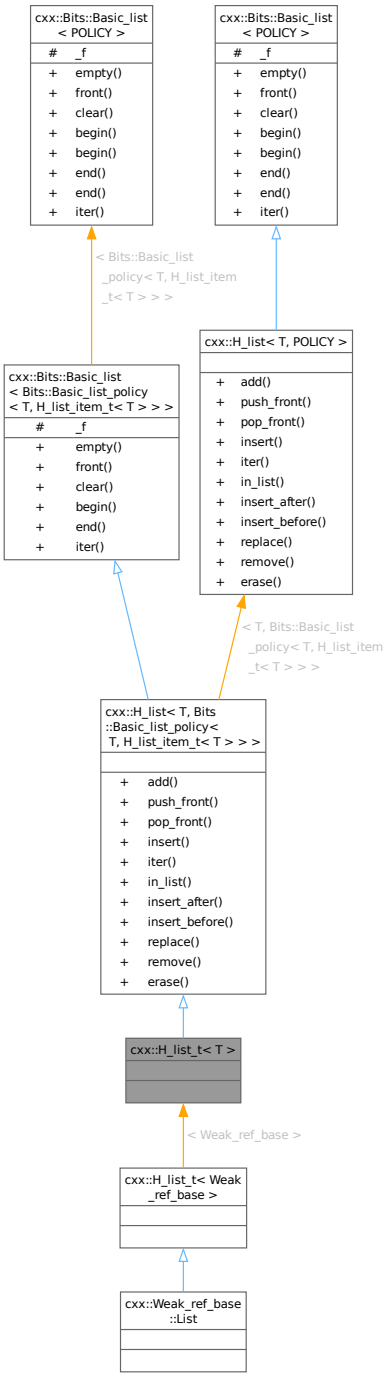
- l4/cxx/hlist

15.35 cxx::H_list_t< T > Struct Template Reference

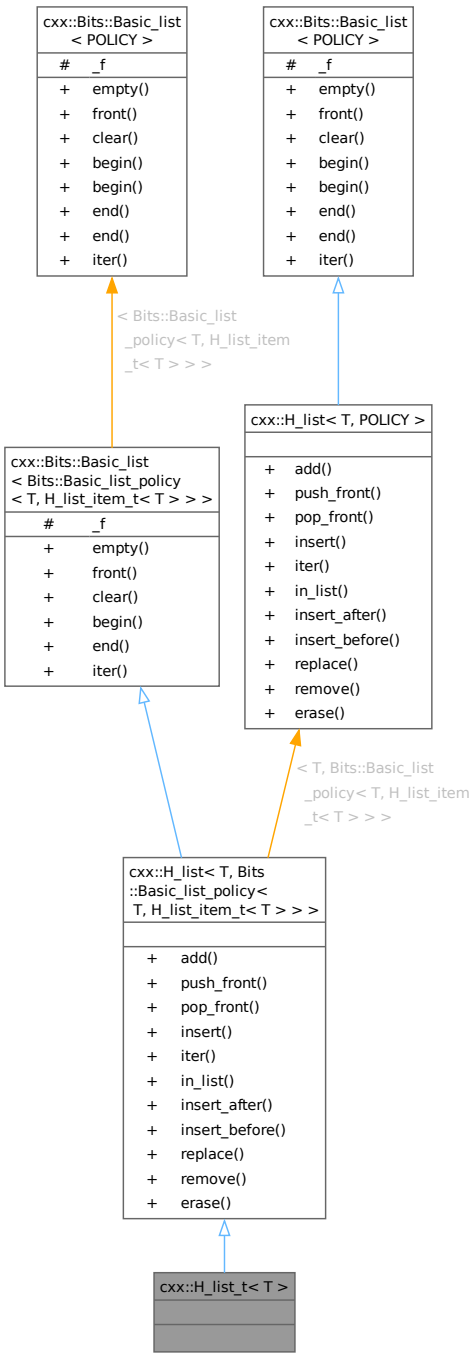
Double-linked list of typed H_list_item_t elements.

`#include <hlist>`

Inheritance diagram for cxx::H_list_t< T >:



Collaboration diagram for cxx::H_list_t< T >:



Additional Inherited Members

Public Member Functions inherited from cxx::H_list< T, Bits::Basic_list_policy< T, H_list_item_t< T > > >

- void **add** (T *e)

  Add element to the front of the list.

- void **push_front** (T *e)

Add element to the front of the list.

- T * pop_front ()

  Remove and return the head element of the list.

- Iterator insert (T *e, Iterator const &pred)

  Insert an element at the iterator position.

Public Member Functions inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< T, H_list_item_t< T > > >

- bool **empty** () const

  Check if the list is empty.

- Value_type **front** () const

  Return the first element in the list.

- void clear ()

  Remove all elements from the list.

- Iterator **begin** ()

  Return an iterator to the beginning of the list.

- Const_iterator **end** () const

  Return a const iterator to the end of the list.

Static Public Member Functions inherited from cxx::H_list< T, Bits::Basic_list_policy< T, H_list_item_t< T > > >

- static Iterator iter (T *c)

  Return an iterator for an arbitrary list element.

- static bool **in_list** (T const *e)

  Check if the given element is currently part of a list.

- static Iterator insert_after (T *e, Iterator const &pred)

  Insert an element after the iterator position.

- static void insert_before (T *e, Iterator const &succ)

  Insert an element before the iterator position.

- static void replace (T *p, T *e)

  Replace an element in a list with a new element.

- static void remove (T *e)

  Remove the given element from its list.

- static Iterator erase (Iterator const &e)

  Remove the element at the given iterator position.

Static Public Member Functions inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< T, H_list_item_t< T > > >

- static Const_iterator iter (Const_value_type c)

  Return a const iterator that begins at the given element.

Protected Attributes inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< T, H_list_item_t< T > > >

- Bits::Basic_list_policy< T, H_list_item_t< T > >::Head_type **_f**

  Pointer to front of the list.

15.35.1 Detailed Description

template<typename T>
struct cxx::H_list_t< T >

Double-linked list of typed H_list_item_t elements.

Note

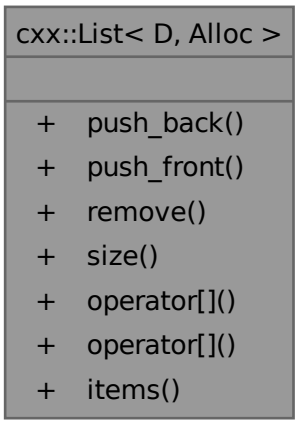
H_lists are not self-cleaning. Elements that are still chained during destruction are not removed and will therefore be in an undefined state after the destruction.

Definition at line 248 of file hlist.
The documentation for this struct was generated from the following file:

- l4/cxx/hlist

15.36 cxx::List< D, Alloc > Class Template Reference

Doubly linked list, with internal allocation.
`#include <list>`
Collaboration diagram for cxx::List< D, Alloc >:



Data Structures

- class Iter

  Iterator.

Public Member Functions

- void **push_back** (D const &d) noexcept

  Add element at the end of the list.
- void **push_front** (D const &d) noexcept

  Add element at the beginning of the list.
- void **remove** (Iter const &i) noexcept

  Remove element pointed to by the iterator.
- unsigned long **size** () const noexcept

Get the length of the list.

- D const & operator[ ] (unsigned long idx) const noexcept

  Random access.

- D & operator[ ] (unsigned long idx) noexcept

  Random access.

- Iter **items** () noexcept

  Get iterator for the list elements.

15.36.1 Detailed Description

template<typename D, template< typename A > class Alloc = New_allocator>
class cxx::List< D, Alloc >

Doubly linked list, with internal allocation.
Container for items of type D, implemented by a doubly linked list. Alloc defines the allocator policy.
Definition at line 326 of file list.

15.36.2 Member Function Documentation

15.36.2.1 operator[]() [1/2]

```
template<typename D, template< typename A > class Alloc = New_allocator>
D const & cxx::List< D, Alloc >::operator[] (
            unsigned long idx) const  [inline], [noexcept]
```

Random access.
Complexity is O(n).
Definition at line 396 of file list.

15.36.2.2 operator[]() [2/2]

```
template<typename D, template< typename A > class Alloc = New_allocator>
D & cxx::List< D, Alloc >::operator[] (
            unsigned long idx)  [inline], [noexcept]
```

Random access.
Complexity is O(n).
Definition at line 400 of file list.

  operator for testing validity (syntactically equal to pointers)

15.37.1 Detailed Description

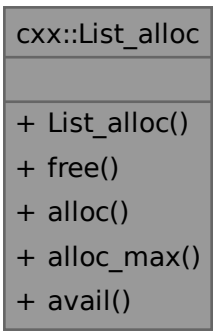
template<typename D, template< typename A > class Alloc = New_allocator>
class cxx::List< D, Alloc >::Iter

Iterator.
Forward and backward iteratable.
Definition at line 346 of file list.
The documentation for this class was generated from the following file:

- l4/cxx/list

15.38 cxx::List_alloc Class Reference

Standard list-based allocator.
`#include <list_alloc>`
Collaboration diagram for cxx::List_alloc:



Public Member Functions

- List_alloc ()

  Initializes an empty list allocator.
- void free (void ∗block, unsigned long size, bool initial_free=false)

  Return a free memory block to the allocator.
- void ∗ alloc (unsigned long size, unsigned long align, unsigned long lower=0, unsigned long upper=∼0UL)

  Allocate a memory block.
- void ∗ alloc_max (unsigned long min, unsigned long ∗max, unsigned long align, unsigned granularity, unsigned long lower=0, unsigned long upper=∼0UL)

  Allocate a memory block of `min` <= size <= `max`.
- unsigned long avail () const

  Get the amount of available memory.

15.38.1 Detailed Description

Standard list-based allocator.
Definition at line 26 of file list_alloc.

15.38.2 Constructor & Destructor Documentation

15.38.2.1 List_alloc()

```
cxx::List_alloc::List_alloc ()  [inline]
```

Initializes an empty list allocator.

Note

To initialize the allocator with available memory use the free() function.

Definition at line 52 of file list_alloc.

15.38.3 Member Function Documentation

15.38.3.1 alloc()

```
void * cxx::List_alloc::alloc (
            unsigned long size,
            unsigned long align,
            unsigned long lower = 0,
            unsigned long upper = ~0UL)  [inline]
```

Allocate a memory block.

Parameters

size	Size of the memory block.
align	Alignment constraint.
lower	Lower bound of the physical region the memory block should be allocated from.
upper	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

Returns

Pointer to memory block

Precondition

0 < `size` <= `~0UL - 32`.

Definition at line 413 of file list_alloc.

15.38.3.2 alloc_max()

```
void * cxx::List_alloc::alloc_max (
            unsigned long min,
            unsigned long * max,
            unsigned long align,
            unsigned granularity,
            unsigned long lower = 0,
            unsigned long upper = ~0UL)  [inline]
```

Allocate a memory block of `min` <= size <= `max`.

Parameters

	min	Minimal size to allocate (in bytes).
in,out	*max*	Maximum size to allocate (in bytes). The actual allocated size is returned here.
	align	Alignment constraint.
	granularity	Granularity to use for the allocation (power of 2).
	lower	Lower bound of the physical region the memory block should be allocated from.
	upper	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

Returns

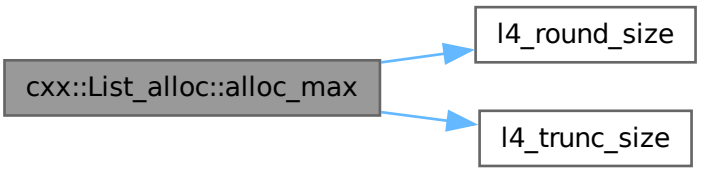
Pointer to memory block

Precondition

$0 < \texttt{min} <= \sim\texttt{0UL} - 32$.

$0 < \texttt{max}$.

Definition at line 293 of file list_alloc.
References l4_round_size(), and l4_trunc_size().
Here is the call graph for this function:



15.38.3.3 avail()

```
unsigned long cxx::List_alloc::avail () const  [inline]
```

Get the amount of available memory.

Returns

Available memory in bytes

Definition at line 501 of file list_alloc.

15.38.3.4 free()

```
void cxx::List_alloc::free (
            void * block,
            unsigned long size,
            bool initial_free = false)  [inline]
```

Return a free memory block to the allocator.

Parameters

block	Pointer to memory block.
size	Size of memory block.
initial_free	Set to true for putting fresh memory to the allocator. This will enforce alignment on that memory.

Precondition

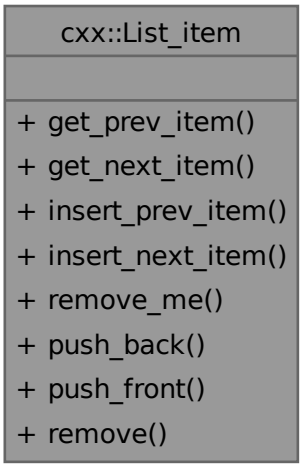
`block` must not be NULL.
`2 * sizeof(void *) <= size <= ~0UL - 32`.

Definition at line 248 of file list_alloc.
The documentation for this class was generated from the following file:

- l4/cxx/list_alloc

15.39 cxx::List_item Class Reference

Basic list item.
`#include <list>`
Collaboration diagram for cxx::List_item:



Data Structures

- class Iter

  Iterator for a list of ListItem-s.
- class T_iter

  Iterator for derived classes from ListItem.

Public Member Functions

- List_item * **get_prev_item** () const noexcept

  Get previous item.

- List_item * **get_next_item** () const noexcept

  Get next item.
- void **insert_prev_item** (List_item *p) noexcept

  Insert item p before this item.
- void **insert_next_item** (List_item *p) noexcept

  Insert item p after this item.
- void **remove_me** () noexcept

  Remove this item from the list.

Static Public Member Functions

- template<typename C, typename N>
  static C * push_back (C *head, N *p) noexcept

  Append item to a list.
- template<typename C, typename N>
  static C * push_front (C *head, N *p) noexcept

  Prepend item to a list.
- template<typename C, typename N>
  static C * remove (C *head, N *p) noexcept

  Remove item from a list.

15.39.1 Detailed Description

Basic list item.
Basic item that can be member of a doubly linked, cyclic list.
Definition at line 26 of file list.

15.39.2 Member Function Documentation

15.39.2.1 push_back()

```
template<typename C, typename N>
C * cxx::List_item::push_back (
            C * head,
            N * p)  [inline], [static], [noexcept]
```

Append item to a list.
Convenience function for empty-head corner case.

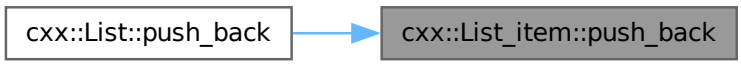
Parameters

head	Pointer to the current list head.
p	Pointer to new item.

Returns

the pointer to the new head.

Definition at line 240 of file list.
Referenced by cxx::List< D, Alloc >::push_back().
Here is the caller graph for this function:



15.39.2.2 push_front()

```
template<typename C, typename N>
C * cxx::List_item::push_front (
            C * head,
            N * p)  [inline], [static], [noexcept]
```

Prepend item to a list.
Convenience function for empty-head corner case.

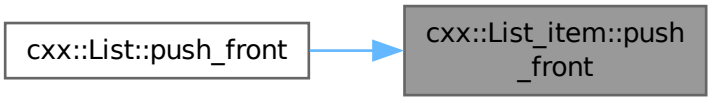
Parameters

head	pointer to the current list head.
p	pointer to new item.

Returns

the pointer to the new head.

Definition at line 251 of file list.
Referenced by cxx::List< D, Alloc >::push_front().
Here is the caller graph for this function:



15.39.2.3 remove()

```
template<typename C, typename N>
C * cxx::List_item::remove (
```

```
C * head,
N * p)  [inline], [static], [noexcept]
```

Remove item from a list.
Convenience function for remove-head corner case.

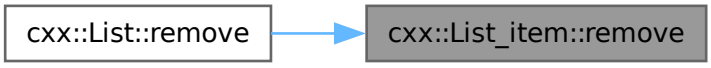
Parameters

head	pointer to the current list head.
p	pointer to the item to remove.

Returns

the pointer to the new head.

Definition at line 261 of file list.
Referenced by cxx::List< D, Alloc >::remove().
Here is the caller graph for this function:



The documentation for this class was generated from the following file:

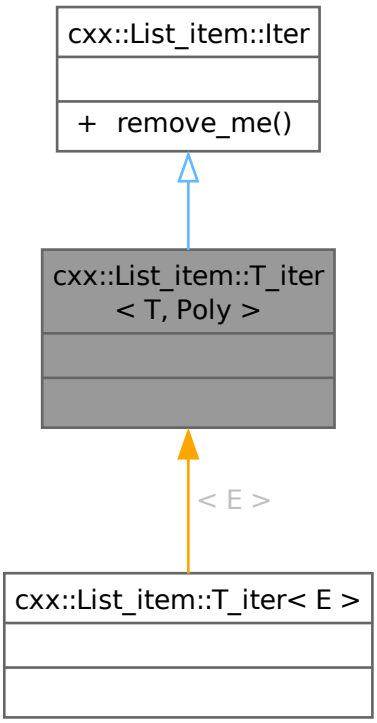
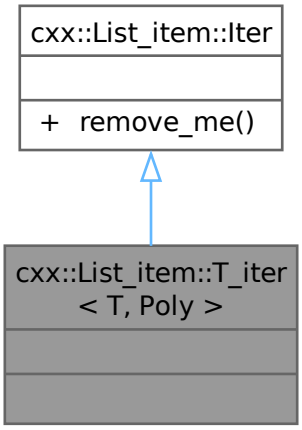
Inheritance diagram for cxx::List_item::T_iter< T, Poly >:



Collaboration diagram for cxx::List_item::T_iter< T, Poly >:



Additional Inherited Members

Public Member Functions inherited from cxx::List_item::Iter

- List_item ∗ **remove_me** () noexcept

  Remove item pointed to by iterator, and return pointer to element.

15.41.1 Detailed Description

template<typename T, bool Poly = false>
class cxx::List_item::T_iter< T, Poly >

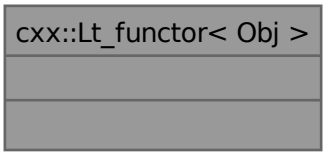
Iterator for derived classes from ListItem.
Allows direct access to derived classes by ∗ operator.
Example: class Foo : public ListItem { public: typedef T_iter<Foo> Iter; ... };
Definition at line 108 of file list.
The documentation for this class was generated from the following file:

- l4/cxx/list

15.42 cxx::Lt_functor< Obj > Struct Template Reference

Generic comparator class that defaults to the less-than operator.
`#include <std_ops>`

Collaboration diagram for cxx::Lt_functor< Obj >:



15.42.1 Detailed Description

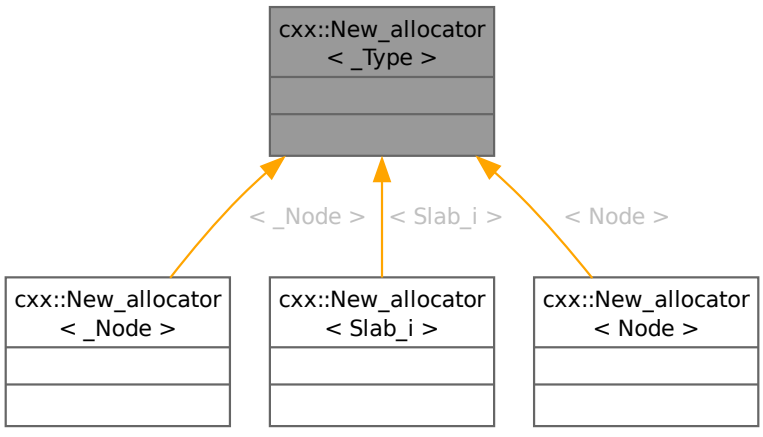
template<**typename Obj**>
struct cxx::Lt_functor< **Obj** >

Generic comparator class that defaults to the less-than operator.
Definition at line 18 of file std_ops.
The documentation for this struct was generated from the following file:

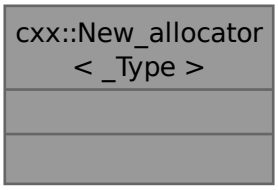
- l4/cxx/std_ops

15.43 cxx::New_allocator< _Type > Class Template Reference

Standard allocator based on `operator new ()` .
`#include <std_alloc>`
Inheritance diagram for cxx::New_allocator< _Type >:



Collaboration diagram for cxx::New_allocator< _Type >:



15.43.1 Detailed Description

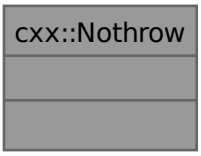
template<typename _Type>
class cxx::New_allocator< _Type >

Standard allocator based on `operator new ()` .
This allocator is the default allocator used for the *cxx Containers*, such as cxx::Avl_set and cxx::Avl_map, to allocate the internal data structures.
Definition at line 56 of file std_alloc.
The documentation for this class was generated from the following file:

- l4/cxx/std_alloc

15.44 cxx::Nothrow Class Reference

Helper type to distinguish the `operator new` version that does not throw exceptions.
`#include <std_alloc>`
Collaboration diagram for cxx::Nothrow:



15.44.1 Detailed Description

Helper type to distinguish the `operator new` version that does not throw exceptions.
Definition at line 19 of file std_alloc.
The documentation for this class was generated from the following file:

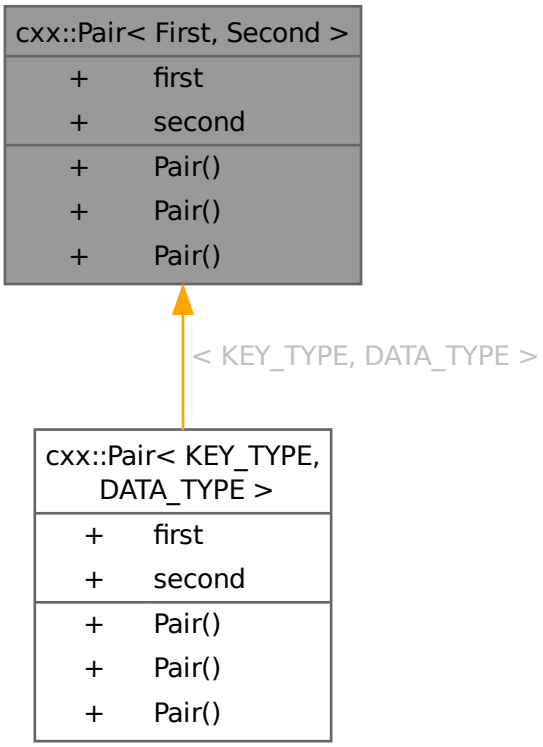
- l4/cxx/std_alloc

15.45 cxx::Pair< First, Second > Struct Template Reference

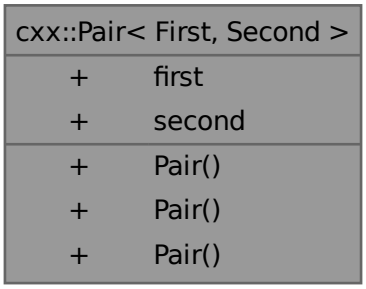
Pair of two values.

`#include <pair>`

Inheritance diagram for cxx::Pair< First, Second >:



Collaboration diagram for cxx::Pair< First, Second >:



Public Types

- typedef First **First_type**

  Type of first value.
- typedef Second **Second_type**

  Type of second value.

Public Member Functions

- template<typename A1, typename A2>
  Pair (A1 &&first, A2 &&second)

  Create a pair from the two values.
- template<typename A1>
  Pair (A1 &&first)

  Create a pair, default constructing the second value.
- **Pair** ()=default

  Default construction.

Data Fields

- First **first**

  First value.
- Second **second**

  Second value.

15.45.1 Detailed Description

template<typename First, typename Second>
struct cxx::Pair< First, Second >

Pair of two values.
Standard container for a pair of values.

Parameters

First	Type of the first value.
Second	Type of the second value.

Definition at line 27 of file pair.

15.45.2 Constructor & Destructor Documentation

15.45.2.1 Pair() [1/2]

```
template<typename First, typename Second>
template<typename A1, typename A2>
cxx::Pair< First, Second >::Pair (
            A1 && first,
            A2 && second)  [inline]
```

Create a pair from the two values.

Parameters

first	The first value.
second	The second value.

Definition at line 45 of file pair.

15.45.2.2 Pair() [2/2]

```
template<typename First, typename Second>
template<typename A1>
cxx::Pair< First, Second >::Pair (
             A1 && first)  [inline]
```

Create a pair, default constructing the second value.

Parameters

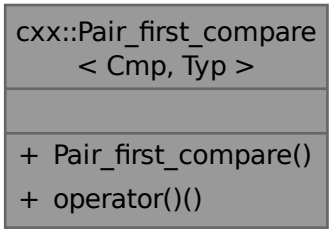
first	The first value.

Definition at line 53 of file pair.
The documentation for this struct was generated from the following file:

- l4/cxx/pair

15.46 cxx::Pair_first_compare< Cmp, Typ > Class Template Reference

Comparison functor for Pair.
`#include <pair>`
Collaboration diagram for cxx::Pair_first_compare< Cmp, Typ >:



Public Member Functions

- Pair_first_compare (Cmp const &cmp=Cmp())
  Construction.
- bool operator() (Typ const &l, Typ const &r) const
  Do the comparison based on the first value.

15.46.1 Detailed Description

template<typename Cmp, typename Typ>
class cxx::Pair_first_compare< Cmp, Typ >

Comparison functor for Pair.

Parameters

Cmp	Comparison functor for the first value of the pair.
Typ	The pair type.

This functor can be used to compare Pair values with respect to the first value.
Definition at line 74 of file pair.

15.46.2 Constructor & Destructor Documentation

15.46.2.1 Pair_first_compare()

```
template<typename Cmp, typename Typ>
cxx::Pair_first_compare< Cmp, Typ >::Pair_first_compare (
            Cmp const & cmp = Cmp())  [inline]
```

Construction.

Parameters

cmp	The comparison functor used for the first value.

Definition at line 84 of file pair.

15.46.3 Member Function Documentation

15.46.3.1 operator()()

```
template<typename Cmp, typename Typ>
bool cxx::Pair_first_compare< Cmp, Typ >::operator() (
            Typ const & l,
            Typ const & r) const  [inline]
```

Do the comparison based on the first value.

Parameters

l	The lefthand value.
r	The righthand value.

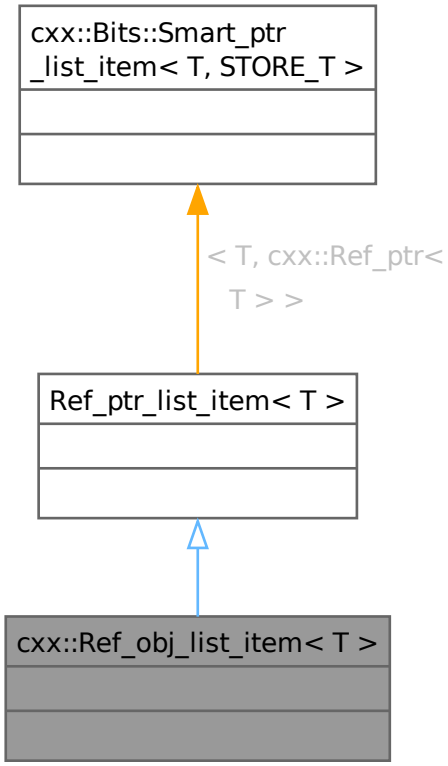
Definition at line 91 of file pair.
The documentation for this class was generated from the following file:

- l4/cxx/pair

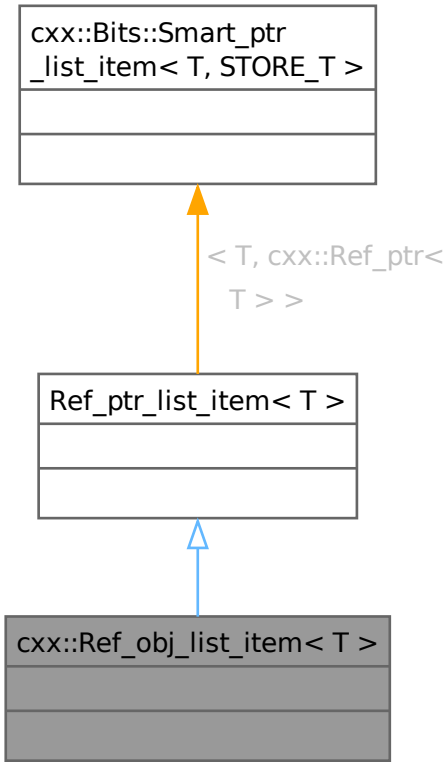
15.47 cxx::Ref_obj_list_item< T > Struct Template Reference

Item for list linked via cxx::Ref_ptr with default refence counting.
`#include <ref_ptr_list>`

Inheritance diagram for cxx::Ref_obj_list_item< T >:



Collaboration diagram for cxx::Ref_obj_list_item< T >:



15.47.1 Detailed Description

template<typename T>
struct cxx::Ref_obj_list_item< T >

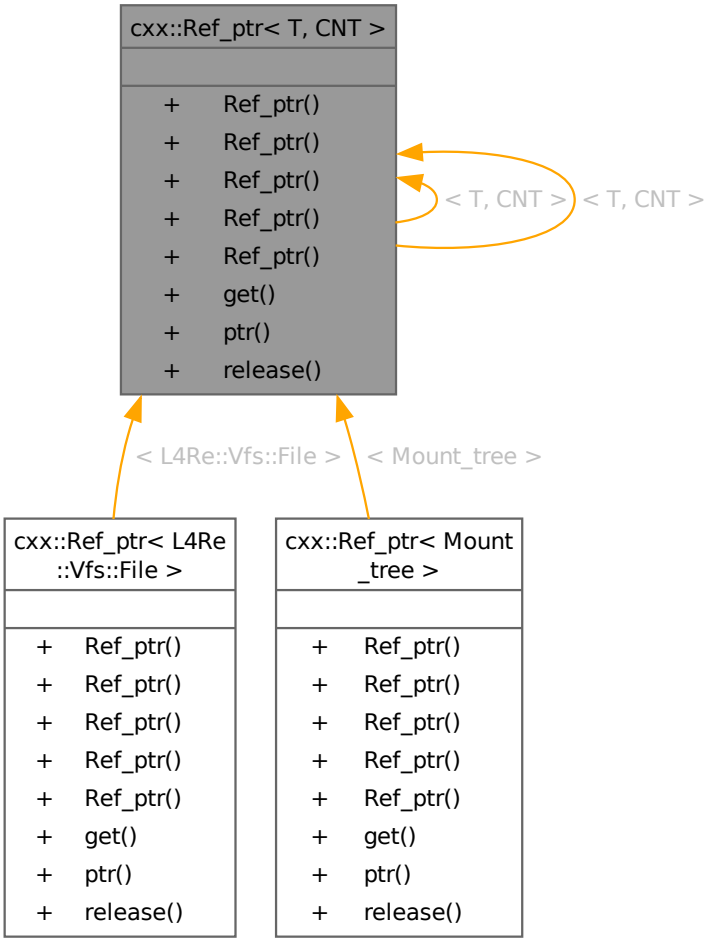
Item for list linked via cxx::Ref_ptr with default refence counting.
Definition at line 26 of file ref_ptr_list.
The documentation for this struct was generated from the following file:

- l4/cxx/ref_ptr_list

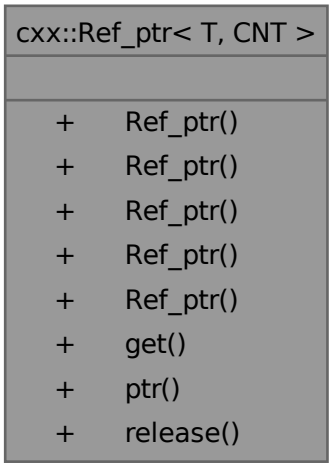
15.48 cxx::Ref_ptr< T, CNT > Class Template Reference

A reference-counting pointer with automatic cleanup.
`#include <ref_ptr>`

Inheritance diagram for cxx::Ref_ptr< T, CNT >:



Collaboration diagram for cxx::Ref_ptr< T, CNT >:



Public Member Functions

- **Ref_ptr** () noexcept

  Default constructor creates a pointer with no managed object.
- Ref_ptr (Wp const &o) noexcept

  Create a shared pointer from a weak pointer.
- **Ref_ptr** (decltype(nullptr) n) noexcept

  allow creation from `nullptr`
- template<typename X>
  Ref_ptr (X *o) noexcept

  Create a shared pointer from a raw pointer.
- Ref_ptr (T *o, bool d) noexcept

  Create a shared pointer from a raw pointer without creating a new reference.
- T * get () const noexcept

  Return a raw pointer to the object this shared pointer points to.
- T * ptr () const noexcept

  Return a raw pointer to the object this shared pointer points to.
- T * release () noexcept

  Release the shared pointer without removing the reference.

15.48.1 Detailed Description

template<typename T = void, template< typename X > class CNT = Default_ref_counter>
class cxx::Ref_ptr< T, CNT >

A reference-counting pointer with automatic cleanup.

Template Parameters

T	Type of object the pointer points to.

CNT	Type of management class that manages the life time of the object.

This pointer is similar to the standard C++-11 shared_ptr but it does the reference counting directly in the object being pointed to, so that no additional management structures need to be allocated from the heap.
Classes that use this pointer type must implement two functions:

```
int remove_ref()
```

is called when a reference is removed and must return 0 when there are no further references to the object.

```
void add_ref()
```

is called when another ref_ptr to the object is created.
Ref_obj provides a simple implementation of this interface from which classes may inherit.

Examples

tmpfs/lib/src/fs.cc.

Definition at line 70 of file ref_ptr.

15.48.2 Constructor & Destructor Documentation

15.48.2.1 Ref_ptr() [1/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
            Wp const & o)  [inline], [noexcept]
```

Create a shared pointer from a weak pointer.
Increases references.
Definition at line 88 of file ref_ptr.

15.48.2.2 Ref_ptr() [2/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
template<typename X>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
            X * o)  [inline], [explicit], [noexcept]
```

Create a shared pointer from a raw pointer.
In contrast to C++11 shared_ptr it is safe to use this constructor multiple times and have the same reference counter.
Definition at line 101 of file ref_ptr.

15.48.2.3 Ref_ptr() [3/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
            T * o,
            bool d)  [inline], [noexcept]
```

Create a shared pointer from a raw pointer without creating a new reference.

Parameters

o	Pointer to the object.
d	Dummy parameter to select this constructor at compile time. The value may be true or false.

This is the counterpart to release().
Definition at line 114 of file ref_ptr.

15.48.3 Member Function Documentation

15.48.3.1 get()

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::get () const  [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.
This does not release the pointer or decrease the reference count.
Definition at line 121 of file ref_ptr.

15.48.3.2 ptr()

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::ptr () const  [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.
This does not release the pointer or decrease the reference count.
Definition at line 127 of file ref_ptr.

15.48.3.3 release()

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::release ()  [inline], [noexcept]
```

Release the shared pointer without removing the reference.

Returns

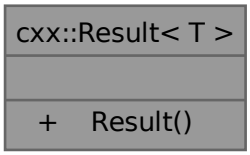
A raw pointer to the managed object.

Definition at line 138 of file ref_ptr.
The documentation for this class was generated from the following file:

- l4/cxx/ref_ptr

15.49 cxx::Result< T > Class Template Reference

A result of a function call.
`#include <result>`
Collaboration diagram for cxx::Result< T >:



Public Member Functions

- Result ()=delete

  Prevent default construction.

15.49.1 Detailed Description

template<typename T>
class cxx::Result< T >

A result of a function call.
Either has some resulting value or an error.
The error is always an integer and, if present, a negative value by convention. Any access to the value is fatal if the objects holds an error.
Definition at line 39 of file result.

15.49.2 Constructor & Destructor Documentation

15.49.2.1 Result()

```
template<typename T>
cxx::Result< T >::Result ()  [delete]
```

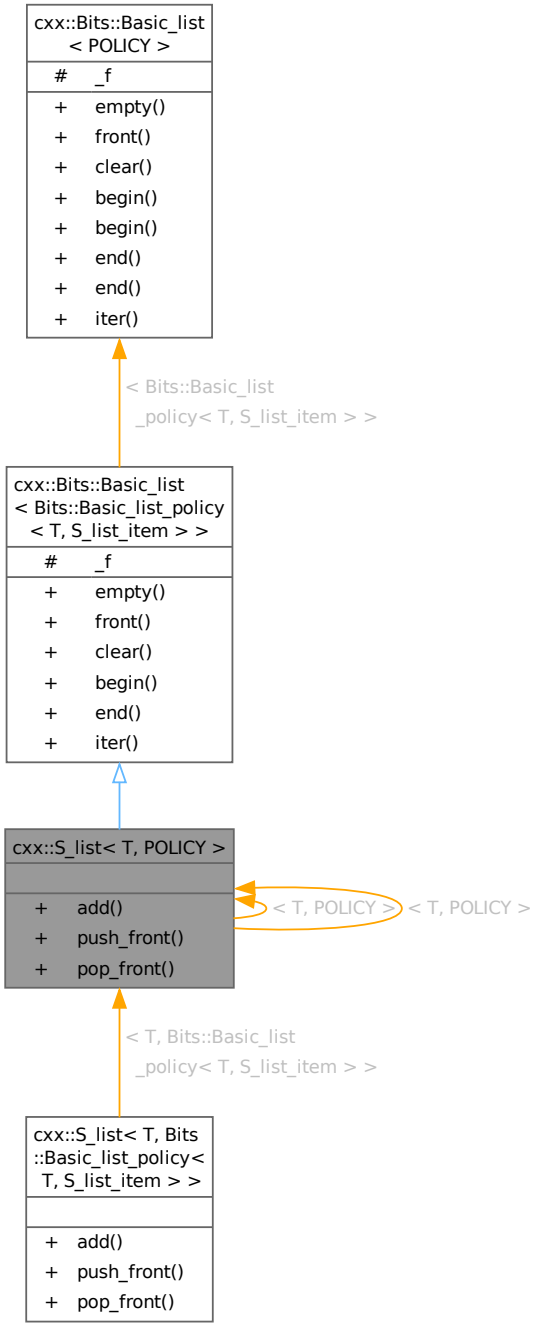
Prevent default construction.
A Result object either holds a value or an error. There is no third "empty" state.
The documentation for this class was generated from the following file:

- l4/cxx/result

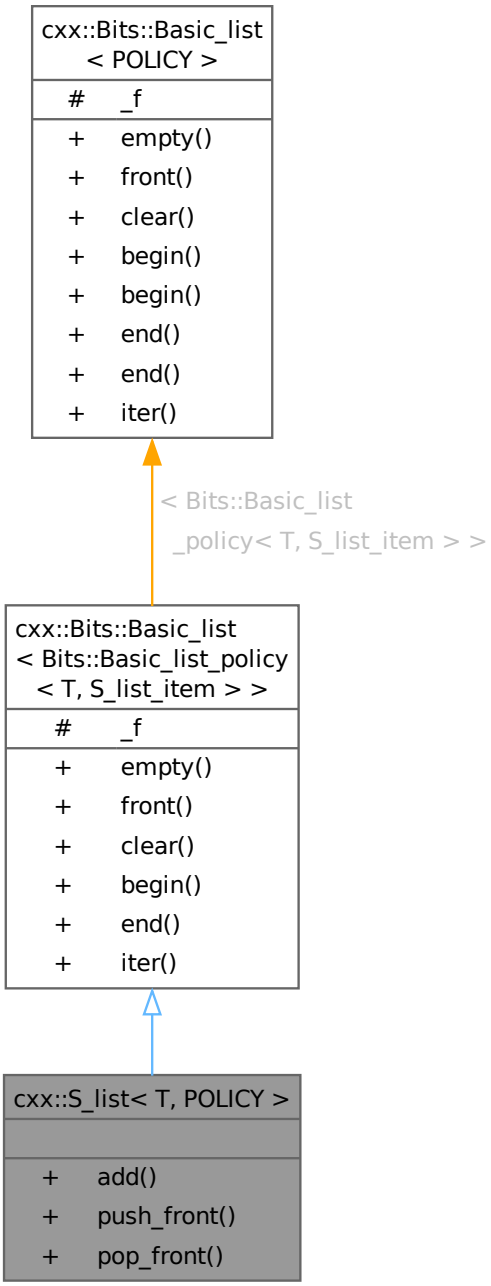
15.50 cxx::S_list< T, POLICY > Class Template Reference

Simple single-linked list.
`#include <slist>`

Inheritance diagram for cxx::S_list< T, POLICY >:



Collaboration diagram for cxx::S_list< T, POLICY >:



Public Member Functions

- void **add** (T ∗e)

  Add an element to the front of the list.
- void **push_front** (T ∗e)

  Add an element to the front of the list.
- T ∗ pop_front ()

  Remove and return the head element of the list.

Public Member Functions inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< T, S_list_item > >

- bool **empty** () const

  Check if the list is empty.
- Value_type **front** () const

  Return the first element in the list.
- void clear ()

  Remove all elements from the list.
- Iterator **begin** ()

  Return an iterator to the beginning of the list.
- Const_iterator **end** () const

  Return a const iterator to the end of the list.

Additional Inherited Members

Static Public Member Functions inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< T, S_list_item > >

- static Const_iterator iter (Const_value_type c)

  Return a const iterator that begins at the given element.

Protected Attributes inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< T, S_list_item > >

- Bits::Basic_list_policy< T, S_list_item >::Head_type **_f**

  Pointer to front of the list.

15.50.1 Detailed Description

template<typename T, typename POLICY = Bits::Basic_list_policy< T, S_list_item >>
class cxx::S_list< T, POLICY >

Simple single-linked list.

Template Parameters

T	Type of elements saved in the list. Must inherit from cxx::S_list_item

Definition at line 40 of file slist.

15.50.2 Member Function Documentation

15.50.2.1 pop_front()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, S_list_item >>
T * cxx::S_list< T, POLICY >::pop_front ()  [inline]
```

Remove and return the head element of the list.

Precondition

The list must not be empty or the behaviour will be undefined.

Definition at line 91 of file slist.
The documentation for this class was generated from the following file:

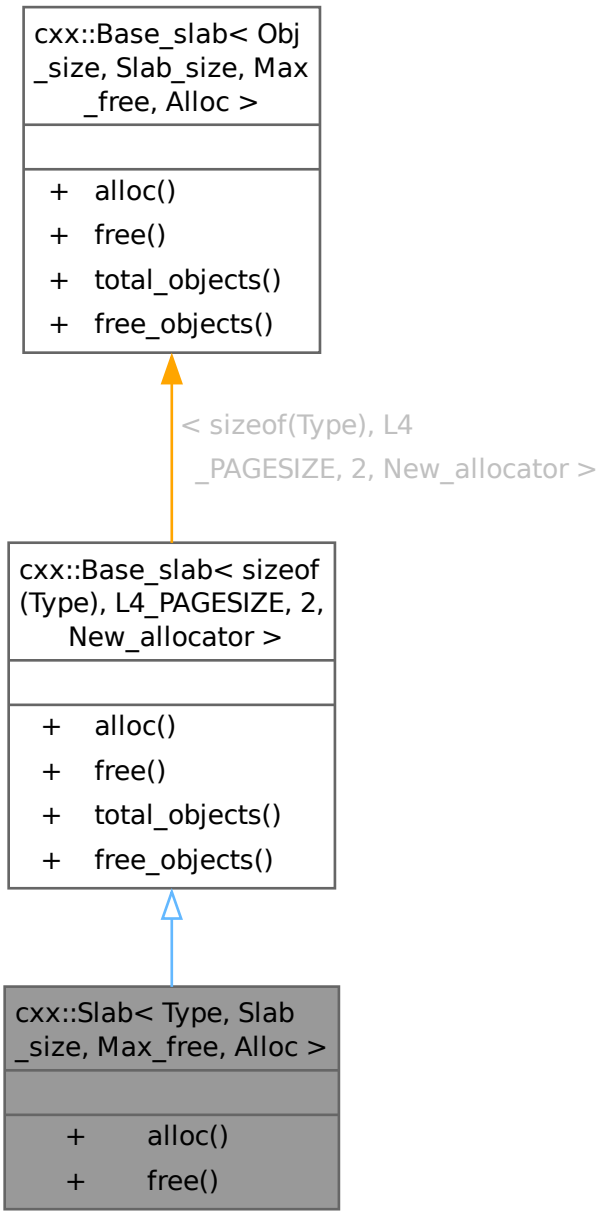
- l4/cxx/slist

15.51 cxx::Slab< Type, Slab_size, Max_free, Alloc > Class Template Reference

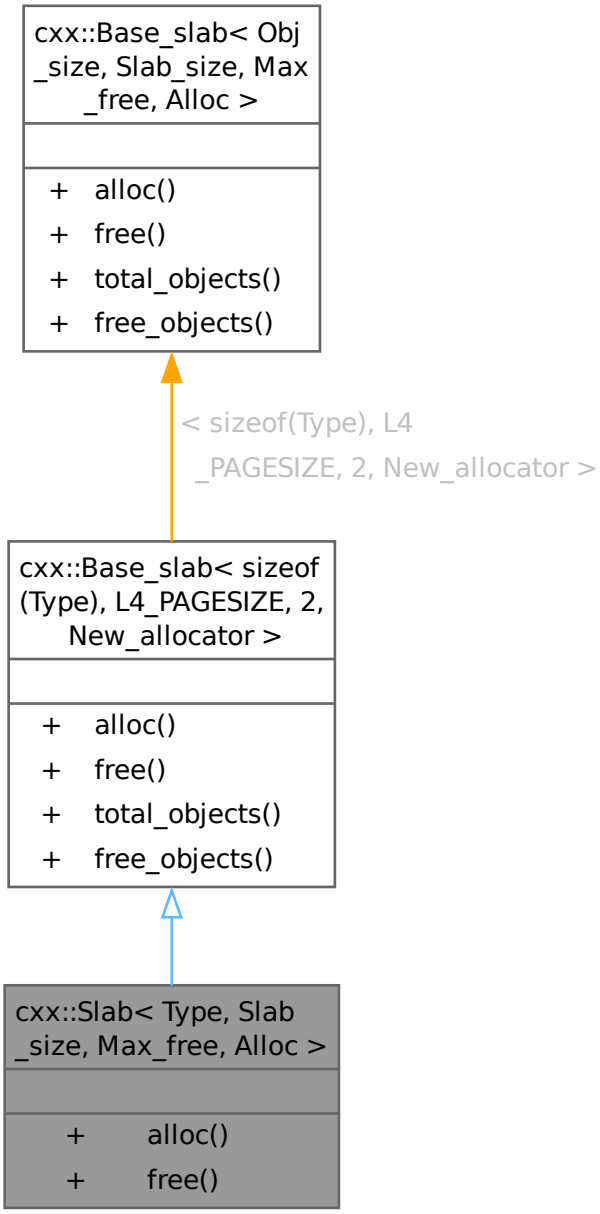
Slab allocator for object of type `Type`.

`#include <slab_alloc>`

Inheritance diagram for cxx::Slab< Type, Slab_size, Max_free, Alloc >:



Collaboration diagram for cxx::Slab< Type, Slab_size, Max_free, Alloc >:



Public Member Functions

- Type * alloc () noexcept

  Allocate an object of type `Type`.
- void free (Type *o) noexcept

  Free the object addressed by `o`.

Public Member Functions inherited from cxx::Base_slab< sizeof(Type), L4_PAGESIZE, 2, New_allocator >

- void * alloc () noexcept

  Allocate a new object.
- void free (void *_o) noexcept

  Free the given object (_o).
- unsigned total_objects () const noexcept

  Get the total number of objects managed by the slab allocator.
- unsigned free_objects () const noexcept

  Get the number of objects which can be allocated before a new empty slab needs to be added to the slab allocator.

Additional Inherited Members

Public Types inherited from cxx::Base_slab< sizeof(Type), L4_PAGESIZE, 2, New_allocator >

- typedef New_allocator< Slab_i > **Slab_alloc**

  Type of the backend allocator.

15.51.1 Detailed Description

template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc = New_allocator>
class cxx::Slab< Type, Slab_size, Max_free, Alloc >

Slab allocator for object of type `Type`.

Template Parameters

Type	The type of the objects to manage.
Slab_size	Size of a slab.
Max_free	The maximum number of free slabs.
Alloc	The allocator for the slabs.

Definition at line 335 of file slab_alloc.

15.51.2 Member Function Documentation

15.51.2.1 alloc()

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
Type * cxx::Slab< Type, Slab_size, Max_free, Alloc >::alloc ()  [inline], [noexcept]
```

Allocate an object of type `Type`.

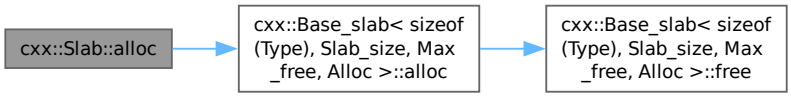
Returns

A pointer to the object just allocated, or 0 on failure.

Note

The user is responsible for initializing the object.

Definition at line 355 of file slab_alloc.
References cxx::Base_slab< sizeof(Type), Slab_size, Max_free, Alloc >::alloc().
Here is the call graph for this function:



15.51.2.2 free()

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void cxx::Slab< Type, Slab_size, Max_free, Alloc >::free (
            Type * o)  [inline], [noexcept]
```

Free the object addressed by o.

Parameters

o	The pointer to the object to free.

Precondition

The object must have been allocated with this allocator.

Definition at line 366 of file slab_alloc.
References free().
Referenced by free().
Here is the call graph for this function:

Here is the caller graph for this function:

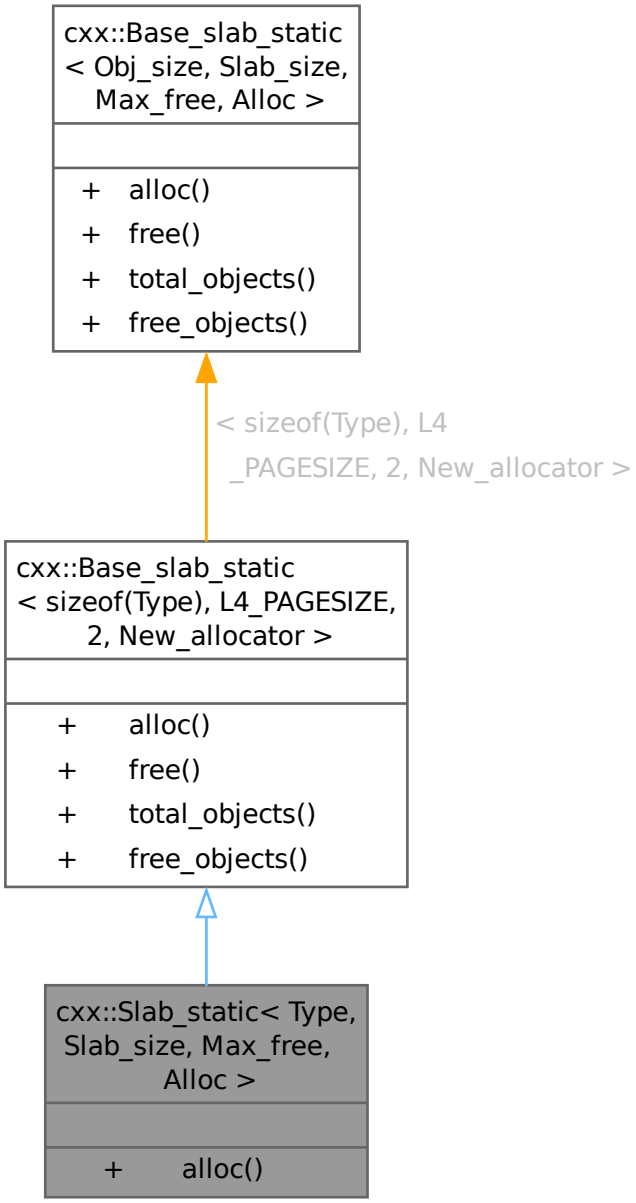
The documentation for this class was generated from the following file:

- l4/cxx/slab_alloc

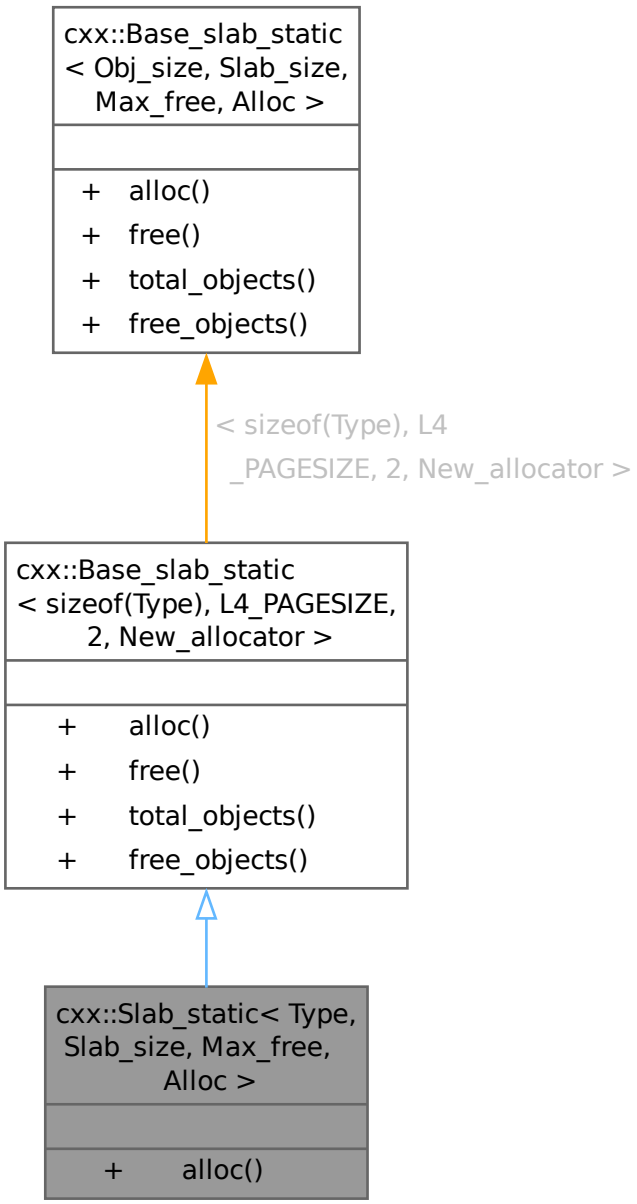
15.52 cxx::Slab_static< Type, Slab_size, Max_free, Alloc > Class Template Reference

Merged slab allocator (allocators for objects of the same size are merged together).
`#include <slab_alloc>`

Inheritance diagram for cxx::Slab_static< Type, Slab_size, Max_free, Alloc >:



Collaboration diagram for cxx::Slab_static< Type, Slab_size, Max_free, Alloc >:



Public Member Functions

- Type * alloc () noexcept

  Allocate an object of type `Type`.

Public Member Functions inherited from cxx::Base_slab_static< sizeof(Type), L4_PAGESIZE, 2, New_allocator >

- void * alloc () noexcept

  Allocate an object.

- void free (void *p) noexcept

  Free the given object (p).
- unsigned total_objects () const noexcept

  Get the total number of objects managed by the slab allocator.
- unsigned free_objects () const noexcept

  Get the number of free objects in the slab allocator.

Additional Inherited Members

Public Types inherited from cxx::Base_slab_static< sizeof(Type), L4_PAGESIZE, 2, New_allocator >

15.52.1 Detailed Description

template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc = New_allocator>
class cxx::Slab_static< Type, Slab_size, Max_free, Alloc >

Merged slab allocator (allocators for objects of the same size are merged together).

Template Parameters

Type	The type of the objects to manage.
Slab_size	The size of a slab.
Max_free	The maximum number of free slabs.
Alloc	The allocator for the slabs.

This slab allocator class is useful for merging slab allocators with the same parameters (equal `sizeof(Type)`, `Slab_size`, `Max_free`, and `Alloc` parameters) together and share the overhead for the slab caches among all equal-sized objects.
Definition at line 465 of file slab_alloc.

15.52.2 Member Function Documentation

15.52.2.1 alloc()

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
Type * cxx::Slab_static< Type, Slab_size, Max_free, Alloc >::alloc ()  [inline], [noexcept]
```

Allocate an object of type `Type`.

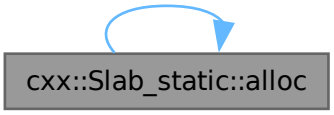
Returns

A pointer to the just allocated object, or 0 on failure.

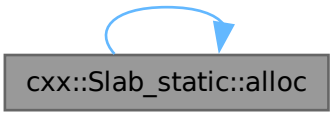
Note

The object is not zeroed out by the slab allocator.

Definition at line 478 of file slab_alloc.
References alloc().
Referenced by alloc().
Here is the call graph for this function:



Here is the caller graph for this function:



The documentation for this class was generated from the following file:

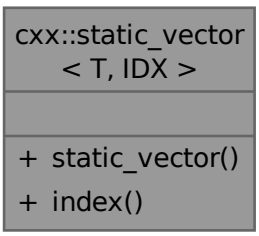
15.53 cxx::static_vector< T, IDX > Class Template Reference

Simple encapsulation for a dynamically allocated array.
`#include <static_vector>`
Collaboration diagram for cxx::static_vector< T, IDX >:



Public Member Functions

- template<typename X, typename = enable_if_t<is_convertible_v<X, T>>>
  static_vector (static_vector< X, IDX > const &o)

  Conversion from compatible arrays.
- index_type **index** (value_type const *o) const

  Get the index of the given element of the array.

15.53.1 Detailed Description

template<typename T, typename IDX = unsigned>
class cxx::static_vector< T, IDX >

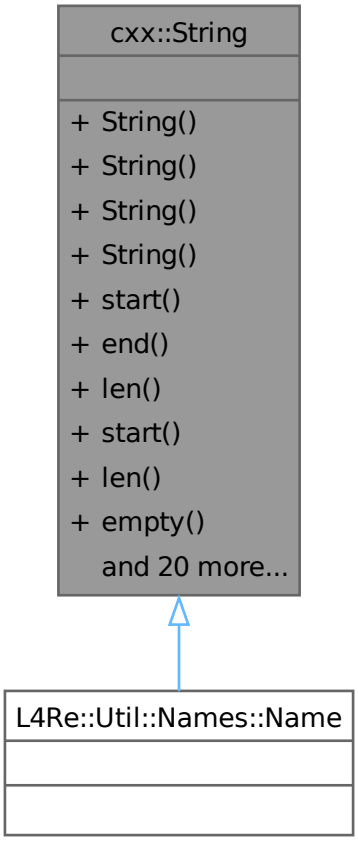
Simple encapsulation for a dynamically allocated array.
The main purpose of this class is to support C++11 range for for simple dynamically allocated array with static size.
Definition at line 16 of file static_vector.
The documentation for this class was generated from the following file:

- l4/cxx/static_vector

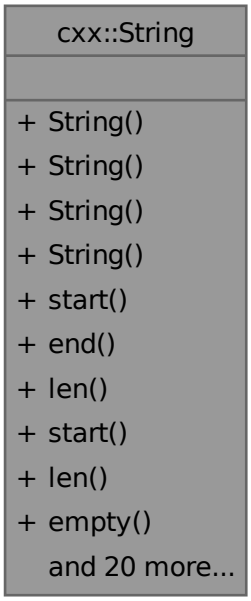
15.54 cxx::String Class Reference

Allocation free string class with explicit length field.
`#include <string>`

Inheritance diagram for cxx::String:



Collaboration diagram for cxx::String:



Public Types

- typedef char const ∗ **Index**

  Character index type.

Public Member Functions

- **String** (char const ∗s) noexcept

  Initialize from a zero-terminated string.
- **String** (char const ∗s, unsigned long len) noexcept

  Initialize from a pointer to first character and a length.
- String (char const ∗s, char const ∗e) noexcept

  Initialize with start and end pointer.
- **String** ()

  Zero-initialize. Create an invalid string.
- Index **start** () const

  Pointer to first character.
- Index **end** () const

  Pointer to first byte behind the string.
- int **len** () const

  Length.
- void **start** (char const ∗s)

  Set start.
- void **len** (unsigned long len)

  Set length.
- bool **empty** () const

Check if the string has length zero.

- String **head** (Index end) const

  Return prefix up to index.

- String **head** (unsigned long end) const

  Prefix of length `end`.

- String **substr** (unsigned long idx, unsigned long len=~0UL) const

  Substring of length `len` starting at `idx`.

- String **substr** (char const *start, unsigned long len=0) const

  Substring of length `len` starting at `start`.

- template<typename F>
  char const * **find_match** (F &&match) const

  Find matching character. `match` should be a function such as `isspace`.

- char const * **find** (char const *c) const

  Find character. Return end() if not found.

- char const * **find** (int c) const

  Find character. Return end() if not found.

- char const * **rfind** (char const *c) const

  Find right-most character. Return end() if not found.

- Index starts_with (cxx::String const &c) const

  Check if `c` is a prefix of string.

- char const * **find** (int c, char const *s) const

  Find character `c` starting at position `s`. Return end() if not found.

- char const * find (char const *c, char const *s) const

  Find character set at position.

- char const & **operator[ ]** (unsigned long idx) const

  Get character at `idx`.

- char const & **operator[ ]** (int idx) const

  Get character at `idx`.

- char const & **operator[ ]** (Index idx) const

  Get character at `idx`.

- bool **eof** (char const *s) const

  Check if pointer `s` points behind string.

- template<typename INT>
  int from_dec (INT *v) const

  Convert decimal string to integer.

- template<typename INT>
  int from_hex (INT *v) const

  Convert hex string to integer.

- template<typename INT>
  int from_number (INT *v, unsigned base=0) const

  Convert a number string to an integer.

- bool **operator==** (String const &o) const

  Equality.

- bool **operator!=** (String const &o) const

  Inequality.

15.54.1 Detailed Description

Allocation free string class with explicit length field.
This class is used to group characters of a string which belong to one syntactical token types number, identifier, string, whitespace or another single character.
Strings in this class can contain null bytes and may denote parts of other strings.

Examples

tmpfs/lib/src/fs.cc.

Definition at line 32 of file string.

15.54.2 Constructor & Destructor Documentation

15.54.2.1 String()

```
cxx::String::String (
             char const * s,
             char const * e)  [inline], [noexcept]
```

Initialize with start and end pointer.

Parameters

s	first character of the string
e	pointer to first byte behind the string

Definition at line 50 of file string.

15.54.3 Member Function Documentation

15.54.3.1 find()

```
char const * cxx::String::find (
             char const * c,
             char const * s) const  [inline]
```

Find character set at position.

Parameters

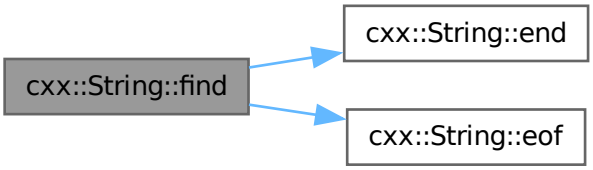
c	zero-terminated string of characters to search for
s	start position of search in string

Return values

end()	if no char in `c` is contained in string at or behind `s`.
position	in string of some character in `c`.

Definition at line 193 of file string.
References end(), and eof().

Here is the call graph for this function:



15.54.3.2 from_dec()

```
template<typename INT>
int cxx::String::from_dec (
            INT * v) const  [inline]
```

Convert decimal string to integer.

Template Parameters

INT	result integer type

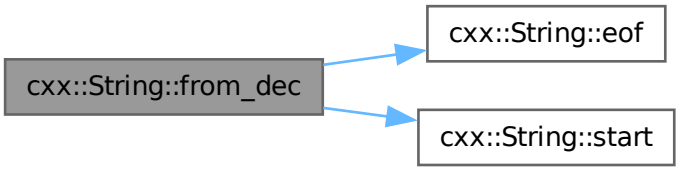
Parameters

out	*v*	conversion result

Returns

position of first character not converted.

Definition at line 230 of file string.
References eof(), and start().
Here is the call graph for this function:



15.54.3.3 from_hex()

```
template<typename INT>
int cxx::String::from_hex (
            INT * v) const  [inline]
```

Convert hex string to integer.

Template Parameters

INT	result integer type

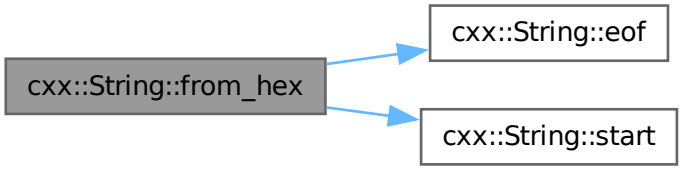
Parameters

out	*v*	conversion result

Return values

-1	if the maximal amount of digits fitting into INT have been read,
position	of first character not converted otherwise.

Definition at line 259 of file string.
References eof(), and start().
Here is the call graph for this function:



15.54.3.4 from_number()

```
template<typename INT>
int cxx::String::from_number (
            INT * v,
            unsigned base = 0) const  [inline]
```

Convert a number string to an integer.
Converts the initial part of the string to a number, according to the given base. The string may start with an arbitrary amount of white space followed by a single optional + or − sign. If base is zero or 16, the string may then include a "0x" or "0X" prefix, and the number will be read in base 16; otherwise, a zero base is taken as 10 (decimal) unless the next character is '0', in which case it is taken as 8 (octal).
Conversion stops at the first character that is not a valid digit for the chosen base. If the string does not contain any digit at all, zero is returned and v is left unmodified.

Template Parameters

INT	result integer type

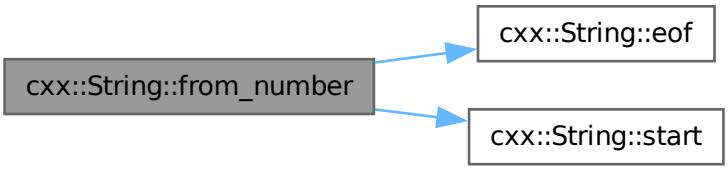
Parameters

out	*v*	conversion result
	base	Base of the number (0, 2..36)

Return values

>0	Success. Position of first character after the number.
0	The string does not contain a number.
-L4_EINVAL	Invalid base parameter
-L4_ERANGE	Parsed number too large to be stored in v

Definition at line 309 of file string.
References eof(), L4_EINVAL, L4_ERANGE, and start().
Here is the call graph for this function:



15.54.3.5 starts_with()

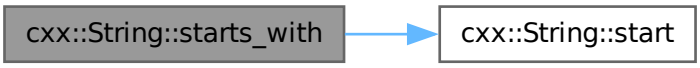
```
Index cxx::String::starts_with (
            cxx::String const & c) const  [inline]
```

Check if c is a prefix of string.

Returns

0 if c is not a prefix, if it is a prefix, return first position not in c (which might be end()).

Definition at line 157 of file string.
References start().
Here is the call graph for this function:

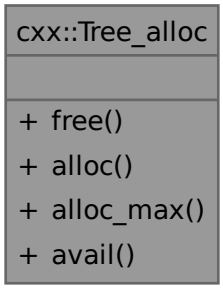


The documentation for this class was generated from the following file:

- l4/cxx/string

15.55 cxx::Tree_alloc Class Reference

Standard tree-based allocator.
`#include <tree_alloc>`
Collaboration diagram for cxx::Tree_alloc:



Public Member Functions

- void free (void *block, unsigned long size, bool initial_free=false)

  Return a free memory block to the allocator.
- void * alloc (unsigned long size, unsigned long align, unsigned long lower=0, unsigned long upper=~0UL)

  Allocate a memory block.
- void * alloc_max (unsigned long min, unsigned long *max, unsigned long align, unsigned granularity, unsigned long lower=0, unsigned long upper=~0UL)

  Allocate a memory block of `min` <= size <= `max`.
- unsigned long avail () const

  Get the amount of available memory.

15.55.1 Detailed Description

Standard tree-based allocator.
Definition at line 28 of file tree_alloc.

15.55.2 Member Function Documentation

15.55.2.1 alloc()

```
void * cxx::Tree_alloc::alloc (
            unsigned long size,
            unsigned long align,
            unsigned long lower = 0,
            unsigned long upper = ~0UL)  [inline]
```

Allocate a memory block.

Parameters

size	Size of the memory block.
align	Alignment constraint.
lower	Lower bound of the physical region the memory block should be allocated from.
upper	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

Returns

Pointer to memory block

Precondition

0 < `size` <= `~0UL - 32`.

Definition at line 377 of file tree_alloc.

15.55.2.2 alloc_max()

```
void * cxx::Tree_alloc::alloc_max (
            unsigned long min,
            unsigned long * max,
            unsigned long align,
            unsigned granularity,
            unsigned long lower = 0,
            unsigned long upper = ~0UL)  [inline]
```

Allocate a memory block of `min` <= size <= `max`.

Parameters

	min	Minimal size to allocate (in bytes).
`in,out`	*max*	Maximum size to allocate (in bytes). The actual allocated size is returned here.
	align	Alignment constraint.
	granularity	Granularity to use for the allocation (power of 2).
	lower	Lower bound of the physical region the memory block should be allocated from.
	upper	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

Returns

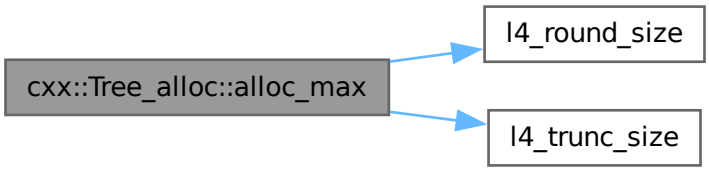
Pointer to memory block

Precondition

0 < `min` <= ~0UL - 32.

0 < `max`.

Definition at line 262 of file tree_alloc.
References l4_round_size(), and l4_trunc_size().
Here is the call graph for this function:



15.55.2.3 avail()

```
unsigned long cxx::Tree_alloc::avail () const  [inline]
```

Get the amount of available memory.

Returns

Available memory in bytes

Definition at line 458 of file tree_alloc.

15.55.2.4 free()

```
void cxx::Tree_alloc::free (
            void * block,
            unsigned long size,
            bool initial_free = false)  [inline]
```

Return a free memory block to the allocator.

Parameters

block	Pointer to memory block.
size	Size of memory block.
initial_free	Set to true for putting fresh memory to the allocator. This will enforce alignment on that memory.

Precondition

`block` must not be NULL.

`2 * sizeof(void *) <= size <= ~0UL - 32`.

Definition at line 217 of file tree_alloc.
The documentation for this class was generated from the following file:

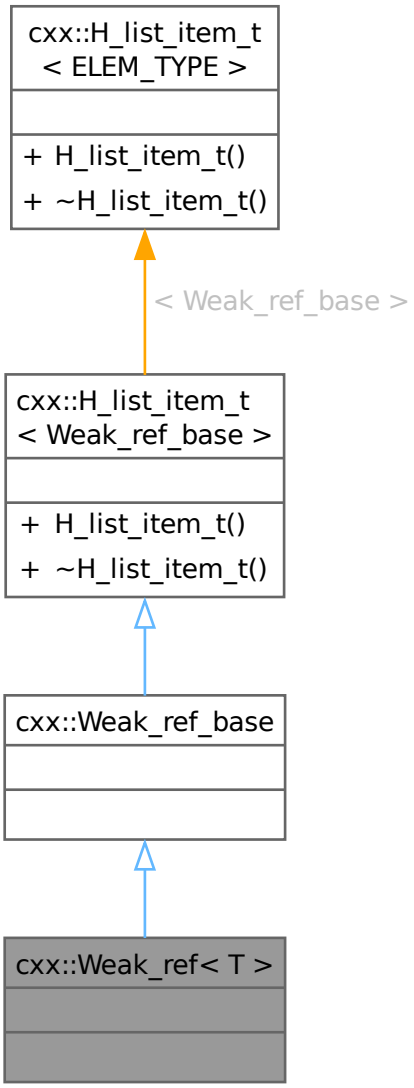
15.56 cxx::Weak_ref< T > Class Template Reference

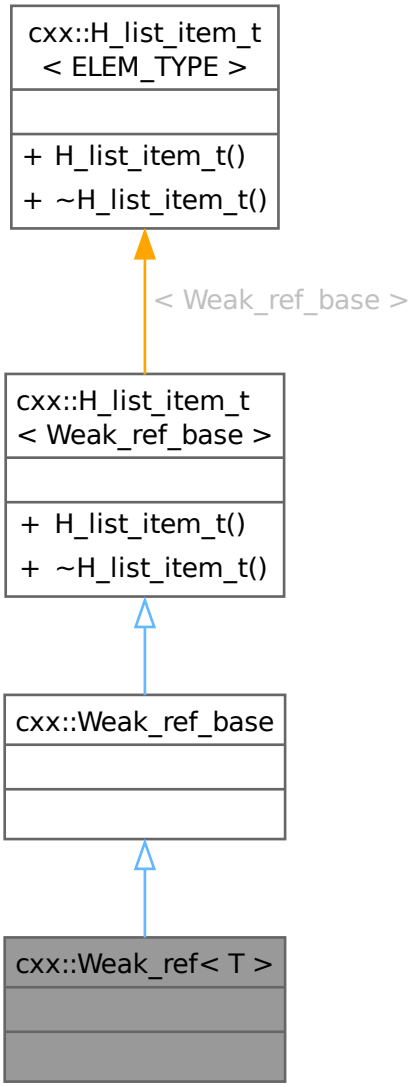
Typed weak reference to an object of type T.

`#include <weak_ref>`

Inheritance diagram for cxx::Weak_ref< T >:



Collaboration diagram for cxx::Weak_ref< T >:



Additional Inherited Members

Public Member Functions inherited from cxx::H_list_item_t< Weak_ref_base >

- constexpr H_list_item_t ()

  Constructor.
- ~H_list_item_t () noexcept

  Destructor.

15.56.1 Detailed Description

template<typename T>
class cxx::Weak_ref< T >

Typed weak reference to an object of type `T`.

Template Parameters

T	The type of the referenced object.

A weak reference is a reference that is invalidated when the referenced object is about to be deleted. All weak references to an object are kept in a linked list (see Weak_ref_base::List) and all the weak references are iterated and reset by the Weak_ref_base::List destructor or Weak_ref_base::List::reset().
The type `T` must provide two methods that handle the housekeeping of weak references: `remove_weak_ref(Weak_ref_base *)` and `add_weak_ref(Weak_ref_base *)`. These functions must handle the insertion and removal of the weak reference into the respective Weak_ref_base::List object. For convenience one can use the cxx::Weak_ref_obj as a base class that handles weak references for you.
For example:

```
class C : public cxx::Weak_ref_obj {};

int main()
{
  cxx::Weak_ref<C> r;  // r is nullptr
  {
    C c;
    r = &c;  // now r points to c
  }  // c is destructed, which implies resetting all weak references to c
  // now r is nullptr
  return 0;
}
```

Note

Weak references have no effect on the lifetime of the referenced object. Hence, a referenced object is *not* deleted when all weak references for it are gone. If automatic deletion is needed, see cxx::Ref_ptr.

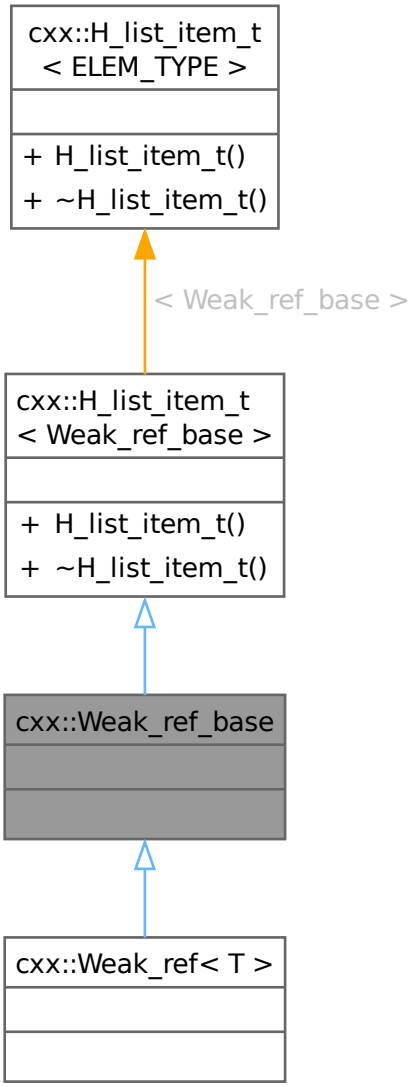
Definition at line 95 of file weak_ref.
The documentation for this class was generated from the following file:

- l4/cxx/weak_ref

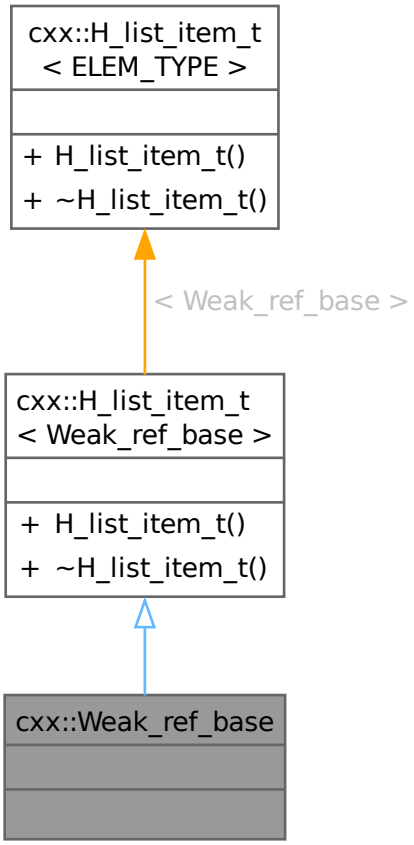
15.57 cxx::Weak_ref_base Class Reference

Generic (base) weak reference to some object.
`#include <weak_ref>`

Inheritance diagram for cxx::Weak_ref_base:



Collaboration diagram for cxx::Weak_ref_base:



Data Structures

- struct List

  The list type for keeping all weak references to an object.

Additional Inherited Members

Public Member Functions inherited from cxx::H_list_item_t< Weak_ref_base >

- constexpr H_list_item_t ()

  Constructor.
- ~H_list_item_t () noexcept

  Destructor.

15.57.1 Detailed Description

Generic (base) weak reference to some object.
A weak reference is a reference that gets reset to NULL when the object shall be deleted. All weak references to the same object are kept in a linked list of weak references.
For typed weak references see `cxx::Weak_ref`.
Definition at line 24 of file weak_ref.
The documentation for this class was generated from the following file:

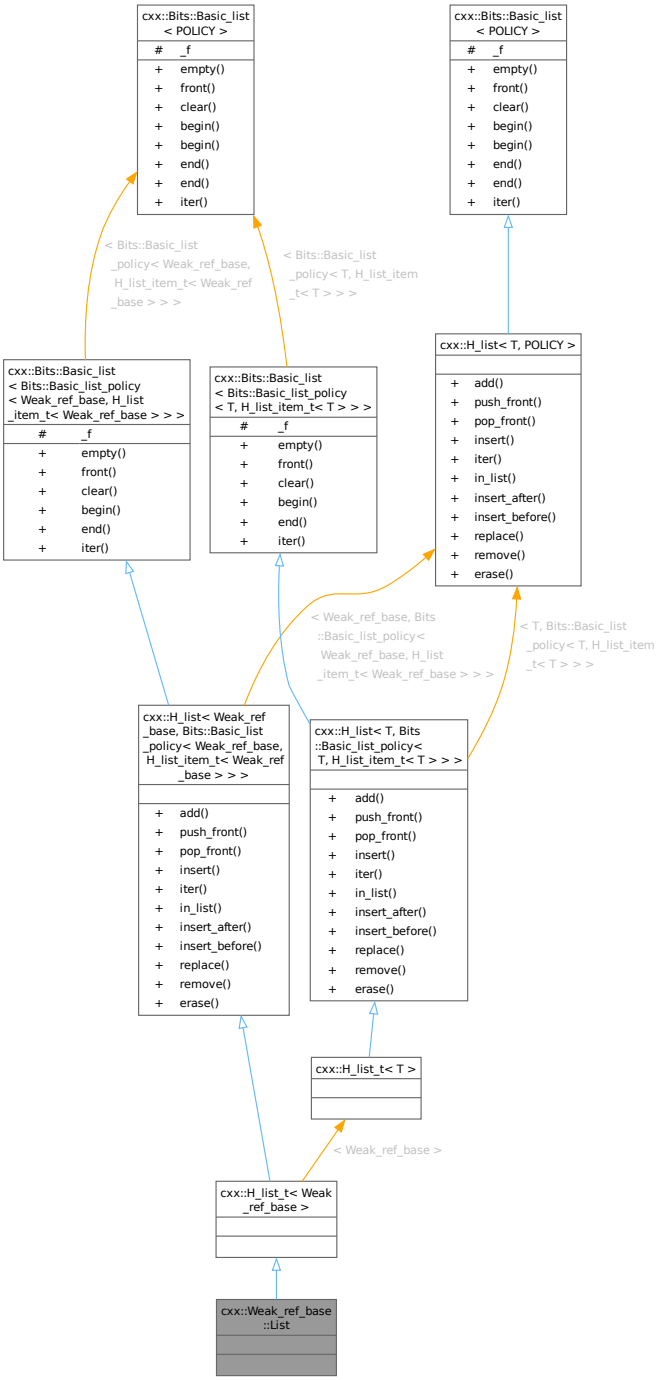
- l4/cxx/weak_ref

15.58 cxx::Weak_ref_base::List Struct Reference

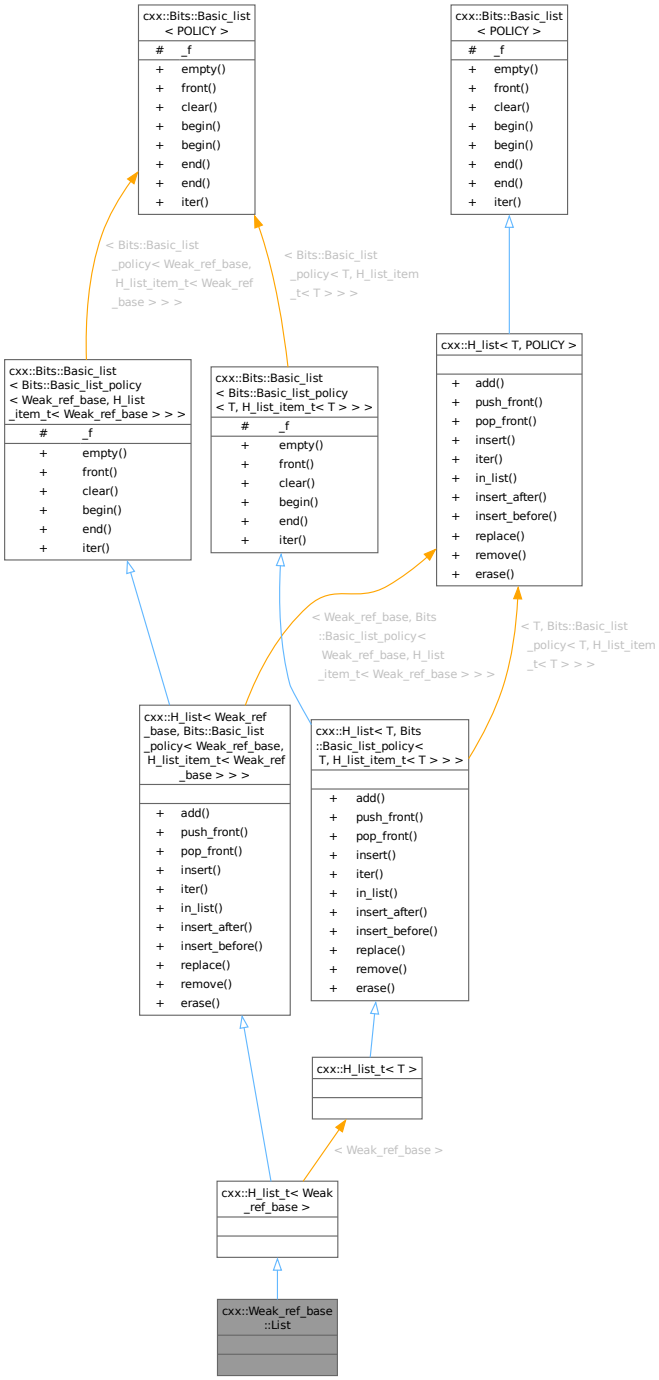
The list type for keeping all weak references to an object.

`#include <weak_ref>`

Inheritance diagram for cxx::Weak_ref_base::List:



Collaboration diagram for cxx::Weak_ref_base::List:



Additional Inherited Members

Public Member Functions inherited from cxx::H_list< Weak_ref_base, Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base >

- void **add** (Weak_ref_base *e)

  Add element to the front of the list.
- void **push_front** (Weak_ref_base *e)

Add element to the front of the list.

- Weak_ref_base * pop_front ()

  Remove and return the head element of the list.

- Iterator insert (Weak_ref_base *e, Iterator const &pred)

  Insert an element at the iterator position.

Public Member Functions inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > > >

- bool **empty** () const

  Check if the list is empty.

- Value_type **front** () const

  Return the first element in the list.

- void clear ()

  Remove all elements from the list.

- Iterator **begin** ()

  Return an iterator to the beginning of the list.

- Const_iterator **end** () const

  Return a const iterator to the end of the list.

Static Public Member Functions inherited from cxx::H_list< Weak_ref_base, Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base >

- static Iterator iter (Weak_ref_base *c)

  Return an iterator for an arbitrary list element.

- static bool **in_list** (Weak_ref_base const *e)

  Check if the given element is currently part of a list.

- static Iterator insert_after (Weak_ref_base *e, Iterator const &pred)

  Insert an element after the iterator position.

- static void insert_before (Weak_ref_base *e, Iterator const &succ)

  Insert an element before the iterator position.

- static void replace (Weak_ref_base *p, Weak_ref_base *e)

  Replace an element in a list with a new element.

- static void remove (Weak_ref_base *e)

  Remove the given element from its list.

- static Iterator erase (Iterator const &e)

  Remove the element at the given iterator position.

Static Public Member Functions inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > > >

- static Const_iterator iter (Const_value_type c)

  Return a const iterator that begins at the given element.

Protected Attributes inherited from cxx::Bits::Basic_list< Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > > >

- Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > >::Head_type **_f**

  Pointer to front of the list.

15.58.1 Detailed Description

The list type for keeping all weak references to an object.
On destruction of a list, all weak references to the respective object are set to `nullptr`.
Definition at line 38 of file weak_ref.

Public Types inherited from L4::Types::Bool< true >

- using **type**

  The meta type itself.

15.77.1 Detailed Description

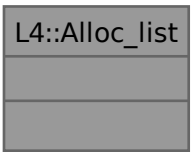
template<typename T>
struct Enum_bitops::Has_marker< T, Void< decltype(enum_bitops_enable(declval< T >()))> >

Marker for the opt-in ADL function.
Definition at line 495 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

15.78 L4::Alloc_list Class Reference

A simple list-based allocator.
`#include <alloc.h>`
Collaboration diagram for L4::Alloc_list:



15.78.1 Detailed Description

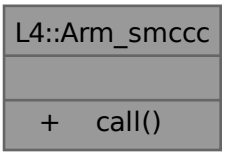
A simple list-based allocator.
Definition at line 20 of file alloc.h.
The documentation for this class was generated from the following file:

- l4/cxx/alloc.h

15.79 L4::Arm_smccc Class Reference

Wrapper for function calls that follow the ARM SMC/HVC calling convention.
`#include <arm_smccc>`

Collaboration diagram for L4::Arm_smccc:



Public Member Functions

- l4_msgtag_t call (l4_umword_t func, l4_umword_t in0, l4_umword_t in1, l4_umword_t in2, l4_umword_t in3, l4_umword_t in4, l4_umword_t in5, l4_umword_t *out0, l4_umword_t *out1, l4_umword_t *out2, l4_umword_t *out3, l4_umword_t client_id)

  ARM SMC/HVC function call.

15.79.1 Detailed Description

Wrapper for function calls that follow the ARM SMC/HVC calling convention.
See l4_arm_smccc_call() for the corresponding C interface.
Definition at line 23 of file arm_smccc.

15.79.2 Member Function Documentation

15.79.2.1 call()

```
l4_msgtag_t L4::Arm_smccc::call (
             l4_umword_t func,
             l4_umword_t in0,
             l4_umword_t in1,
             l4_umword_t in2,
             l4_umword_t in3,
             l4_umword_t in4,
             l4_umword_t in5,
             l4_umword_t * out0,
             l4_umword_t * out1,
             l4_umword_t * out2,
             l4_umword_t * out3,
             l4_umword_t client_id)
```

ARM SMC/HVC function call.
The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.

Parameters

	func	Function identifier. • Bit 31 has to be set: This marks the call as *Fast Call*. *Yielding Calls* (bit 31 unset) are rejected by the kernel. • Bit 30 defines the calling convention: • Bit 30 == 1: 64-bit calling convention. • Bit 30 == 0: 32-bit calling convention. • Bits 24..29 determine the service call ID. The permitted IDs are set in the kernel configuration. By default only service IDs >= 0x30000000 (*Trusted Application Calls* and *Trusted OS Calls*) are allowed.
in	*in0*	First input parameter.
in	*in1*	Second input parameter.
in	*in2*	Third input parameter.
in	*in3*	Fourth input parameter.
in	*in4*	Fifth input parameter.
in	*in5*	Sixth input parameter.
out	*out0*	First output parameter.
out	*out1*	Second output parameter.
out	*out2*	Third output parameter.
out	*out3*	Fourth output parameter.
in	*client_id*	Client ID. According to the specification, this value might be ignored by certain functions.

Return values

-L4_ENOSYS	Either bit 31 of the function call not set or service ID outside the range permitted by kernel configuration.
-L4_EINVAL	Invalid number of parameters.
<0	Other L4 error.
0	Success.

The documentation for this class was generated from the following file:

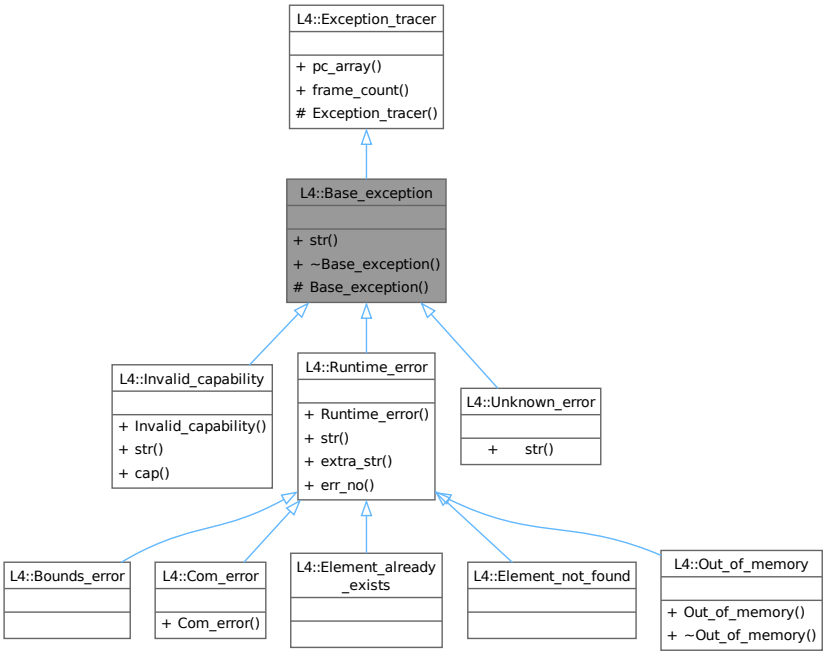
- l4/sys/arm_smccc

15.80 L4::Base_exception Class Reference

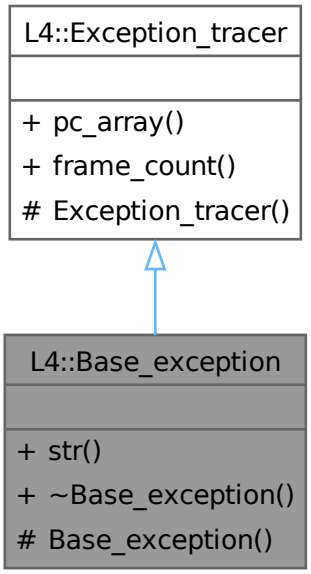
Base class for all exceptions, thrown by the L4Re framework.

`#include <l4/cxx/exceptions>`

Inheritance diagram for L4::Base_exception:



Collaboration diagram for L4::Base_exception:



Public Member Functions

- virtual char const ∗ **str** () const noexcept=0

Return a human readable string for the exception.

- virtual ~**Base_exception** () noexcept

  Destruction.

Public Member Functions inherited from L4::Exception_tracer

- void const *const * **pc_array** () const noexcept

  Get the array containing the call trace.

- int **frame_count** () const noexcept

  Get the number of entries that are valid in the call trace.

Protected Member Functions

- **Base_exception** () noexcept

  Create a base exception.

Protected Member Functions inherited from L4::Exception_tracer

- **Exception_tracer** () noexcept

  Create a back trace.

15.80.1 Detailed Description

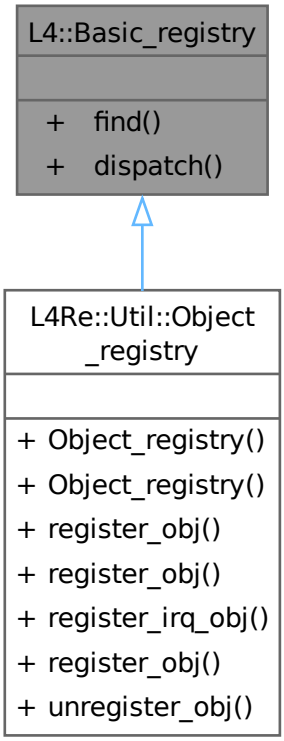
Base class for all exceptions, thrown by the L4Re framework.
This is the abstract base of all exceptions thrown within the L4Re framework. It is basically also a good idea to use it as base of all user defined exceptions.
Definition at line 105 of file exceptions.
The documentation for this class was generated from the following file:

- l4/cxx/exceptions

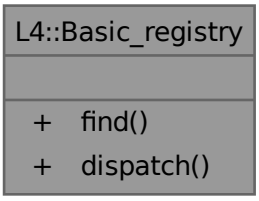
15.81 L4::Basic_registry Class Reference

This registry returns the corresponding server object based on the label of an Ipc_gate.
`#include <ipc_epiface>`

Inheritance diagram for L4::Basic_registry:



Collaboration diagram for L4::Basic_registry:



Static Public Member Functions

- static Value * find (l4_umword_t label)

  Get the server object for an lpc_gate label.
- static l4_msgtag_t dispatch (l4_msgtag_t tag, l4_umword_t label, l4_utcb_t *utcb)

  The dispatch function called by the server loop.

15.81.1 Detailed Description

This registry returns the corresponding server object based on the label of an lpc_gate.
Definition at line 690 of file ipc_epiface.

15.81.2 Member Function Documentation

15.81.2.1 dispatch()

```
l4_msgtag_t L4::Basic_registry::dispatch (
            l4_msgtag_t tag,
            l4_umword_t label,
            l4_utcb_t * utcb)  [inline], [static]
```

The dispatch function called by the server loop.
This function forwards the message to the server object identified by the given *label*.

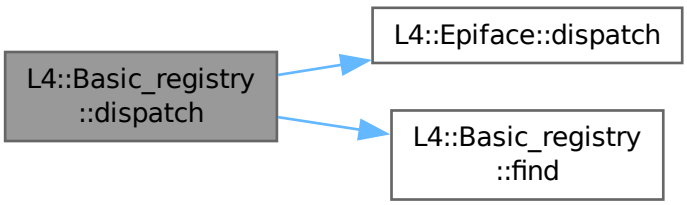
Parameters

tag	The message tag used for the invocation.
label	The label used to find the object including the rights bits of the invoked capability.
utcb	The UTCB used for the invocation.

Returns

The return code from the object's dispatch function or -L4_ENOENT if the object does not exist.

Definition at line 715 of file ipc_epiface.
References L4::Epiface::dispatch(), and find().
Here is the call graph for this function:



15.81.2.2 find()

```
Value * L4::Basic_registry::find (
            l4_umword_t label)  [inline], [static]
```

Get the server object for an lpc_gate label.

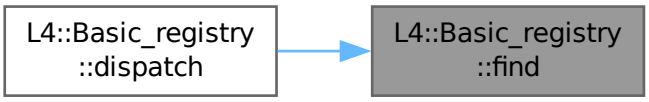
Parameters

label	The label usually stored in an lpc_gate.

Returns

A pointer to the Epiface identified by the given label.

Definition at line 699 of file ipc_epiface.
Referenced by dispatch().
Here is the caller graph for this function:



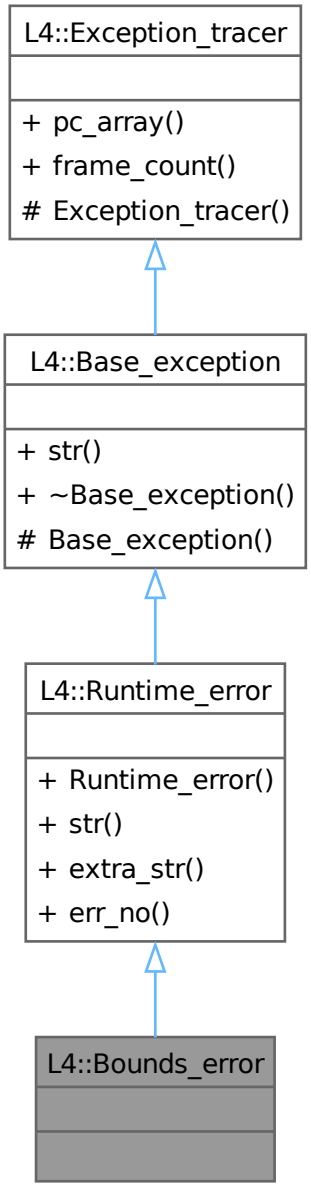
The documentation for this class was generated from the following file:

- l4/sys/cxx/ipc_epiface

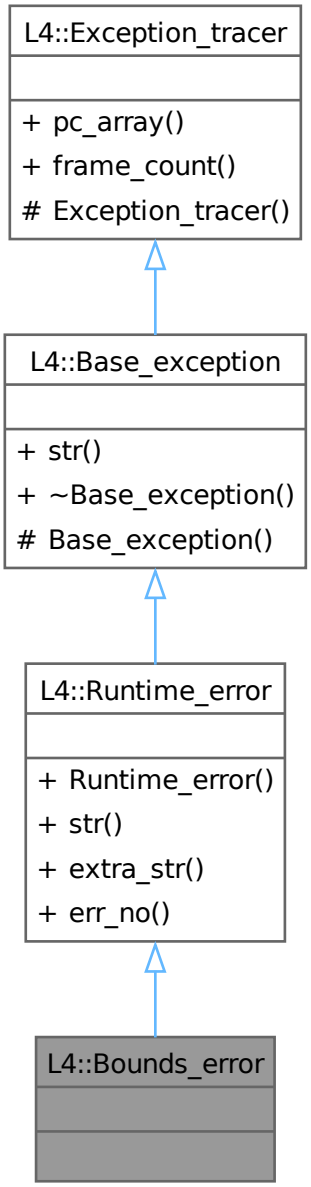
15.82 L4::Bounds_error Class Reference

Access out of bounds.
`#include <exceptions>`

Inheritance diagram for L4::Bounds_error:



Collaboration diagram for L4::Bounds_error:



Additional Inherited Members

Public Member Functions inherited from L4::Runtime_error

- Runtime_error (long err_no, char const *extra=0) noexcept

  Create a new Runtime_error.
- char const * **str** () const noexcept override

  Return a human readable string for the exception.
- char const * extra_str () const

  Get the description text for this runtime error.

- long err_no () const noexcept

  Get the error value for this runtime error.

Public Member Functions inherited from L4::Base_exception

- virtual ~**Base_exception** () noexcept

  Destruction.

Public Member Functions inherited from L4::Exception_tracer

- void const *const * **pc_array** () const noexcept

  Get the array containing the call trace.
- int **frame_count** () const noexcept

  Get the number of entries that are valid in the call trace.

Protected Member Functions inherited from L4::Base_exception

- **Base_exception** () noexcept

  Create a base exception.

Protected Member Functions inherited from L4::Exception_tracer

- **Exception_tracer** () noexcept

  Create a back trace.

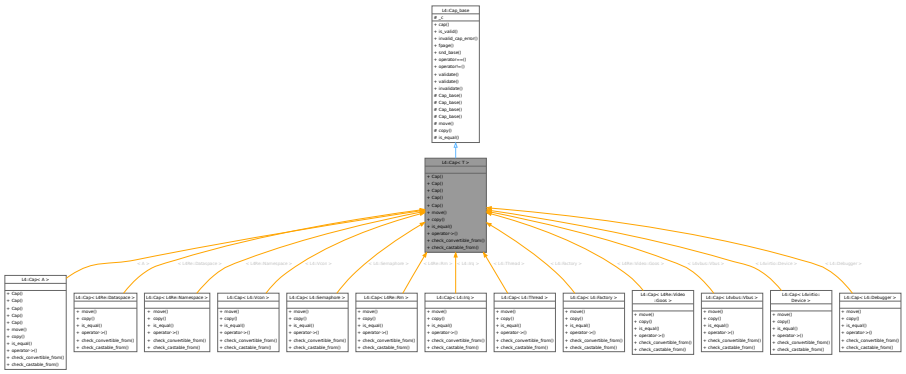
15.82.1 Detailed Description

Access out of bounds.
Definition at line 278 of file exceptions.
The documentation for this class was generated from the following file:

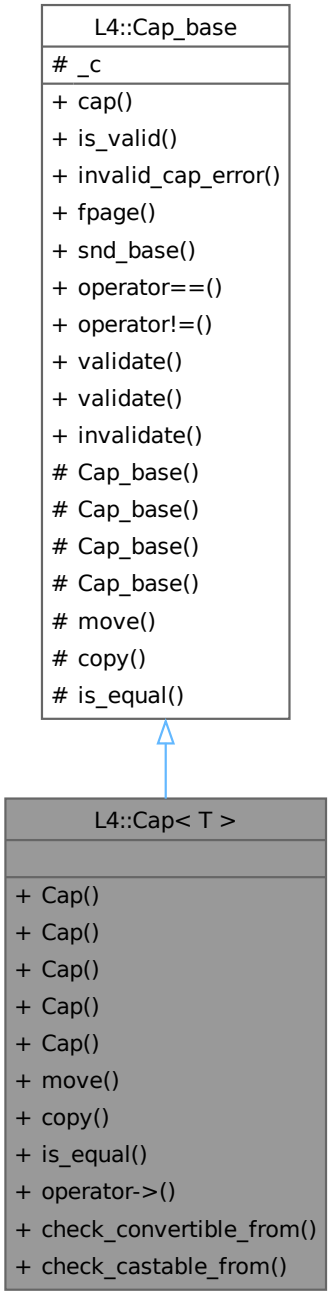
- l4/cxx/exceptions

15.83 L4::Cap< T > Class Template Reference

C++ interface for capabilities.
`#include <capability.h>`
Inheritance diagram for L4::Cap< T >:



Collaboration diagram for L4::Cap< T >:



Public Member Functions

- template<typename O>
  Cap (Cap< O > const &o) noexcept

  Create a copy from o, supporting implicit type casting.
- Cap (Cap_type cap) noexcept

  Constructor to create an invalid capability selector.
- Cap (l4_default_caps_t cap) noexcept

Initialize capability with one of the default capability selectors.

- Cap (l4_cap_idx_t idx=L4_INVALID_CAP) noexcept

  Initialize capability, defaults to the invalid capability selector.

- **Cap** (No_init_type) noexcept

  Create an uninitialized capability selector.

- bool move (Cap const &src) const noexcept

  Replace this capability with the contents of `src`.

- bool copy (Cap const &src) const noexcept

  Copy a capability.

- bool is_equal (Cap const &other) const noexcept

  Test whether this capability points to the same object with the same permissions as `other`.

- T * **operator->** () const noexcept

  Member access of a `T`.

Public Member Functions inherited from L4::Cap_base

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

- bool is_valid () const noexcept

  Test whether the capability is a valid capability index (i.e., L4_INVALID_CAP_BIT is not set).

- int **invalid_cap_error** () const noexcept

  Return the transported error code in an invalid capability selector.

- l4_fpage_t fpage (unsigned rights=L4_CAP_FPAGE_RWS) const noexcept

  Return flexpage for the capability.

- l4_umword_t snd_base (unsigned grant=L4_MAP_ITEM_MAP, l4_cap_idx_t base=L4_INVALID_CAP) const noexcept

  Return send base.

- bool **operator==** (Cap_base const &o) const noexcept

  Test if two capabilities are equal.

- bool **operator!=** (Cap_base const &o) const noexcept

  Test if two capabilities are not equal.

- l4_msgtag_t validate (l4_utcb_t *u=l4_utcb()) const noexcept

  Check whether a capability is present (refers to an object).

- l4_msgtag_t validate (Cap< Task > task, l4_utcb_t *u=l4_utcb()) const noexcept

  Check whether a capability is present (refers to an object).

- void **invalidate** () noexcept

  Set this capability to invalid (L4_INVALID_CAP).

Static Public Member Functions

- template<typename From>
  static void check_convertible_from () noexcept

  Perform the type conversion that needs to compile in order for a capability of type From to be convertible to one of type T.

- template<typename From>
  static void check_castable_from () noexcept

  Perform the type conversion that needs to compile in order for a capability of type From te be castable (via the correct cap_cast) to one of type T.

Friends

- class **L4::Kobject**

Additional Inherited Members

Public Types inherited from L4::Cap_base

- enum No_init_type { No_init }

  Special value for uninitialized capability objects.
- enum Cap_type { Invalid = L4_INVALID_CAP }

  Invalid capability type.

Protected Member Functions inherited from L4::Cap_base

- Cap_base (l4_cap_idx_t c) noexcept

  Generate a capability from its C representation.
- **Cap_base** (Cap_type cap) noexcept

  Constructor to create an invalid capability.
- Cap_base (l4_default_caps_t cap) noexcept

  Initialize capability with one of the default capabilities.
- **Cap_base** () noexcept

  Create an uninitialized instance.
- bool move (Cap_base const &src) const noexcept

  Replace this capability with the contents of `src`.
- bool copy (Cap_base const &src) const noexcept

  Copy a capability.
- bool is_equal (Cap_base const &other) const noexcept

  Test whether this capability points to the same object with the same permissions as `other`.

Protected Attributes inherited from L4::Cap_base

- l4_cap_idx_t **_c**

  The C representation of a capability selector.

15.83.1 Detailed Description

template<typename T>
class L4::Cap< T >

C++ interface for capabilities.

Template Parameters

T	Type of the object the capability points to.

The C++ version of a capability is comparable to a pointer, in fact it is a kind of smart pointer for our kernel objects and the objects derived from the kernel objects (L4::Kobject).
Add

```
#include <l4/sys/capability>
```

to your code to use the capability interface.

Examples

examples/clntsrv/src/client.cc, examples/libs/l4re/c++/mem_alloc/ma+rm.cc, examples/libs/l4re/c++/shared_ds/ds_clnt.cc, examples/libs/l4re/c++/shared_ds/ds_srv.cc, examples/libs/l4re/streammap/client.cc, and examples/sys/migrate/thread_migrate

Definition at line 248 of file capability.h.

15.83.2 Constructor & Destructor Documentation

15.83.2.1 Cap() [1/4]

```
template<typename T>
template<typename O>
L4::Cap< T >::Cap (
            Cap< O > const & o)  [inline], [noexcept]
```

Create a copy from o, supporting implicit type casting.

Parameters

o	The source selector that shall be copied (and casted).

Definition at line 300 of file capability.h.

15.83.2.2 Cap() [2/4]

```
template<typename T>
L4::Cap< T >::Cap (
            Cap_type cap)  [inline], [noexcept]
```

Constructor to create an invalid capability selector.

Parameters

cap	Capability selector.

Definition at line 307 of file capability.h.

15.83.2.3 Cap() [3/4]

```
template<typename T>
L4::Cap< T >::Cap (
            l4_default_caps_t cap)  [inline], [noexcept]
```

Initialize capability with one of the default capability selectors.

Parameters

cap	Capability selector.

Definition at line 313 of file capability.h.

15.83.2.4 Cap() [4/4]

```
template<typename T>
L4::Cap< T >::Cap (
            l4_cap_idx_t idx = L4_INVALID_CAP)  [inline], [explicit], [noexcept]
```

Initialize capability, defaults to the invalid capability selector.

Parameters

idx	Capability selector.

Definition at line 319 of file capability.h.

15.83.3 Member Function Documentation

15.83.3.1 check_castable_from()

```
template<typename T>
template<typename From>
void L4::Cap< T >::check_castable_from ()  [inline], [static], [noexcept]
```

Perform the type conversion that needs to compile in order for a capability of type From te be castable (via the correct cap_cast) to one of type T.

Template Parameters

From	Type to convert from

Definition at line 289 of file capability.h.

15.83.3.2 check_convertible_from()

```
template<typename T>
template<typename From>
void L4::Cap< T >::check_convertible_from ()  [inline], [static], [noexcept]
```

Perform the type conversion that needs to compile in order for a capability of type From to be convertible to one of type T.

Template Parameters

From	Type to convert from

Definition at line 276 of file capability.h.

15.83.3.3 copy()

```
template<typename T>
bool L4::Cap< T >::copy (
            Cap< T > const & src) const  [inline], [noexcept]
```

Copy a capability.

Parameters

src	the source capability.

After this operation this capability refers to the same object as `src`.
Definition at line 335 of file capability.h.

15.83.3.4 is_equal()

```
template<typename T>
bool L4::Cap< T >::is_equal (
            Cap< T > const & other) const  [inline], [noexcept]
```

Test whether this capability points to the same object with the same permissions as `other`.
As an extension, invalid capabilities are considered equal by this function. See l4_task_cap_equal() for further details.

Parameters

other	The capability to comapre to.

Definition at line 341 of file capability.h.

15.83.3.5 move()

```
template<typename T>
bool L4::Cap< T >::move (
            Cap< T > const & src) const  [inline], [noexcept]
```

Replace this capability with the contents of `src`.

Parameters

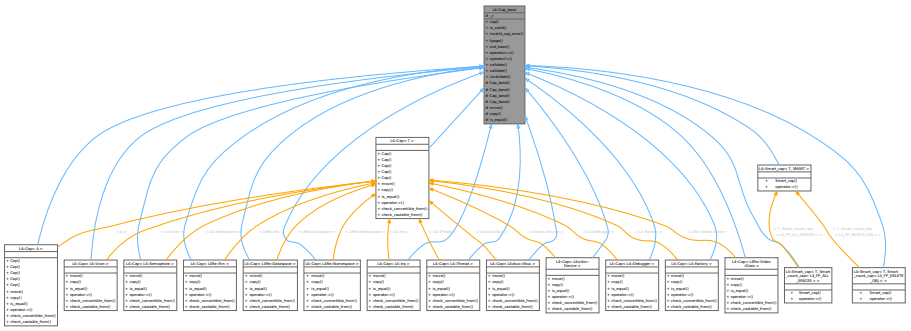
src	the source capability.

After the operation this capability refers to the object formerly referred to by the source capability `src`, and the source capability no longer refers to an object.
Definition at line 329 of file capability.h.
The documentation for this class was generated from the following file:

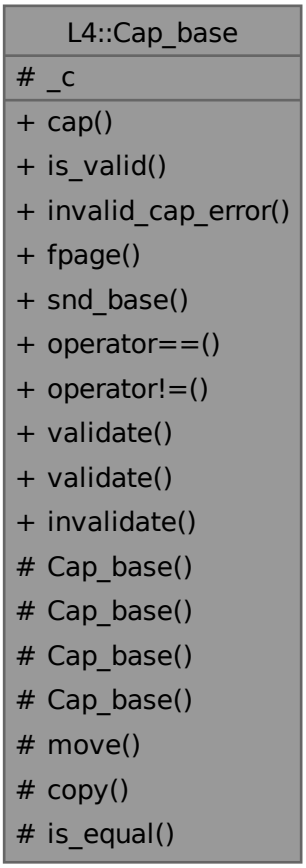
- l4/sys/cxx/capability.h

15.84 L4::Cap_base Class Reference

Base class for all kinds of capabilities.
`#include <l4/sys/capability>`
Inheritance diagram for L4::Cap_base:



Collaboration diagram for L4::Cap_base:



Public Types

- enum No_init_type { No_init }

  Special value for uninitialized capability objects.
- enum Cap_type { Invalid = L4_INVALID_CAP }

  Invalid capability type.

Public Member Functions

- l4_cap_idx_t cap () const noexcept

  Return capability selector.
- bool is_valid () const noexcept

  Test whether the capability is a valid capability index (i.e., L4_INVALID_CAP_BIT is not set).
- int **invalid_cap_error** () const noexcept

  Return the transported error code in an invalid capability selector.
- l4_fpage_t fpage (unsigned rights=L4_CAP_FPAGE_RWS) const noexcept

  Return flexpage for the capability.
- l4_umword_t snd_base (unsigned grant=L4_MAP_ITEM_MAP, l4_cap_idx_t base=L4_INVALID_CAP) const noexcept

Return send base.

- bool **operator==** (Cap_base const &o) const noexcept

  Test if two capabilities are equal.
- bool **operator!=** (Cap_base const &o) const noexcept

  Test if two capabilities are not equal.
- l4_msgtag_t validate (l4_utcb_t *u=l4_utcb()) const noexcept

  Check whether a capability is present (refers to an object).
- l4_msgtag_t validate (Cap< Task > task, l4_utcb_t *u=l4_utcb()) const noexcept

  Check whether a capability is present (refers to an object).
- void **invalidate** () noexcept

  Set this capability to invalid (L4_INVALID_CAP).

Protected Member Functions

- Cap_base (l4_cap_idx_t c) noexcept

  Generate a capability from its C representation.
- **Cap_base** (Cap_type cap) noexcept

  Constructor to create an invalid capability.
- Cap_base (l4_default_caps_t cap) noexcept

  Initialize capability with one of the default capabilities.
- **Cap_base** () noexcept

  Create an uninitialized instance.
- bool move (Cap_base const &src) const noexcept

  Replace this capability with the contents of `src`.
- bool copy (Cap_base const &src) const noexcept

  Copy a capability.
- bool is_equal (Cap_base const &other) const noexcept

  Test whether this capability points to the same object with the same permissions as `other`.

Protected Attributes

- l4_cap_idx_t **_c**

  The C representation of a capability selector.

15.84.1 Detailed Description

Base class for all kinds of capabilities.

Attention

This class is not for direct use, use L4::Cap instead.

This class contains all the things that are independent of the type of the object referred by the capability.

See also

L4::Cap for typed capabilities.

Definition at line 25 of file capability.h.

15.84.2 Member Enumeration Documentation

15.84.2.1 Cap_type

enum L4::Cap_base::Cap_type
Invalid capability type.

Enumerator

Invalid	Invalid capability selector.

Definition at line 40 of file capability.h.

15.84.2.2 No_init_type

enum L4::Cap_base::No_init_type
Special value for uninitialized capability objects.

Enumerator

No_init	Special value for constructing uninitialized Cap objects.

Definition at line 29 of file capability.h.

15.84.3 Constructor & Destructor Documentation

15.84.3.1 Cap_base() [1/2]

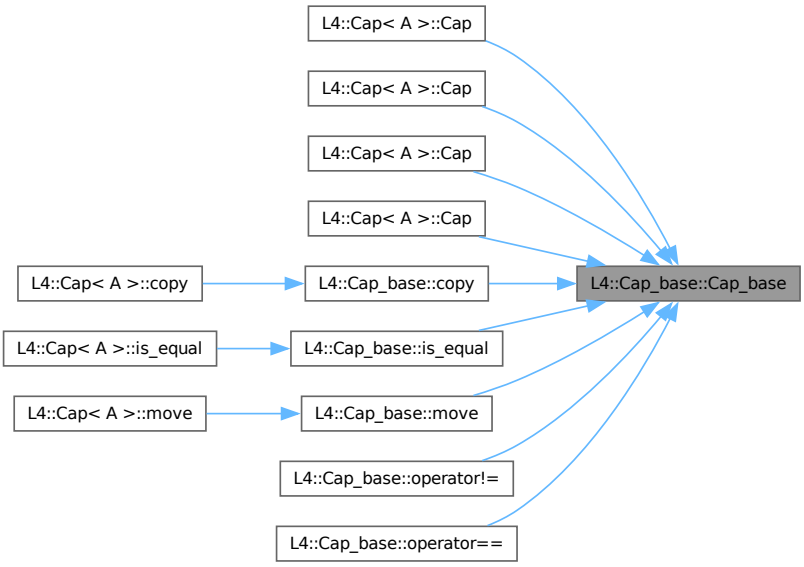
```
L4::Cap_base::Cap_base (
            l4_cap_idx_t c)  [inline], [explicit], [protected], [noexcept]
```
Generate a capability from its C representation.

Parameters

c	The C capability

Definition at line 149 of file capability.h.
References _c.
Referenced by L4::Cap< A >::Cap(), L4::Cap< A >::Cap(), L4::Cap< A >::Cap(), L4::Cap< A >::Cap(), copy(), is_equal(), move(), operator!=(), and operator==().

Here is the caller graph for this function:



15.84.3.2 Cap_base() [2/2]

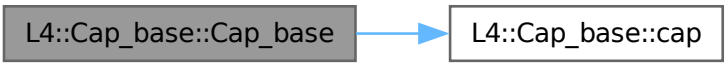
```
L4::Cap_base::Cap_base (
            l4_default_caps_t cap)  [inline], [explicit], [protected], [noexcept]
```

Initialize capability with one of the default capabilities.

Parameters

cap	Capability.

Definition at line 160 of file capability.h.
References _c, and cap().
Here is the call graph for this function:



15.84.4 Member Function Documentation

15.84.4.1 cap()

```
l4_cap_idx_t L4::Cap_base::cap () const  [inline], [noexcept]
```

Return capability selector.

Returns

Capability selector.

Definition at line 49 of file capability.h.
References _c.
Referenced by L4::Thread_group::add(), L4Re::Util::Br_manager::alloc_buffer_demand(), L4vbus::Vbus::assign_dma_domain(), L4::Icu::bind(), L4::Rcv_endpoint::bind_snd_destination(), L4::Irq::bind_vcpu(), L4::Cap< A >::Cap(), L4::Cap< A >::Cap(), Cap_base(), Cap_base(), L4::Task::cap_equal(), L4::Task::cap_valid(), L4Re::Smart_count_cap< Unmap_flags >::copy(), L4Re::Util::Smart_count_cap< Unmap_flags >::copy(), L4::Factory::create_factory(), L4::Factory::create_gate(), L4::Factory::create_task(), L4::Factory::create_thread_group(), L4::Task::delete_obj(), L4Re::Util::Smart_cap_auto< Unmap_flags >

```
l4_fpage_t L4::Cap_base::fpage (
            unsigned rights = L4_CAP_FPAGE_RWS) const  [inline], [noexcept]
```

Return flexpage for the capability.

Parameters

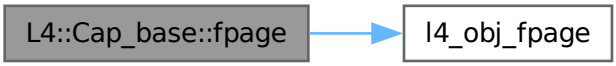
rights	Rights, defaults to 'rws'

Returns

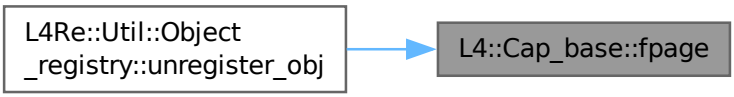
flexpage

Definition at line 74 of file capability.h.
References _c, L4_CAP_FPAGE_RWS, and l4_obj_fpage().
Referenced by L4Re::Util::Object_registry::unregister_obj().

Here is the call graph for this function:



Here is the caller graph for this function:



15.84.4.4 is_equal()

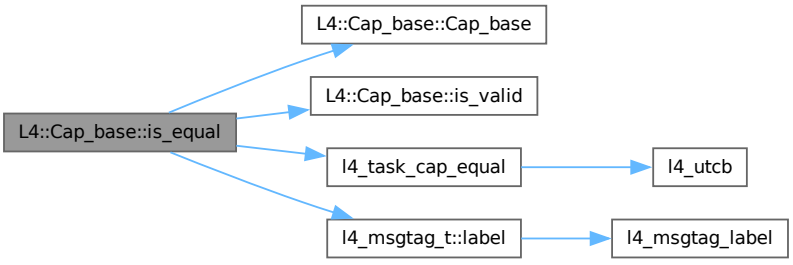
```
bool L4::Cap_base::is_equal (
            Cap_base const & other) const  [inline], [protected], [noexcept]
```

Test whether this capability points to the same object with the same permissions as `other`.
As an extension, invalid capabilities are considered equal by this function. See l4_task_cap_equal() for further details.

Parameters

other	The capability to comapre to.

Definition at line 215 of file capability.h.
References _c, Cap_base(), is_valid(), L4_BASE_TASK_CAP, l4_task_cap_equal(), and l4_msgtag_t::label().
Referenced by L4::Cap< A >::is_equal().
Here is the call graph for this function:



Here is the caller graph for this function:

15.84.4.5 is_valid()

`bool L4::Cap_base::is_valid () const [inline], [noexcept]`

Test whether the capability is a valid capability index (i.e., L4_INVALID_CAP_BIT is not set).

Returns

True if capability is not invalid, false if invalid

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, and examples/libs/l4re/c++/shared_ds/ds_clnt.cc.

Definition at line 57 of file capability.h.

```
l4_umword_t L4::Cap_base::snd_base (
            unsigned grant = L4_MAP_ITEM_MAP,
            l4_cap_idx_t base = L4_INVALID_CAP) const  [inline], [noexcept]
```

Return send base.

Parameters

grant	Indicates if object shall be granted. Allowed values: L4_MAP_ITEM_MAP, L4_MAP_ITEM_GRANT.
base	Base capability (first in a bundle of aligned capabilities)

Returns

Map object.

Definition at line 86 of file capability.h.
References _c, L4_INVALID_CAP, L4_MAP_ITEM_MAP, and l4_map_obj_control().

15.84.4.8 validate() [1/2]

```
l4_msgtag_t L4::Cap_base::validate (
            Cap< Task > task,
            l4_utcb_t * u = l4_utcb()) const  [inline], [noexcept]
```

Check whether a capability is present (refers to an object).

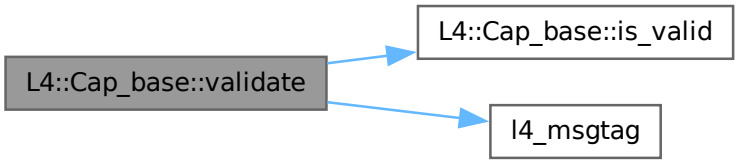
Parameters

task	Task to check the capability in.
u	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

l4_msgtag_t::label() > 0	Capability is present (refers to an object).
l4_msgtag_t::label() == 0	No capability present (void object or invalid capability selector).

A capability is considered present when it refers to an existing kernel object.
Definition at line 74 of file capability.
References _c, is_valid(), and l4_msgtag().
Here is the call graph for this function:



15.84.4.9 validate() [2/2]

```
l4_msgtag_t L4::Cap_base::validate (
            l4_utcb_t * u = l4_utcb()) const  [inline], [noexcept]
```

Check whether a capability is present (refers to an object).

Parameters

u	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

l4_msgtag_t::label() > 0	Capability is present (refers to an object).
l4_msgtag_t::label() == 0	No capability present (void object or invalid capability selector).

A capability is considered present when it refers to an existing kernel object.
Definition at line 81 of file capability.
References _c, is_valid(), L4_BASE_TASK_CAP, and l4_msgtag().

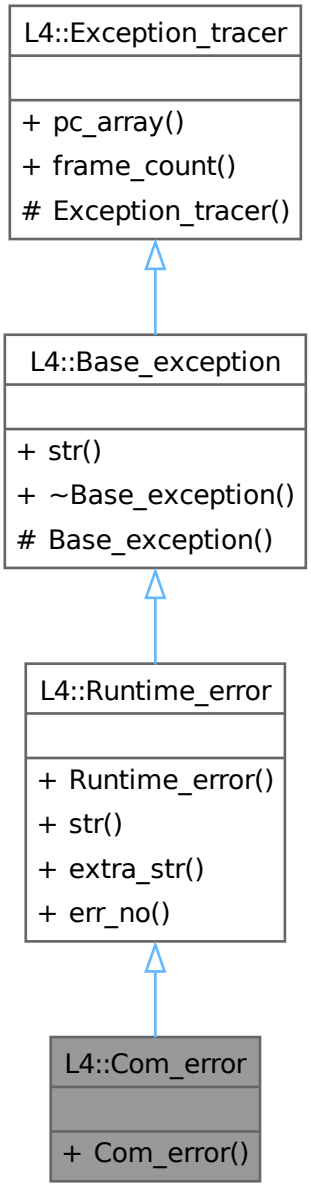
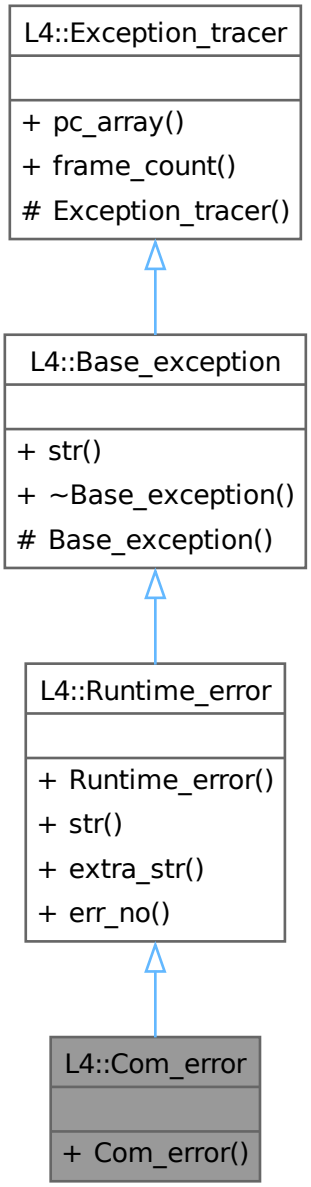
15.85 L4::Com_error Class Reference

Error conditions during IPC.
`#include <l4/cxx/exceptions>`

Inheritance diagram for L4::Com_error:



Collaboration diagram for L4::Com_error:



Public Member Functions

- Com_error (long err) noexcept

  Create a Com_error for the given L4 IPC error code.

Public Member Functions inherited from L4::Runtime_error

- Runtime_error (long err_no, char const ∗extra=0) noexcept

  Create a new Runtime_error.
- char const ∗ **str** () const noexcept override

Return a human readable string for the exception.

- char const * extra_str () const

  Get the description text for this runtime error.

- long err_no () const noexcept

  Get the error value for this runtime error.

Public Member Functions inherited from L4::Base_exception

- virtual ~**Base_exception** () noexcept

  Destruction.

Public Member Functions inherited from L4::Exception_tracer

- void const *const * **pc_array** () const noexcept

  Get the array containing the call trace.

- int **frame_count** () const noexcept

  Get the number of entries that are valid in the call trace.

Additional Inherited Members

Protected Member Functions inherited from L4::Base_exception

- **Base_exception** () noexcept

  Create a base exception.

Protected Member Functions inherited from L4::Exception_tracer

- **Exception_tracer** () noexcept

  Create a back trace.

15.85.1 Detailed Description

Error conditions during IPC.
This exception encapsulates all IPC error conditions of L4 IPC.
Definition at line 263 of file exceptions.

15.85.2 Constructor & Destructor Documentation

15.85.2.1 Com_error()

```
L4::Com_error::Com_error (
            long err)  [inline], [explicit], [noexcept]
```

Create a Com_error for the given L4 IPC error code.

Parameters

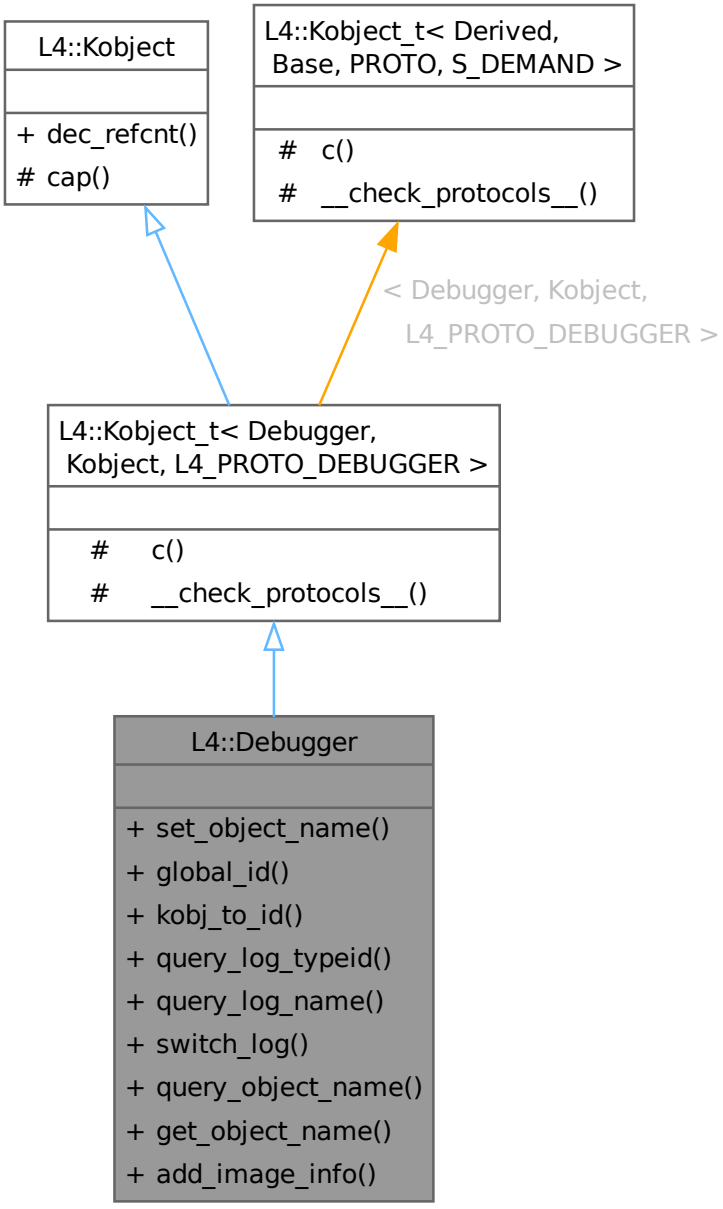
err	The L4 IPC error code (l4_ipc... return value).

Definition at line 270 of file exceptions.
The documentation for this class was generated from the following file:

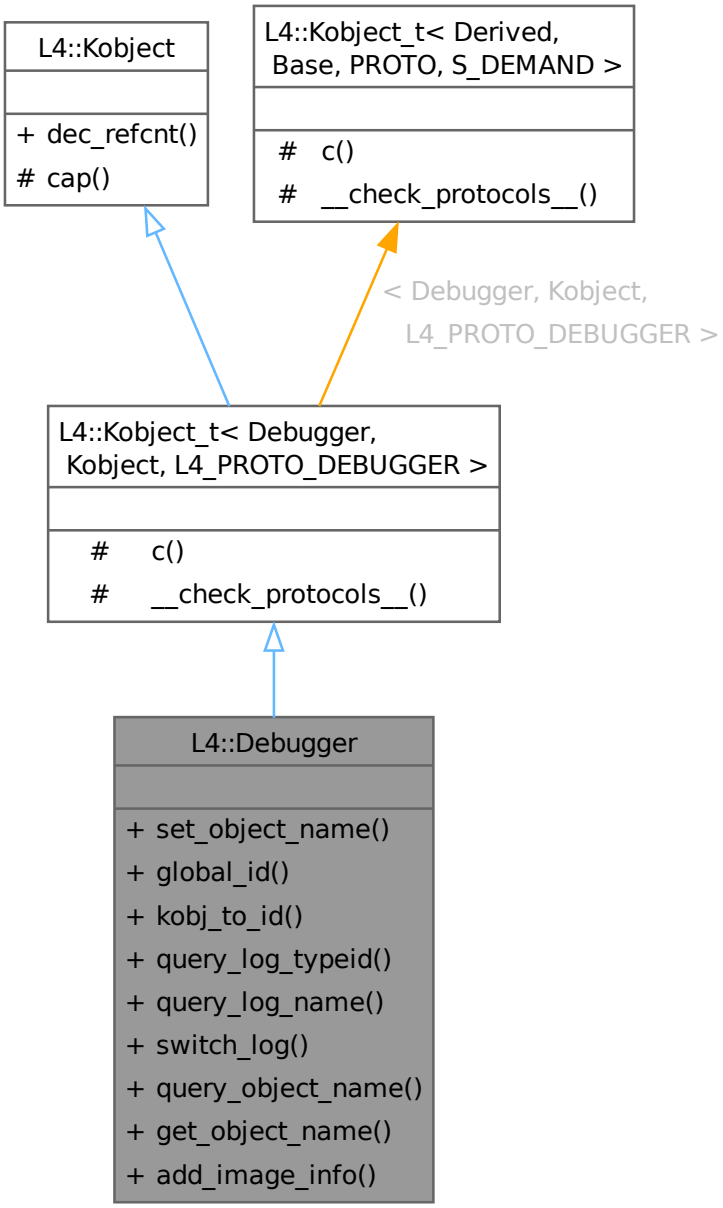
- l4/cxx/exceptions

15.86 L4::Debugger Class Reference

C++ kernel debugger API.
`#include <debugger>`
Inheritance diagram for L4::Debugger:



Collaboration diagram for L4::Debugger:



Public Member Functions

- l4_msgtag_t set_object_name (const char *name, l4_utcb_t *utcb=l4_utcb()) noexcept
  Set the name of a kernel object.
- unsigned long global_id (l4_utcb_t *utcb=l4_utcb()) noexcept
  Get the globally unique ID of the object behind a capability.
- unsigned long kobj_to_id (l4_addr_t kobjp, l4_utcb_t *utcb=l4_utcb()) noexcept
  Get the globally unique ID of the object behind the kobject pointer.
- l4_ret_t query_log_typeid (const char *name, unsigned idx, l4_utcb_t *utcb=l4_utcb()) noexcept
  Query the log-id for a log type.

- l4_ret_t query_log_name (unsigned idx, char *name, unsigned namelen, char *shortname, unsigned shortnamelen, l4_utcb_t *utcb=l4_utcb()) noexcept

  Query the name of a log type given the ID.
- l4_msgtag_t switch_log (const char *name, unsigned on_off, l4_utcb_t *utcb=l4_utcb()) noexcept

  Set or unset log.
- l4_ret_t query_object_name (unsigned id, char *name, unsigned size, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get name of object with Id `id`.
- l4_ret_t get_object_name (char *name, unsigned size, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get name of object.
- l4_msgtag_t add_image_info (l4_addr_t base, const char *name, l4_utcb_t *utcb=l4_utcb()) noexcept

  Add loaded image information for a task.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Debugger, Kobject, L4_PROTO_DEBUGGER >

- typedef Debugger **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Debugger > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Debugger, Kobject, L4_PROTO_DEBUGGER >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Debugger, Kobject, L4_PROTO_DEBUGGER >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.86.1 Detailed Description

C++ kernel debugger API.

Attention

This API is subject to change! Do not rely on it in production code.

This API is to be used for debugging exclusively.
This is the API for accessing kernel-debugger functionality from user-level programs. Specifically, it provides functionality to enrich the kernel debugger with insights into the program. The purpose is to facilitate debugging with the kernel debugger. For instance, a developer might choose to name the threads of her program so that she can find them in the kernel debugger thread list.
This API interacts with a kernel object that interfaces with the kernel debugger, the jdb-kernel object. The jdb-kernel object is fix and only available when the kernel debugger is built into the microkernel. The developer needs to pass the capability through to her program.

Include File

```
#include <l4/sys/debugger>
```

Definition at line 42 of file debugger.

15.86.2 Member Function Documentation

15.86.2.1 add_image_info()

```
l4_msgtag_t L4::Debugger::add_image_info (
             l4_addr_t base,
             const char * name,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Add loaded image information for a task.

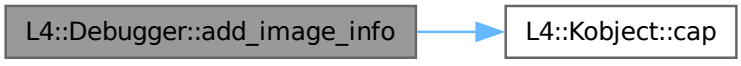
Parameters

base	Image load base address
name	Image name
utcb	The UTCB to use for the operation.

Returns

System call return tag.

Definition at line 177 of file debugger.
References L4::Kobject::cap().
Here is the call graph for this function:



15.86.2.2 get_object_name()

```
l4_ret_t L4::Debugger::get_object_name (
             char * name,
             unsigned size,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Get name of object.

Parameters

out	*name*	Buffer to copy the name into. The buffer must be allocated by the caller.
	size	Length of the name buffer.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

0	Success
<0	Error

Definition at line 164 of file debugger.
References L4::Kobject::cap().
Here is the call graph for this function:

15.86.2.3 global_id()

```
unsigned long L4::Debugger::global_id (
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Get the globally unique ID of the object behind a capability.

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

~0UL	The capability is invalid.
>=0	The global debugger id.

Definition at line 71 of file debugger.
References L4::Kobject::cap().

Here is the call graph for this function:

15.86.2.4 kobj_to_id()

```
unsigned long L4::Debugger::kobj_to_id (
            l4_addr_t kobjp,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Get the globally unique ID of the object behind the kobject pointer.

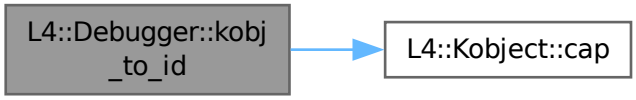
Parameters

kobjp	Kobject pointer
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

~0UL	The capability or the Kobject pointer are invalid.
>=0	The globally unique id.

Definition at line 83 of file debugger.
References L4::Kobject::cap().
Here is the call graph for this function:



15.86.2.5 query_log_name()

```
l4_ret_t L4::Debugger::query_log_name (
            unsigned idx,
            char * name,
            unsigned namelen,
            char * shortname,
```

```
            unsigned shortnamelen,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Query the name of a log type given the ID.

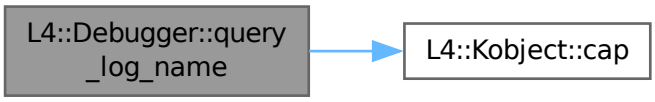
Parameters

	idx	ID to query.
out	*name*	Buffer to copy name to. The buffer must be allocated by the caller.
	namelen	Buffer length of name.
out	*shortname*	Buffer to copy `shortname` to. The buffer must be allocated by the caller.
	shortnamelen	Buffer length of `shortname`.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

0	Success
<0	Error

Definition at line 116 of file debugger.
References L4::Kobject::cap().
Here is the call graph for this function:



15.86.2.6 query_log_typeid()

```
l4_ret_t L4::Debugger::query_log_typeid (
            const char * name,
            unsigned idx,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Query the log-id for a log type.

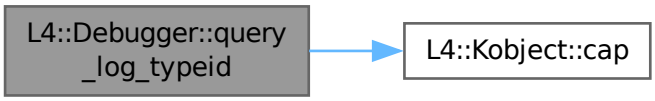
Parameters

name	Name to query for.
idx	Idx to start searching, start with 0
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

>=0	Id
<0	Error

Definition at line 97 of file debugger.
References L4::Kobject::cap().
Here is the call graph for this function:



15.86.2.7 query_object_name()

```
l4_ret_t L4::Debugger::query_object_name (
            unsigned id,
            char * name,
            unsigned size,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Get name of object with Id `id`.

Parameters

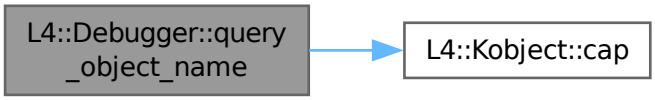
	id	Id of the object whose name is asked.
`out`	*name*	Buffer to copy the name into. The buffer must be allocated by the caller.
	size	Length of the `name` buffer.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

0	Success
<0	Error

Definition at line 149 of file debugger.
References L4::Kobject::cap().

Here is the call graph for this function:



15.86.2.8 set_object_name()

```
l4_msgtag_t L4::Debugger::set_object_name (
            const char * name,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Set the name of a kernel object.

Parameters

name	Name
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag.

Definition at line 59 of file debugger.
References L4::Kobject::cap().
Here is the call graph for this function:

15.86.2.9 switch_log()

```
l4_msgtag_t L4::Debugger::switch_log (
            const char * name,
            unsigned on_off,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Set or unset log.

Parameters

name	Name of the log type.

on_off	1: turn log on, 0: turn log off
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Definition at line 133 of file debugger.
References L4::Kobject::cap().

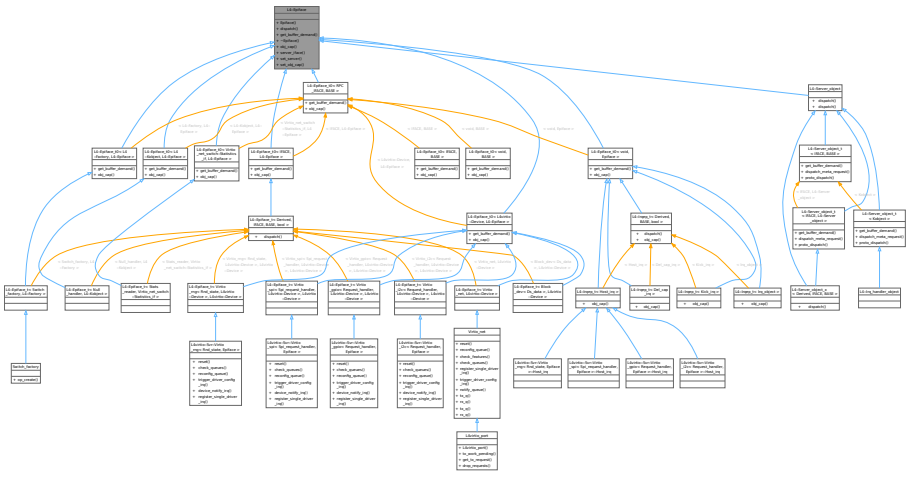
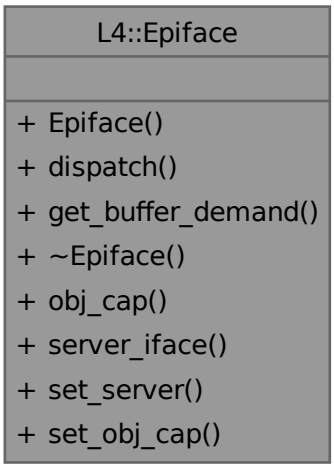
15.89 L4::Epiface Struct Reference

Base class for interface implementations.
`#include <ipc_epiface>`
Inheritance diagram for L4::Epiface:



Collaboration diagram for L4::Epiface:



Public Types

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Member Functions

- **Epiface** ()

  Make a server object.
- virtual l4_msgtag_t dispatch (l4_msgtag_t tag, unsigned rights, l4_utcb_t *utcb)=0

  The abstract handler for client requests to the object.
- virtual Demand get_buffer_demand () const =0

  Get the server-side receive buffer demand for this object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

15.89.1 Detailed Description

Base class for interface implementations.
An Epiface is the base interface of objects registered in the server loop. Incoming IPC gets dispatched to the appropriate Epiface object where the call is then handled appropriately.

Note

Server loops are allowed to internally keep raw pointers to Epiface objects for dispatching calls. Instances must therefore never be copied or moved.

Definition at line 263 of file ipc_epiface.

15.89.2 Member Function Documentation

15.89.2.1 dispatch()

```
virtual l4_msgtag_t L4::Epiface::dispatch (
             l4_msgtag_t tag,
             unsigned rights,
             l4_utcb_t * utcb)  [pure virtual]
```

The abstract handler for client requests to the object.

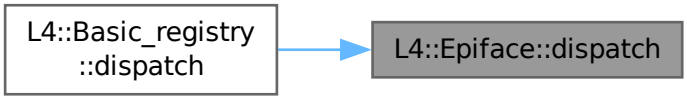
Parameters

tag	The message tag for this invocation.
rights	The rights bits in the invoked capability.
utcb	The UTCB used for the invocation.

Return values

-L4_ENOREPLY	No reply message is sent.
<0	Error, reply with error code.
>=0	Success, reply with return value.

This function must be implemented by application specific server objects.
Implemented in L4::Epiface_t< Derived, IFACE, BASE, bool >, L4::Epiface_t< Block_dev< Ds_data >, L4virtio::Device >, L4::Epiface_t< Null_handler, L4::Kobject >, L4::Epiface_t< Stats_reader, Virtio_net_switch::Statistics_if >, L4::Epiface_t< Switch_factory, L4::Factory >, L4::Epiface_t< Virtio_gpio< Request_handler, L4virtio::Device >, L4virtio::Device >, L4::Epiface_t< Virtio_i2c< Request_handler, L4virtio::Device >, L4virtio::Device >, L4::Epiface_t< Virtio_net, L4virtio::Device >, L4::Epiface_t< Virtio_rng< Rnd_state, L4virtio::Device >, L4virtio::Device >, L4::Epiface_t< Virtio_spi< Spi_request_handler, L4vi L4::Irqep_t< Derived, BASE, bool >, L4::Irqep_t< Del_cap_irq >, L4::Irqep_t< Host_irq >, L4::Irqep_t< Irq_object >, L4::Irqep_t< Kick_irq >, and L4::Server_object.
Referenced by L4::Basic_registry::dispatch().
Here is the caller graph for this function:



15.89.2.2 get_buffer_demand()

```
virtual Demand L4::Epiface::get_buffer_demand () const  [pure virtual]
```

Get the server-side receive buffer demand for this object.

Note

This function is usually not implemented directly, but by using Server_object_t template with an IPC interface definition.

Returns

The needed server-side receive buffers for this object

Implemented in L4::Epiface_t0< RPC_IFACE, BASE >, L4::Epiface_t0< IFACE, L4::Epiface >, L4::Epiface_t0< L4::Factory, L4::Epi
L4::Epiface_t0< L4::Kobject, L4::Epiface >, L4::Epiface_t0< L4virtio::Device, L4::Epiface >, L4::Epiface_t0< Virtio_net_switch::Stat
L4::Epiface_t0< void, Epiface >, L4::Server_object_t< IFACE, BASE >, L4::Server_object_t< IFACE, L4::Server_object >,
and L4::Server_object_t< Kobject >.

15.89.2.3 obj_cap()

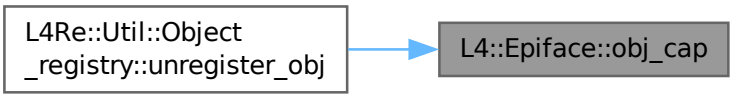
```
Stored_cap L4::Epiface::obj_cap () const  [inline]
```

Get the capability to the kernel object belonging to this object.

Returns

Capability for the kernel object behind the server.

This is usually either an Ipc_gate or an Irq.
Definition at line 324 of file ipc_epiface.
Referenced by L4Re::Util::Object_registry::unregister_obj().
Here is the caller graph for this function:



15.89.2.4 server_iface()

```
Server_iface * L4::Epiface::server_iface () const  [inline]
```

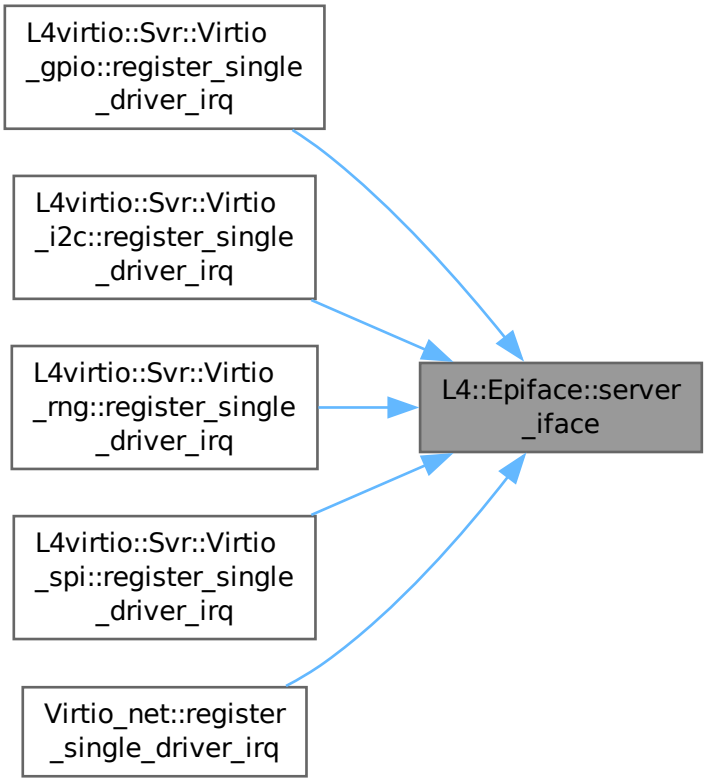
Get pointer to server interface at which the object is currently registered.

Returns

Pointer to the server at which the object is currently registered, NULL if the object is not registered at any server.

Definition at line 331 of file ipc_epiface.
Referenced by L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::register_single_driver_irq(), L4virtio::Svr::Virtio_i2c< Reques
L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >::register_single_driver_irq(), L4virtio::Svr::Virtio_spi< Spi_request_handler, Epiface
and Virtio_net::register_single_driver_irq().

Here is the caller graph for this function:



15.89.2.5 set_server()

```
int L4::Epiface::set_server (
            Server_iface * srv,
            Cap< void > cap,
            bool managed = false)  [inline]
```

Set server registration info for the object.

Parameters

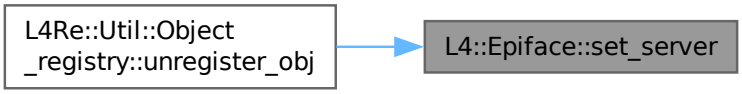
srv	The server to register at
cap	The capability that connects the object.
managed	Mark the capability as managed or unmanaged. Typical server implementations use this flag to remember whether the capability was internally allocated or not.

Returns

0 on success, -L4_EINVAL if the srv and cap are not consistent.

Definition at line 342 of file ipc_epiface.
References L4_EINVAL.

Referenced by L4Re::Util::Object_registry::unregister_obj().
Here is the caller graph for this function:



The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_epiface

15.90 L4::Epiface_t< Derived, IFACE, BASE, bool > Struct Template Reference

Epiface implementation for Kobject-based interface implementations.

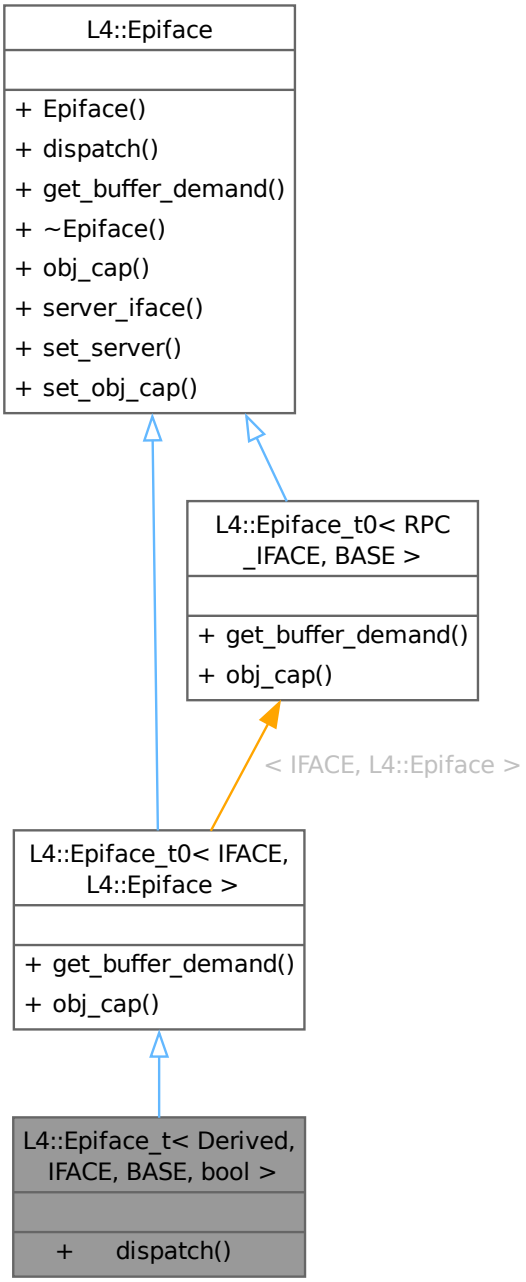
Collaboration diagram for L4::Epiface_t< Derived, IFACE, BASE, bool >:



Public Member Functions

- l4_msgtag_t dispatch (l4_msgtag_t tag, unsigned rights, l4_utcb_t *utcb) final

  The abstract handler for client requests to the object.

Public Member Functions inherited from L4::Epiface_t0< IFACE, L4::Epiface >

- Type_info::Demand **get_buffer_demand** () const

Get the server-side buffer demand based in IFACE.

- Cap< IFACE > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< IFACE, L4::Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

15.90.1 Detailed Description

template<typename Derived, typename IFACE, typename BASE = L4::Epiface, bool = cxx::is_polymorphic<BASE>::value>
struct L4::Epiface_t< Derived, IFACE, BASE, bool >

Epiface implementation for Kobject-based interface implementations.

Template Parameters

Derived	Class providing the interface implementations.
BASE	Epiface base class.

Examples

examples/clntsrv/src/server.cc.

Definition at line 664 of file ipc_epiface.

15.90.2 Member Function Documentation

15.90.2.1 dispatch()

```
template<typename Derived, typename IFACE, typename BASE = L4::Epiface, bool = cxx::is_↩
polymorphic<BASE>::value>
l4_msgtag_t L4::Epiface_t< Derived, IFACE, BASE, bool >::dispatch (
            l4_msgtag_t tag,
            unsigned rights,
            l4_utcb_t * utcb)  [inline], [final], [virtual]
```

The abstract handler for client requests to the object.

Parameters

tag	The message tag for this invocation.
rights	The rights bits in the invoked capability.
utcb	The UTCB used for the invocation.

Return values

-L4_ENOREPLY	No reply message is sent.
<0	Error, reply with error code.
>=0	Success, reply with return value.

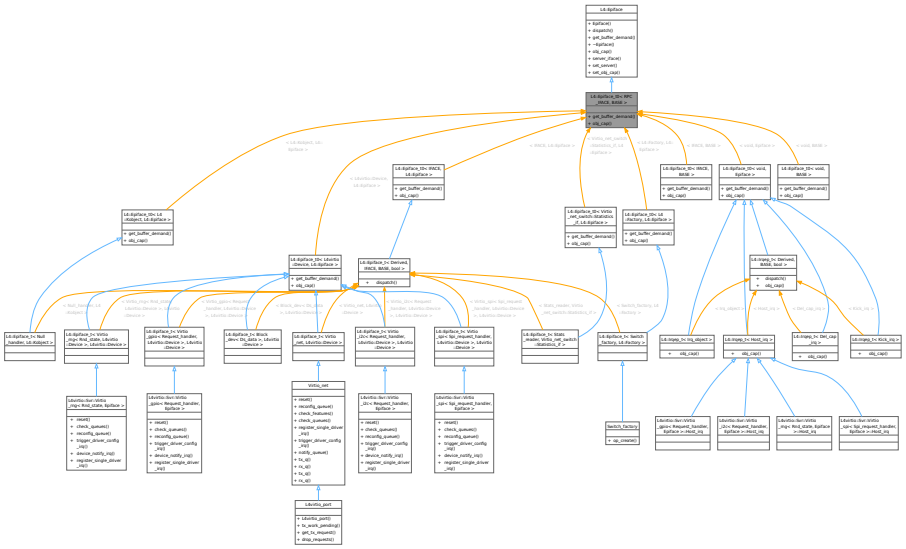
This function must be implemented by application specific server objects.
Implements L4::Epiface.
Definition at line 667 of file ipc_epiface.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_epiface

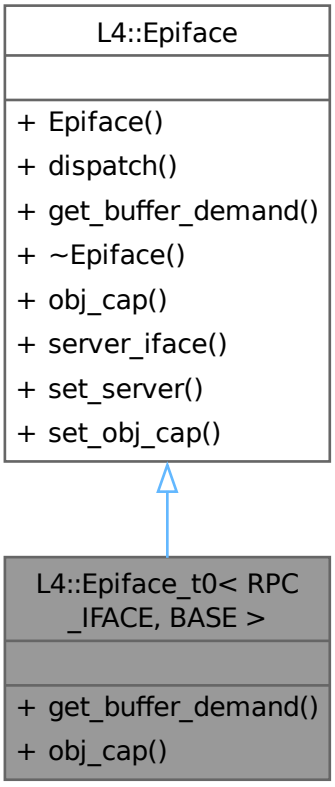
15.91 L4::Epiface_t0< RPC_IFACE, BASE > Struct Template Reference

Epiface mixin for generic Kobject-based interfaces.
`#include <ipc_epiface>`

Inheritance diagram for L4::Epiface_t0< RPC_IFACE, BASE >:



Collaboration diagram for L4::Epiface_t0< RPC_IFACE, BASE >:



Public Types

- using **Interface** = RPC_IFACE

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Member Functions

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< RPC_IFACE > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual l4_msgtag_t dispatch (l4_msgtag_t tag, unsigned rights, l4_utcb_t *utcb)=0

  The abstract handler for client requests to the object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

15.91.1 Detailed Description

template<typename RPC_IFACE, typename BASE = Epiface>
struct L4::Epiface_t0< RPC_IFACE, BASE >

Epiface mixin for generic Kobject-based interfaces.

Template Parameters

RPC_IFACE	Data type of the IPC interface definition.
BASE	Base Epiface class.

Definition at line 374 of file ipc_epiface.

15.91.2 Member Function Documentation

15.91.2.1 obj_cap()

```
template<typename RPC_IFACE, typename BASE = Epiface>
Cap< RPC_IFACE > L4::Epiface_t0< RPC_IFACE, BASE >::obj_cap () const  [inline]
```

Get the (typed) capability to this object.

Returns

Capability for the kernel object behind the server.

Definition at line 387 of file ipc_epiface.
References L4::cap_cast().
Here is the call graph for this function:

The documentation for this struct was generated from the following file:

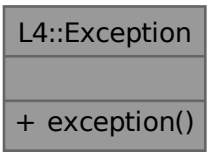
15.92 L4::Exception Class Reference

Exception interface.
`#include <exception>`
Collaboration diagram for L4::Exception:



Public Member Functions

- l4_msgtag_t exception (L4::Ipc::In_out< l4_exc_regs_t * > regs, L4::Ipc::Rcv_fpage rwin, L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)

  Exception call.

15.92.1 Detailed Description

Exception interface.

This class defines the interface for handling exception IPC. When an exception occurs during program execution, for example due to a division by zero, the kernel will synthesise an exception IPC and send it to the thread's exception handler, who can then handle it.
The exception handler is set with the L4::Thread::control interface.
Definition at line 31 of file exception.

15.92.2 Member Function Documentation

15.92.2.1 exception()

```
l4_msgtag_t L4::Exception::exception (
             L4::Ipc::In_out< l4_exc_regs_t * > regs,
             L4::Ipc::Rcv_fpage rwin,
             L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)
```

Exception call.

Parameters

	regs	Register state of the faulting thread.
	rwin	Receive window in the address space.
out	*fp*	Optional flexpage to resolve the exception.

Returns

Message tag containing error code.

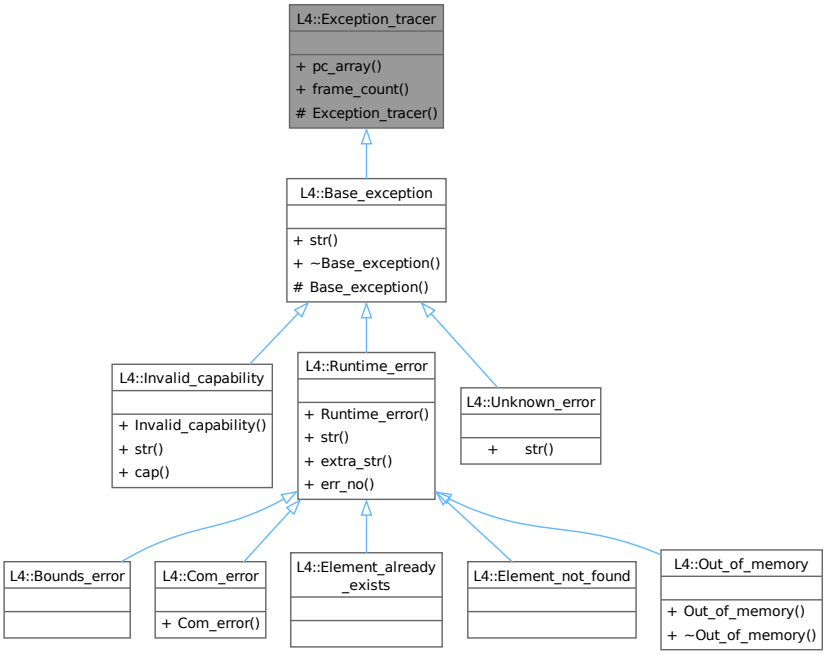
The documentation for this class was generated from the following file:

- l4/sys/exception

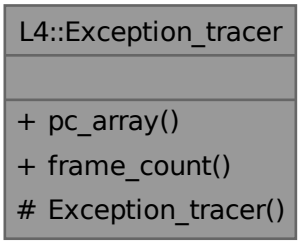
15.93 L4::Exception_tracer Class Reference

Back-trace support for exceptions.
`#include <l4/cxx/exceptions>`

Inheritance diagram for L4::Exception_tracer:



Collaboration diagram for L4::Exception_tracer:



Public Member Functions

- void const ∗const ∗ **pc_array** () const noexcept

  Get the array containing the call trace.
- int **frame_count** () const noexcept

  Get the number of entries that are valid in the call trace.

Protected Member Functions

- **Exception_tracer** () noexcept

  Create a back trace.

15.93.1 Detailed Description

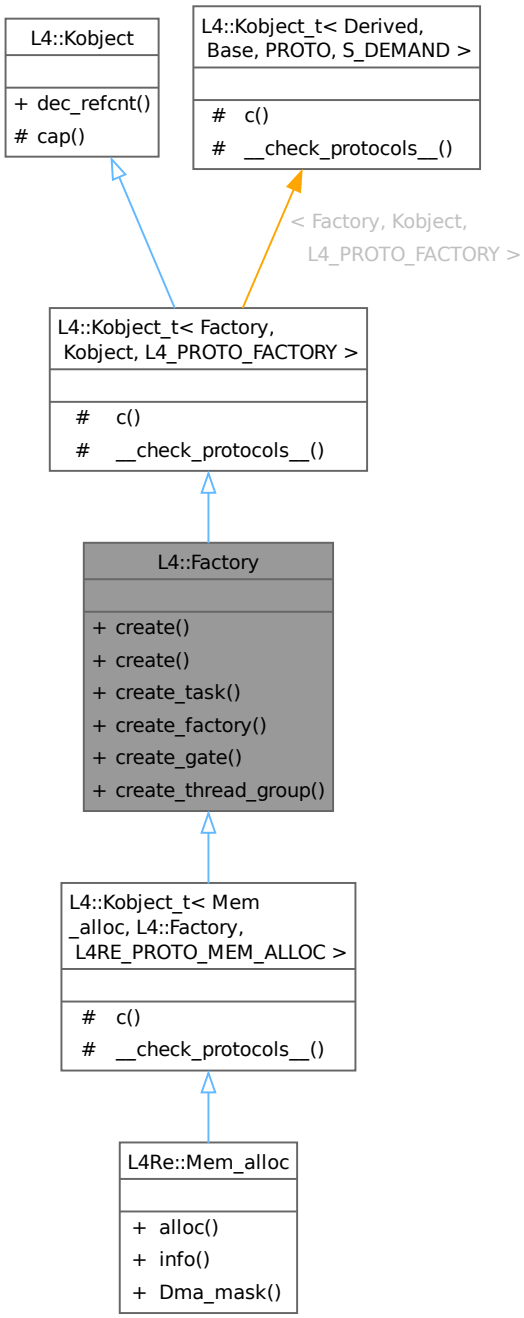
Back-trace support for exceptions.
This class holds an array of at most L4_CXX_EXCEPTION_BACKTRACE instruction pointers containing the call trace at the instant when an exception was thrown.
Definition at line 51 of file exceptions.
The documentation for this class was generated from the following file:

- l4/cxx/exceptions

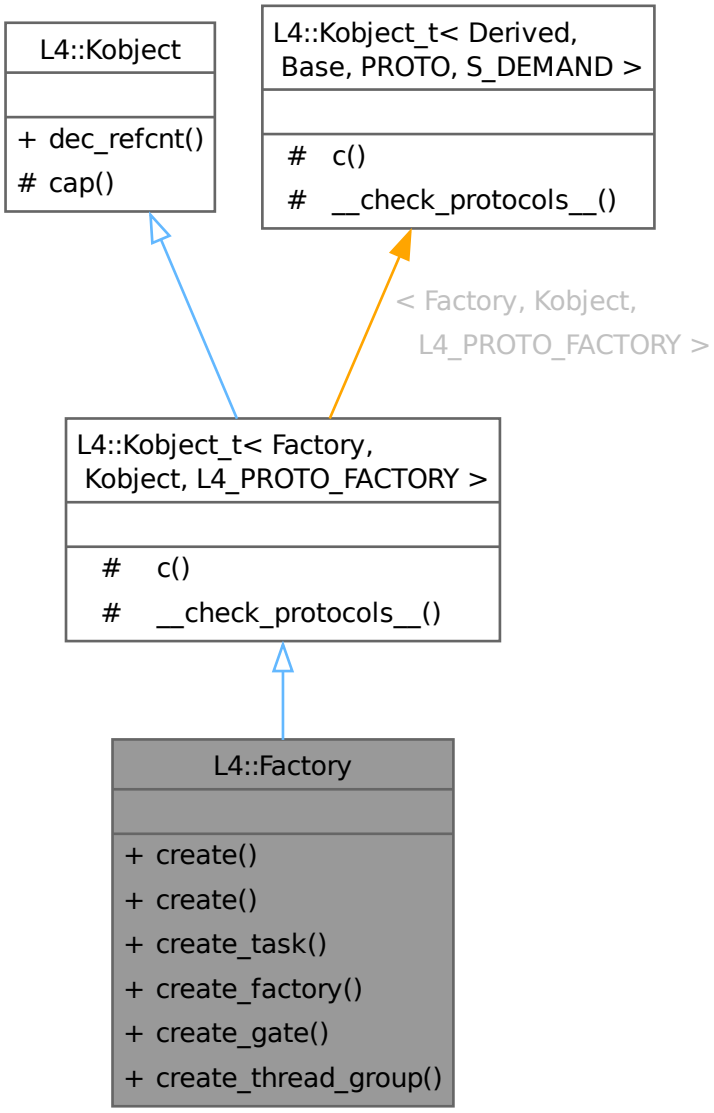
15.94 L4::Factory Class Reference

C++ Factory interface, see Factory for the C interface.
`#include <factory>`

Inheritance diagram for L4::Factory:



Collaboration diagram for L4::Factory:



Data Structures

- struct Nil

  Special type to add a void argument into the factory create stream.
- struct Lstr

  Special type to add a pascal string into the factory create stream.
- class S

  Stream class for the create() argument stream.

Public Member Functions

- S create (Cap< void > target, long obj, l4_utcb_t *utcb=l4_utcb()) noexcept

Generic create call to the factory.

- template<typename OBJ>
  S create (Cap< OBJ > target, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create call for typed capabilities.
- l4_msgtag_t create_task (Cap< Task > const &target_cap, l4_fpage_t *utcb_area, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new task.
- l4_msgtag_t create_factory (Cap< Factory > const &target_cap, unsigned long limit, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new factory.
- l4_msgtag_t create_gate (Cap< void > const &target_cap, Cap< Snd_destination > const &snd_dst_cap, l4_umword_t label, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new IPC gate, optionally bound to a send destination (a thread or thread group).
- l4_msgtag_t create_thread_group (Cap< Thread_group > const &target_cap, unsigned policy, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new thread group.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Factory, Kobject, L4_PROTO_FACTORY >

- typedef Factory **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Factory > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Factory, Kobject, L4_PROTO_FACTORY >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Factory, Kobject, L4_PROTO_FACTORY >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.94.1 Detailed Description

C++ Factory interface, see Factory for the C interface.
Factories provide an interface to create objects which are accessed via capabilities.
For additional information about which objects can be created via this interface, see server-specific information in Kernel Factory and L4Re Servers.

Include File

```
#include <l4/sys/factory>
```

For the C interface refer to Factory.
Definition at line 38 of file factory.

15.94.2 Member Function Documentation

15.94.2.1 create() [1/2]

```
template<typename OBJ>
S L4::Factory::create (
             Cap< OBJ > target,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Create call for typed capabilities.

Template Parameters

OBJ	Capability type of the object to be created.

Parameters

out	*target*	Capability of type OBJ.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

A create stream that allows additional arguments to be passed to the `create()` call via the left-shift (<<) operator (see S::operator <<).

This method does not directly invoke the factory. The factory is invoked when the create stream returned by this method is converted to an l4_msgtag_t (see S::operator l4_msgtag_t()), or otherwise when the stream goes out of scope (not recommended; see S::~S()).

Precondition

The invoked Factory capability must have the permission L4_CAP_FPAGE_S, otherwise the later factory IPC will fail with L4_EPERM (see S::operator l4_msgtag_t()).

Note

The create stream uses the UTCB to store parameters for the service call. During the lifetime of a create stream or, until it is converted to an l4_msgtag_t, other UTCB-using operations must not be used.

Usage:

```
L4::Cap<L4Re::Dataspace> ds = L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>();
factory->create(ds) << l4_mword_t(size_in_bytes);
```

Definition at line 329 of file factory.
References L4::Kobject::cap().

Here is the call graph for this function:

15.94.2.2 create() [2/2]

```
S L4::Factory::create (
            Cap< void > target,
            long obj,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Generic create call to the factory.

Parameters

out	*target*	Capability slot for the new object. The caller must allocate the capability slot. The kernel stores the new object's capability into this slot.
	obj	The protocol ID that specifies which kind of object shall be created.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

A create stream that allows additional arguments to be passed to the `create()` call via the left-shift (<<) operator (see S::operator <<).

This method does not directly invoke the factory. The factory is invoked when the create stream returned by this method is converted to an l4_msgtag_t (see S::operator l4_msgtag_t()), or otherwise when the stream goes out of scope (not recommended; see S::~S()).

Precondition

The invoked Factory capability must have the permission L4_CAP_FPAGE_S, otherwise the later factory IPC will fail with L4_EPERM (see S::operator l4_msgtag_t()).

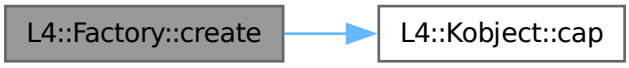
Note

The create stream uses the UTCB to store parameters for the service call. During the lifetime of a create stream or, until it is converted to an l4_msgtag_t, other UTCB-using operations must not be used.

See also

create(Cap<OBJ>, l4_utcb_t *)

Definition at line 292 of file factory.
References L4::Kobject::cap().
Here is the call graph for this function:



15.94.2.3 create_factory()

```
l4_msgtag_t L4::Factory::create_factory (
            Cap< Factory > const & target_cap,
            unsigned long limit,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Create a new factory.

Parameters

out	*target_cap*	The kernel stores the new factory's capability into this slot.
	limit	Limit for the new factory in bytes.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

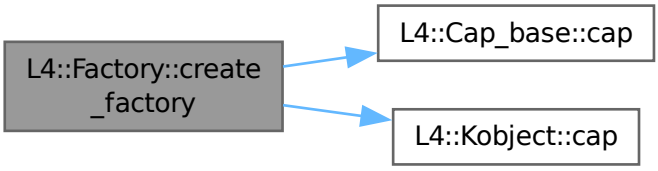
The invoked Factory capability must have the permission L4_CAP_FPAGE_S.

Note

In addition to memory needed for internal data structures, the `limit` (quota) of the new factory is counted towards the quota of the creating factory. The `limit` must be within `1 ≤ limit ≤ 2^(8 * sizeof(l4_umword_t) - 1) - 2` otherwise the behavior is undefined.

This method is only guaranteed to work with the Kernel Factory. For other services, use the generic create() method and consult the service documentation for information on the arguments that need to be passed to the create stream.

Definition at line 404 of file factory.
References L4::Cap_base::cap(), and L4::Kobject::cap().
Here is the call graph for this function:



15.94.2.4 create_gate()

```
l4_msgtag_t L4::Factory::create_gate (
            Cap< void > const & target_cap,
            Cap< Snd_destination > const & snd_dst_cap,
            l4_umword_t label,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Create a new IPC gate, optionally bound to a send destination (a thread or thread group).

Parameters

out	*target_cap*	The kernel stores the new IPC gate's capability into this slot.
	snd_dst_cap	Optional capability index of a thread or thread group to bind the gate to. Use L4_INVALID_CAP to create an unbound IPC gate.
	label	Optional label of the gate (precisely used if snd_dst_cap is valid). If snd_dst_cap is valid, label must be present.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	No error occurred.
-L4_ENOMEM	Out-of-memory during allocation of the Ipc_gate object.
-L4_EINVAL	snd_dst_cap is void or points to something that is not a thread or thread group.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

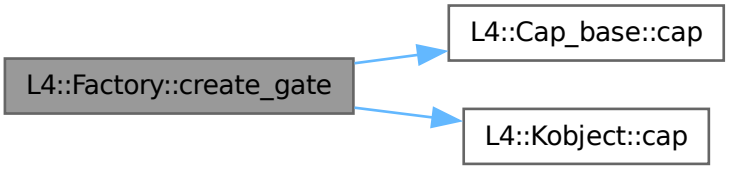
The invoked Factory capability must have the permission L4_CAP_FPAGE_S. Also snd_dst_cap (if valid) must have the permission L4_CAP_FPAGE_S.

An unbound IPC gate can be bound to a thread or thread group using L4::Ipc_gate::bind_thread() or bind_snd_↩ destination().

See also

L4::Ipc_gate

Definition at line 440 of file factory.
References L4::Cap_base::cap(), and L4::Kobject::cap().
Here is the call graph for this function:



15.94.2.5 create_task()

```
l4_msgtag_t L4::Factory::create_task (
            Cap< Task > const & target_cap,
            l4_fpage_t * utcb_area,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Create a new task.

Parameters

out	*target_cap*	The kernel stores the new task's capability into this slot.
in,out	*utcb_area*	Flexpage that describes an area in the address space of the new task, where the kernel should map the kernel-allocated kernel-user memory to. The kernel uses the kernel-user memory to store UTCBs and vCPU state-save-areas of the new task.

On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.

<0	Error code.

Precondition

The invoked Factory capability must have the permission L4_CAP_FPAGE_S.

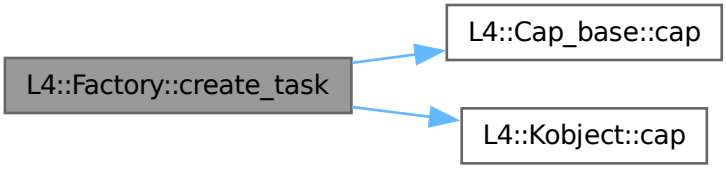
Note

The size of the UTCB area specifies indirectly the number of UTCBs available for this task. Refer to L4::Task::add_ku_mem for adding more of this type of memory.

See also

L4::Task

Definition at line 370 of file factory.
References L4::Cap_base::cap(), and L4::Kobject::cap().
Here is the call graph for this function:



15.94.2.6 create_thread_group()

```
l4_msgtag_t L4::Factory::create_thread_group (
            Cap< Thread_group > const & target_cap,
            unsigned policy,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Create a new thread group.
An IPC endpoint can be bound to a thread group. When a message arrives at the IPC endpoint, a specific thread of the thread group is selected to actually receive the message. A thread group is a send destination for an IPC endpoint.

Parameters

out	*target_cap*	The kernel stores the new thread group's capability into this slot.
	policy	Policy parameter for the thread group. See L4_thread_group_policy for a list of supported values.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	No error occurred.
-L4_ENOMEM	Out-of-memory during allocation of the Thread_group object.
-L4_EINVAL	Invalid policy parameter.
-L4_EPERM	The factory instance requires L4_CAP_FPAGE_S rights on the invoked capability and L4_CAP_FPAGE_S is not present.

Definition at line 475 of file factory.
References L4::Cap_base::cap(), and L4::Kobject::cap().

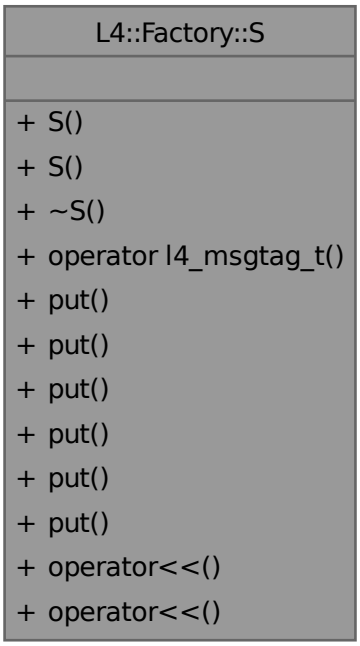
15.97 L4::Factory::S Class Reference

Stream class for the create() argument stream.

`#include <factory>`

Collaboration diagram for L4::Factory::S:



Public Member Functions

- S (S &&o) noexcept

  Move constructor.
- S (l4_cap_idx_t f, long obj, L4::Cap< void > target, l4_utcb_t *utcb) noexcept

  Create a stream for a specific create() call.
- ~S () noexcept

  Commit the create() operation if not already done explicitly via operator l4_msgtag_t().
- operator l4_msgtag_t () noexcept

  Explicitly commits the operation and returns the result.
- void put (l4_mword_t i) noexcept

  Put a single l4_mword_t as next argument.
- void put (l4_umword_t i) noexcept

  Put a single l4_umword_t as next argument.
- void put (char const *s) &noexcept

  Add a zero-terminated string as next argument.
- void put (Lstr const &s) &noexcept

  Add a pascal string as next argument.
- void **put** (Nil) &noexcept

  Add an empty argument.
- void put (l4_fpage_t d) &noexcept

Add a flexpage as next argument.

- template<typename T>
  S & operator<< (T const &d) &noexcept

  Add next argument.
- template<typename T>
  S && operator<< (T const &d) &&noexcept

  Add next argument.

15.97.1 Detailed Description

Stream class for the create() argument stream.
This stream allows a variable number of arguments to be added to a create() call.
Definition at line 79 of file factory.

15.97.2 Constructor & Destructor Documentation

15.97.2.1 S() [1/2]

```
L4::Factory::S::S (
            S && o)  [inline], [noexcept]
```

Move constructor.

Parameters

o	Instance of S to move.

Definition at line 98 of file factory.

15.97.2.2 S() [2/2]

```
L4::Factory::S::S (
            l4_cap_idx_t f,
            long obj,
            L4::Cap< void > target,
            l4_utcb_t * utcb)  [inline], [noexcept]
```

Create a stream for a specific create() call.

Parameters

	f	The capability for the factory object (L4::Factory).
	obj	The protocol ID to describe the type of the object that shall be created.
out	*target*	The capability slot for the new object. The caller must allocate the capability slot. The kernel stores the new object's capability into this slot.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Precondition

The capability `f` must have the permission L4_CAP_FPAGE_S, otherwise the later factory IPC will fail with L4_EPERM.

Definition at line 125 of file factory.

15.97.2.3 ~S()

```
L4::Factory::S::~S ()  [inline], [noexcept]
```

Commit the create() operation if not already done explicitly via operator l4_msgtag_t().

Warning

If the commit is deferred until destruction, potential errors are silently ignored. It is therefore recommended to commit explicitly via operator l4_msgtag_t() and check the return value.

Definition at line 139 of file factory.

15.97.3 Member Function Documentation

15.97.3.1 operator l4_msgtag_t()

```
L4::Factory::S::operator l4_msgtag_t () [inline], [noexcept]
```

Explicitly commits the operation and returns the result.

Returns

The result of the create() operation.

Return values

L4_EOK	No error occurred.
-L4_EPERM	Insufficient permissions; see precondition.
<0	Error code.

Precondition

The invoked Factory capability must have the permission L4_CAP_FPAGE_S.

Definition at line 157 of file factory.

15.97.3.2 operator<<() [1/2]

```
template<typename T>
S && L4::Factory::S::operator<< (
             T const & d) &&  [inline], [noexcept]
```

Add next argument.

Template Parameters

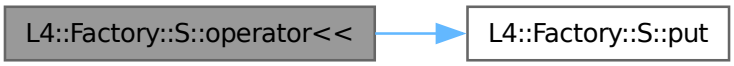
T	The argument type. Compilation succeeds only if it is a possible argument type for `S::put()`.

Parameters

d	The value to add as next argument.

Definition at line 252 of file factory.
References put().

Here is the call graph for this function:



15.97.3.3 operator<<() [2/2]

```
template<typename T>
S & L4::Factory::S::operator<< (
            T const & d) &  [inline], [noexcept]
```

Add next argument.

Template Parameters

T	The argument type. Compilation succeeds only if it is a possible argument type for `S::put()`.

Parameters

d	The value to add as next argument.

Definition at line 237 of file factory.
References put().
Here is the call graph for this function:

15.97.3.4 put() [1/5]

```
void L4::Factory::S::put (
            char const * s) &  [inline], [noexcept]
```

Add a zero-terminated string as next argument.

Parameters

s	The string to add as next argument.

The string will be added with the zero-terminator.
Definition at line 191 of file factory.

15.97.3.5 put() [2/5]

```
void L4::Factory::S::put (
            l4_fpage_t d) &  [inline], [noexcept]
```

Add a flexpage as next argument.

Parameters

d	The flexpage to add (there will be no map operation).

Definition at line 223 of file factory.

15.97.3.6 put() [3/5]

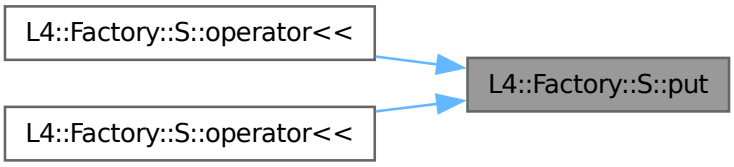
```
void L4::Factory::S::put (
            l4_mword_t i)  [inline], [noexcept]
```

Put a single l4_mword_t as next argument.

Parameters

i	The value to add as next argument.

Definition at line 169 of file factory.
Referenced by operator<<(), and operator<<().
Here is the caller graph for this function:



15.97.3.7 put() [4/5]

```
void L4::Factory::S::put (
            l4_umword_t i)  [inline], [noexcept]
```

Put a single l4_umword_t as next argument.

Parameters

i	The value to add as next argument.

Definition at line 179 of file factory.

15.97.3.8 put() [5/5]

```
void L4::Factory::S::put (
            Lstr const & s) &  [inline], [noexcept]
```

Add a pascal string as next argument.

Parameters

s	The string to add as next argument.

The string will be added with the exact length given. It is the responsibility of the caller to make sure that the string is zero- terminated when that is required by the server.
Definition at line 205 of file factory.

Public Member Functions

- l4_msgtag_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

Remove binding of an interrupt line from the interrupt controller object.

- l4_msgtag_t info (l4_icu_info_t *info, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get information about the ICU features.
- l4_msgtag_t msi_info (l4_umword_t irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info)

  Get MSI info about IRQ.
- l4_msgtag_t mask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Mask an IRQ line.
- l4_msgtag_t set_mode (unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb=l4_utcb()) noexcept

  Set interrupt mode.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- typedef Icu **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Icu > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Irq_eoi::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Static Protected Member Functions inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.98.1 Detailed Description

C++ Icu interface, see Interrupt controller for the C interface.

Note

"ICU" is short for "interrupt control unit".

This class defines the interface for interrupt controllers. It defines functions for binding L4::Irq objects to interrupt lines and other interrupt sources, as well as functions for masking and unmasking of interrupts.
To setup an interrupt line the following steps are required:

1. set_mode() (optional if interrupt has a default mode)
2. L4::Rcv_endpoint::bind_thread() or L4::Rcv_endpoint::bind_snd_destination() to attach the L4::Irq object to a send destination.

3. bind()
4. unmask() to receive the first interrupt

For certain interrupt sources only some of these steps are necessary and supported, see L4::Scheduler and L4::Vcon.
At most one L4::Irq object can be bound to a certain interrupt source and a certain L4::Irq object can be bound to at most one interrupt source.

Include File

```
#include <l4/sys/icu>
```

Definition at line 250 of file irq.

15.98.2 Member Function Documentation

15.98.2.1 bind()

```
l4_msgtag_t L4::Icu::bind (
            unsigned irqnum,
            L4::Cap< Triggerable > irq,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

Parameters

irqnum	IRQ line at the ICU.
irq	IRQ object for the given IRQ line to bind to this ICU.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. The caller should check the return value using l4_error() to check for errors and to identify the correct method for unmasking the interrupt. Return values < 0 indicate an error. A return value of 0 means a direct unmask via the IRQ object using L4::Irq::unmask. A return value of 1 means that the interrupt has to be unmasked via the ICU using L4::Icu::unmask.

Return values

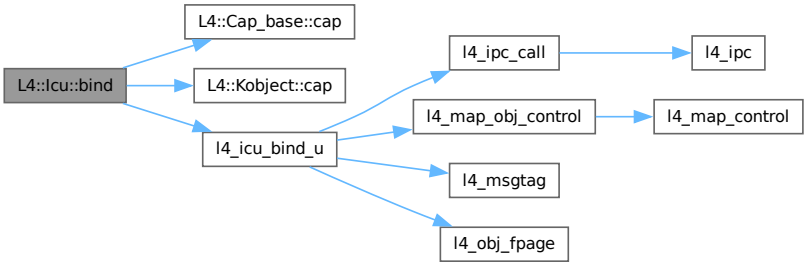
-L4_EINVAL	`irq` is bound to an interrupt source.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_W.

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different L4::Irq object, only the unbinding happens. An L4::Irq object that is bound to an interrupt source will get unbound if the L4::Irq object is deleted.
Definition at line 310 of file irq.
References L4::Cap_base::cap(), L4::Kobject::cap(), and l4_icu_bind_u().

Here is the call graph for this function:



15.98.2.2 info()

```
l4_msgtag_t L4::Icu::info (
            l4_icu_info_t * info,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Get information about the ICU features.

Parameters

out	*info*	Info structure to be filled with information.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Definition at line 345 of file irq.
References L4::Kobject::cap(), info(), and l4_icu_info_u().
Referenced by L4Re::Event::get_axis_info(), L4Re::Event::get_stream_info(), L4Re::Event::get_stream_info_for_id(), and info().

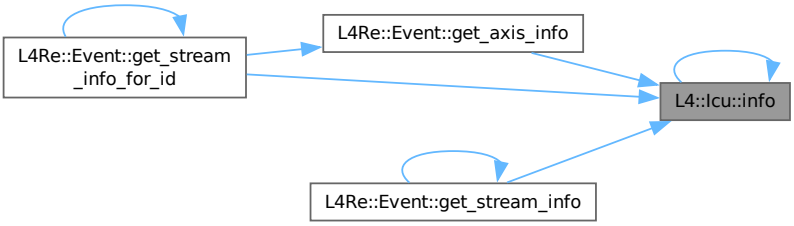
Here is the caller graph for this function:



15.98.2.3 mask()

```
l4_msgtag_t L4::Icu::mask (
            unsigned irqnum,
            l4_umword_t * label = 0,
            l4_timeout_t to = L4_IPC_NEVER,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Mask an IRQ line.

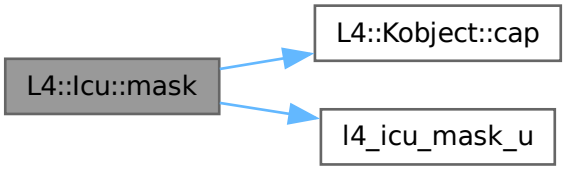
Parameters

irqnum	IRQ line at the ICU.
label	If NULL, this function is a send-only message to the ICU. If not NULL, this function will enter an open wait after sending the mask message and the received label is returned here.
to	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL `label` only.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. If `label` is NULL, this function performs an IPC send-only operation and there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. In this case use l4_ipc_error() to check for errors and **do not** use l4_error().

Definition at line 393 of file irq.
References L4::Kobject::cap(), l4_icu_mask_u(), and L4_IPC_NEVER.
Here is the call graph for this function:



15.98.2.4 msi_info()

```
l4_msgtag_t L4::Icu::msi_info (
            l4_umword_t irqnum,
            l4_uint64_t source,
            l4_icu_msi_info_t * msi_info)
```

Get MSI info about IRQ.

Parameters

	irqnum	IRQ line at the ICU.
	source	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	*msi_info*	A l4_icu_msi_info_t structure receiving the address and the data value to trigger this MSI.

Returns

Syscall return tag

References msi_info().
Referenced by msi_info().
Here is the call graph for this function:

Here is the caller graph for this function:

15.98.2.5 set_mode()

```
l4_msgtag_t L4::Icu::set_mode (
            unsigned irqnum,
            l4_umword_t mode,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Set interrupt mode.

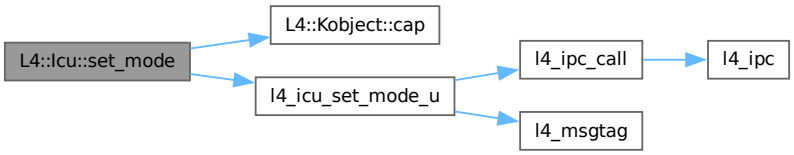
Parameters

irqnum	IRQ line at the ICU.
mode	Mode, see L4_irq_mode.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Definition at line 421 of file irq.
References L4::Kobject::cap(), and l4_icu_set_mode_u().
Here is the call graph for this function:



15.98.2.6 unbind()

```
l4_msgtag_t L4::Icu::unbind (
            unsigned irqnum,
            L4::Cap< Triggerable > irq,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Remove binding of an interrupt line from the interrupt controller object.

Parameters

irqnum	IRQ line at the ICU.
irq	IRQ object to remove from the ICU.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Definition at line 328 of file irq.
References L4::Cap_base::cap(), L4::Kobject::cap(), and l4_icu_unbind_u().
Here is the call graph for this function:

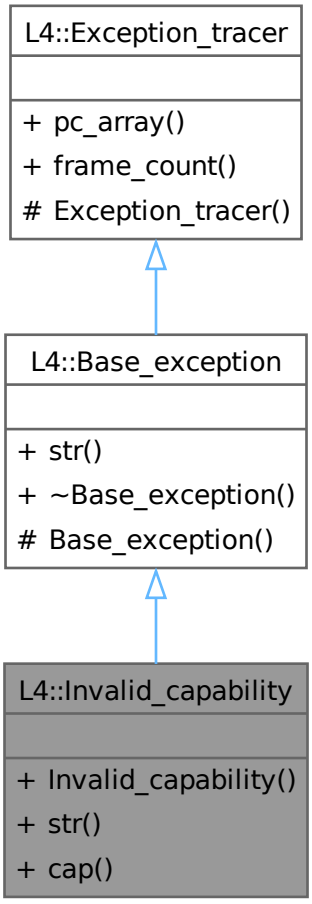
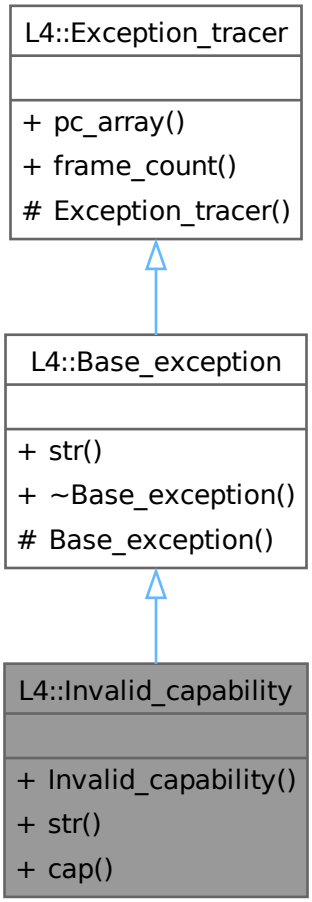
15.100 L4::Invalid_capability Class Reference

Indicates that an invalid object was invoked.
`#include <l4/cxx/exceptions>`

Inheritance diagram for L4::Invalid_capability:



Collaboration diagram for L4::Invalid_capability:



Public Member Functions

- Invalid_capability (Cap< void > const &o) noexcept

  Create an Invalid_object exception for the Object o.
- char const * **str** () const noexcept override

  Return a human readable string for the exception.
- Cap< void > const & cap () const noexcept

  Get the object that caused the error.

Public Member Functions inherited from L4::Base_exception

- virtual ~**Base_exception** () noexcept

  Destruction.

Public Member Functions inherited from L4::Exception_tracer

- void const *const * **pc_array** () const noexcept

  Get the array containing the call trace.

- int **frame_count** () const noexcept

  Get the number of entries that are valid in the call trace.

Additional Inherited Members

Protected Member Functions inherited from L4::Base_exception

- **Base_exception** () noexcept

  Create a base exception.

Protected Member Functions inherited from L4::Exception_tracer

- **Exception_tracer** () noexcept

  Create a back trace.

15.100.1 Detailed Description

Indicates that an invalid object was invoked.
An Object is invalid if it has L4_INVALID_ID as server L4 UID, or if the server does not know the object ID.
Definition at line 234 of file exceptions.

15.100.2 Constructor & Destructor Documentation

15.100.2.1 Invalid_capability()

```
L4::Invalid_capability::Invalid_capability (
            Cap< void > const & o)  [inline], [explicit], [noexcept]
```

Create an Invalid_object exception for the Object o.

Parameters

o	The object that caused the server side error.

Definition at line 244 of file exceptions.

15.100.3 Member Function Documentation

15.100.3.1 cap()

```
Cap< void > const & L4::Invalid_capability::cap () const  [inline], [noexcept]
```

Get the object that caused the error.

Returns

The object that caused the error on invocation.

Definition at line 253 of file exceptions.

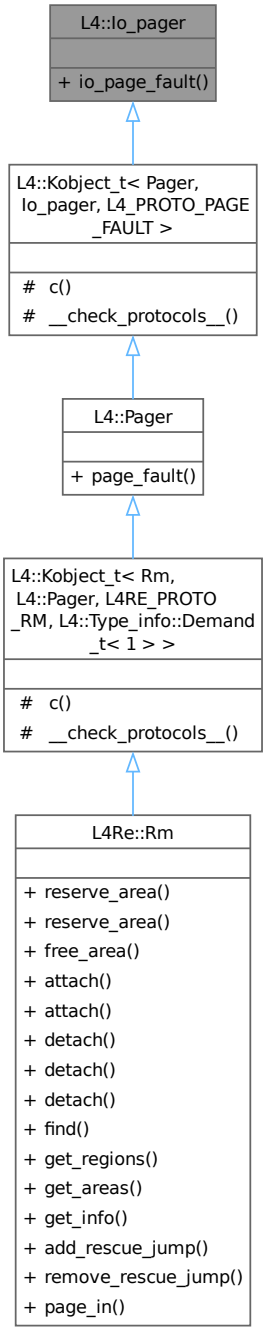
15.101 L4::Io_pager Class Reference

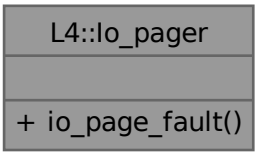
Io_pager interface.

```
#include <pager>
```

Inheritance diagram for L4::Io_pager:



Collaboration diagram for L4::Io_pager:



Public Member Functions

- l4_msgtag_t io_page_fault (l4_fpage_t io_pfa, l4_umword_t pc, L4::Ipc::Rcv_fpage rwin, L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)

  IO page fault protocol message.

15.101.1 Detailed Description

Io_pager interface.

Note

This interface is x86 specific.

This class defines the interface for handling IO page faults. IO page faults happen when a thread tries to access an IO port that it does not currently have access to.
Depending on the microkernel's implementation, IO page faults can be handled in two ways.
If the microkernel does not support IO page faults, this IO pagefault interface is not used. Instead, the microkernel sends an exception IPC to the thread's exception handler (L4::Exception), indicating a GP (exception number 13). The exception handler must consult the faulting instruction to determine the cause of the exception. This is the default in the Fiasco microkernel.
In contrast, if the microkernel supports IO page faults, the microkernel will generate an IO page fault message and send it to the thread's page fault handler (pager). The page fault handler can implement this interface to handle the IO page faults.

Note

A program may use this mechanism to implement a lazy IO port access scheme.

The page fault and exception handlers are set with the L4::Thread::control interface.

Definition at line 51 of file pager.

15.101.2 Member Function Documentation

15.101.2.1 io_page_fault()

```
l4_msgtag_t L4::Io_pager::io_page_fault (
             l4_fpage_t io_pfa,
             l4_umword_t pc,
             L4::Ipc::Rcv_fpage rwin,
             L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)
```

IO page fault protocol message.

Parameters

	io_pfa	Flexpage describing the faulting IO-port.
	pc	Faulting program counter.
	rwin	The receive window for a flexpage mapping.
`out`	*fp*	Optional: flexpage descriptor to send to the task raising the page fault.

Returns

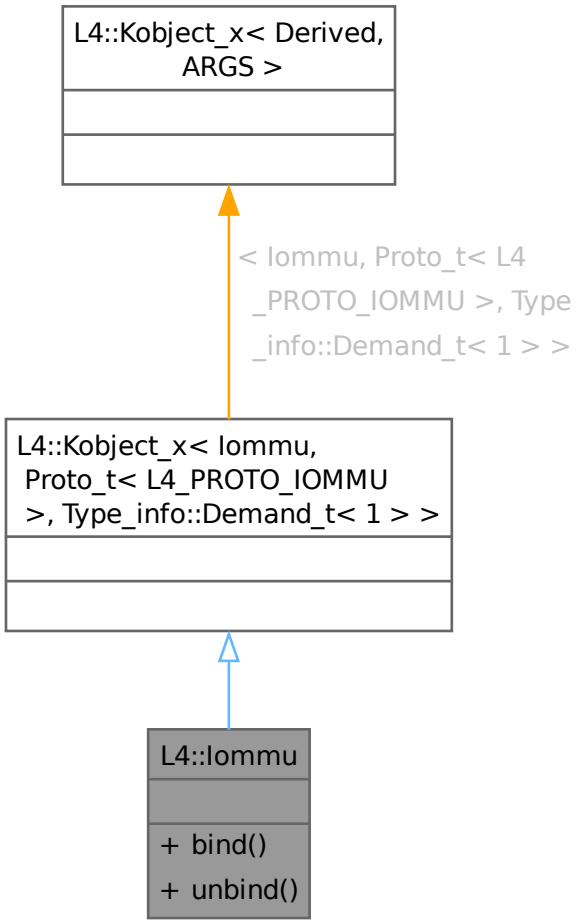
System call message tag; use l4_error() to check for errors.

IO-port fault messages are usually generated by the kernel and an IO-page-fault handler needs to be in place to handle such faults and generate a reply, potentially filling in `fp`.
The documentation for this class was generated from the following file:

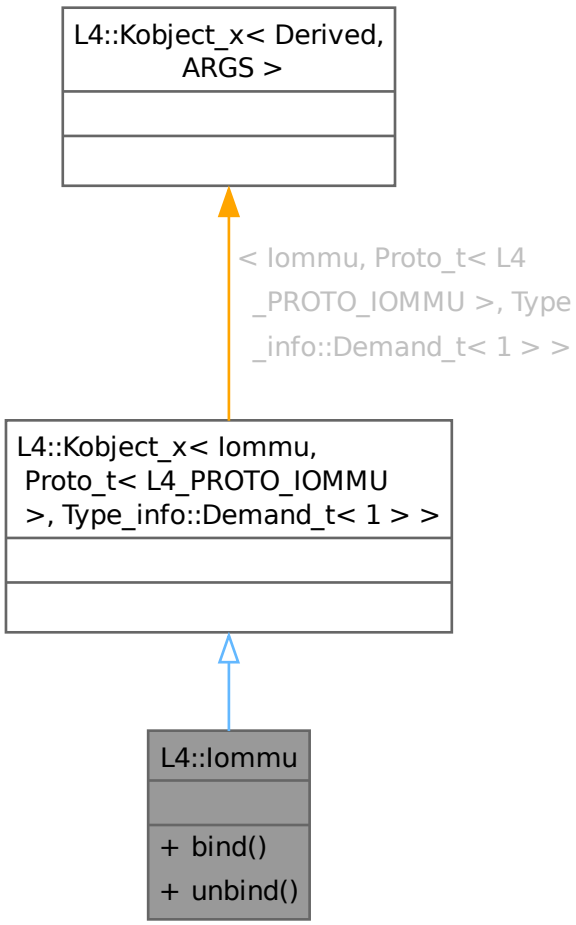
- l4/sys/pager

15.102 L4::Iommu Class Reference

Interface for IO-MMUs used for DMA remapping.
`#include <iommu>`
Inheritance diagram for L4::Iommu:



Collaboration diagram for L4::Iommu:



Public Member Functions

- l4_msgtag_t bind (l4_uint64_t src_id, Ipc::Cap< Task > dma_space, l4_uint64_t *min_addr, l4_uint64_t *max_addr)

  Associate `dma_space` with the set of device(s) specified by `src_id`.
- l4_msgtag_t unbind (l4_uint64_t src_id, Ipc::Cap< Task > dma_space)

  Remove the association of the given DMA address space from the device(s) specified by `src_id`.

15.102.1 Detailed Description

Interface for IO-MMUs used for DMA remapping.

Note

This interface is only present in the kernel if the kernel detected an IOMMU during boot.

This interface allows to associate a DMA address space with a platform dependent set of devices. The kernel automatically keeps the memory spaces of associated DMA spaces in sync with the respective page table structures in the IOMMU.
Definition at line 21 of file iommu.

15.102.2 Member Function Documentation

15.102.2.1 bind()

```
l4_msgtag_t L4::Iommu::bind (
             l4_uint64_t src_id,
             Ipc::Cap< Task > dma_space,
             l4_uint64_t * min_addr,
             l4_uint64_t * max_addr)
```

Associate `dma_space` with the set of device(s) specified by `src_id`.
Updates the respective page table structures in the IOMMU and keeps them in sync when memory is mapped to the `dma_space` or revoked from it.

Parameters

	src_id	Platform dependent source ID specifying the set of devices that shall use `dma_space` for DMA remapping.
	dma_space	The DMA space (L4::Task created with L4_PROTO_DMA_SPACE) providing the mappings that shall be used for the device(s).
`out`	*min_addr*	Minimum address supported by IOMMU for this device.
`out`	*max_addr*	Maximum address (inclusive) supported by IOMMU for this device.

Note

If an association for the source ID already exists, whether established through this interface or pre-configured by the kernel, it will be replaced.

15.102.2.2 unbind()

```
l4_msgtag_t L4::Iommu::unbind (
             l4_uint64_t src_id,
             Ipc::Cap< Task > dma_space)
```

Remove the association of the given DMA address space from the device(s) specified by `src_id`.
Clear the respective page table structures in the IOMMU.

Parameters

src_id	Platform dependent source ID specifying the set of devices that shall no longer use `dma_space` for DMA remapping.
dma_space	The DMA space formerly associated with bind().

References unbind().
Referenced by unbind().

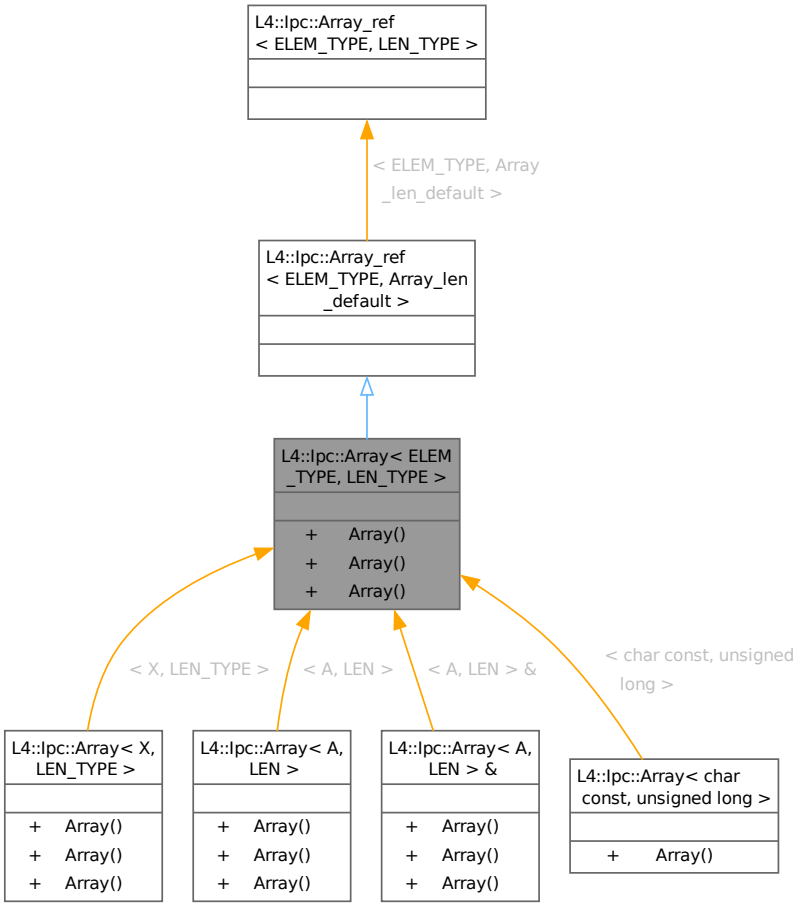
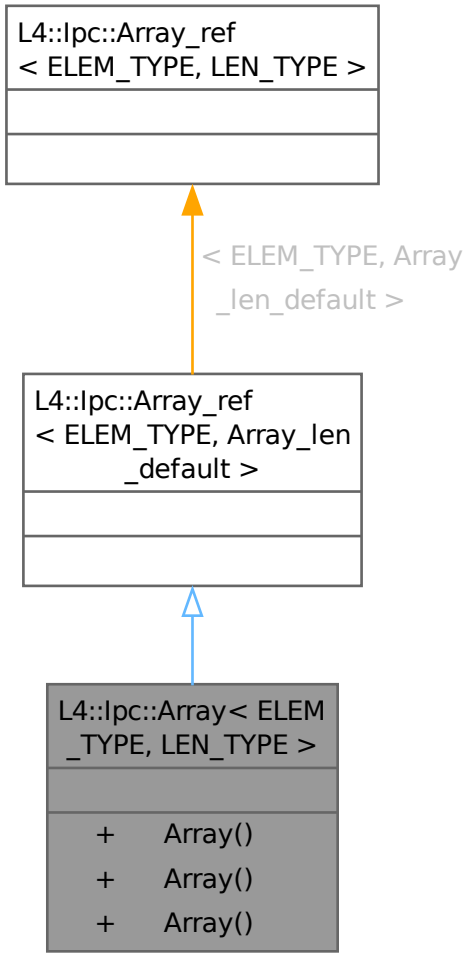
15.104 L4::Ipc::Array< ELEM_TYPE, LEN_TYPE > Struct Template Reference

Array data type for dynamically sized arrays in RPCs.
`#include <ipc_array>`

Inheritance diagram for L4::Ipc::Array< ELEM_TYPE, LEN_TYPE >:



Collaboration diagram for L4::Ipc::Array< ELEM_TYPE, LEN_TYPE >:



Public Member Functions

- **Array** ()

  Make array.
- **Array** (LEN_TYPE length, ELEM_TYPE *data)

  Make array from length and data pointer.
- **Array** (typename Non_const< ELEM_TYPE >::type const &other)

  Make a const array from a non-const array.

15.104.1 Detailed Description

template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default>
struct L4::Ipc::Array< ELEM_TYPE, LEN_TYPE >

Array data type for dynamically sized arrays in RPCs.

Template Parameters

ELEM_TYPE	The data type of an array element, should be 'const' when used as input.
LEN_TYPE	Data type used to store the number of elements in the array.

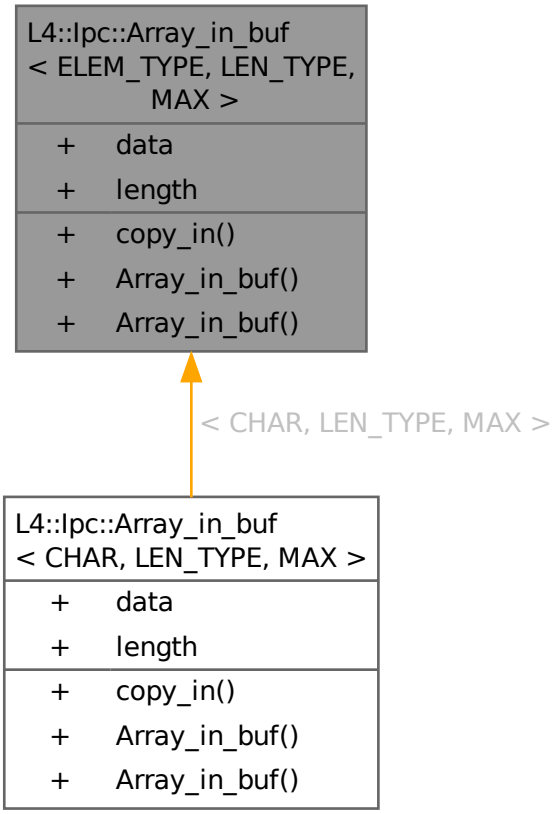
An Array generally encapsulates a data pointer and a length (number of elements). Array does *not* provide any storage for the data itself. The storage is either provided by a client-side caller or in the case of Array_ref is the message itself.
Arrays can be used as input or as output arguments, when used as input ELEM_TYPE should be qualified *const*, when used as output a reference to an array must be used and the ELEM_TYPE must *not* be qualified *const*. It is the caller's responsibility to provide an array buffer of sufficient length. If a message from the server is too large it will be silently truncated.
If backward compatibility with Ipc::Stream is required, then LEN_TYPE must be `unsigned long`.
Definition at line 81 of file ipc_array.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_array

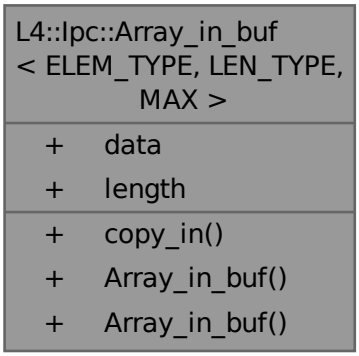
15.105 L4::Ipc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX > Struct Template Reference

Server-side copy in buffer for Array.
`#include <ipc_array>`

Inheritance diagram for L4::Ipc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >:



Collaboration diagram for L4::Ipc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >:



Public Member Functions

- void **copy_in** (const_array a)

  copy in data from a source array
- **Array_in_buf** (const_array a)

  Make Array_in_buf from a const array.
- **Array_in_buf** (array a)

  Make Array_in_buf from a non-const array.

Data Fields

- ELEM_TYPE **data** [MAX]

  The data elements.
- LEN_TYPE **length**

  The length of the array.

15.105.1 Detailed Description

template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default, LEN_TYPE MAX = (L4_UTCB_GENERIC_DATA_SIZE * sizeof(l4_umword_t)) / sizeof(ELEM_TYPE)>
struct L4::Ipc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >

Server-side copy in buffer for Array.

Template Parameters

ELEM_TYPE	Data type of an array element.
LEN_TYPE	Data type for the number of elements in the array.
MAX	The maximum number of elements in the buffer. If the actual message is longer than the buffer, it will be silently truncated.

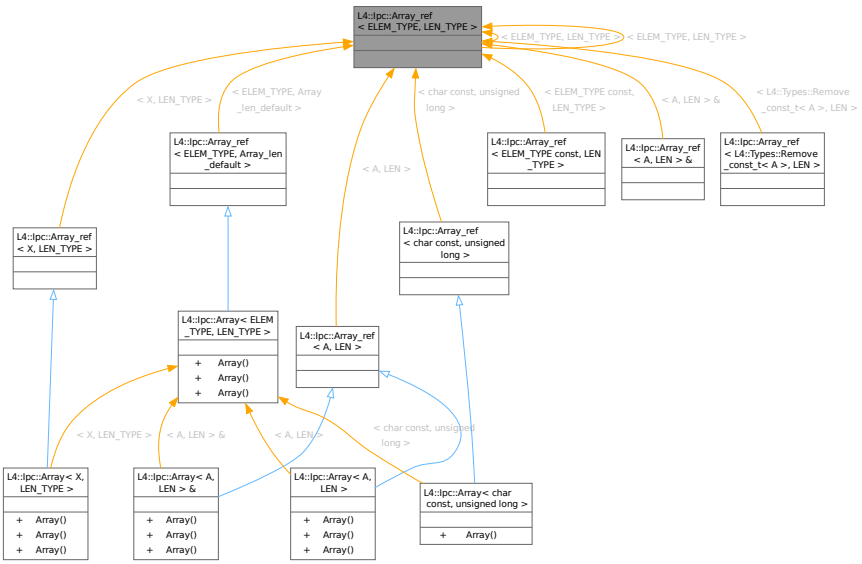
This type is assignment compatible to Array_ref<ELEM_TYPE, LEN_TYPE> and provides a transparent server-side copy-in mechanism for array parameters. The Array_in_buf provides the storage for the array data and receives a copy of the data passed to the server-function.
Definition at line 126 of file ipc_array.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_array

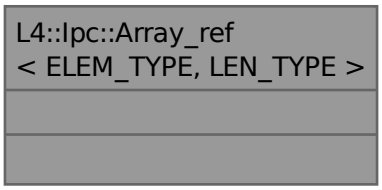
15.106 L4::Ipc::Array_ref< ELEM_TYPE, LEN_TYPE > Struct Template Reference

Array reference data type for arrays located in the message.
`#include <ipc_array>`

Inheritance diagram for L4::Ipc::Array_ref< ELEM_TYPE, LEN_TYPE >:



Collaboration diagram for L4::Ipc::Array_ref< ELEM_TYPE, LEN_TYPE >:



15.106.1 Detailed Description

template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default>
struct L4::Ipc::Array_ref< ELEM_TYPE, LEN_TYPE >

Array reference data type for arrays located in the message.

Note

Use Array for normal RPC interfaces, Array_ref is usually used as server-side argument, see Array.

Template Parameters

ELEM_TYPE	The data type of an array element, should be 'const' when used as input.
LEN_TYPE	Data type used to store the number of elements in the array.

Definition at line 28 of file ipc_array.
The documentation for this struct was generated from the following file:

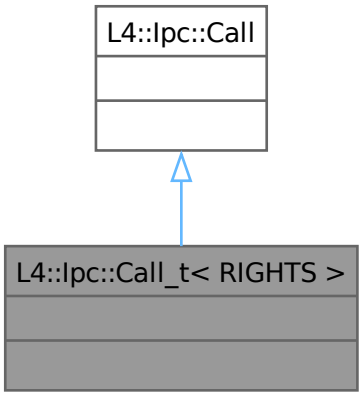
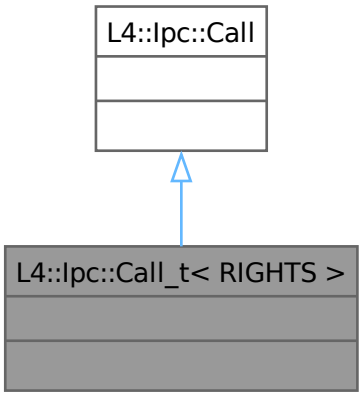
RPC attribute for an RPC call with required rights.
`#include <ipc_iface>`
Inheritance diagram for L4::Ipc::Call_t< RIGHTS >:



Collaboration diagram for L4::Ipc::Call_t< RIGHTS >:



15.108.1 Detailed Description

template<unsigned RIGHTS>
struct L4::Ipc::Call_t< RIGHTS >

RPC attribute for an RPC call with required rights.

Template Parameters

RIGHTS	The capability rights required for this call. L4_CAP_FPAGE_W and L4_CAP_FPAGE_S are checked within the server (and -L4_EPERM shall be returned if the caller has insufficient rights). L4_CAP_FPAGE_R is always on but might be specified for documentation purposes. Other rights cannot be used in this context, because they cannot be checked at the server side.

Examples:

```
L4_RPC(l4_ret_t, func, (unsigned value), L4::Ipc::Call_t<L4_CAP_FPAGE_RW>);
```

Definition at line 270 of file ipc_iface.

  Make a Cap from L4::Cap<T>, with minimal rights.
- template<typename O>
  Cap (L4::Cap< O > cap) noexcept

  Make IPC Cap from L4::Cap with conversion (and minimal rights).
- **Cap** () noexcept

  Make an invalid cap.
- Cap (L4::Cap< T > cap, unsigned char rights) noexcept

  Make a Cap from L4::Cap<T> with the given rights.
- Cap (L4::Cap< T > cap, unsigned char rights, Map_type map_type) noexcept

  Make a Cap from L4::Cap<T> with the given rights and map type.
- L4::Cap< T > **cap** () const noexcept

  Return the L4::Cap<T> of this Cap.
- unsigned **rights** () const noexcept

  Return the rights bits stored in this IPC cap.
- L4::Ipc::Snd_fpage **fpage** () const noexcept

Return the send flexpage for this Cap (see l4_fpage_t).

- bool **is_valid** () const noexcept

  Return true if this Cap is valid.

Static Public Member Functions

- static Cap from_ci (l4_cap_idx_t c) noexcept

  Create an IPC capability from a C capability index plus rights.

15.110.1 Detailed Description

template<typename T>
class L4::Ipc::Cap< T >

Capability type for RPC interfaces (see `L4::Cap<T>`).

Template Parameters

T	type of the interface referenced by the capability.

In contrast to `L4::Cap<T>` this type additionally stores a rights mask that shall be used when the capability is transferred to the receiver. This allows to apply restrictions to the transferred capability in the form of a subset of the rights possessed by the sender.

See also

L4::Ipc::make_cap()

Definition at line 724 of file ipc_types.

15.110.2 Member Enumeration Documentation

15.110.2.1 anonymous enum

```
template<typename T>
anonymous enum
```

Enumerator

Rights_mask	Mask for rights bits stored internally. (L4_FPAGE_RIGHTS_MASK | L4_FPAGE_C_NO_REF_CNT | L4_FPAGE_C_OBJ_RIGHTS).
Map_type_mask	Mask for map vs. grant operation.
Cap_mask	Mask for significant capability bits. (incl. the invalid bit to support invalid caps)

Definition at line 730 of file ipc_types.

15.110.2.2 Map_type

```
template<typename T>
enum L4::Ipc::Cap::Map_type
```

Kind of mapping.

Enumerator

Map	Map capability in RPC operation.

Grant	Grant capability in RPC operation. **See also** L4_MAP_ITEM_GRANT

Definition at line 752 of file ipc_types.

15.110.3 Constructor & Destructor Documentation

15.110.3.1 Cap() [1/2]

```
template<typename T>
L4::Ipc::Cap< T >::Cap (
            L4::Cap< T > cap,
            unsigned char rights)  [inline], [noexcept]
```

Make a Cap from L4::Cap<T> with the given rights.

Parameters

cap	Capability to be sent.
rights	Rights to be sent. Consists of L4_fpage_rights and Attributes and additional permissions for object send items.

Definition at line 790 of file ipc_types.

15.110.3.2 Cap() [2/2]

```
template<typename T>
L4::Ipc::Cap< T >::Cap (
            L4::Cap< T > cap,
            unsigned char rights,
            Map_type map_type)  [inline], [noexcept]
```

Make a Cap from L4::Cap<T> with the given rights and map type.

Parameters

cap	Capability to be sent.
rights	Rights to be sent. Consists of L4_fpage_rights and Attributes and additional permissions for object send items.
map_type	Indicate if capability is mapped or granted.

Definition at line 801 of file ipc_types.

15.110.4 Member Function Documentation

15.110.4.1 from_ci()

```
template<typename T>
Cap L4::Ipc::Cap< T >::from_ci (
            l4_cap_idx_t c)  [inline], [static], [noexcept]
```

Create an IPC capability from a C capability index plus rights.

Parameters

c	C capability index with the lowest 8 bits used as rights for the map operation (see L4_fpage_rights).

Definition at line 811 of file ipc_types.
The documentation for this class was generated from the following file:

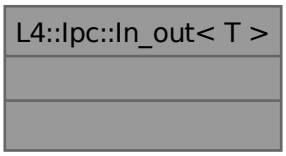
15.112 L4::Ipc::In_out< T > Struct Template Reference

Mark an argument as in-out argument.
`#include <ipc_types>`
Collaboration diagram for L4::Ipc::In_out< T >:



15.112.1 Detailed Description

template<typename T>
struct L4::Ipc::In_out< T >

Mark an argument as in-out argument.

Template Parameters

T	The original argument type, usually a pointer or a reference.

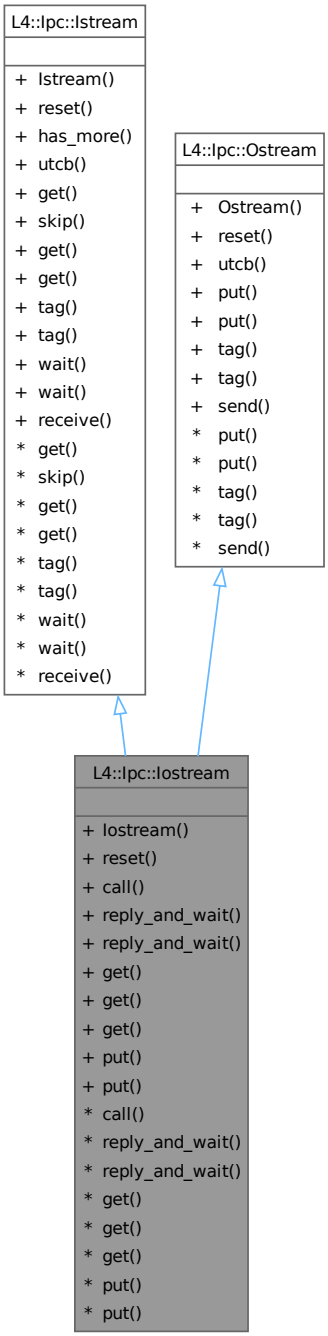
In_out<> is used when an otherwise output-only value shall also be used as input value.
Definition at line 41 of file ipc_types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_types

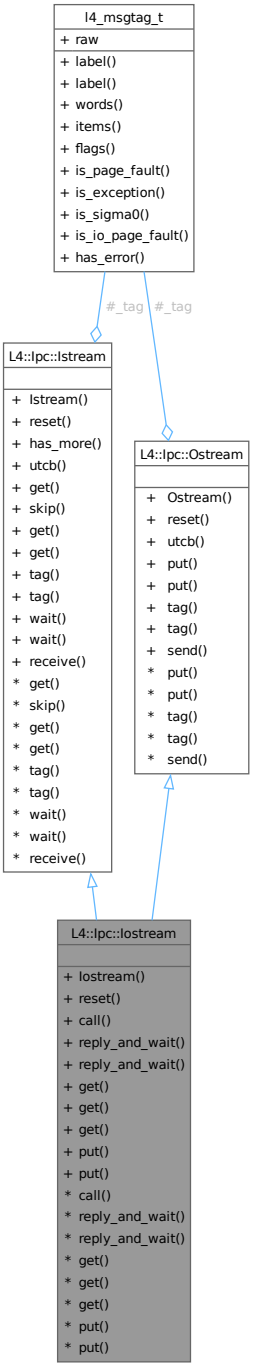
15.113 L4::Ipc::Iostream Class Reference

Input/Output stream for IPC [un]marshalling.
`#include <ipc_stream>`

Inheritance diagram for L4::Ipc::Iostream:



Collaboration diagram for L4::Ipc::Iostream:



Public Member Functions

- Iostream (l4_utcb_t *utcb)

  Create an IPC IO stream with a single message buffer.

- void reset ()

  Reset the stream to its initial state.

IPC operations.

- l4_msgtag_t call (l4_cap_idx_t dst, l4_timeout_t timeout, long proto=0)
  Do an IPC call using the message in the output stream and receive the reply in the input stream.
- l4_msgtag_t reply_and_wait (l4_umword_t *src_dst, long proto=0)
  Do an IPC reply and wait.
- l4_msgtag_t reply_and_wait (l4_umword_t *src_dst, l4_timeout_t timeout, long proto=0)
  Do an IPC reply and wait.

Get/Put functions.

These functions are basically used to implement the insertion operators (<<) and should not be called directly.

- template<typename T>
  unsigned long get (T *buf, unsigned long elems)
  Copy out an array of type `T` with `size` elements.
- template<typename T>
  unsigned long get (Msg_ptr< T > const &buf, unsigned long elems=1)
  Read one size elements of type T from the stream and return a pointer.
- template<typename T>
  bool get (T &v)
  Extract a single element of type T from the stream.
- template<typename T>
  bool put (T *buf, unsigned long size)
  Put an array with `size` elements of type `T` into the stream.
- template<typename T>
  bool put (T const &v)
  Insert an element of type `T` into the stream.

Public Member Functions inherited from L4::Ipc::Istream

- Istream (l4_utcb_t *utcb)
  Create an input stream for the given message buffer.
- void reset ()
  Reset the stream to empty, and ready for receive()/wait().
- template<typename T>
  bool **has_more** (unsigned long count=1)
  Check whether a value of type T can be obtained from the stream.
- l4_utcb_t * **utcb** () const
  Return utcb pointer.

- template<typename T>
  unsigned long get (T *buf, unsigned long elems)
  Copy out an array of type `T` with `size` elements.
- template<typename T>
  void skip (unsigned long elems)
  Skip size elements of type T in the stream.
- template<typename T>
  unsigned long get (Msg_ptr< T > const &buf, unsigned long elems=1)
  Read one size elements of type T from the stream and return a pointer.
- template<typename T>
  bool get (T &v)
  Extract a single element of type T from the stream.
- l4_msgtag_t tag () const
  Get the message tag of a received IPC.
- l4_msgtag_t & tag ()
  Get the message tag of a received IPC.

- l4_msgtag_t wait (l4_umword_t *src)

Wait for an incoming message from any sender.

- l4_msgtag_t wait (l4_umword_t *src, l4_timeout_t timeout)

  Wait for an incoming message from any sender.
- l4_msgtag_t receive (l4_cap_idx_t src)

  Wait for a message from the specified sender.

Public Member Functions inherited from L4::Ipc::Ostream

- **Ostream** (l4_utcb_t *utcb)

  Create an IPC output stream using the given message buffer `utcb`.
- void **reset** ()

  Reset the stream to empty, same state as a newly created stream.
- l4_utcb_t * **utcb** () const

  Return utcb pointer.

- template<typename T>
  bool put (T *buf, unsigned long size)

  Put an array with `size` elements of type `T` into the stream.
- template<typename T>
  bool put (T const &v)

  Insert an element of type `T` into the stream.
- l4_msgtag_t tag () const

  Extract the L4 message tag from the stream.
- l4_msgtag_t & tag ()

  Extract a reference to the L4 message tag from the stream.

- l4_msgtag_t send (l4_cap_idx_t dst, long proto=0, unsigned flags=0)

  Send the message via IPC to the given receiver.

15.113.1 Detailed Description

Input/Output stream for IPC [un]marshalling.
The Ipc::Iostream is part of the AW Env IPC framework as well as Ipc::Istream and Ipc::Ostream. In particular an Ipc::Iostream is a combination of an Ipc::Istream and an Ipc::Ostream. It can use either a single message buffer for receiving and sending messages or a pair of a receive and a send buffer. The stream also supports combined IPC operations such as call() and reply_and_wait(), which can be used to implement RPC functionality.

Examples

examples/libs/l4re/c++/shared_ds/ds_srv.cc, examples/libs/l4re/streammap/client.cc, and examples/libs/l4re/streammap/server.

Definition at line 789 of file ipc_stream.

15.113.2 Constructor & Destructor Documentation

15.113.2.1 Iostream()

```
L4::Ipc::Iostream::Iostream (
             l4_utcb_t * utcb)  [inline], [explicit]
```

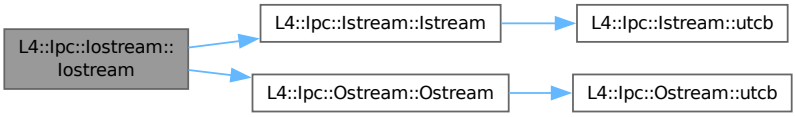
Create an IPC IO stream with a single message buffer.

Parameters

utcb	The message buffer used as backing store.

The created IO stream uses the same message buffer for sending and receiving IPC messages.
Definition at line 801 of file ipc_stream.

References L4::Ipc::Istream::Istream(), and L4::Ipc::Ostream::Ostream().
Here is the call graph for this function:



15.113.3 Member Function Documentation

15.113.3.1 call()

```
l4_msgtag_t L4::Ipc::Iostream::call (
            l4_cap_idx_t dst,
            l4_timeout_t timeout,
            long proto = 0)  [inline]
```

Do an IPC call using the message in the output stream and receive the reply in the input stream.

Parameters

dst	The destination to call.
timeout	The IPC timeout for the call.
proto	The protocol value to use in the message tag.

Returns

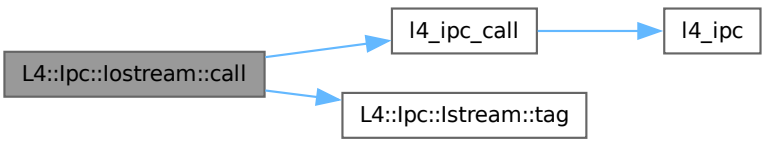
The result tag of the IPC operation.

This is a combined IPC operation consisting of a send and a receive to/from the given destination `dst`.
A call is usually used by clients for RPCs to a server.

Examples

examples/libs/l4re/streammap/client.cc.

Definition at line 966 of file ipc_stream.
References l4_ipc_call(), and L4::Ipc::Istream::tag().
Here is the call graph for this function:



15.113.3.2 get() [1/3]

```
template<typename T>
unsigned long L4::Ipc::Istream::get (
             Msg_ptr< T > const & buf,
             unsigned long elems = 1)  [inline]
```

Read one size elements of type T from the stream and return a pointer.

Parameters

buf	A Msg_ptr that is actually set to point to the element in the stream.
elems	Number of elements to extract (default is 1).

Returns

The number of elements extracted.

In contrast to a normal get, this version does actually not copy the data but returns a pointer to the data.
See operator>>()
Definition at line 439 of file ipc_stream.

15.113.3.3 get() [2/3]

```
template<typename T>
bool L4::Ipc::Istream::get (
             T & v)  [inline]
```

Extract a single element of type T from the stream.

Parameters

out	*v*	The element.

Return values

true	An element was successfully extracted.
false	An element could not be extracted.

See operator>>()
Definition at line 464 of file ipc_stream.

15.113.3.4 get() [3/3]

```
template<typename T>
unsigned long L4::Ipc::Istream::get (
             T * buf,
             unsigned long elems)  [inline]
```

Copy out an array of type T with size elements.

Parameters

buf	Pointer to a buffer for size elements of type T.
elems	Number of elements of type T to copy out.

Returns

The number of elements copied out.

See operator>>()
Definition at line 394 of file ipc_stream.

15.113.3.5 put() [1/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
             T * buf,
             unsigned long size)  [inline]
```

Put an array with `size` elements of type `T` into the stream.

Parameters

buf	A pointer to the array to insert into the buffer.
size	The number of elements in the array.

Definition at line 660 of file ipc_stream.

15.113.3.6 put() [2/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
             T const & v)  [inline]
```

Insert an element of type `T` into the stream.

Parameters

v	The element to insert.

Definition at line 678 of file ipc_stream.

15.113.3.7 reply_and_wait() [1/2]

```
l4_msgtag_t L4::Ipc::Iostream::reply_and_wait (
             l4_umword_t * src_dst,
             l4_timeout_t timeout,
             long proto = 0)  [inline]
```

Do an IPC reply and wait.

Parameters

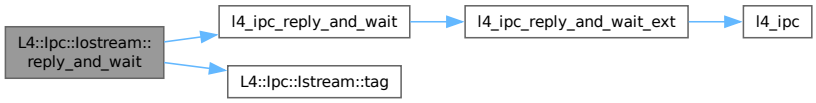
`in,out`	*src_dst*	Input: the destination for the send operation. Output: the source of the received message.
	timeout	Timeout used for IPC.
	proto	Protocol to use.

Returns

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send operation and an open wait for any message.
A reply and wait is usually used by servers that reply to a client and wait for the next request by any other client.

Definition at line 981 of file ipc_stream.
References l4_ipc_reply_and_wait(), and L4::Ipc::Istream::tag().
Here is the call graph for this function:



15.113.3.8 reply_and_wait() [2/2]

```
l4_msgtag_t L4::Ipc::Iostream::reply_and_wait (
            l4_umword_t * src_dst,
            long proto = 0)  [inline]
```

Do an IPC reply and wait.

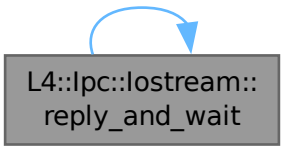
Parameters

in,out	*src_dst*	Input: the destination for the send operation. Output: the source of the received message.
	proto	Protocol to use.

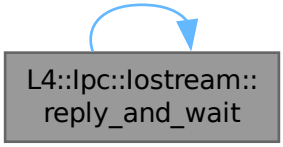
Returns

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send operation and an open wait for any message.
A reply and wait is usually used by servers that reply to a client and wait for the next request by any other client.
Definition at line 874 of file ipc_stream.
References L4_IPC_SEND_TIMEOUT_0, and reply_and_wait().
Referenced by reply_and_wait().
Here is the call graph for this function:



Here is the caller graph for this function:



15.113.3.9 reset()

```
void L4::Ipc::Iostream::reset () [inline]
```

Reset the stream to its initial state.
Input as well as the output stream are reset.
Definition at line 815 of file ipc_stream.
References L4::Ipc::Istream::reset(), and L4::Ipc::Ostream::reset().
Here is the call graph for this function:

  Wait for an incoming message from any sender.
- l4_msgtag_t receive (l4_cap_idx_t src)

  Wait for a message from the specified sender.

15.114.1 Detailed Description

Input stream for IPC unmarshalling.
Ipc::Istream is part of the dynamic IPC marshalling infrastructure, as well as Ipc::Ostream and Ipc::Iostream.
Ipc::Istream is an input stream supporting extraction of values from an IPC message buffer. A received IPC message can be unmarshalled using the usual extraction operator (>>).
There exist some special wrapper classes to extract arrays (see Ipc_buf_cp_in and Ipc_buf_in) and indirect strings (see Msg_in_buffer and Msg_io_buffer).
Definition at line 334 of file ipc_stream.

15.114.2 Constructor & Destructor Documentation

15.114.2.1 Istream()

```
L4::Ipc::Istream::Istream (
            l4_utcb_t * utcb)  [inline]
```

Create an input stream for the given message buffer.
The given message buffer is used for IPC operations wait()/receive() and received data can be extracted using the >> operator afterwards. In the case of indirect message parts a buffer of type Msg_in_buffer must be inserted into the stream before the IPC operation and contains received data afterwards.

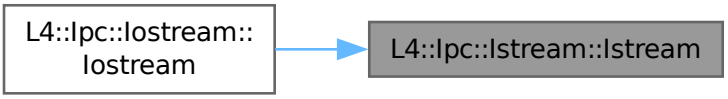
Parameters

utcb	The message buffer to receive IPC messages.

Definition at line 348 of file ipc_stream.

References utcb().
Referenced by L4::Ipc::Iostream::Iostream().
Here is the call graph for this function:

Here is the caller graph for this function:



15.114.3 Member Function Documentation

15.114.3.1 get() [1/3]

```
template<typename T>
unsigned long L4::Ipc::Istream::get (
            Msg_ptr< T > const & buf,
            unsigned long elems = 1)  [inline]
```

Read one size elements of type T from the stream and return a pointer.

Parameters

buf	A Msg_ptr that is actually set to point to the element in the stream.
elems	Number of elements to extract (default is 1).

Returns

The number of elements extracted.

In contrast to a normal get, this version does actually not copy the data but returns a pointer to the data.

15.114.3.4 receive()

```
l4_msgtag_t L4::Ipc::Istream::receive (
```

l4_cap_idx_t *src*) [inline]

Wait for a message from the specified sender.

Parameters

src	The sender id to receive from.

Returns

The IPC result tag (l4_msgtag_t).

This is commonly known as 'closed wait'.
Definition at line 572 of file ipc_stream.
References L4_IPC_NEVER, and receive().
Referenced by receive().
Here is the call graph for this function:

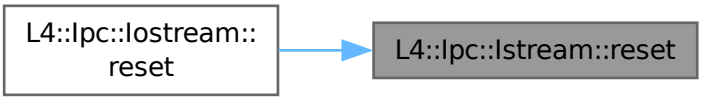
Here is the caller graph for this function:

15.114.3.5 reset()

void L4::Ipc::Istream::reset () [inline]

Reset the stream to empty, and ready for receive()/wait().
The stream is reset to the same state as on its creation.
Definition at line 358 of file ipc_stream.
Referenced by L4::Ipc::Iostream::reset().

Here is the caller graph for this function:



15.114.3.6 skip()

```
template<typename T>
void L4::Ipc::Istream::skip (
             unsigned long elems)  [inline]
```

Skip size elements of type T in the stream.

Parameters

elems	Number of elements to skip.

Definition at line 414 of file ipc_stream.
References has_more(), and L4_UNLIKELY.
Here is the call graph for this function:

15.114.3.7 tag() [1/2]

```
l4_msgtag_t & L4::Ipc::Istream::tag ()  [inline]
```

Get the message tag of a received IPC.

Returns

A reference to the L4 message tag for the received IPC.

This is in particular useful for handling page faults or exceptions.
See operator>>()
Definition at line 517 of file ipc_stream.

15.114.3.8 tag() [2/2]

```
l4_msgtag_t L4::Ipc::Istream::tag () const  [inline]
```

Get the message tag of a received IPC.

Returns

The L4 message tag for the received IPC.

This is in particular useful for handling page faults or exceptions.
See operator>>()
Definition at line 505 of file ipc_stream.
Referenced by L4::Ipc::Iostream::call(), operator>>(), L4::Ipc::Iostream::reply_and_wait(), and wait().

15.115.2.1 from_msg_data()

```
template<typename T>
constexpr int L4::Ipc::Msg::Clnt_noops< T >::from_msg_data (
            char * msg,
            unsigned offset,
            unsigned limit,
            T & arg)  [inline], [static], [constexpr], [noexcept]
```

Read IPC data for `arg` from UTCB.
Called only for output arguments.

Parameters

	msg	Pointer to first filled UTCB MR
	offset	Byte offset into UTCB MRs
	limit	Number of bytes available in `msg` array
`out`	*arg*	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 263 of file ipc_basics.

15.115.2.2 from_msg_items()

```
template<typename T>
constexpr int L4::Ipc::Msg::Clnt_noops< T >::from_msg_items (
             char * msg,
             unsigned offset,
             unsigned limit,
             T & arg)  [inline], [static], [constexpr], [noexcept]
```

Read IPC return items for `arg` from UTCB.
Called only for output arguments.

Parameters

	msg	Pointer to first filled UTCB MR
	offset	Byte offset into UTCB MRs
	limit	Number of bytes available in `msg` array
`out`	*arg*	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 282 of file ipc_basics.

15.115.2.3 to_msg_buffers()

```
template<typename T>
constexpr int L4::Ipc::Msg::Clnt_noops< T >::to_msg_buffers (
             char * brs,
             unsigned offset,
             unsigned limit,
             T const & arg)  [inline], [static], [constexpr], [noexcept]
```

Setup receive buffers for object capabilities in UTCB.
Called only for output arguments.

Parameters

brs	Pointer to first usable UTCB BR
offset	Byte offset into UTCB BRs
limit	Maximum number of bytes available in `brs` array
arg	The IPC argument

Return values

<0	Error code
>=0	Offset into `brs` for next IPC argument

Definition at line 244 of file ipc_basics.

15.115.2.4 to_msg_data()

```
template<typename T>
constexpr int L4::Ipc::Msg::Clnt_noops< T >::to_msg_data (
            char * msg,
            unsigned offset,
            unsigned limit,
            T const & arg)  [inline], [static], [constexpr], [noexcept]
```

Write IPC data of `arg` into UTCB.
Called only for input arguments.

Parameters

msg	Pointer to first usable UTCB MR
offset	Byte offset into UTCB MRs
limit	Maximum number of bytes available in `msg` array
arg	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 208 of file ipc_basics.

15.115.2.5 to_msg_items()

```
template<typename T>
constexpr int L4::Ipc::Msg::Clnt_noops< T >::to_msg_items (
            char * msg,
            unsigned offset,
            unsigned limit,
            T const & arg)  [inline], [static], [constexpr], [noexcept]
```

Write IPC send items of `arg` into UTCB.
Called only for input arguments.

Parameters

msg	Pointer to first usable UTCB MR
offset	Byte offset into UTCB MRs
limit	Maximum number of bytes available in `msg` array
arg	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

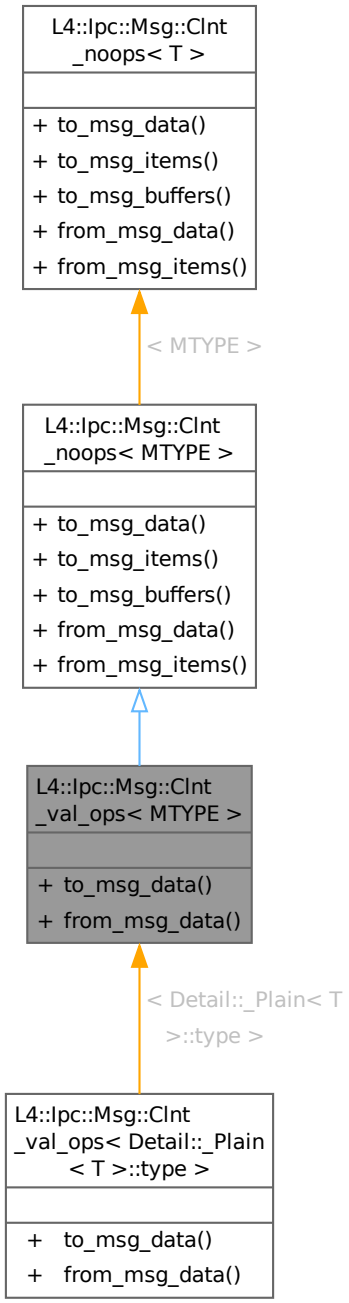
Definition at line 226 of file ipc_basics.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_basics

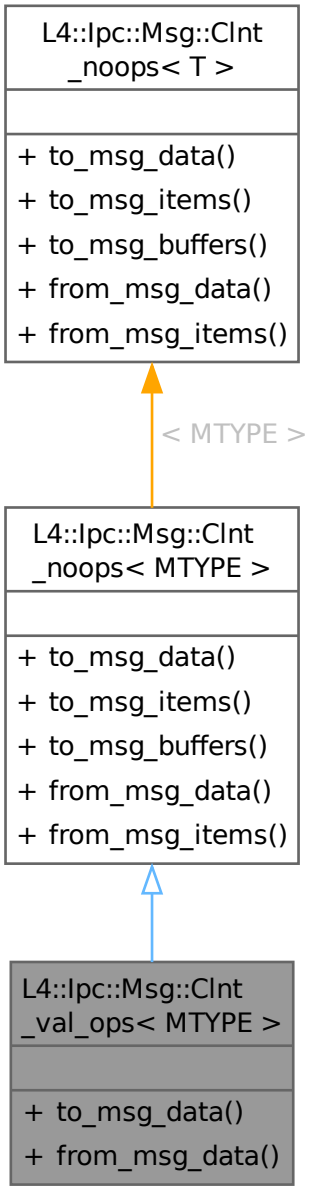
15.116 L4::Ipc::Msg::Clnt_val_ops< MTYPE > Struct Template Reference

Defines client-side handling of 'MTYPE' as RPC argument.
`#include <ipc_basics>`

Inheritance diagram for L4::Ipc::Msg::Clnt_val_ops< MTYPE >:



Collaboration diagram for L4::Ipc::Msg::Clnt_val_ops< MTYPE >:



Static Public Member Functions

- static int **to_msg_data** (char *msg, unsigned offset, unsigned limit, MTYPE const &arg) noexcept

  Copy a T into the message (arg must be either MTYPE or MTYPE const &).
- static int **from_msg_data** (char *msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept

  Copy data from the message to a T client reference (arg must be MTYPE &).

Static Public Member Functions inherited from L4::Ipc::Msg::Clnt_noops< MTYPE >

- static constexpr int to_msg_data (char *msg, unsigned offset, unsigned limit, MTYPE const &arg) noexcept

Write IPC data of `arg` into UTCB.

- static constexpr int to_msg_items (char *msg, unsigned offset, unsigned limit, MTYPE const &arg) noexcept

  Write IPC send items of `arg` into UTCB.
- static constexpr int to_msg_buffers (char *brs, unsigned offset, unsigned limit, MTYPE const &arg) noexcept

  Setup receive buffers for object capabilities in UTCB.
- static constexpr int from_msg_data (char *msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept

  Read IPC data for `arg` from UTCB.
- static constexpr int from_msg_items (char *msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept

  Read IPC return items for `arg` from UTCB.

15.116.1 Detailed Description

template<typename MTYPE>
struct L4::Ipc::Msg::Clnt_val_ops< MTYPE >

Defines client-side handling of 'MTYPE' as RPC argument.
This provides the default implementation for trivially copyable data types. Other types override the marshalling operations by partially specializing Clnt_val_ops.
The template is always instantiated with the `Detail::_Plain<typename Elem<ARG>::arg_type>::type` of the IPC method signature.

Template Parameters

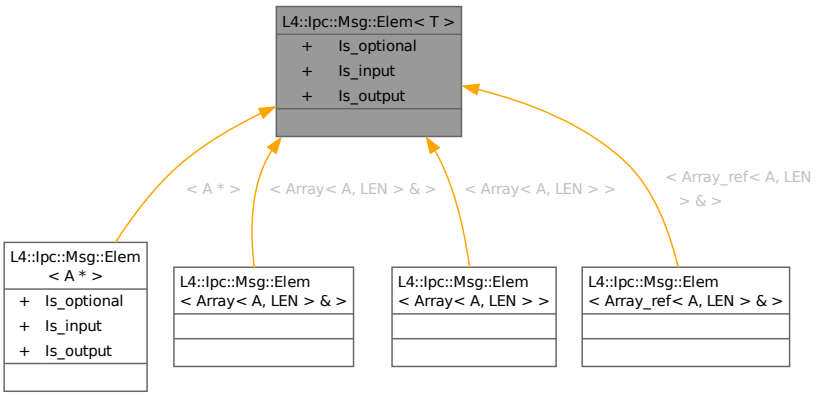
MTYPE	Elem<T>::arg_type (where T is the type used in the RPC definition)

Definition at line 408 of file ipc_basics.
The documentation for this struct was generated from the following file:

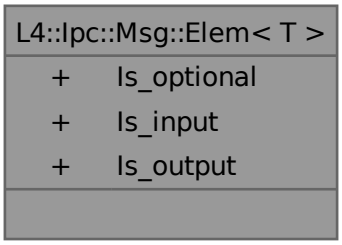
- l4/sys/cxx/ipc_basics

15.117 L4::Ipc::Msg::Elem< T > Struct Template Reference

Helper struct to describe various aspects of an IPC argument.
`#include <ipc_basics>`
Inheritance diagram for L4::Ipc::Msg::Elem< T >:



Collaboration diagram for L4::Ipc::Msg::Elem< T >:



Public Types

- using **arg_type** = T

  The type used in client argument list.
- using **svr_type** = T

  The data type used to store the T on the server-side.
- using **svr_arg_type** = T

  The argument type for the server-side function.

Static Public Attributes

- static constexpr bool **Is_optional** = false

  Is it an optional argument?
- static constexpr bool **Is_input** = true

  Is the argument transferred from client to server?
- static constexpr bool **Is_output** = false

  Is the argument transferred from server to client?

15.117.1 Detailed Description

template<typename T>
struct L4::Ipc::Msg::Elem< T >

Helper struct to describe various aspects of an IPC argument.
There are standard specializations to handle input and output arguments of trivial data types. More complex types need to add further specializations as needed.
Definition at line 471 of file ipc_basics.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_basics

  Reserve IPC data bytes in UTCB.

- static constexpr int to_svr_data (char *msg, unsigned offset, unsigned limit, T &arg) noexcept
  Read IPC data for `arg` from UTCB.
- static constexpr int to_svr_items (char *msg, unsigned offset, unsigned limit, T &arg) noexcept
  Read IPC return items for `arg` from UTCB.

15.123.1 Detailed Description

template<typename T>
struct L4::Ipc::Msg::Svr_noops< T >

Empty server side marshalling code.
Used as basis for concrete marshalling code.
Definition at line 294 of file ipc_basics.

15.123.2 Member Function Documentation

15.123.2.1 from_svr_data()

```
template<typename T>
constexpr int L4::Ipc::Msg::Svr_noops< T >::from_svr_data (
            char * msg,
            unsigned offset,
            unsigned limit,
            T const & arg)  [inline], [static], [constexpr], [noexcept]
```

Write IPC data of `arg` into UTCB.
Called only for output arguments.

Parameters

msg	Pointer to first usable UTCB MR
offset	Byte offset into UTCB MRs
limit	Maximum number of bytes available in `msg` array
arg	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 309 of file ipc_basics.

15.123.2.2 from_svr_items()

```
template<typename T>
constexpr int L4::Ipc::Msg::Svr_noops< T >::from_svr_items (
            char * msg,
            unsigned offset,
            unsigned limit,
            T const & arg)  [inline], [static], [constexpr], [noexcept]
```

Write IPC send items of `arg` into UTCB.
Called only for output arguments.

Parameters

msg	Pointer to first usable UTCB MR
offset	Byte offset into UTCB MRs
limit	Maximum number of bytes available in `msg` array
arg	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 328 of file ipc_basics.

15.123.2.3 reserve_data()

```
template<typename T>
constexpr int L4::Ipc::Msg::Svr_noops< T >::reserve_data (
             char * msg,
             unsigned offset,
             unsigned limit,
             T & arg)  [inline], [static], [constexpr], [noexcept]
```

Reserve IPC data bytes in UTCB.
Called only for output arguments. The argument type may remember the `msg` pointer if the data is put directly into the UTCB.

Parameters

msg	Pointer to first usable UTCB MR
offset	Byte offset into UTCB MRs
limit	Maximum number of bytes available in `msg` array
arg	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 348 of file ipc_basics.

15.123.2.4 to_svr_data()

```
template<typename T>
constexpr int L4::Ipc::Msg::Svr_noops< T >::to_svr_data (
             char * msg,
             unsigned offset,
             unsigned limit,
             T & arg)  [inline], [static], [constexpr], [noexcept]
```

Read IPC data for `arg` from UTCB.
Called only for input arguments.

Parameters

	msg	Pointer to first filled UTCB MR
	offset	Byte offset into UTCB MRs
	limit	Number of bytes available in `msg` array
`out`	*arg*	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

Definition at line 367 of file ipc_basics.

15.123.2.5 to_svr_items()

```
template<typename T>
constexpr int L4::Ipc::Msg::Svr_noops< T >::to_svr_items (
             char * msg,
             unsigned offset,
             unsigned limit,
             T & arg)  [inline], [static], [constexpr], [noexcept]
```

Read IPC return items for `arg` from UTCB.
Called only for input arguments.

Parameters

	msg	Pointer to first filled UTCB MR
	offset	Byte offset into UTCB MRs
	limit	Number of bytes available in `msg` array
`out`	*arg*	The IPC argument

Return values

<0	Error code
>=0	Offset into `msg` for next IPC argument

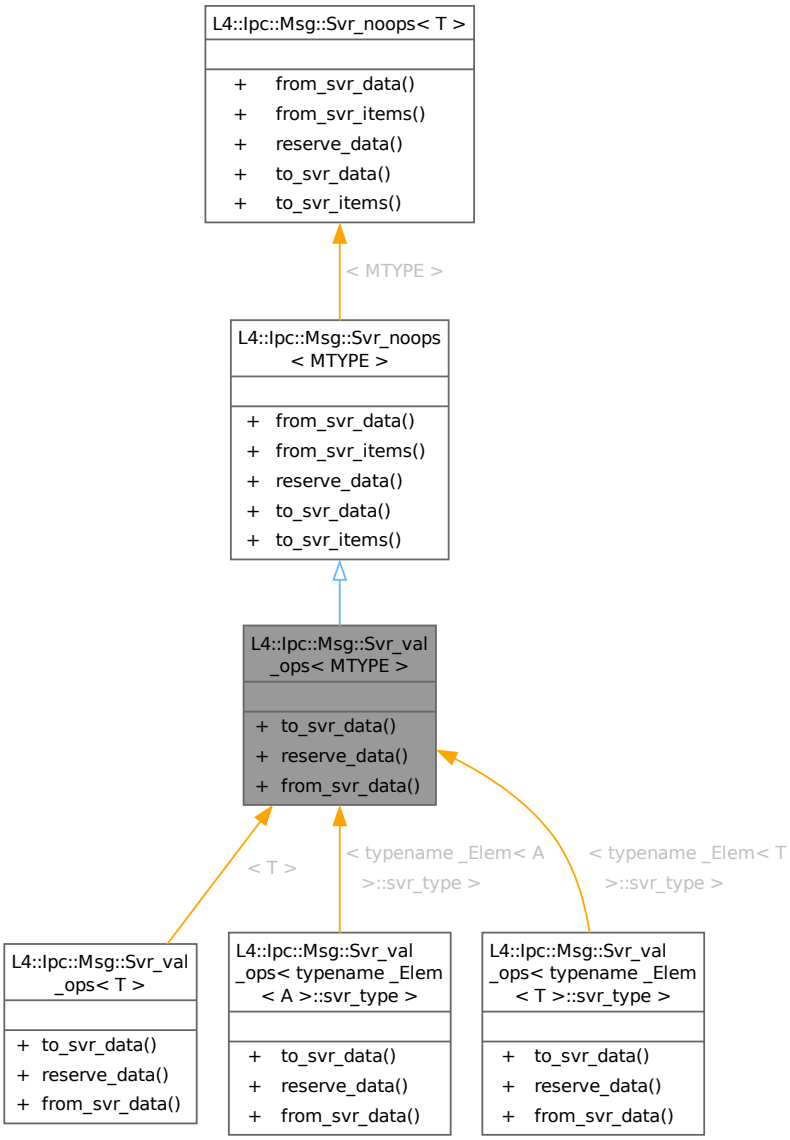
Definition at line 386 of file ipc_basics.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_basics

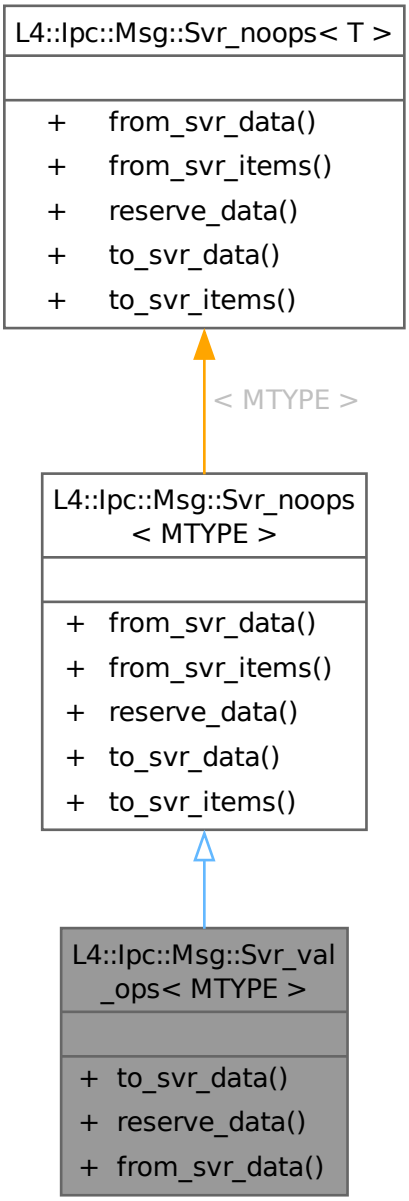
15.124 L4::Ipc::Msg::Svr_val_ops< MTYPE > Struct Template Reference

Defines server-side handling of 'MTYPE' as RPC argument.
`#include <ipc_basics>`

Inheritance diagram for L4::Ipc::Msg::Svr_val_ops< MTYPE >:



Collaboration diagram for L4::Ipc::Msg::Svr_val_ops< MTYPE >:



Static Public Member Functions

- static int **to_svr_data** (char ∗msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept

  Copy data from the message to a T server reference (arg must be MTYPE &).
- static int **reserve_data** (char ∗, unsigned offs, unsigned limit, MTYPE &) noexcept

  Prepare a T output operand (arg must be MTYPE &).
- static int **from_svr_data** (char ∗msg, unsigned offset, unsigned limit, MTYPE const &arg) noexcept

  Copy a T into the message (arg must be either MTYPE or MTYPE const &).

Static Public Member Functions inherited from L4::Ipc::Msg::Svr_noops< MTYPE >

- static constexpr int from_svr_data (char *msg, unsigned offset, unsigned limit, MTYPE const &arg) noexcept
  Write IPC data of `arg` into UTCB.
- static constexpr int from_svr_items (char *msg, unsigned offset, unsigned limit, MTYPE const &arg) noexcept
  Write IPC send items of `arg` into UTCB.
- static constexpr int reserve_data (char *msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept
  Reserve IPC data bytes in UTCB.
- static constexpr int to_svr_data (char *msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept
  Read IPC data for `arg` from UTCB.
- static constexpr int to_svr_items (char *msg, unsigned offset, unsigned limit, MTYPE &arg) noexcept
  Read IPC return items for `arg` from UTCB.

15.124.1 Detailed Description

template<typename MTYPE>
struct L4::Ipc::Msg::Svr_val_ops< MTYPE >

Defines server-side handling of 'MTYPE' as RPC argument.
This provides the default implementation for trivially copyable data types. Other types override the marshalling operations by partially specializing Svr_val_ops.
The template is always instantiated with the `Elem<ARG>::svr_type` of the IPC method signature.

Template Parameters

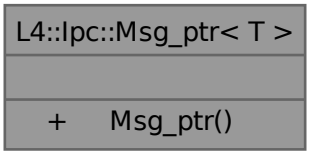
MTYPE	Elem<T>::arg_type (where T is the type used in the RPC definition)

Definition at line 438 of file ipc_basics.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_basics

15.125 L4::Ipc::Msg_ptr< T > Class Template Reference

Pointer to an element of type T in an Ipc::Istream.
`#include <ipc_stream>`
Collaboration diagram for L4::Ipc::Msg_ptr< T >:



Public Member Functions

- Msg_ptr (T *&p)
  Create a Msg_ptr object that set pointer p to point into the message buffer.

15.125.1 Detailed Description

template<typename T>
class L4::Ipc::Msg_ptr< T >

Pointer to an element of type T in an Ipc::Istream.
This wrapper can be used to extract an element of type T from an Ipc::Istream, whereas the data is not copied out, but a pointer into the message buffer itself is returned. With is mechanism it is possible to avoid an extra copy of large data structures from a received IPC message, instead the returned pointer gives direct access to the data in the message.
See msg_ptr().
Definition at line 229 of file ipc_stream.

15.125.2 Constructor & Destructor Documentation

15.125.2.1 Msg_ptr()

```
template<typename T>
L4::Ipc::Msg_ptr< T >::Msg_ptr (
            T *& p)  [inline], [explicit]
```

Create a Msg_ptr object that set pointer p to point into the message buffer.

Parameters

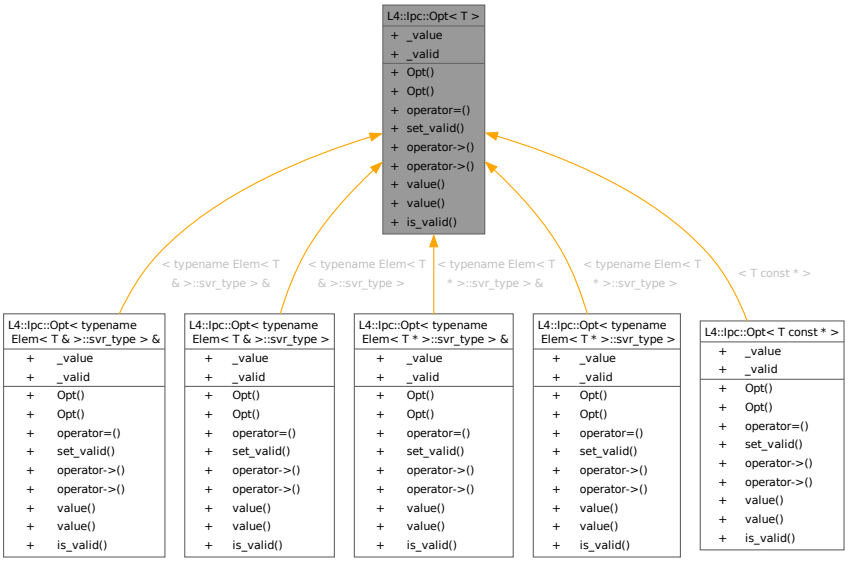
p	The pointer that is adjusted to point into the message buffer.

Definition at line 240 of file ipc_stream.
The documentation for this class was generated from the following file:

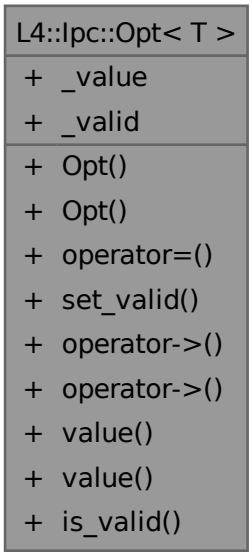
- l4/cxx/ipc_stream

15.126 L4::Ipc::Opt< T > Struct Template Reference

Attribute for defining an optional RPC argument.
`#include <ipc_types>`
Inheritance diagram for L4::Ipc::Opt< T >:



Collaboration diagram for L4::Ipc::Opt< T >:



Public Member Functions

- **Opt** () noexcept=default

  Make an absent optional argument.
- **Opt** (T value) noexcept

  Make a present optional argument with the given value.
- Opt & **operator=** (T value) noexcept

  Assign a value to the optional argument (makes the argument present).
- void **set_valid** (bool valid=true) noexcept

  Set the argument to present or absent.
- T * **operator->** () noexcept

  Get the pointer to the value.
- T const * **operator->** () const noexcept

  Get the const pointer to the value.
- T const & **value** () const noexcept

  Get the value.
- T & **value** () noexcept

  Get the value.
- bool **is_valid** () const noexcept

  Get true if present, false if not.

Data Fields

- T **_value** {}

  The value.
- bool **_valid** = false

  True if the optional argument is present, false else.

15.126.1 Detailed Description

template<typename T>
struct L4::Ipc::Opt< T >

Attribute for defining an optional RPC argument.

Attention

Do not use in new code. It is solely used for the implementation of some legacy message formats and should generally not be needed for the definition of ordinary interfaces.

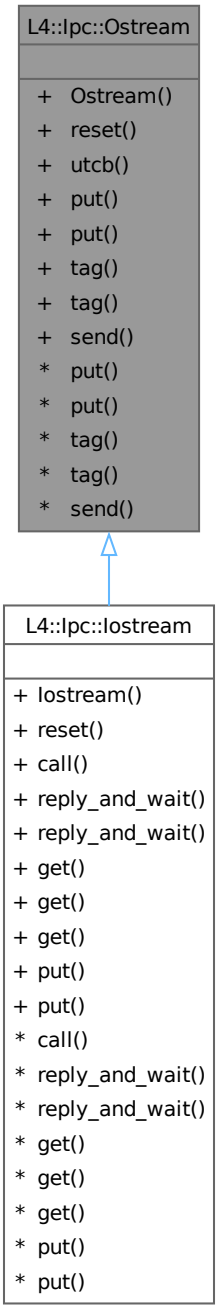
Definition at line 80 of file ipc_types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_types

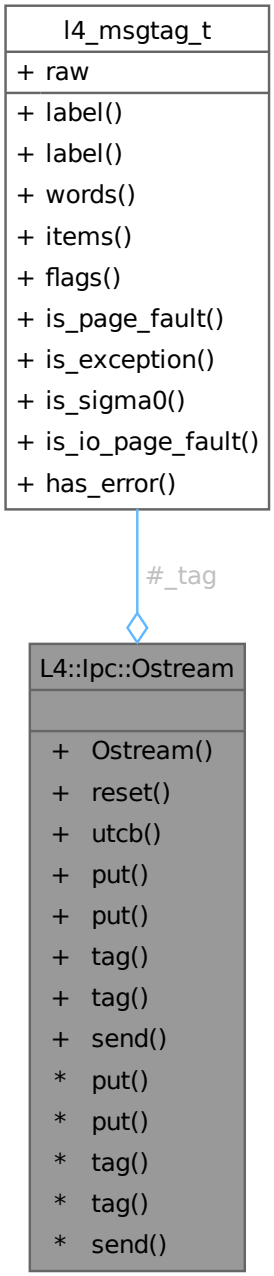
15.127 L4::Ipc::Ostream Class Reference

Output stream for IPC marshalling.
`#include <ipc_stream>`

Inheritance diagram for L4::Ipc::Ostream:



Collaboration diagram for L4::Ipc::Ostream:



Public Member Functions

- **Ostream** (l4_utcb_t *utcb)

  Create an IPC output stream using the given message buffer `utcb`.
- void **reset** ()

  Reset the stream to empty, same state as a newly created stream.
- l4_utcb_t * **utcb** () const

  Return utcb pointer.

Get/Put functions.

These functions are basically used to implement the insertion operators (<<) and should not be called directly.

- template<typename T>
  bool put (T *buf, unsigned long size)
  Put an array with `size` elements of type `T` into the stream.
- template<typename T>
  bool put (T const &v)
  Insert an element of type `T` into the stream.
- l4_msgtag_t tag () const
  Extract the L4 message tag from the stream.
- l4_msgtag_t & tag ()
  Extract a reference to the L4 message tag from the stream.

IPC operations.

- l4_msgtag_t send (l4_cap_idx_t dst, long proto=0, unsigned flags=0)
  Send the message via IPC to the given receiver.

15.127.1 Detailed Description

Output stream for IPC marshalling.
Ipc::Ostream is part of the dynamic IPC marshalling infrastructure, as well as Ipc::Istream and Ipc::Iostream.
Ipc::Ostream is an output stream supporting insertion of values into an IPC message buffer. A IPC message can be marshalled using the usual insertion operator <<, see IPC stream operators .
There exist some special wrapper classes to insert arrays (see Ipc::Buf_cp_out) and indirect strings (see Msg_↩ out_buffer and Msg_io_buffer).
Definition at line 623 of file ipc_stream.

15.127.2 Member Function Documentation

15.127.2.1 put() [1/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
            T * buf,
            unsigned long size)  [inline]
```

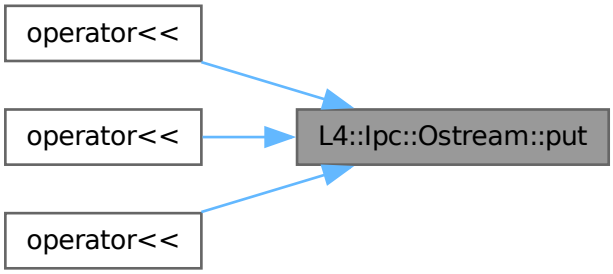
Put an array with `size` elements of type `T` into the stream.

Parameters

buf	A pointer to the array to insert into the buffer.
size	The number of elements in the array.

Definition at line 660 of file ipc_stream.
Referenced by operator<<(), operator<<(), and operator<<().

Here is the caller graph for this function:



15.127.2.2 put() [2/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
             T const & v)  [inline]
```

Insert an element of type `T` into the stream.

Parameters

v	The element to insert.

Definition at line 678 of file ipc_stream.

15.127.2.3 send()

```
l4_msgtag_t L4::Ipc::Ostream::send (
             l4_cap_idx_t dst,
             long proto = 0,
             unsigned flags = 0)  [inline]
```

Send the message via IPC to the given receiver.

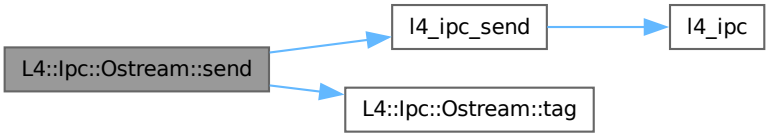
Parameters

dst	The destination for the message.
proto	Protocol to use.
flags	Flags to use.

Returns

The syscall return tag.

Definition at line 959 of file ipc_stream.
References L4_IPC_NEVER, l4_ipc_send(), L4_MSGTAG_FLAGS, and tag().
Here is the call graph for this function:



15.127.2.4 tag() [1/2]

```
l4_msgtag_t & L4::Ipc::Ostream::tag ()  [inline]
```

Extract a reference to the L4 message tag from the stream.

Returns

A reference to the L4 message tag.

Definition at line 713 of file ipc_stream.

15.127.2.5 tag() [2/2]

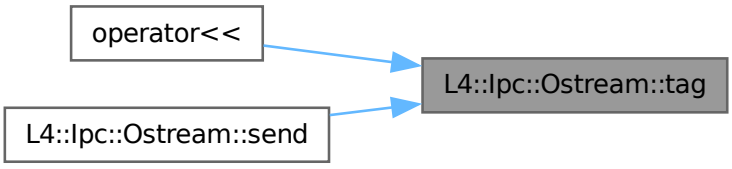
```
l4_msgtag_t L4::Ipc::Ostream::tag () const  [inline]
```

Extract the L4 message tag from the stream.

Returns

The extracted L4 message tag.

Definition at line 706 of file ipc_stream.
Referenced by operator<<(), and send().
Here is the caller graph for this function:

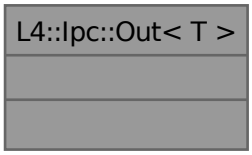


The documentation for this class was generated from the following file:

- l4/cxx/ipc_stream

15.128 L4::Ipc::Out< T > Struct Template Reference

Mark an argument as a output value in an RPC signature.
Collaboration diagram for L4::Ipc::Out< T >:



15.128.1 Detailed Description

template<typename T>
struct L4::Ipc::Out< T >

Mark an argument as a output value in an RPC signature.

Template Parameters

T	The original type of the argument.

Note

The use of Out<> is usually not needed, because typical output data types in C++ (pointers to non-const objects or non-const references are interpreted as output values anyway. However, there are some data types, such as returned capabilities that can be marked as such by using Out<>.

  Type of mapping object, see L4_fpage_type.

15.129.1 Detailed Description

Non-small receive item.
This class represents a non-small receive item. A receive item is a message item in the buffer registers of the UTCB of the receiver (see l4_utcb_br()).
In an RPC interface, a Rcv_fpage must be combined with a Snd_fpage output argument. The Rcv_fpage argument is removed from the server function signature. Instead, the adjacent Snd_fpage output argument is used by the server function to send the capability. On the client side, the caller can check the Snd_fpage output argument what has been received. See the following example:

```
L4_RPC(l4_ret_t, test, (L4::Ipc::Rcv_fpage fp, L4::Ipc::Snd_fpage &snd_fp));
```

Definition at line 531 of file ipc_types.

15.129.2 Constructor & Destructor Documentation

15.129.2.1 Rcv_fpage()

```
L4::Ipc::Rcv_fpage::Rcv_fpage (
             l4_fpage_t const & fp,
             l4_addr_t snd_base = 0,
             l4_cap_idx_t rcv_task = L4_INVALID_CAP)  [inline], [noexcept]
```

Construct a non-small receive item.

Parameters

fp	Flexpage defining where and which kind of capabilities may be received.
snd_base	Reserved; should be zero.
rcv_task	Optional destination task for received capabilities. If invalid, capabilities are received in the invoking task.

Definition at line 548 of file ipc_types.

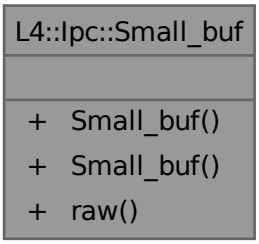
15.131 L4::Ipc::Small_buf Class Reference

A receive item for receiving a single object capability.
`#include <ipc_types>`
Collaboration diagram for L4::Ipc::Small_buf:



Public Member Functions

- Small_buf (L4::Cap< void > cap, unsigned long flags=0) noexcept

  Create a receive item from a C++ cap.
- Small_buf (l4_cap_idx_t cap, unsigned long flags=0) noexcept

  Create a receive item from a C cap.
- l4_umword_t **raw** () const noexcept

  Return the raw data.

15.131.1 Detailed Description

A receive item for receiving a single object capability.
This class is the main abstraction for receiving object capabilities via Ipc::Istream. To receive an object capability, an instance of Small_buf that refers to an empty capability slot must be inserted into the Ipc::Istream before the receive operation.
In an RPC interface, a Small_buf must be combined with a Snd_fpage output argument. The Small_buf argument is removed from the server function signature. Instead, the adjacent Snd_fpage output argument is used by the server function to send the capability. On the client side, the caller can check the Snd_fpage output argument what has been received. See the following example:

```
L4_RPC(l4_ret_t, test, (L4::Ipc::Small_buf cap, L4::Ipc::Snd_fpage &snd_cap));
```

Definition at line 233 of file ipc_types.

```
L4::Ipc::Small_buf::Small_buf (
            L4::Cap< void > cap,
            unsigned long flags = 0)  [inline], [explicit], [noexcept]
```

Create a receive item from a C++ cap.

Parameters

cap	Capability slot where to save the capability.
flags	Receive buffer flags, see l4_msg_item_consts_t. L4_RCV_ITEM_SINGLE_CAP will always be set.

Definition at line 243 of file ipc_types.
References L4_RCV_ITEM_SINGLE_CAP.

15.131.2.2 Small_buf() [2/2]

```
L4::Ipc::Small_buf::Small_buf (
            l4_cap_idx_t cap,
            unsigned long flags = 0)  [inline], [explicit], [noexcept]
```

Create a receive item from a C cap.

Parameters

cap	Capability slot where to save the capability.
flags	Receive buffer flags, see l4_msg_item_consts_t. L4_RCV_ITEM_SINGLE_CAP will always be set.

Definition at line 250 of file ipc_types.
References L4_RCV_ITEM_SINGLE_CAP.

  Type of mapping object, see L4_fpage_type.

Public Member Functions

- **Snd_fpage** (l4_umword_t base=0, l4_umword_t data=0) noexcept

  Construct from raw values.
- Snd_fpage (l4_fpage_t const &fp, l4_addr_t snd_base=0, Map_type map_type=Map, Cacheopt cache=None, Continue cont=Last) noexcept

  Construct a send item for the memory space.
- Snd_fpage (L4::Cap< void > cap, unsigned rights, Map_type map_type=Map) noexcept

  Construct a send item for the object space.
- unsigned **order** () const noexcept

  (Defined only if send item or if local_id_received() is true.) Get $\log_2$ size.
- unsigned **snd_order** () const noexcept

  (Defined only if send item or if local_id_received() is true.) Get $\log_2$ size.
- unsigned **rcv_order** () const noexcept

  (Defined for return items only.) Get $\log_2$ size.
- l4_addr_t **base** () const noexcept

  (Defined only if send item or if local_id_received() is true.) Get the start of the item (i.e., the start of its flexpage).
- l4_addr_t **snd_base** () const noexcept

  Get the position in receive window for the case that this item has a different size than the corresponding receive item.
- void **snd_base** (l4_addr_t b) noexcept

  Set the position in receive window for the case that this item has a different size than the corresponding receive item.
- bool **is_valid** () const noexcept

  Check if the capability is valid.
- bool cap_received () const noexcept

  (Defined for return items only.) Check if at least one object capability has been mapped for this item.
- bool id_received () const noexcept

  (Defined for return items only.) Check if an IPC gate label has been received instead of a mapping.
- bool local_id_received () const noexcept

  (Defined for return items only.) Check if a raw object flexpage has been received instead of a mapping.
- bool is_compound () const noexcept

  Check if the item has the compound bit set, see Continue.

Public Member Functions inherited from L4::Ipc::Gen_fpage

- **Gen_fpage** (l4_umword_t base, l4_umword_t data) noexcept

  Construct from raw values.
- l4_umword_t **data** () const noexcept

  Return the raw flexpage descriptor.
- l4_umword_t **base_x** () const noexcept

  Return the raw base descriptor.

Static Public Member Functions

- static Snd_fpage obj (l4_cap_idx_t base, int order, unsigned char rights, l4_addr_t snd_base=0, Map_type map_type=Map, Continue cont=Last) noexcept

  Construct a send item for the object space.
- static Snd_fpage mem (l4_addr_t base, int order, unsigned char rights, l4_addr_t snd_base=0, Map_type map_type=Map, Cacheopt cache=None, Continue cont=Last) noexcept

  Construct a send item for the memory space.
- static Snd_fpage io (unsigned long base, int order, unsigned char rights, l4_addr_t snd_base=0, Map_type map_type=Map, Continue cont=Last) noexcept

  Construct a send item for the I/O port space.

15.132.1 Detailed Description

Send item or return item.
This class represents a typed message item in the message registers of the UTCB. If it is provided by the sender, then it is a *send item*. If it is provided by the kernel during IPC, it is a *return item*.
Note that some members are dedicated for send items only or return items only.
Definition at line 299 of file ipc_types.

15.132.2 Member Enumeration Documentation

15.132.2.1 Cacheopt

`enum L4::Ipc::Snd_fpage::Cacheopt`
(Defined for memory send items only.) Caching options, see l4_fpage_cacheability_opt_t.

Enumerator

None	Copy options from sender.
Cached	Cacheability option to enable caches for the mapping.
Buffered	Cacheability option to enable buffered writes for the mapping.
Uncached	Cacheability option to disable caching for the mapping.

Definition at line 312 of file ipc_types.

15.132.2.2 Continue

`enum L4::Ipc::Snd_fpage::Continue`
Specify if the following item is associated with the same receive item as this one, see L4_ITEM_CONT.

Enumerator

Single	Inverse of Compound.
Last	Inverse of More.
More	Alias for Compound.
Compound	Denote that the following item shall be put into the same receive item as this one.

Definition at line 322 of file ipc_types.

15.132.2.3 Map_type

`enum L4::Ipc::Snd_fpage::Map_type`
(Defined for send items only.) Kind of mapping.

Enumerator

Map	Flag as usual *map* operation.
Grant	Flag as *grant* instead of *map* operation. This means, the sender delegates access to the receiver and the kernel removes the rights from the sender (basically a move operation). The mapping in the receiver gets the new parent of any child mappings of the mapping of the sender. Rights revocation via send item/flexpage is *not* guaranteed to be applied to descendant mappings in case of grant. See Spaces and Mappings for more details on map/grant. **Note** The grant operation is not performed if the resulting rights of the receiver mapping would not contain the L4_CAP_FPAGE_R bit (for object capabilities) or none of the L4_FPAGE_RWX bits (memory and IO ports). In that case, the mapping is not created in the receiver space and not removed from the sender space. If the removal of the whole mapping from the sender is not possible because the size of the mapped frame at the sender exceeds the size defined by the send or receive flexpage, the grant operation is turned into a regular map operation and the mapping is *not* removed from the sender. This would happen if, for example, a smaller part of an L4 superpage mapping shall be granted.

Definition at line 304 of file ipc_types.

15.132.3 Constructor & Destructor Documentation

15.132.3.1 Snd_fpage() [1/2]

```
L4::Ipc::Snd_fpage::Snd_fpage (
             l4_fpage_t const & fp,
             l4_addr_t snd_base = 0,
             Map_type map_type = Map,
             Cacheopt cache = None,
             Continue cont = Last)  [inline], [noexcept]
```

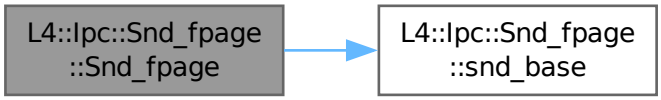
Construct a send item for the memory space.

Parameters

fp	Memory flexpage defining which range and kind of capabilities shall be sent (see l4_fpage()).
snd_base	Position in receive window in case it has a different size than `fp`.
map_type	See Map_type.
cache	See Cacheopt.
cont	See Continue.

Definition at line 346 of file ipc_types.
References L4_ITEM_MAP, Last, Map, None, and snd_base().

Here is the call graph for this function:



15.132.3.2 Snd_fpage() [2/2]

```
L4::Ipc::Snd_fpage::Snd_fpage (
            L4::Cap< void > cap,
            unsigned rights,
            Map_type map_type = Map)  [inline], [noexcept]
```

Construct a send item for the object space.

Parameters

cap	Capability to be sent.
rights	Permissions to be transferred. See L4_cap_fpage_rights and Attributes and additional permissions for object send items.
map_type	See Map_type.

Definition at line 362 of file ipc_types.
References L4_ITEM_MAP, and Map.

15.132.4 Member Function Documentation

15.132.4.1 cap_received()

```
bool L4::Ipc::Snd_fpage::cap_received () const  [inline], [noexcept]
```

(Defined for return items only.) Check if at least one object capability has been mapped for this item.
The capabilities themselves can then be retrieved from the cap slots that have been provided in the receive operation.

Note

If this function returns `true` and the receive window covers more than one capability slot, then it is not possible to determine which slots actually got capabilities mapped from the sender.

If the received capabilities do not have type object (see L4_FPAGE_OBJ), then this function returns `false`.

Definition at line 472 of file ipc_types.

15.132.4.2 id_received()

```
bool L4::Ipc::Snd_fpage::id_received () const  [inline], [noexcept]
```

(Defined for return items only.) Check if an IPC gate label has been received instead of a mapping.
If the L4_RCV_ITEM_LOCAL_ID flag has been set by the receiver, the conditions for local_id_received() do not apply, the sender sent an IPC gate capability, and the receiving thread is in the same task as the thread that is attached to the IPC gate, then no mapping is done for this item and only the bitwise OR (|) of the label of the IPC gate and the special and write permission (L4_CAP_FPAGE_S and L4_CAP_FPAGE_W) that would have been mapped is received.

The bitwise OR of the label and the permissions can be retrieved with Gen_fpage::data().
Definition at line 488 of file ipc_types.

15.132.4.3 io()

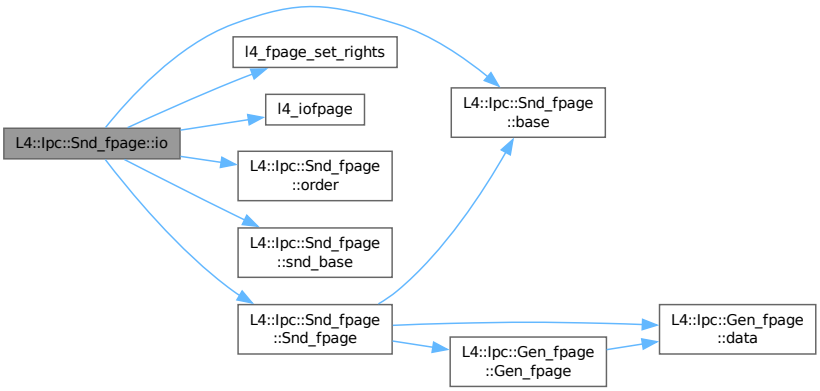
```
Snd_fpage L4::Ipc::Snd_fpage::io (
            unsigned long base,
            int order,
            unsigned char rights,
            l4_addr_t snd_base = 0,
            Map_type map_type = Map,
            Continue cont = Last)  [inline], [static], [noexcept]
```

Construct a send item for the I/O port space.

Parameters

base	Start of flexpage (see l4_iofpage()).
order	Log_2 size of flexpage (see l4_iofpage()).
rights	Permissions of flexpage (see L4_fpage_rights).
snd_base	Position in receive window in case it has a different size than `1 << order`.
map_type	See Map_type.
cont	See Continue.

Definition at line 421 of file ipc_types.
References base(), l4_fpage_set_rights(), l4_iofpage(), Last, Map, None, order(), snd_base(), and Snd_fpage().
Here is the call graph for this function:



15.132.4.4 is_compound()

```
bool L4::Ipc::Snd_fpage::is_compound () const  [inline], [noexcept]
```

Check if the item has the compound bit set, see Continue.
A set compound bit means the next message item of the same type will be mapped to the same receive buffer as this message item.
Definition at line 511 of file ipc_types.

15.132.4.5 local_id_received()

```
bool L4::Ipc::Snd_fpage::local_id_received () const  [inline], [noexcept]
```

(Defined for return items only.) Check if a raw object flexpage has been received instead of a mapping.
If the L4_RCV_ITEM_LOCAL_ID flag has been set by the receiver, and sender and receiver are in the same task, then no mapping is done for this item and only the raw flexpage (l4_fpage_t) is received.
This function checks if this is the case and if it is an object flexpage.
The flexpage can be retrieved with Gen_fpage::data().

Note

If a raw flexpage was received, but it does not have type object (see L4_FPAGE_OBJ), then this function returns `false`.

Definition at line 504 of file ipc_types.

15.132.4.6 mem()

```
Snd_fpage L4::Ipc::Snd_fpage::mem (
             l4_addr_t base,
             int order,
             unsigned char rights,
             l4_addr_t snd_base = 0,
             Map_type map_type = Map,
             Cacheopt cache = None,
             Continue cont = Last)  [inline], [static], [noexcept]
```

Construct a send item for the memory space.

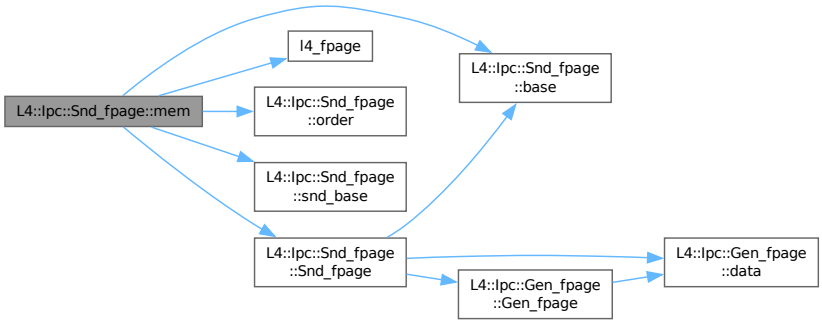
Parameters

base	Start of flexpage (see l4_fpage()).
order	Log_2 size of flexpage (see l4_fpage()).
rights	Permissions of flexpage (see l4_fpage()).
snd_base	Position in receive window in case it has a different size than `1 << order`.
map_type	See Map_type.
cache	See Cacheopt.
cont	See Continue.

Examples

examples/libs/l4re/streammap/server.cc.

Definition at line 400 of file ipc_types.
References base(), l4_fpage(), Last, Map, None, order(), snd_base(), and Snd_fpage().
Here is the call graph for this function:



15.132.4.7 obj()

```
Snd_fpage L4::Ipc::Snd_fpage::obj (
            l4_cap_idx_t base,
            int order,
            unsigned char rights,
            l4_addr_t snd_base = 0,
            Map_type map_type = Map,
            Continue cont = Last)  [inline], [static], [noexcept]
```

Construct a send item for the object space.

Parameters

base	Start of flexpage (see l4_obj_fpage()).
order	Log_2 size of flexpage (see l4_obj_fpage()).
rights	Permissions of flexpage (see l4_obj_fpage()).
snd_base	Position in receive window in case it has a different size than `1 << order`.
map_type	See Map_type.
cont	See Continue.

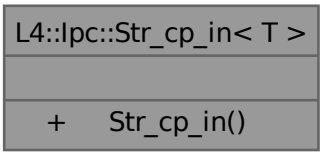
15.133 L4::Ipc::Str_cp_in< T > Class Template Reference

Abstraction for extracting a zero-terminated string from an Ipc::Istream.
`#include <ipc_stream>`

Collaboration diagram for L4::Ipc::Str_cp_in< T >:



Public Member Functions

- Str_cp_in (T *v, unsigned long &size)

  Create a buffer for extracting an array from an Ipc::Istream.

15.133.1 Detailed Description

template<typename T>
class L4::Ipc::Str_cp_in< T >

Abstraction for extracting a zero-terminated string from an Ipc::Istream.
An instance of Str_cp_in can be used to extract a zero-terminated string an Ipc::Istream. The data from the received message is thereby copied to the given buffer and size is set to the number of characters found in the stream. The string is zero terminated in any circumstances. When the given buffer is smaller than the received string the last byte in the buffer will be the zero terminator. In the case the received string is shorter than the given buffer the zero termination will be placed behind the received data. This provides a zero-terminated result even in cases where the sender did not provide proper termination or in cases of too small receiver buffers.

See also

str_cp_in().

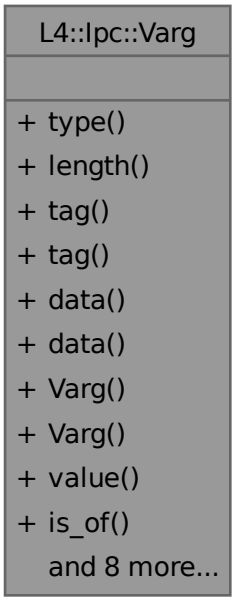
15.134 L4::Ipc::Varg Class Reference

Variably sized RPC argument.
`#include <ipc_varg>`
Collaboration diagram for L4::Ipc::Varg:



Public Types

- using **Tag** = l4_umword_t

  The data type for the tag.

Public Member Functions

- L4_varg_type type () const
- unsigned length () const

  Get the size of the RPC argument.
- Tag tag () const
- void **tag** (Tag tag)

  Set Varg tag (usually from message).
- void **data** (char const *d)

  Set Varg to indirect data value (usually in UTCB).
- char const * data () const
- **Varg** ()=default

  Make uninitialized Varg.
- **Varg** (L4_varg_type t, void const *v, int len)

  Make an indirect varg.
- template<typename V>
  Va_type< V >::Ret_value value () const
- template<typename T>
  bool is_of () const

- bool is_nil () const
- bool is_of_int () const
- template<typename T>
  bool get_value (typename Va_type< T >::Value *v) const

  Get the value of the Varg as type T.
- template<typename T>
  void **set_value** (void const *d)

  Set to indirect value of type T.
- template<typename T>
  void **set_direct_value** (T val, L4::Types::Enable_if_t< sizeof(T)<=sizeof(char const *), bool >=true)

  Set to directly stored value of type T.
- template<typename T>
  Varg (T const *data)

  Make Varg from indirect value (pointer).
- **Varg** (char const *data)

  Make Varg from null-terminated string.
- template<typename T>
  Varg (T data, L4::Types::Enable_if_t< sizeof(T)<=sizeof(char const *), bool >=true)

  Make Varg from direct value.

15.134.1 Detailed Description

Variably sized RPC argument.
Definition at line 96 of file ipc_varg.

15.134.2 Member Function Documentation

15.134.2.1 data()

```
char const * L4::Ipc::Varg::data () const  [inline]
```

Returns

pointer to the data, also safe for direct data

Definition at line 129 of file ipc_varg.

15.134.2.2 get_value()

```
template<typename T>
bool L4::Ipc::Varg::get_value (
            typename Va_type< T >::Value * v) const  [inline]
```

Get the value of the Varg as type T.

Template Parameters

T	The expected type of the Varg.

Parameters

v	Pointer to store the value

Returns

true when the Varg is of type T, false if not

Definition at line 191 of file ipc_varg.
References is_of(), and value().

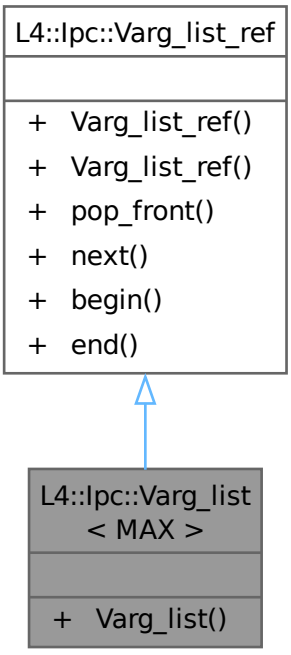
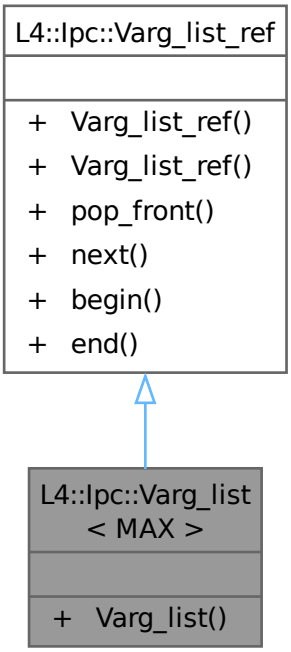
15.135 L4::Ipc::Varg_list< MAX > Class Template Reference

Self-contained list of variable-sized RPC parameters.
`#include <ipc_varg>`
Inheritance diagram for L4::Ipc::Varg_list< MAX >:



Collaboration diagram for L4::Ipc::Varg_list< MAX >:



Public Member Functions

- **Varg_list** (Varg_list_ref const &r)

  Create a parameter list as a copy from a referencing list.

Public Member Functions inherited from L4::Ipc::Varg_list_ref

- **Varg_list_ref** ()=default

  Create an empty parameter list.
- Varg_list_ref (void const *start, void const *end)

  Create a parameter list over a given memory region.
- Varg **pop_front** ()

  Get the next parameter in the list.
- Varg **next** ()

  Get the next parameter in the list.
- Iterator **begin** () const

  Returns an iterator to the first Varg.
- Iterator **end** () const

  Returns the end of the list.

15.135.1 Detailed Description

template<unsigned MAX>
class L4::Ipc::Varg_list< MAX >

Self-contained list of variable-sized RPC parameters.

Works like Varg_list_ref but contains a full copy of the data. Use this as a parameter in server functions, if the handler function needs to use the UTCB (e.g. while sending further IPC).

Template Parameters

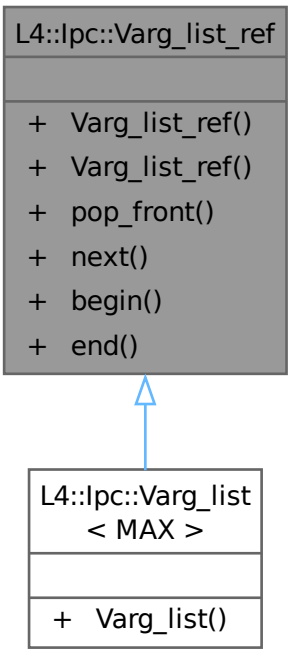
MAX	Size of the copy, in machine words. A list that does not fit is truncated; the default is large enough for any list that can arrive in the message registers.

Definition at line 421 of file ipc_varg.
The documentation for this class was generated from the following file:

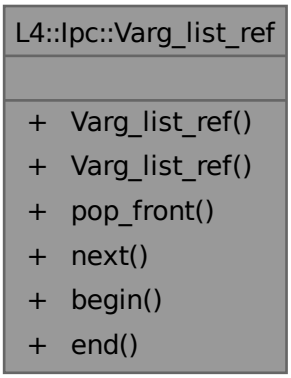
- l4/sys/cxx/ipc_varg

15.136 L4::Ipc::Varg_list_ref Class Reference

List of variable-sized RPC parameters as received by the server.
`#include <ipc_varg>`
Inheritance diagram for L4::Ipc::Varg_list_ref:



Collaboration diagram for L4::Ipc::Varg_list_ref:



Data Structures

- class Iterator

  Iterator for Valists.

Public Member Functions

- **Varg_list_ref** ()=default

  Create an empty parameter list.
- Varg_list_ref (void const ∗start, void const ∗end)

  Create a parameter list over a given memory region.
- Varg **pop_front** ()

  Get the next parameter in the list.
- Varg **next** ()

  Get the next parameter in the list.
- Iterator **begin** () const

  Returns an iterator to the first Varg.
- Iterator **end** () const

  Returns the end of the list.

15.136.1 Detailed Description

List of variable-sized RPC parameters as received by the server.
The list can be traversed exactly once using *next()*.
This is a reference list, where the returned Varg point to data in the underlying storage, conventionally the UTCB. This type should only be used in server functions when the implementation can ensure that all content is read before the UTCB is reused (e.g. for IPC), otherwise use Varg_list.
Definition at line 259 of file ipc_varg.

15.136.2 Constructor & Destructor Documentation

15.136.2.1 Varg_list_ref()

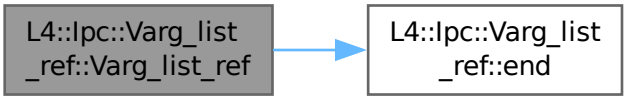
```
L4::Ipc::Varg_list_ref::Varg_list_ref (
            void const * start,
            void const * end)  [inline]
```

Create a parameter list over a given memory region.

Parameters

start	Pointer to start of the parameter list.
end	Pointer to end of the list (inclusive).

Definition at line 338 of file ipc_varg.
References end().
Here is the call graph for this function:



The documentation for this class was generated from the following file:

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.138.1 Detailed Description

The C++ IPC gate interface, see IPC-Gate API for the C interface.
IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the L4::Factory interface.
Depending on the permissions of the capability used, an IPC gate forwards IPC to the L4::Thread or L4::Thread_group the IPC gate is *bound* to (cf. bind_thread() and bind_snd_destination()). If the capability has the L4_FPAGE_C_IPCGATE_SVR permission, only IPC using a protocol different from the L4_PROTO_KOBJECT protocol is forwarded. Without the L4_FPAGE_C_IPCGATE_SVR permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.
Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the L4::Thread interface of that thread is not accessible via an IPC gate. The L4::Ipc_gate interface of an IPC gate is only accessible if the capability used has the L4_FPAGE_C_IPCGATE_SVR permission (cf. previous paragraph). Conversely that means, if the capability used lacks the L4_FPAGE_C_IPCGATE_SVR permission, L4::Ipc_gate interface calls are forwarded to the thread or thread group the IPC gate is bound to instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without L4_FPAGE_C_IPCGATE_SVR permission so the client cannot tamper with the IPC gate.
When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. bind_thread() and bind_snd_destination()). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the L4_CAP_FPAGE_S and L4_CAP_FPAGE_W permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to (or to the selected thread of the thread group the IPC gate is bound to) upon receive. However, the configured label of an IPC gate can also be queried via get_infos() if the capability used has the L4_FPAGE_C_IPCGATE_SVR permission.
When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, L4::Thread::modify_senders() shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.
When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

Include File

```
#include <l4/sys/ipc_gate>
```

For the C interface refer to the C IPC-Gate API.

See also

Object Invocation

Definition at line 85 of file ipc_gate.

15.138.2 Member Function Documentation

15.138.2.1 get_infos()

```
l4_msgtag_t L4::Ipc_gate::get_infos (
              l4_umword_t * label)
```

Get information about the IPC-gate.

Parameters

out	*label*	The label of the IPC gate is returned here.

Returns

System call return tag.

Precondition

If the IPC gate capability used to invoke this operation does not possess the L4_FPAGE_C_IPCGATE_SVR right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread or thread group the IPC gate is bound to, blocking the caller if the IPC gate is not bound yet.

Public Member Functions

- int alloc_buffer_demand (Demand const &demand) override

  Tells the server to allocate buffers for the given demand.
- L4::Cap< void > **get_rcv_cap** (int) const override

  Returns L4::Cap<void>::Invalid, we have no buffer management.
- int **realloc_rcv_cap** (int) override

  Returns -L4_ENOMEM, we have no buffer management.
- int **add_timeout** (Timeout *, l4_kernel_clock_t) override

  Returns -L4_ENOSYS, we have no timeout queue.
- int **remove_timeout** (Timeout *) override

  Returns -L4_ENOSYS, we have no timeout queue.

Public Member Functions inherited from L4::Ipc_svr::Server_iface

- **Server_iface** ()

  Make a server interface.
- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.
- virtual cxx::Result< Mem_window > get_rcv_mem () noexcept

  Take the current memory receive window.
- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Protected Member Functions

- unsigned **first_free_br** () const

  Returns 1 as first free buffer.
- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode)

  Setup wait function for the server loop (Server<>).

Additional Inherited Members

Public Types inherited from L4::Ipc_svr::Server_iface

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

15.139.1 Detailed Description

Empty implementation of Server_iface.
This implementation of Server_iface provides no buffer or timeout management at all it just returns errors for all calls that express other than empty demands. However, this may be useful for very simple servers that serve simple server objects only.
Definition at line 233 of file ipc_server_loop.

15.139.2 Member Function Documentation

15.139.2.1 alloc_buffer_demand()

```
int L4::Ipc_svr::Br_manager_no_buffers::alloc_buffer_demand (
            Demand const & demand)  [inline], [override], [virtual]
```

Tells the server to allocate buffers for the given demand.

Parameters

demand	The total server-side demand of receive buffers needed for a given interface, see Demand.

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.

Returns

success (0) if demand is empty, -L4_ENOMEM else.

Implements L4::Ipc_svr::Server_iface.
Definition at line 240 of file ipc_server_loop.
References L4_ENOMEM, L4_EOK, and L4::Type_info::Demand::no_demand().

  Make an exception handling dispatcher.
- l4_msgtag_t **operator()** (l4_msgtag_t tag, l4_umword_t obj, l4_utcb_t *utcb)

  Dispatch the call via Direct_dispatch<R>(), handle exceptions, and print the exception message.

15.141.1 Detailed Description

template<typename R, typename Exc, typename Printer>
struct L4::Ipc_svr::Dbg_dispatch< R, Exc, Printer >

Dispatch helper that, in addition to what Exc_dispatch does, prints exception messages.

Template Parameters

R	Data type of the registry used for dispatching to objects.
Exc	Data type of the exceptions that shall be caught. This data type must provide a member err_no() that returns the negative integer (int) error code for the exception. In addition, methods str() and extra_str() are required that return a c-string describing the error.
Printer	A type that provides a printf() member that is used (with the usual format string syntax) to print error messages.

This dispatcher wraps Direct_dispatch<R> with a try-catch (Exc).
Definition at line 184 of file ipc_server_loop.
The documentation for this struct was generated from the following file:

15.146.1 Detailed Description

template<typename R>
struct L4::Ipc_svr::Direct_dispatch< R * >

Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry *R*.

Template Parameters

R	Data type of the registry that is used for dispatching to different server objects, usually based on the protected IPC label.

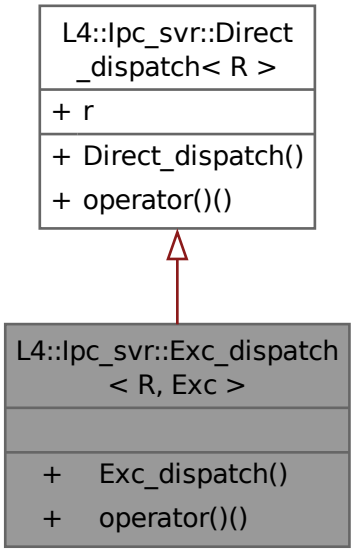
Definition at line 116 of file ipc_server_loop.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc_server_loop

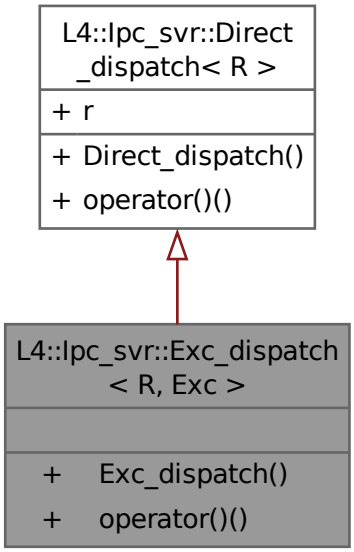
15.147 L4::Ipc_svr::Exc_dispatch< R, Exc > Struct Template Reference

Dispatch helper wrapping try {} catch {} around the dispatch call.
`#include <ipc_server_loop>`

Inheritance diagram for L4::Ipc_svr::Exc_dispatch< R, Exc >:



Collaboration diagram for L4::Ipc_svr::Exc_dispatch< R, Exc >:



Public Member Functions

- **Exc_dispatch** (R r)

Make an exception handling dispatcher.

- l4_msgtag_t **operator()** (l4_msgtag_t tag, l4_umword_t obj, l4_utcb_t *utcb)

  Dispatch the call via Direct_dispatch<R>() and handle exceptions.

15.147.1 Detailed Description

template<typename R, typename Exc>
struct L4::Ipc_svr::Exc_dispatch< R, Exc >

Dispatch helper wrapping try {} catch {} around the dispatch call.

Template Parameters

R	Data type of the registry used for dispatching to objects.
Exc	Data type of the exceptions that shall be caught. This data type must provide a member err_no() that returns the negative integer (int) error code for the exception.

This dispatcher wraps Direct_dispatch<R> with a try-catch (Exc).
Definition at line 140 of file ipc_server_loop.

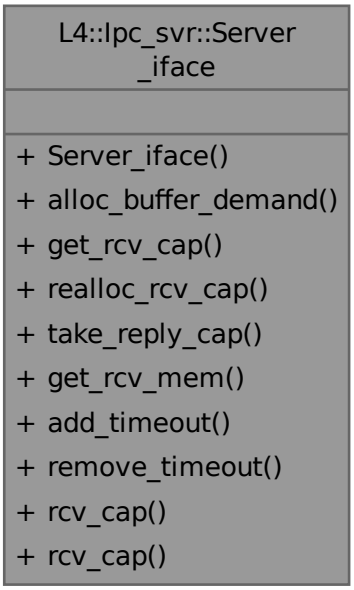
Collaboration diagram for L4::Ipc_svr::Server_iface:



Data Structures

- class Mem_window

  Memory receive window.

Public Types

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

Public Member Functions

- **Server_iface** ()

  Make a server interface.
- virtual int alloc_buffer_demand (Demand const &demand)=0

  Tells the server to allocate buffers for the given demand.
- virtual L4::Cap< void > get_rcv_cap (int index) const =0

  Get capability slot allocated to the given receive buffer.
- virtual int realloc_rcv_cap (int index)=0

  Allocate a new capability for the given receive buffer.
- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.
- virtual cxx::Result< Mem_window > get_rcv_mem () noexcept

  Take the current memory receive window.
- virtual int add_timeout (Timeout *timeout, l4_kernel_clock_t time)=0

  Add a timeout to the server internal timeout queue.
- virtual int remove_timeout (Timeout *timeout)=0

Remove the given timeout from the timer queue.

- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

15.149.1 Detailed Description

Interface for server-loop related functions.
This interface provides access to high-level server-loop related functions, such as management of receive buffers and timeouts.
Definition at line 37 of file ipc_epiface.

15.149.2 Member Function Documentation

15.149.2.1 add_timeout()

```
virtual int L4::Ipc_svr::Server_iface::add_timeout (
             Timeout * timeout,
             l4_kernel_clock_t time)  [pure virtual]
```

Add a timeout to the server internal timeout queue.

Parameters

timeout	The timeout object to register.
time	The time (absolute) at which the timeout shall expire.

Precondition

timeout must not be in any queue.

Returns

0 on success, 1 if timeout is already expired, < 0 on error.

Implemented in L4::Ipc_svr::Br_manager_no_buffers, L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >, L4::Ipc_svr::Timeout_queue_hooks< Br_manager_timeout_hooks, Br_manager >, and L4Re::Util::Br_manager.

15.149.2.2 alloc_buffer_demand()

```
virtual int L4::Ipc_svr::Server_iface::alloc_buffer_demand (
             Demand const & demand)  [pure virtual]
```

Tells the server to allocate buffers for the given demand.

Parameters

demand	The total server-side demand of receive buffers needed for a given interface, see Demand.

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.
Implemented in L4::Ipc_svr::Br_manager_no_buffers, and L4Re::Util::Br_manager.

15.149.2.3 get_rcv_cap()

```
virtual L4::Cap< void > L4::Ipc_svr::Server_iface::get_rcv_cap (
            int index) const  [pure virtual]
```

Get capability slot allocated to the given receive buffer.

Parameters

index	The receive buffer index of the expected capability argument (0 <= `index` < `caps` registered with alloc_buffer_demand()).

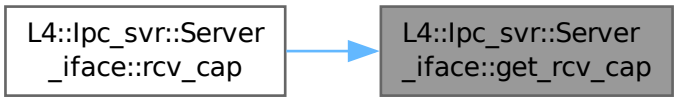
Precondition

0 <= `index` < `caps` registered with alloc_buffer_demand()

Returns

Capability slot currently allocated to the given receive buffer.

Implemented in L4::Ipc_svr::Br_manager_no_buffers, and L4Re::Util::Br_manager.
Referenced by rcv_cap().
Here is the caller graph for this function:



15.149.2.4 get_rcv_mem()

```
virtual cxx::Result< Mem_window > L4::Ipc_svr::Server_iface::get_rcv_mem ()  [inline], [virtual],
[noexcept]
```

Take the current memory receive window.
The caller takes the ownership of the memory receive window. A new receive window will be allocated for the next call.

Attention

The caller has to ensure that the received IPC call actually mapped some memory flexpage. Still, the IPC client can revoke the pages at any time. Thus, any access into the memory window could create unresolved page faults.

Reimplemented in L4Re::Util::Br_manager.
Definition at line 201 of file ipc_epiface.
References L4_ENOSYS.

15.149.2.5 rcv_cap() [1/2]

```
L4::Cap< void > L4::Ipc_svr::Server_iface::rcv_cap (
            int index) const  [inline]
```

Get receive cap with the given index as generic (void) type.

Parameters

index	The index of the cap receive buffer of the expected capability. (0 <= `index` < `caps` registered with alloc_buffer_demand().)

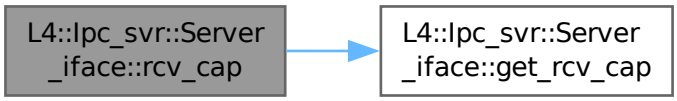
Returns

Capability slot currently allocated to the given capability buffer.

Note

This is a convenience wrapper for get_rcv_cap().

Definition at line 244 of file ipc_epiface.
References get_rcv_cap().
Here is the call graph for this function:



15.149.2.6 rcv_cap() [2/2]

```
template<typename T>
L4::Cap< T > L4::Ipc_svr::Server_iface::rcv_cap (
            int index) const  [inline]
```

Get given receive buffer as typed capability.

See also

get_rcv_cap()

Parameters

index	The receive buffer index of the expected capability argument. (0 <= `index` < `caps` registered with alloc_buffer_demand().)

Precondition

0 <= `index` < `caps` registered with alloc_buffer_demand()

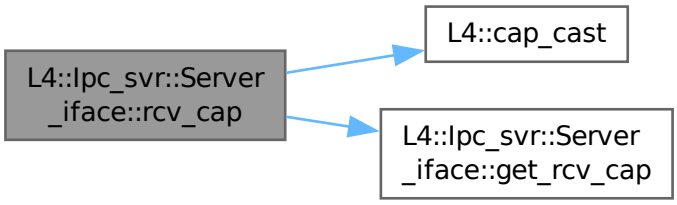
Returns

Capability slot currently allocated to the given receive buffer.

Note

This is a convenience wrapper for get_rcv_cap() to avoid L4::cap_cast<>().

Definition at line 232 of file ipc_epiface.
References L4::cap_cast(), and get_rcv_cap().
Here is the call graph for this function:



15.149.2.7 realloc_rcv_cap()

```
virtual int L4::Ipc_svr::Server_iface::realloc_rcv_cap (
            int index)  [pure virtual]
```

Allocate a new capability for the given receive buffer.

Parameters

index	The receive buffer index of the expected capability argument (0 <= `index` < `caps` registered with alloc_buffer_demand()).

Precondition

0 <= `index` < `caps` registered with alloc_buffer_demand()

Returns

0 on success, < 0 on error.

On success, the caller implicitly takes ownership of the former rcv_cap(`index`) prior to the call. On error, rcv_cap(`index`) remains unchanged and will be reused for the next IPC receive of the server.
Implemented in L4::Ipc_svr::Br_manager_no_buffers, and L4Re::Util::Br_manager.

15.149.2.8 remove_timeout()

```
virtual int L4::Ipc_svr::Server_iface::remove_timeout (
            Timeout * timeout)  [pure virtual]
```

Remove the given timeout from the timer queue.

Parameters

timeout	The timout object to remove.

Returns

0 on success, < 0 on error.

Implemented in L4::Ipc_svr::Br_manager_no_buffers, L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >, L4::Ipc_svr::Timeout_queue_hooks< Br_manager_timeout_hooks, Br_manager >, and L4Re::Util::Br_manager.

15.149.2.9 take_reply_cap()

```
virtual cxx::Result< L4::Reply_cap > L4::Ipc_svr::Server_iface::take_reply_cap () [inline],
[virtual], [noexcept]
```

Take the currently used reply capability.
The caller takes ownership of the reply capability. A new reply capability is allocated for the next call.
Definition at line 187 of file ipc_epiface.
References L4_ENOSYS.
The documentation for this class was generated from the following file:

- l4/sys/cxx/ipc_epiface

15.150 L4::Ipc_svr::Server_iface::Mem_window Class Reference

Memory receive window.

  Destroy a timeout.
- virtual void expired ()=0

  callback function to be called when timeout happened
- l4_kernel_clock_t timeout () const

  return absolute timeout of this callback.

Public Member Functions inherited from cxx::H_list_item_t< void >

- constexpr H_list_item_t ()

  Constructor.
- ~H_list_item_t () noexcept

  Destructor.

15.151.1 Detailed Description

Callback interface for Timeout_queue.
Definition at line 18 of file ipc_timeout_queue.

15.151.2 Member Function Documentation

15.151.2.1 expired()

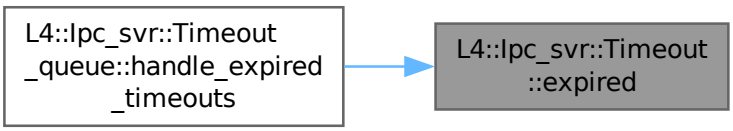
```
virtual void L4::Ipc_svr::Timeout::expired ()  [pure virtual]
```

callback function to be called when timeout happened

Note

The timeout object is already dequeued when this function is called, this means the timeout may be safely queued again within the expired() function.

Referenced by L4::Ipc_svr::Timeout_queue::handle_expired_timeouts().
Here is the caller graph for this function:



15.151.2.2 timeout()

```
l4_kernel_clock_t L4::Ipc_svr::Timeout::timeout () const  [inline]
```

return absolute timeout of this callback.

Returns

absolute timeout for this instance of the timeout.

Precondition

The timeout object must have been in a queue before, otherwise the timeout is not set.

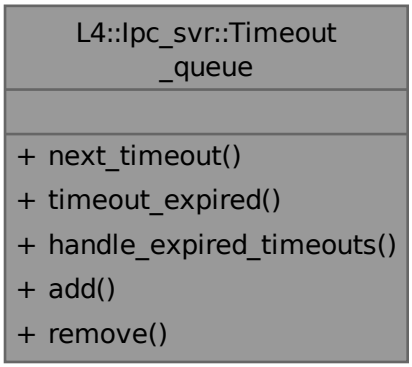
Definition at line 42 of file ipc_timeout_queue.
The documentation for this class was generated from the following file:

- l4/cxx/ipc_timeout_queue

15.152 L4::Ipc_svr::Timeout_queue Class Reference

Timeout queue to be used in l4re server loop.
`#include <ipc_timeout_queue>`

Collaboration diagram for L4::Ipc_svr::Timeout_queue:



Public Types

- typedef L4::Ipc_svr::Timeout **Timeout**

  Provide a local definition of Timeout for backward compatibility.

Public Member Functions

- l4_kernel_clock_t next_timeout () const

  Get the time for the next timeout.
- bool timeout_expired (l4_kernel_clock_t now) const

  Determine if a timeout has happened.
- void handle_expired_timeouts (l4_kernel_clock_t now)

  run the callbacks of expired timeouts
- void add (Timeout *timeout, l4_kernel_clock_t time)

  Add a timeout to the queue.
- void remove (Timeout *timeout)

  Remove timeout from the queue.

15.152.1 Detailed Description

Timeout queue to be used in l4re server loop.
Definition at line 55 of file ipc_timeout_queue.

15.152.2 Member Function Documentation

15.152.2.1 add()

```
void L4::Ipc_svr::Timeout_queue::add (
            Timeout * timeout,
            l4_kernel_clock_t time)  [inline]
```

Add a timeout to the queue.

Parameters

timeout	timeout object to add
time	the time when the timeout expires

Precondition

timeout must not be in any queue already

Definition at line 111 of file ipc_timeout_queue.

15.152.2.2 handle_expired_timeouts()

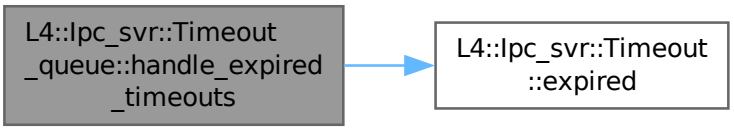
```
void L4::Ipc_svr::Timeout_queue::handle_expired_timeouts (
            l4_kernel_clock_t now)  [inline]
```

run the callbacks of expired timeouts

Parameters

now	the current time.

Definition at line 91 of file ipc_timeout_queue.
References L4::Ipc_svr::Timeout::expired().
Here is the call graph for this function:



15.152.2.3 next_timeout()

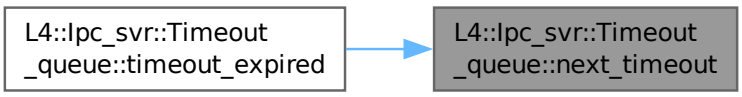
```
l4_kernel_clock_t L4::Ipc_svr::Timeout_queue::next_timeout () const  [inline]
```

Get the time for the next timeout.

Returns

the time for the next timeout or 0 if there is none

Definition at line 65 of file ipc_timeout_queue.
Referenced by timeout_expired().
Here is the caller graph for this function:



15.152.2.4 remove()

```
void L4::Ipc_svr::Timeout_queue::remove (
            Timeout * timeout)  [inline]
```

Remove *timeout* from the queue.

Parameters

timeout	timeout to remove from timeout queue

Precondition

timeout must be in this queue

Definition at line 126 of file ipc_timeout_queue.

15.152.2.5 timeout_expired()

```
bool L4::Ipc_svr::Timeout_queue::timeout_expired (
            l4_kernel_clock_t now) const  [inline]
```

Determine if a timeout has happened.

Parameters

now	The current time.

Return values

true	There is at least one expired timeout in the queue. false No expired timeout in the queue.

Definition at line 81 of file ipc_timeout_queue.
References next_timeout().

Public Member Functions

- l4_timeout_t **timeout** ()

  get the time for the next timeout
- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode mode)

  setup_wait() for the server loop
- L4::Ipc_svr::Reply_mode **before_reply** (l4_msgtag_t, l4_utcb_t *)

  server loop hook
- int add_timeout (Timeout *timeout, l4_kernel_clock_t time) override

Add a timeout to the queue for time time.

- int remove_timeout (Timeout *timeout) override

  Remove timeout from the queue.

Public Member Functions inherited from L4::Ipc_svr::Server_iface

- **Server_iface** ()

  Make a server interface.
- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.
- virtual cxx::Result< Mem_window > get_rcv_mem () noexcept

  Take the current memory receive window.
- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Public Member Functions inherited from L4::Ipc_svr::Br_manager_no_buffers

- int alloc_buffer_demand (Demand const &demand) override

  Tells the server to allocate buffers for the given demand.
- L4::Cap< void > **get_rcv_cap** (int) const override

  Returns L4::Cap< void >::Invalid, we have no buffer management.
- int **realloc_rcv_cap** (int) override

  Returns -L4_ENOMEM, we have no buffer management.

Data Fields

- Timeout_queue **queue**

  Use this timeout queue.

Additional Inherited Members

Public Types inherited from L4::Ipc_svr::Server_iface

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

Protected Member Functions inherited from L4::Ipc_svr::Br_manager_no_buffers

- unsigned **first_free_br** () const

  Returns 1 as first free buffer.
- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode)

  Setup wait function for the server loop (Server<>).

15.153.1 Detailed Description

template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
class L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >

Loop hooks mixin for integrating a timeout queue into the server loop.

Template Parameters

HOOKS	has to inherit from Timeout_queue_hooks<> and provide the functions now() that has to return the current time.
BR_MAN	This used as a base class for and provides the API for selecting the buffer register (BR) that is used to store the timeout value. This is usually L4Re::Util::Br_manager or L4::Ipc_svr::Br_manager_no_buffers.

Definition at line 150 of file ipc_timeout_queue.

15.153.2 Member Function Documentation

15.153.2.1 add_timeout()

```
template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
int L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::add_timeout (
            Timeout * timeout,
            l4_kernel_clock_t time)  [inline], [override], [virtual]
```

Add a timeout to the queue for time *time*.

Parameters

timeout	The timeout object to add into the queue (must not be in any queue currently).
time	The time when the timeout shall expire.

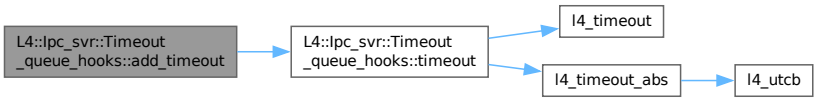
Precondition

timeout must not be in any queue.

Note

The timeout is automatically dequeued before the Timeout::expired() function is called

Implements L4::Ipc_svr::Server_iface.
Definition at line 202 of file ipc_timeout_queue.
References queue, and timeout().
Here is the call graph for this function:



15.153.2.2 remove_timeout()

```
template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
int L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::remove_timeout (
            Timeout * timeout)  [inline], [override], [virtual]
```

Remove timeout from the queue.

Parameters

timeout	The timeout object to be removed from the queue.

Note

This function may be safely called even if the timeout is not currently enqueued.

in Timeout::expired() the timeout is already dequeued!

Implements L4::Ipc_svr::Server_iface.
Definition at line 215 of file ipc_timeout_queue.
References queue, and timeout().
Here is the call graph for this function:

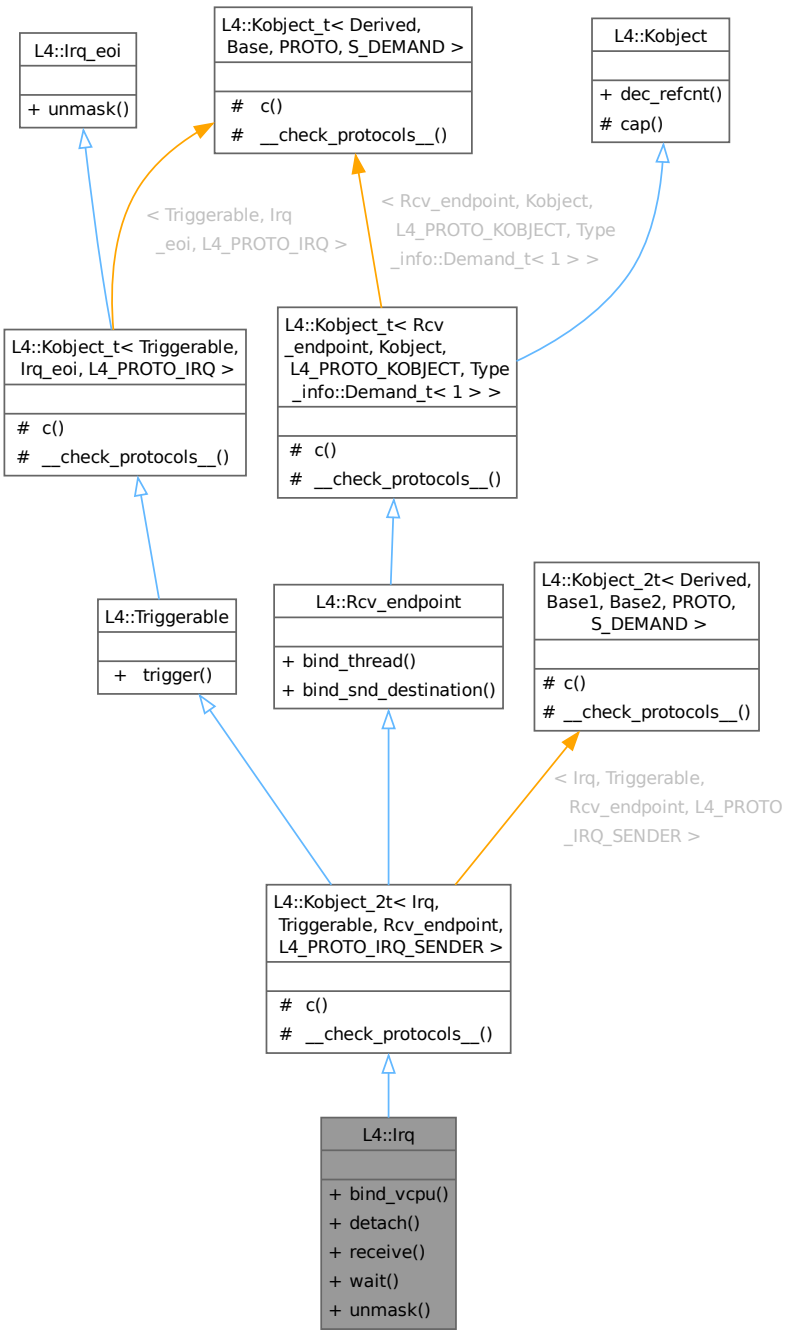
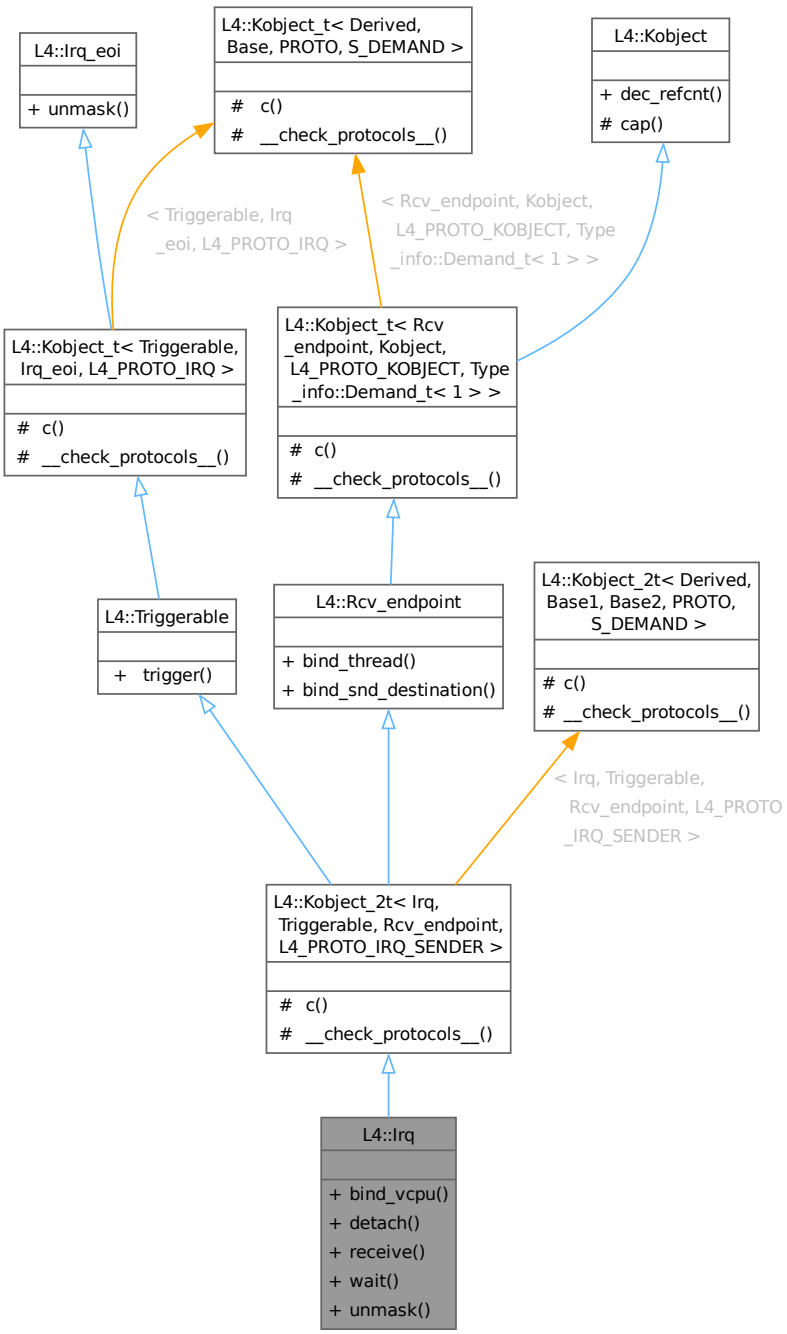
15.154 L4::Irq Class Reference

C++ Irq interface, see IRQs for the C interface.
`#include <irq>`

Inheritance diagram for L4::Irq:



Collaboration diagram for L4::Irq:



Public Member Functions

- l4_msgtag_t bind_vcpu (L4::Cap< Thread > const &thread, l4_umword_t cfg, l4_utcb_t *utcb=l4_utcb()) noexcept

  Bind a thread to this Irq for vCPU interrupt forwarding.
- l4_msgtag_t detach (l4_utcb_t *utcb=l4_utcb()) noexcept

  Detach from this interrupt.
- l4_msgtag_t receive (l4_timeout_t timeout=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

Unmask and wait for this IRQ.

- l4_msgtag_t wait (l4_umword_t *label, l4_timeout_t timeout=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask IRQ and (open) wait for any message.

- l4_msgtag_t unmask (l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask this IRQ.

Public Member Functions inherited from L4::Triggerable

- l4_msgtag_t trigger (l4_utcb_t *utcb=l4_utcb()) noexcept

  Trigger the object.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

Public Member Functions inherited from L4::Rcv_endpoint

- l4_msgtag_t bind_thread (Ipc::Cap< Thread > t, l4_umword_t label)

  Bind the IPC receive endpoint to a thread.

- l4_msgtag_t bind_snd_destination (Cap< Snd_destination > snd_dst, l4_umword_t label)

  Bind a send destination (a thread or thread group) to an IPC receive endpoint.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_2t< Irq, Triggerable, Rcv_endpoint, L4_PROTO_IRQ_SENDER >

- typedef Irq Class

  The target interface type (inheriting from Kobject_t).

- typedef Typeid::Iface< PROTO, Irq > __Iface

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, Typeid::Merge_list< typename Triggerable::__Iface_list, typename Rcv_endpoint::__Iface_list > > __Iface_list

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Triggerable, Irq_eoi, L4_PROTO_IRQ >

- typedef Triggerable **Class**

  The target interface type (inheriting from Kobject_t).

- typedef Typeid::Iface< PROTO, Triggerable > **__Iface**

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Irq_eoi::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Rcv_endpoint, Kobject, L4_PROTO_KOBJECT, Type_info::Demand_t< 1 > >

- typedef Rcv_endpoint **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Rcv_endpoint > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_2t< Irq, Triggerable, Rcv_endpoint, L4_PROTO_IRQ_SENDER >

- L4::Cap< Class > c () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject_t< Triggerable, Irq_eoi, L4_PROTO_IRQ >

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject_t< Rcv_endpoint, Kobject, L4_PROTO_KOBJECT, Type_info::Demand_t< 1 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_2t< Irq, Triggerable, Rcv_endpoint, L4_PROTO_IRQ_SENDER >

- static void __check_protocols__ () noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Triggerable, Irq_eoi, L4_PROTO_IRQ >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Rcv_endpoint, Kobject, L4_PROTO_KOBJECT, Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.154.1 Detailed Description

C++ Irq interface, see IRQs for the C interface.

Note

"IRQ" is short for "interrupt request". This is often used interchangeably for "interrupt"

The Irq class provides access to abstract interrupts provided by the microkernel. Interrupts may be

- hardware interrupts provided by the platform interrupt controller,
- virtual device interrupts provided by the microkernel's virtual devices (virtual serial or trace buffer) or
- virtual interrupts that can be triggered by user programs (IRQs) via the inherited method L4::Triggerable::trigger().

For hardware and virtual device interrupts the Irq object must be bound to an interrupt source, see L4::Icu. To receive interrupts, the Irq object must be bound to a thread, see L4::Rcv_endpoint.
Irq objects can be created using a factory, see the L4::Factory API (L4::Factory::create()).

Include File

```
#include <l4/sys/irq>
```

For the C interface refer to the IRQs API for an overview.

Examples

examples/libs/l4re/c++/shared_ds/ds_clnt.cc.

Definition at line 120 of file irq.

15.154.2 Member Function Documentation

15.154.2.1 bind_vcpu()

```
l4_msgtag_t L4::Irq::bind_vcpu (
             L4::Cap< Thread > const & thread,
             l4_umword_t cfg,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Bind a thread to this Irq for vCPU interrupt forwarding.
If the interrupt is triggered, the kernel will directly inject the interrupt into the guest. This requires that the thread is currently in extended vCPU user mode. Otherwise the interrupt will stay pending and gets injected on the next vCPU user mode transition. Optionally a doorbell Irq can be registered on the thread (see Thread::register_doorbell_irq()) that is triggered in this case.
If a guest has acknowledged the interrupt but has not yet issued an EOI (i.e. the interrupt is in "active" state), it is not possible to bind the Irq to a new thread object. Either wait for the guest to issue the EOI or detach() from the current thread. In this case the interrupt will stay active in the guest and it is the responsibility of the VMM to handle the eventual EOI of the guest.

Parameters

thread	Thread object this Irq shall be bound to.
cfg	Architecture specific interrupt configuration.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

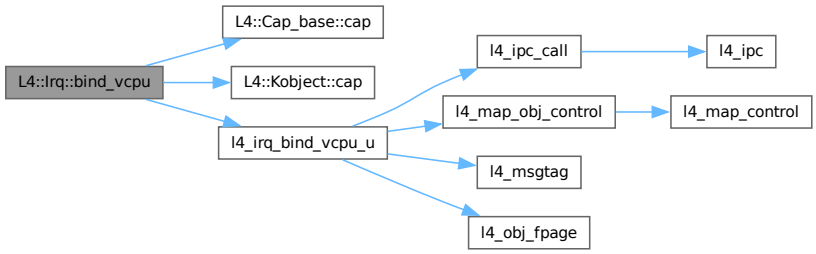
Return values

-L4_EPERM	Insufficient permissions; see precondition.
-L4_EBUSY	Cannot bind to the new thread because interrupt is active on previous thread and guest has to issue end-of-interrupt first.
-L4_ENOSYS	The kernel does not support direct interrupt forwarding.

Precondition

The invoked Irq capability and the capability `thread` both must have the permission L4_CAP_FPAGE_S.

Definition at line 158 of file irq.
References L4::Cap_base::cap(), L4::Kobject::cap(), and l4_irq_bind_vcpu_u().
Here is the call graph for this function:



15.154.2.2 detach()

```
l4_msgtag_t L4::Irq::detach (
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Detach from this interrupt.

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

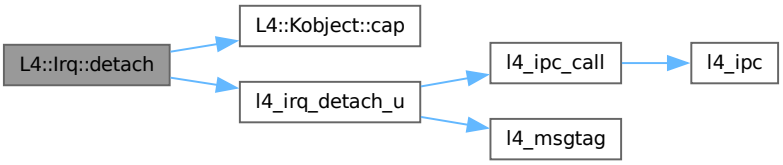
Return values

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
2	Successfully detached, an active vIRQ was abandoned.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The invoked Irq capability must have the permission L4_CAP_FPAGE_S.

Definition at line 176 of file irq.
References L4::Kobject::cap(), and l4_irq_detach_u().
Here is the call graph for this function:



15.154.2.3 receive()

```
l4_msgtag_t L4::Irq::receive (
            l4_timeout_t timeout = L4_IPC_NEVER,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Unmask and wait for this IRQ.

Parameters

timeout	Timeout.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

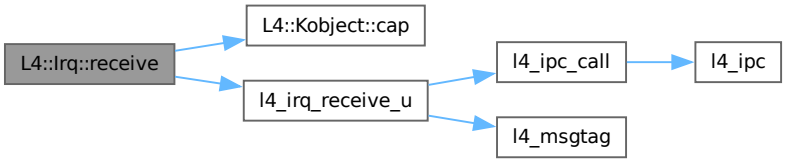
Returns

Syscall return tag

Note

If this is the function normally used for your IRQs consider using L4::Semaphore instead of L4::Irq.

Definition at line 191 of file irq.
References L4::Kobject::cap(), L4_IPC_NEVER, and l4_irq_receive_u().
Here is the call graph for this function:



15.154.2.4 unmask()

```
l4_msgtag_t L4::Irq::unmask (
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Unmask this IRQ.

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag for a send-only operation, this means there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. Use l4_ipc_error() to check for errors and **do not** use l4_error().

Irq::wait() and Irq::receive() operations already include an unmask(), do not use an extra unmask() in these cases.
Definition at line 221 of file irq.
References L4_IPC_NEVER, and unmask().
Referenced by unmask(), and wait().

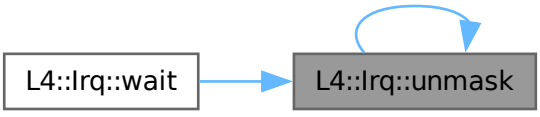
Here is the caller graph for this function:



15.154.2.5 wait()

```
l4_msgtag_t L4::Irq::wait (
            l4_umword_t * label,
            l4_timeout_t timeout = L4_IPC_NEVER,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Unmask IRQ and (open) wait for any message.

Parameters

label	The *protected label* shall be received here.
timeout	Timeout.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

Definition at line 204 of file irq.
References L4_IPC_NEVER, and unmask().

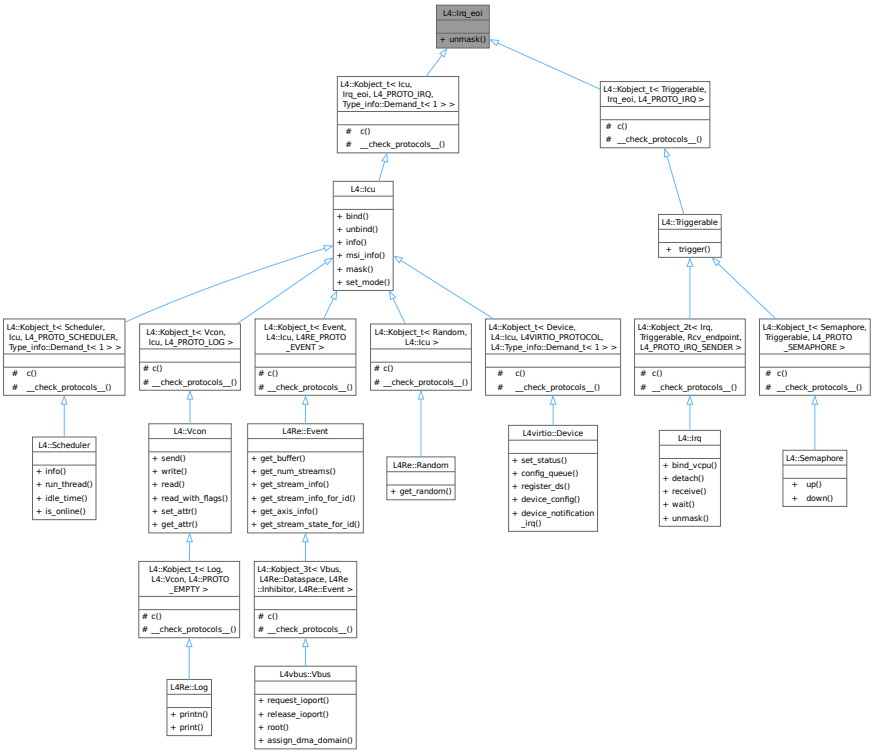
The documentation for this class was generated from the following file:

- l4/sys/irq

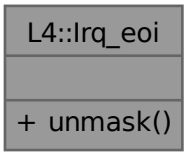
15.155 L4::Irq_eoi Class Reference

Interface for sending an unmask message to an object.
`#include <irq>`

Inheritance diagram for L4::Irq_eoi:



Collaboration diagram for L4::Irq_eoi:



Public Member Functions

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

15.155.1 Detailed Description

Interface for sending an unmask message to an object.
The object is usually an ICU or an IRQ.
When the kernel receives an IRQ, it masks the interrupt line at the interrupt controller and immediately acknowledges the interrupt. This interface is used to let the kernel know that userspace has dealt with the IRQ. The kernel will unmask the interrupt line and further IRQs can then be delivered.

See also

L4::Icu, L4::Irq

Definition at line 37 of file irq.

15.155.2 Member Function Documentation

15.155.2.1 unmask()

```
l4_msgtag_t L4::Irq_eoi::unmask (
             unsigned irqnum,
             l4_umword_t * label = 0,
             l4_timeout_t to = L4_IPC_NEVER,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Unmask the given interrupt line.
When the object is an IRQ, the given interrupt line is ignored and instead the line which the IRQ is bound to (if any) is unmasked.
Its counterpart for explicitly masking an interrupt line is L4::Icu::mask().

Parameters

	irqnum	The interrupt line that shall be unmasked. Ignored if the object is an IRQ.
out	*label*	If NULL, this is a send-only unmask. If not NULL, this operation enters an open wait and the *protected label* shall be received here.
	to	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL `label` only.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. If `label` is NULL, this function performs an IPC send-only operation and there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. In this case use l4_ipc_error() to check for errors and **do not** use l4_error().

Definition at line 64 of file irq.
References L4::Kobject::cap(), and L4_IPC_NEVER.
Here is the call graph for this function:

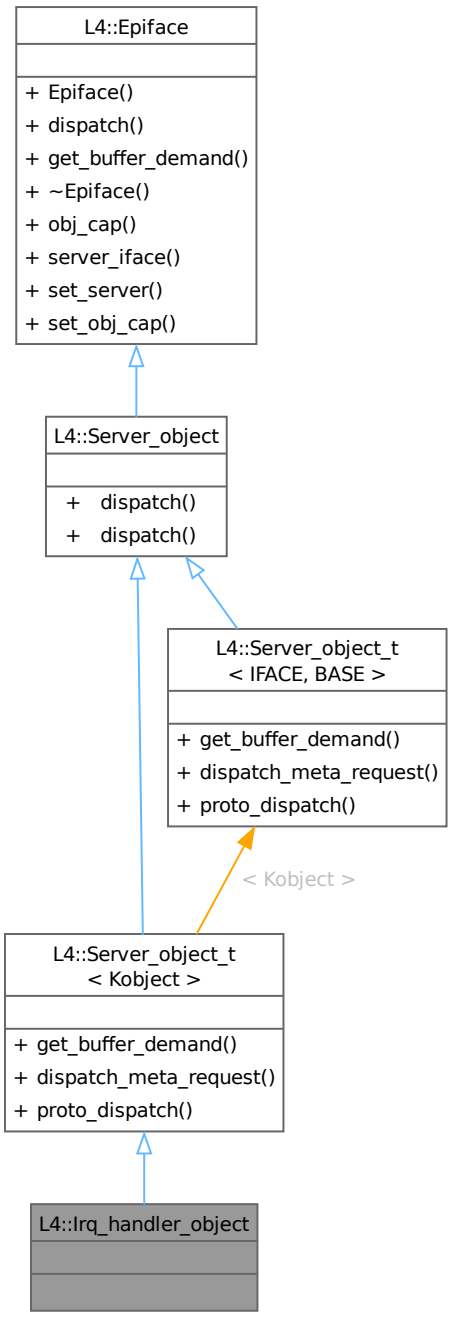
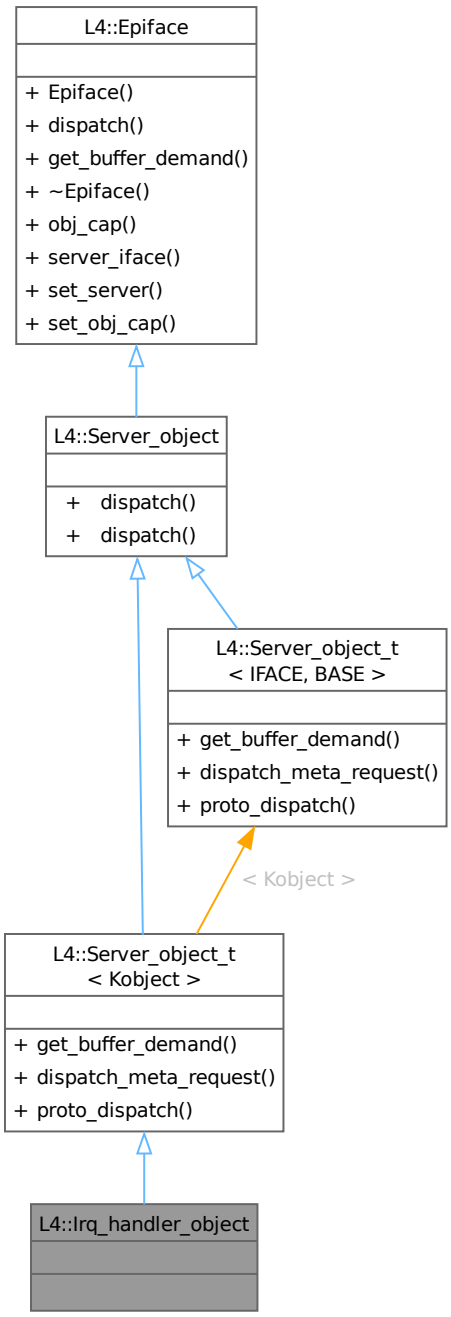
15.156 L4::Irq_handler_object Struct Reference

Server object base class for handling IRQ messages.
`#include <ipc_server>`

Inheritance diagram for L4::Irq_handler_object:



Collaboration diagram for L4::Irq_handler_object:



Additional Inherited Members

Public Types inherited from L4::Server_object_t< Kobject >

- typedef Kobject **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Member Functions inherited from L4::Server_object_t< Kobject >

- L4::Server_object::Demand get_buffer_demand () const override
- int dispatch_meta_request (L4::Ipc::Iostream &ios)

  Implementation of the meta protocol based on IFACE.

Public Member Functions inherited from L4::Server_object

- virtual int dispatch (unsigned long rights, Ipc::Iostream &ios)=0

  The abstract handler for client requests to the object.
- l4_msgtag_t dispatch (l4_msgtag_t tag, unsigned rights, l4_utcb_t *utcb) override

  The abstract handler for client requests to the object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Static Public Member Functions inherited from L4::Server_object_t< Kobject >

- static int proto_dispatch (THIS *self, l4_umword_t rights, L4::Ipc::Iostream &ios)

  Implementation of protocol-based dispatch for this server object.

15.156.1 Detailed Description

Server object base class for handling IRQ messages.
This server object base class implements the empty interface (L4::Kobject). The implementation of Server_object::dispatch() must return -L4_ENOREPLY, because IRQ messages do not handle replies.

Examples

examples/libs/l4re/c++/shared_ds/ds_srv.cc.

Definition at line 161 of file ipc_server.
The documentation for this struct was generated from the following file:

- l4/cxx/ipc_server

15.157 L4::Irqep_t< Derived, BASE, bool > Struct Template Reference

Epiface implementation for interrupt handlers.

`#include <ipc_epiface>`

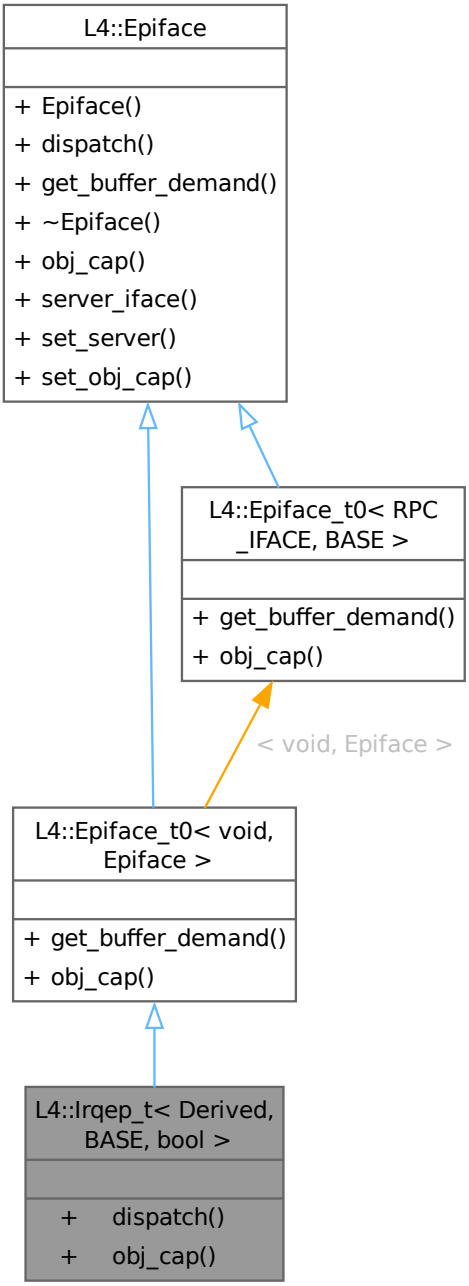
Collaboration diagram for L4::Irqep_t< Derived, BASE, bool >:



Public Member Functions

- l4_msgtag_t dispatch (l4_msgtag_t, unsigned, l4_utcb_t *) final

  The abstract handler for client requests to the object.
- Cap< L4::Irq > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface_t0< void, Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< void > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< void, Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

15.157.1 Detailed Description

template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
struct L4::Irqep_t< Derived, BASE, bool >

Epiface implementation for interrupt handlers.

Template Parameters

Derived	Irq handler implementation class. The class must provide a single function handle_irq().
BASE	Base Epiface class.

Definition at line 400 of file ipc_epiface.

15.157.2 Member Function Documentation

15.157.2.1 dispatch()

```
template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
l4_msgtag_t L4::Irqep_t< Derived, BASE, bool >::dispatch (
            l4_msgtag_t tag,
            unsigned rights,
            l4_utcb_t * utcb)  [inline], [final], [virtual]
```

The abstract handler for client requests to the object.

Parameters

tag	The message tag for this invocation.
rights	The rights bits in the invoked capability.
utcb	The UTCB used for the invocation.

Return values

-L4_ENOREPLY	No reply message is sent.
<0	Error, reply with error code.
>=0	Success, reply with return value.

This function must be implemented by application specific server objects.
Implements L4::Epiface.
Definition at line 402 of file ipc_epiface.
References L4_ENOREPLY, and l4_msgtag().
Here is the call graph for this function:

15.157.2.2 obj_cap()

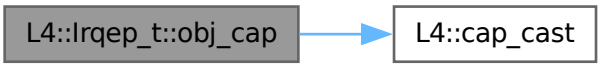
```
template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
Cap< L4::Irq > L4::Irqep_t< Derived, BASE, bool >::obj_cap () const  [inline]
```

Get the (typed) capability to this object.

Returns

Irq capability for the kernel object behind the server.

Definition at line 412 of file ipc_epiface.
References L4::cap_cast().
Here is the call graph for this function:



The documentation for this struct was generated from the following file:

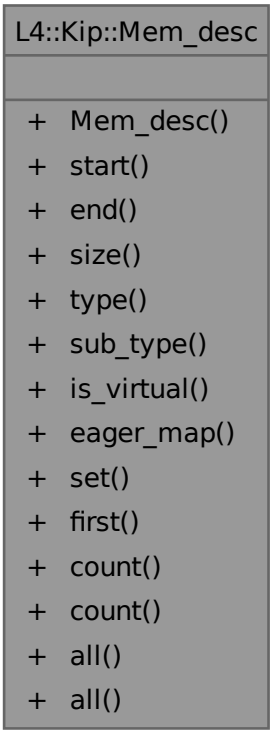
15.158 L4::Kip::Mem_desc Class Reference

Memory descriptors stored in the kernel interface page.
`#include <kip>`
Collaboration diagram for L4::Kip::Mem_desc:



Public Types

- enum Mem_type {
  Undefined = 0x0 , Conventional = 0x1 , Reserved = 0x2 , Dedicated = 0x3 ,
  Shared = 0x4 , Kmem = 0x5 , Info = 0xd , Bootloader = 0xe ,
  Arch = 0xf }

  Memory types.
- enum Info_sub_type { Info_acpi_rsdp = 0 , Reserved_kernel = 0 , Reserved_heap = 1 , Reserved_mmio = 2 }

  Memory sub types for the Mem_type::Info type.
- enum Arch_sub_type_common { Arch_acpi_tables = 3 , Arch_acpi_nvs = 4 , Arch_cpu_fw = 5 }

  Common sub types across all architectures for the Mem_type::Arch type.

Public Member Functions

- Mem_desc (unsigned long start, unsigned long end, Mem_type t, unsigned char st=0, bool virt=false, bool eager=false) noexcept

  Initialize memory descriptor.
- unsigned long start () const noexcept

  Return start address of memory descriptor.
- unsigned long end () const noexcept

  Return end address of memory descriptor.
- unsigned long size () const noexcept

  Return size of region described by the memory descriptor.
- Mem_type type () const noexcept

  Return type of the memory descriptor.
- unsigned char sub_type () const noexcept

  Return sub-type of the memory descriptor.
- unsigned is_virtual () const noexcept

  Return whether the memory descriptor describes a virtual or physical region.
- unsigned **eager_map** () const noexcept

  Return whether the region shall be eligible for eager mapping in sigma0 or the root task.
- void set (unsigned long start, unsigned long end, Mem_type t, unsigned char st=0, bool virt=false, bool eager=false) noexcept

  Set values of a memory descriptor.

Static Public Member Functions

- static Mem_desc * first (l4_kernel_info_t *kip) noexcept

  Get first memory descriptor.
- static unsigned long count (l4_kernel_info_t const *kip) noexcept

  Return number of memory descriptors stored in the kernel info page.
- static void count (l4_kernel_info_t *kip, unsigned count) noexcept

  Set number of memory descriptors.
- static cxx::static_vector< Mem_desc const > all (l4_kernel_info_t const *kip)

  Return enumerable list of memory descriptors.
- static cxx::static_vector< Mem_desc > all (l4_kernel_info_t *kip)

  Return enumerable list of memory descriptors.

15.158.1 Detailed Description

Memory descriptors stored in the kernel interface page.

Include File

```
#include <l4/sys/kip>
```

Definition at line 42 of file kip.

15.158.2 Member Enumeration Documentation

15.158.2.1 Arch_sub_type_common

`enum L4::Kip::Mem_desc::Arch_sub_type_common`
Common sub types across all architectures for the Mem_type::Arch type.

Enumerator

Arch_acpi_tables	Firmware ACPI tables.
Arch_acpi_nvs	Firmware reserved address space.
Arch_cpu_fw	CPU firmware.

Definition at line 79 of file kip.

15.158.2.2 Info_sub_type

`enum L4::Kip::Mem_desc::Info_sub_type`
Memory sub types for the Mem_type::Info type.

Enumerator

Info_acpi_rsdp	Physical address of the ACPI root pointer.
Reserved_kernel	Kernel image.
Reserved_heap	Kernel heap.
Reserved_mmio	MMIO range reserved by kernel.

Definition at line 67 of file kip.

15.158.2.3 Mem_type

`enum L4::Kip::Mem_desc::Mem_type`
Memory types.

Enumerator

Undefined	Undefined memory.
Conventional	Conventional memory.
Reserved	Reserved region, do not use this memory.
Dedicated	Dedicated.
Shared	Shared.
Kmem	Kernel memory.
Info	Info by boot loader.
Bootloader	Memory belongs to the boot loader.
Arch	Architecture specific memory.

Definition at line 48 of file kip.

15.158.3 Constructor & Destructor Documentation

15.158.3.1 Mem_desc()

`L4::Kip::Mem_desc::Mem_desc (`

```
            unsigned long start,
            unsigned long end,
            Mem_type t,
            unsigned char st = 0,
            bool virt = false,
            bool eager = false)  [inline], [noexcept]
```

Initialize memory descriptor.

Parameters

start	Start address
end	End address
t	Memory type
st	Memory subtype, defaults to 0
virt	True for virtual memory, false for physical memory, defaults to physical
eager	The region shall be eligible for eager mapping in sigma0 or the root task. This is just an optimization to prevent on-demand paging.

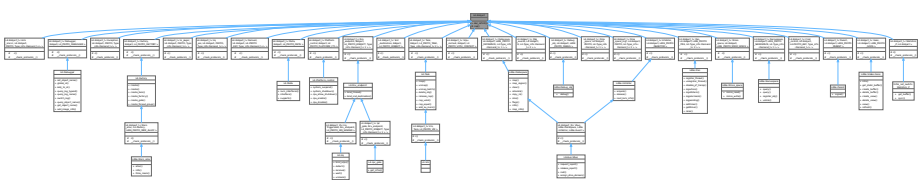
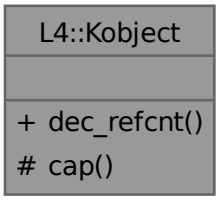
15.159 L4::Kobject Class Reference

Base class for all kinds of kernel objects and remote objects, referenced by capabilities.
`#include <kobject>`
Inheritance diagram for L4::Kobject:



Collaboration diagram for L4::Kobject:



Public Member Functions

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Protected Member Functions

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

15.159.1 Detailed Description

Base class for all kinds of kernel objects and remote objects, referenced by capabilities.

Include File

```
#include <l4/sys/capability>
```

This is the base class for all remote objects accessible using RPC. However, subclasses do not directly inherit from L4::Kobject but *must* use L4::Kobject_t (L4::Kobject_0t, L4::Kobject_2t, L4::Kobject_3t, or L4::Kobject_x) for inheritance, otherwise these classes cannot be used as RPC interfaces.

Attention

Objects derived from Kobject *must* never add any data to those objects. Kobjects can act only as proxy object for encapsulating object invocations.

Definition at line 36 of file kobject.

15.159.2 Member Function Documentation

15.159.2.1 cap()

```
l4_cap_idx_t L4::Kobject::cap () const  [inline], [protected], [noexcept]
```

Return capability selector.

Returns

Capability selector.

This method is for derived classes to gain access to the actual capability selector.
Definition at line 69 of file kobject.

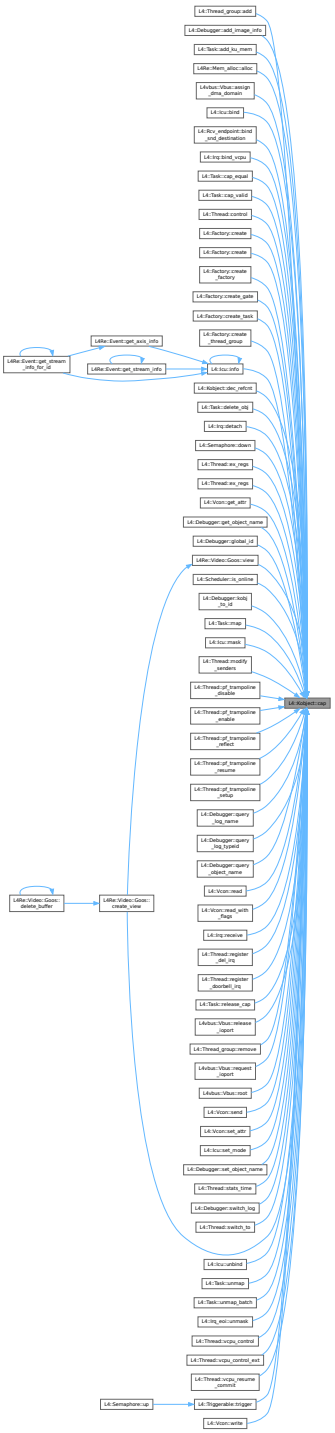
Here is the caller graph for this function:



15.159.2.2 dec_refcnt()

```
l4_msgtag_t L4::Kobject::dec_refcnt (
            l4_mword_t diff,
            l4_utcb_t * utcb = l4_utcb())  [inline]
```

Decrement the in kernel reference counter for the object.

Parameters

diff	The delta that shall be subtracted from the reference count.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag

This function is intended for servers to be able to remove the servers own capability from the counted references. This leads to the semantics that the kernel will delete the object even if the capability of the server is valid. The server can detect the deletion by polling its capabilities or by using the IPC-gate deletion IRQs. And to cleanup if the clients dropped the last reference (capability) to the object.
This function only succeeds on a kernel object of type L4::Ipc_gate which has the server right (L4_FPAGE_C_IPCGATE_SVR). For other kernel objects, -L4_ENOSYS is returned.

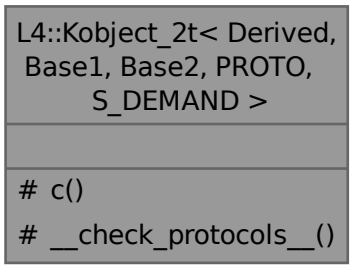
Collaboration diagram for L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >:



Protected Types

- typedef Derived Class

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Derived > __Iface

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, Typeid::Merge_list< typename Base1::__Iface↩ _list, typename Base2::__Iface_list > > __Iface_list

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions

- L4::Cap< Class > c () const noexcept

  Get the capability to ourselves.

Static Protected Member Functions

- static void __check_protocols__ () noexcept

  Helper to check for protocol conflicts.

15.160.1 Detailed Description

template<typename Derived, typename Base1, typename Base2, l4_proto_t PROTO = PROTO_ANY, typename S_DEMAND = Type_info::Demand_t<>>
class L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >

Helper class to create an L4Re interface class that is derived from two base classes (see `L4::Kobject_t`).

Template Parameters

Derived	is the name of the new interface.
Base1	is the name of the interface's first base class.
Base2	is the name of the interface's second base class.
PROTO	may be set to the statically assigned protocol number used to communicate with this interface.
S_DEMAND	type defining the demand of server-side resources for this interface, usually a L4::Type_info::Demand_t. This value must describe the server-side resources needed by the interface itself, the resource demand of the base interfaces (Base1 and Base2) are automatically included.

The typical usage pattern is shown in the following code snippet. The semantics of this example is an interface My_iface that is derived from L4::Icu and L4Re::Dataspace.

```
class My_iface : public L4::Kobject_2t<My_iface, L4::Icu, L4Re::Dataspace>
{
  ...
};
```

15.163.1 Detailed Description

template<typename Derived, typename Base, l4_proto_t PROTO = PROTO_ANY, typename S_DEMAND = Type_info::Demand_t<>>
class L4::Kobject_t< Derived, Base, PROTO, S_DEMAND >

Helper class to create an L4Re interface class that is derived from a single base class.

Template Parameters

Derived	is the name of the new interface.
Base	is the name of the interfaces single base class.
PROTO	may be set to the statically assigned protocol number used to communicate with this interface.
S_DEMAND	type defining the demand on server-side resources for this interface, usually a L4::Type_info::Demand_t. This value must describe the server-side resources needed by the interface itself, the resource demand of the base interface `Base` is automatically included.

The typical usage pattern is shown in the following code snippet. The semantics of this example is an interface My_iface that is derived from L4::Kobject.

```
class My_iface : public L4::Kobject_t<My_iface, L4::Kobject>
{
  ...
};
```

Examples

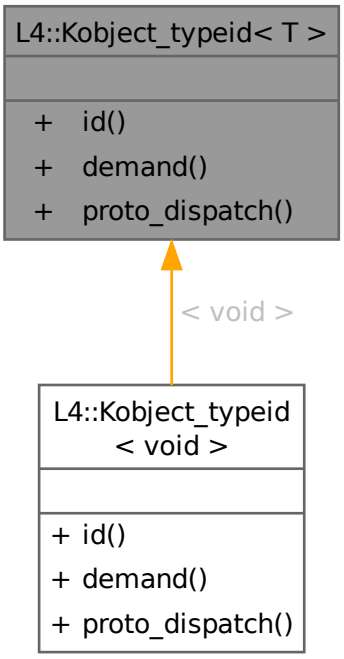
examples/clntsrv/src/shared.h.

Definition at line 749 of file __typeinfo.h.
The documentation for this class was generated from the following file:

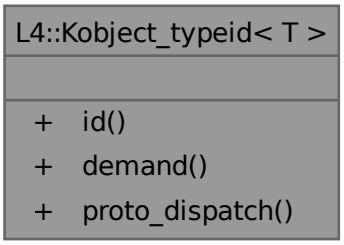
- l4/sys/__typeinfo.h

15.164 L4::Kobject_typeid< T > Struct Template Reference

Meta object for handling access to type information of Kobjects.
`#include <__typeinfo.h>`
Inheritance diagram for L4::Kobject_typeid< T >:



Collaboration diagram for L4::Kobject_typeid< T >:



Public Types

- typedef T::__Kobject_typeid::Demand Demand

  Data type expressing the static demand of receive buffers in a server.

Static Public Member Functions

- static Type_info const * id () noexcept

  Get a pointer to the Kobject type information of T.
- static Type_info::Demand demand () noexcept

  Get the receive-buffer demand for the server providing the interface T.
- template<typename THIS, typename A1, typename A2>
  static int proto_dispatch (THIS *self, l4_proto_t proto, A1 a1, A2 &a2)

  Protocol based server-side dispatch function.

15.164.1 Detailed Description

template<typename T>
struct L4::Kobject_typeid< T >

Meta object for handling access to type information of Kobjects.

Template Parameters

T	The data type derived from Kobject, usually using Kobject_t.

Definition at line 610 of file __typeinfo.h.

15.164.2 Member Typedef Documentation

15.164.2.1 Demand

```
template<typename T>
typedef T::__Kobject_typeid::Demand L4::Kobject_typeid< T >::Demand
```

Data type expressing the static demand of receive buffers in a server.
This information is the combined demand of all base interfaces for T and the buffer demand of T itself. The buffer demand of T is usually specified as the S_DEMAND argument of the Kobject_t or Kobject_2t inheritance helpers. S_DEMAND is usually of type L4::Type_info::Demand_t, or L4::Type_info::Demand_union_t.
Definition at line 622 of file __typeinfo.h.

15.164.3 Member Function Documentation

15.164.3.1 demand()

```
template<typename T>
Type_info::Demand L4::Kobject_typeid< T >::demand ()  [inline], [static], [noexcept]
```

Get the receive-buffer demand for the server providing the interface T.

Returns

A demand value describing the minimum receive buffers needed for handling server side requests for interface T.

Definition at line 639 of file __typeinfo.h.

15.164.3.2 id()

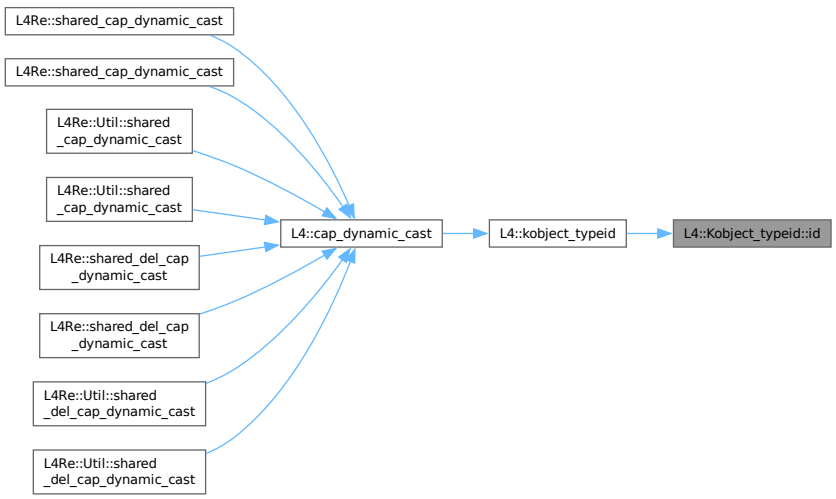
```
template<typename T>
Type_info const * L4::Kobject_typeid< T >::id ()  [inline], [static], [noexcept]
```

Get a pointer to the Kobject type information of T.

Returns

a pointer to the Kobject typeinfo of T.

Definition at line 630 of file __typeinfo.h.
Referenced by L4::kobject_typeid().
Here is the caller graph for this function:



15.164.3.3 proto_dispatch()

```
template<typename T>
template<typename THIS, typename A1, typename A2>
int L4::Kobject_typeid< T >::proto_dispatch (
            THIS * self,
            l4_proto_t proto,
            A1 a1,
            A2 & a2)  [inline], [static]
```

Protocol based server-side dispatch function.

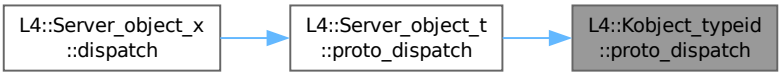
Template Parameters

THIS	Data type of the server-side object implementing the interface T.
A1	Data type of second argument for p_dispatch()
A2	Data type of third argument for p_dispatch()

Parameters

self	The pointer to the server object
proto	The protocol number used by the caller
a1	The second argument passed to self->p_dispatch()
a2	The third argument passed to self->p_dispatch()

This function forwards the call to the overloaded p_dispatch() function of self. The data type of the first argument for p_dispatch is determined by the given protocol number.
Definition at line 660 of file __typeinfo.h.
Referenced by L4::Server_object_t< IFACE, BASE >::proto_dispatch().
Here is the caller graph for this function:



The documentation for this struct was generated from the following file:

  Get the receive-buffer demand for the server providing the interface T.
- static int proto_dispatch (THIS *self, l4_proto_t proto, A1 a1, A2 &a2)

  Protocol based server-side dispatch function.

15.165.1 Detailed Description

Minimalistic ID for `void` interface.
Definition at line 667 of file __typeinfo.h.

15.165.2 Member Function Documentation

15.165.2.1 demand()

`Type_info::Demand L4::Kobject_typeid< void >::demand () [inline], [static], [noexcept]`
Get the receive-buffer demand for the server providing the interface T.

Returns

A demand value describing the minimum receive buffers needed for handling server side requests for interface T.

Definition at line 639 of file __typeinfo.h.

15.165.2.2 id()

```
Type_info const * L4::Kobject_typeid< void >::id ()  [inline], [static], [noexcept]
```

Get a pointer to the Kobject type information of T.

Returns

a pointer to the Kobject typeinfo of T.

Definition at line 630 of file __typeinfo.h.

15.165.2.3 proto_dispatch()

```
int L4::Kobject_typeid< void >::proto_dispatch (
            THIS * self,
            l4_proto_t proto,
            A1 a1,
            A2 & a2)  [inline], [static]
```

Protocol based server-side dispatch function.

Template Parameters

THIS	Data type of the server-side object implementing the interface T.
A1	Data type of second argument for p_dispatch()
A2	Data type of third argument for p_dispatch()

Parameters

self	The pointer to the server object
proto	The protocol number used by the caller
a1	The second argument passed to self->p_dispatch()
a2	The third argument passed to self->p_dispatch()

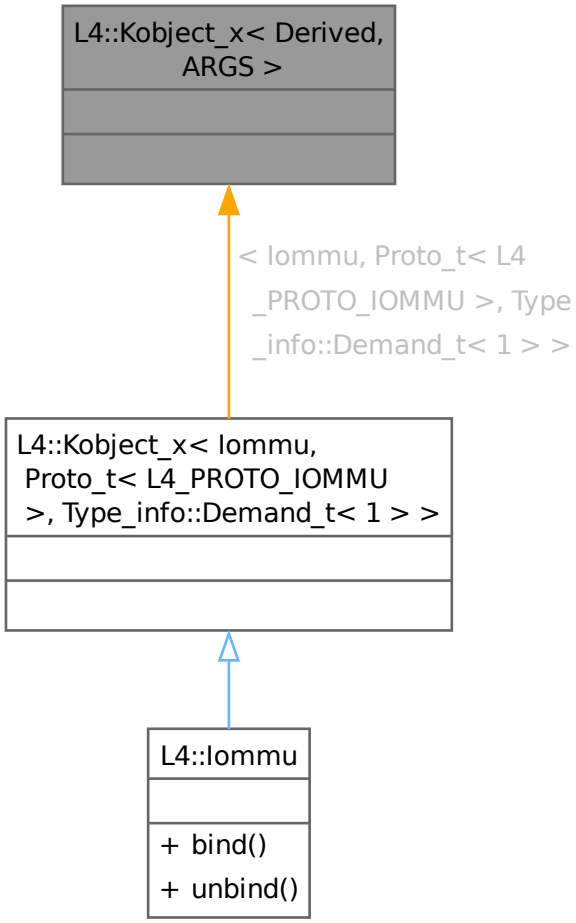
This function forwards the call to the overloaded p_dispatch() function of self. The data type of the first argument for p_dispatch is determined by the given protocol number.
Definition at line 660 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

- l4/sys/__typeinfo.h

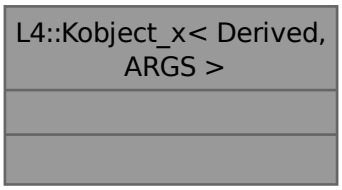
15.166 L4::Kobject_x< Derived, ARGS > Struct Template Reference

Generic Kobject inheritance template.

Inheritance diagram for L4::Kobject_x< Derived, ARGS >:



Collaboration diagram for L4::Kobject_x< Derived, ARGS >:



15.166.1 Detailed Description

template<typename Derived, typename ... ARGS>
struct L4::Kobject_x< Derived, ARGS >

Generic Kobject inheritance template.

Template Parameters

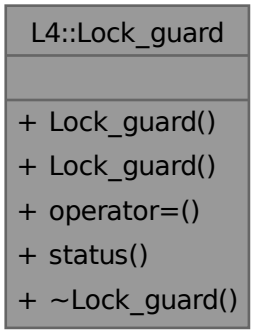
Derived	The class name that derives from Kobject_x.
ARGS	An optional protocol number via L4::Proto_t, followed by an optional server-side requirement passed as L4::Type_info::Demand_t, followed by the list of base classes.

Definition at line 1197 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

- l4/sys/__typeinfo.h

15.167 L4::Lock_guard Class Reference

Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code.
`#include <lock_guard.h>`
Collaboration diagram for L4::Lock_guard:



Public Member Functions

- Lock_guard (pthread_mutex_t &lock)

  Construct the lock guard and lock the associated mutex.
- Lock_guard (Lock_guard &&guard)

  Move constructor from other lock guard.
- Lock_guard & operator= (Lock_guard &&guard)

  Move assignment from other lock guard.
- int status () const

  Return last lock/unlock operation error status.
- ~Lock_guard ()

  Lock guard destructor.

15.167.1 Detailed Description

Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code.
Targeting `pthread_mutex_t`.
An instance of lock guard cannot be copied, but it can be moved.
The typical usage pattern of the lock guard is:

```
pthread_mutex_t mtx = PTHREAD_MUTEX_INITIALIZER;

{
  auto guard = L4Re::Lock_guard(mtx);

  // Correctness check.
  assert(guard.status() == 0);

  // Critical section protected by mtx.

  // The mtx is automatically unlocked when guard goes out of scope.
}
```

Definition at line 44 of file lock_guard.h.

15.167.2 Constructor & Destructor Documentation

15.167.2.1 Lock_guard() [1/2]

```
L4::Lock_guard::Lock_guard (
            pthread_mutex_t & lock)  [inline], [explicit]
```

Construct the lock guard and lock the associated mutex.
The error condition of the locking operation can be checked by the status() method.

Parameters

lock	Associated mutex to be locked.

Definition at line 59 of file lock_guard.h.

15.167.2.2 Lock_guard() [2/2]

```
L4::Lock_guard::Lock_guard (
            Lock_guard && guard)  [inline]
```

Move constructor from other lock guard.
The mutex associated with the other lock guard is kept locked.

Parameters

guard	Lock guard to be moved.

Definition at line 71 of file lock_guard.h.

15.167.2.3 ~Lock_guard()

```
L4::Lock_guard::~Lock_guard ()  [inline]
```

Lock guard destructor.
The associated mutex (if any) is unlocked.
There is no mechanism for indicating any error conditions. However, if the mutex has been previously locked successfully by this class and if the implementation of the mutex behaves according to the POSIX specification, the construction of this class guarantees that the unlock operation does not fail.
Definition at line 126 of file lock_guard.h.

15.167.3 Member Function Documentation

15.167.3.1 operator=()

```
Lock_guard & L4::Lock_guard::operator= (
            Lock_guard && guard)  [inline]
```

Move assignment from other lock guard.
The mutex currently associated with this lock guard is unlocked. The mutex associated with the other lock guard is kept locked.
There is no mechanism for indicating any error conditions of the unlocking operation. However, if the mutex has been previously locked successfully by this class and if the implementation of the mutex behaves according to the POSIX specification, the construction of this class guarantees that the unlock operation does not fail.

Parameters

guard	Lock guard to be moved.

Definition at line 90 of file lock_guard.h.

15.167.3.2 status()

```
int L4::Lock_guard::status () const  [inline]
```

Return last lock/unlock operation error status.

Returns

Zero indicating no errors, any other value indicating an error.

Definition at line 110 of file lock_guard.h.
The documentation for this class was generated from the following file:

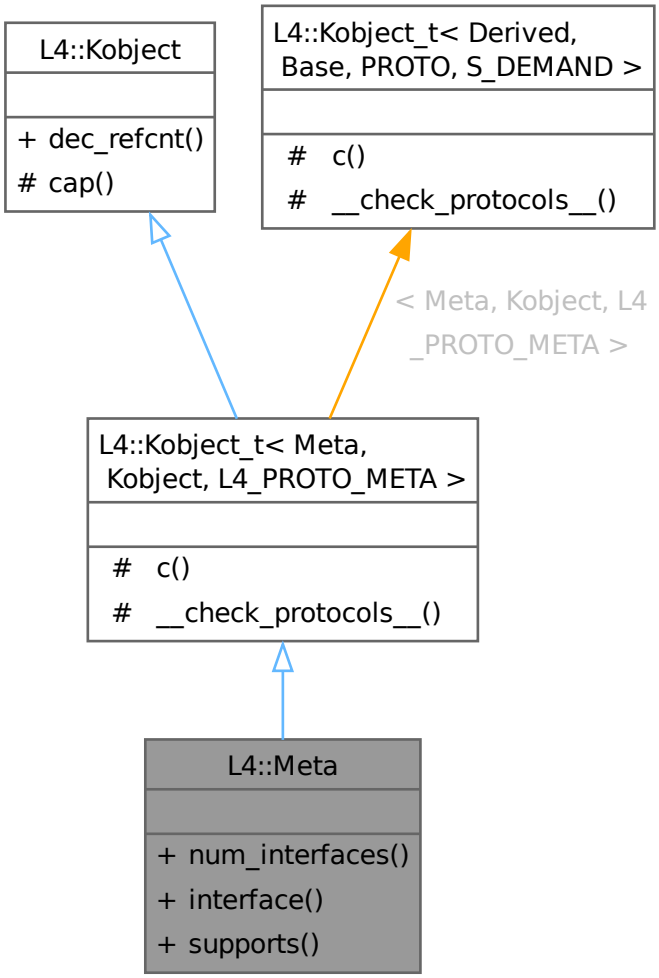
- l4/cxx/lock_guard.h

15.168 L4::Meta Class Reference

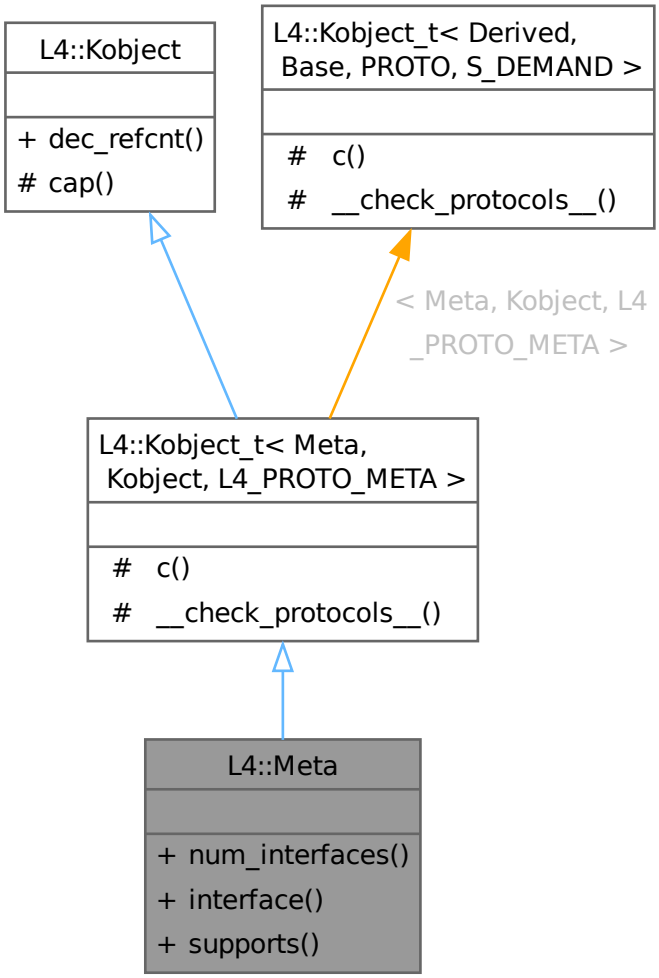
Meta interface that shall be implemented by each L4Re object and gives access to the dynamic type information for L4Re objects.

```
#include <meta>
```

Inheritance diagram for L4::Meta:



Collaboration diagram for L4::Meta:



Public Member Functions

- l4_msgtag_t num_interfaces ()

  Get the number of interfaces implemented by this object.
- l4_msgtag_t interface (l4_umword_t idx, long *proto, L4::Ipc::String< char > *name)

  Get the protocol number that must be used for the interface with the number `idx`.
- l4_msgtag_t supports (l4_mword_t protocol)

  Figure out if the object supports the given protocol (number).

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Meta, Kobject, L4_PROTO_META >

- typedef Meta **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Meta > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Meta, Kobject, L4_PROTO_META >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Meta, Kobject, L4_PROTO_META >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.168.1 Detailed Description

Meta interface that shall be implemented by each L4Re object and gives access to the dynamic type information for L4Re objects.
Definition at line 26 of file meta.

15.168.2 Member Function Documentation

15.168.2.1 interface()

```
l4_msgtag_t L4::Meta::interface (
             l4_umword_t idx,
             long * proto,
             L4::Ipc::String< char > * name)
```

Get the protocol number that must be used for the interface with the number `idx`.

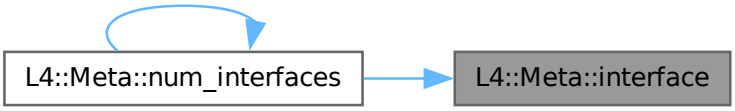
Parameters

	idx	The index of the interface to get the protocol number for. `idx` must be >= 0 and < the return value of num_interfaces().
`out`	*proto*	The protocol number for interface `idx`.
`out`	*name*	The protocol name for interface `idx`.

Return values

l4_msgtag_t::label() == 0	Successful; see `proto` and `name`.
l4_msgtag_t::label() < 0	Error code.

Referenced by num_interfaces().
Here is the caller graph for this function:



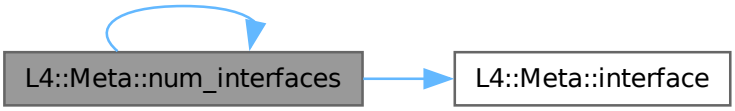
15.168.2.2 num_interfaces()

`l4_msgtag_t L4::Meta::num_interfaces ()`
Get the number of interfaces implemented by this object.

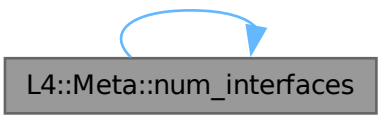
Return values

l4_msgtag_t::label() >= 0	The number of supported interfaces.
l4_msgtag_t::label() < 0	Error code of the occurred error.

References interface(), and num_interfaces().
Referenced by num_interfaces().
Here is the call graph for this function:



Here is the caller graph for this function:



15.168.2.3 supports()

```
l4_msgtag_t L4::Meta::supports (
            l4_mword_t protocol)
```

Figure out if the object supports the given protocol (number).

Parameters

protocol	The protocol number to check for.

Return values

l4_msgtag_t::label() == 1	protocol is supported.
l4_msgtag_t::label() == 0	protocol is not supported.

This method is intended to be used for statically assigned protocol numbers.
References supports().
Referenced by supports().

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Io_pager::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Pager, Io_pager, L4_PROTO_PAGE_FAULT >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Static Protected Member Functions inherited from L4::Kobject_t< Pager, Io_pager, L4_PROTO_PAGE_FAULT >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.170.1 Detailed Description

Pager interface including the Io_pager interface.
This class defines the interface for handling page fault IPC. If a thread causes a page fault, the microkernel synthesises a page fault IPC message and sends it to the thread's page fault handler (pager). The pager can then handle the message, for example by establishing a suitable page mapping.
The page fault handler is set with the L4::Thread::control interface.
Definition at line 88 of file pager.

15.170.2 Member Function Documentation

15.170.2.1 page_fault()

```
l4_msgtag_t L4::Pager::page_fault (
             l4_umword_t pfa,
             l4_umword_t pc,
             L4::Ipc::Rcv_fpage rwin,
             L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)
```

Page-fault protocol message.

Parameters

	pfa	Faulting address including failure reason: bits [0:2].
	pc	Faulting program counter.
	rwin	Receive window for a flexpage mapping resolving the page fault.
out	*fp*	Optional: flexpage descriptor to send to the task raising the page fault.

Returns

System call message tag; use l4_error() to check for errors.

Page-fault messages are usually generated by the kernel and need to be handled by an appropriate handler function, potentially filling in `fp` for the reply.
`pfa` encoding is as shown:

[63/31 .. 3]	2	1	0
PFA	X	W	r

- **PFA** Bits 63/31..3 of `pfa` are the page fault address bits 63/31 to 3, bits 2..0 are masked.

- **X** Bit 2 of `pfa` if set, indicates a page fault during instruction fetch. Note, this bit is implementation-defined and might always be clear. Therefore, if this bit is clear it does not imply that the page fault is not due to an instruction fetch.
- **W** Bit 1 of `pfa` is set to 1 for a page fault due to a write operation.
- **r** Bit0: reserved, undefined.

The documentation for this class was generated from the following file:

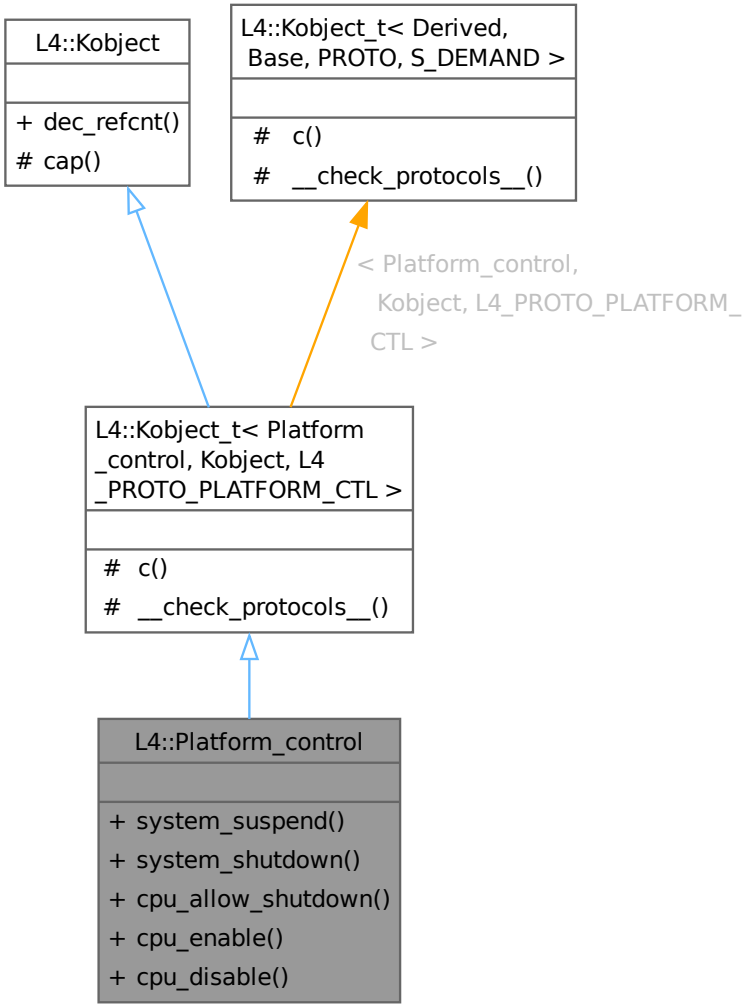
- l4/sys/pager

15.171 L4::Platform_control Class Reference

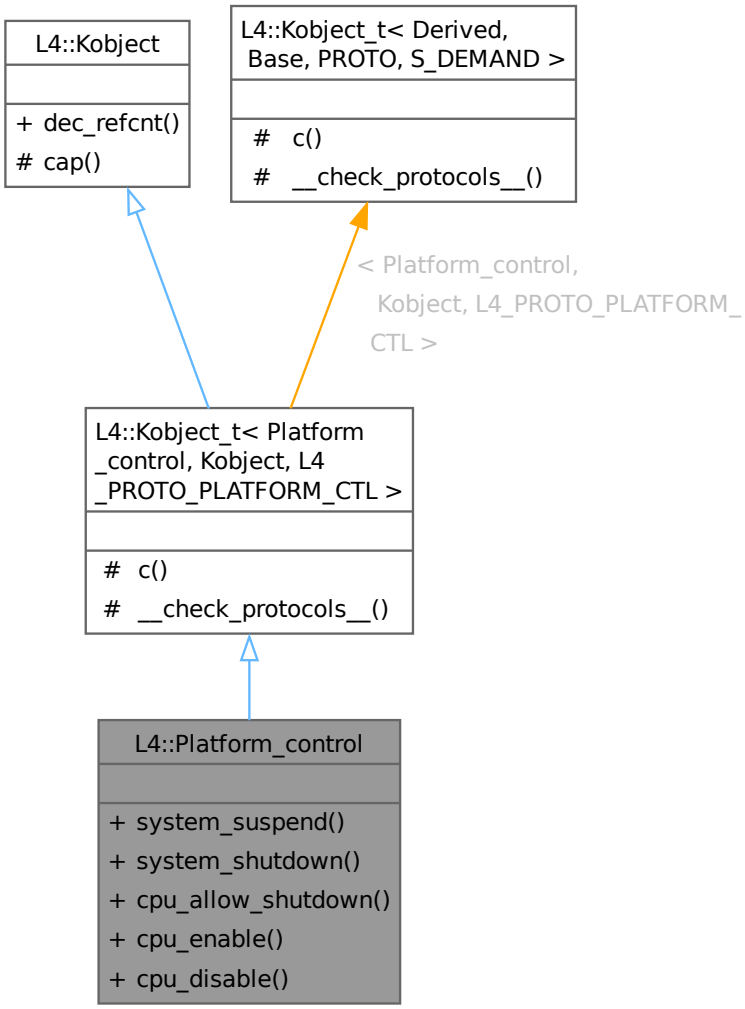
L4 C++ interface for controlling platform-wide properties, see Platform Control C API for the C interface.

`#include <platform_control>`

Inheritance diagram for L4::Platform_control:



Collaboration diagram for L4::Platform_control:



Public Member Functions

Static Protected Member Functions inherited from L4::Kobject_t< Platform_control, Kobject, L4_PROTO_PLATFORM_CTL >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.171.1 Detailed Description

L4 C++ interface for controlling platform-wide properties, see Platform Control C API for the C interface.
Add

```
#include <l4/sys/platform_control>
```

to your code to use the platform control functions. The API allows a client to suspend, reboot or shutdown the system.
For the C interface refer to the Platform Control C API.
Definition at line 36 of file platform_control.

15.171.2 Member Function Documentation

15.171.2.1 cpu_allow_shutdown()

```
l4_msgtag_t L4::Platform_control::cpu_allow_shutdown (
             l4_umword_t phys_id,
             l4_umword_t enable)
```

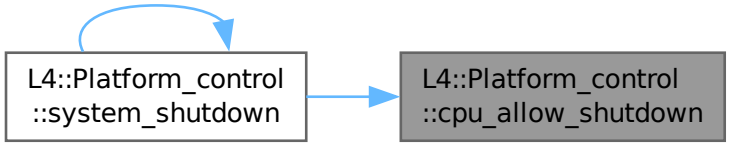
Allow CPU shutdown.

Parameters

phys_id	Physical CPU id of CPU (e.g. local APIC id) to disable.

enable	Allow shutdown when 1, disallow when 0.

Sets or unsets a hint that a CPU that is not currently used may be powered down.
References L4_PLATFORM_CTL_CPU_ENABLE_OP.
Referenced by system_shutdown().
Here is the caller graph for this function:



15.171.2.2 cpu_disable()

```
l4_msgtag_t L4::Platform_control::cpu_disable (
             l4_umword_t phys_id)
```

Disable an online CPU.

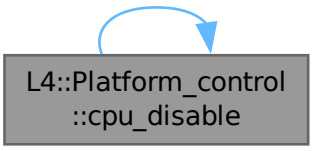
Parameters

phys↩ _id	Physical CPU id of CPU (e.g. local APIC id) to disable.

Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.
References cpu_disable().
Referenced by cpu_disable().
Here is the call graph for this function:



Here is the caller graph for this function:

15.171.2.3 cpu_enable()

```
l4_msgtag_t L4::Platform_control::cpu_enable (
            l4_umword_t phys_id)
```

Enable an offline CPU.

Parameters

phys↩ _id	Physical CPU id of CPU (e.g. local APIC id) to enable.

Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.
References cpu_enable(), and L4_PLATFORM_CTL_CPU_DISABLE_OP.
Referenced by cpu_enable().

15.171.2.4 system_shutdown()

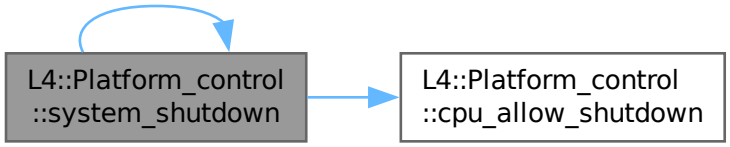
```
l4_msgtag_t L4::Platform_control::system_shutdown (
            l4_umword_t reboot)
```

Shutdown/Reboot the system.

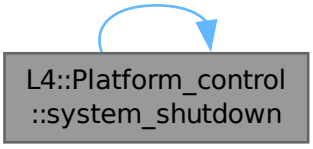
Parameters

reboot	1 for reboot, 0 for power off

References cpu_allow_shutdown(), L4_PLATFORM_CTL_CPU_ALLOW_SHUTDOWN_OP, and system_shutdown().
Referenced by system_shutdown().
Here is the call graph for this function:



Here is the caller graph for this function:



15.171.2.5 system_suspend()

```
l4_msgtag_t L4::Platform_control::system_suspend (
            l4_umword_t extras)
```

Enter suspend to RAM.

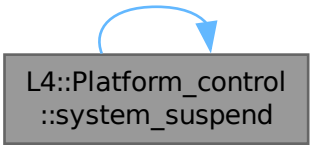
Precondition

Must only be invoked on the boot CPU. Furthermore it must be ensured that the invoking thread is not migrated to a different CPU during the suspend.

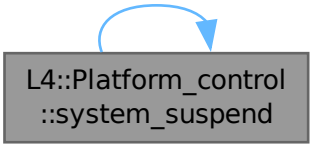
Parameters

extras	Some extra platform-specific information needed to enter suspend to RAM. On x86 platforms and when using the Platform_control object provided by Fiasco, the value defines the sleep state. The sleep states are defined in the ACPI table. Other platforms as well as Io's Platform_control object don't make use of this value at the moment.

References L4_PLATFORM_CTL_SYS_SHUTDOWN_OP, and system_suspend().
Referenced by system_suspend().
Here is the call graph for this function:



Here is the caller graph for this function:



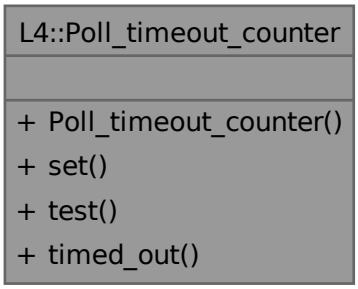
The documentation for this class was generated from the following file:

- l4/sys/platform_control

15.172 L4::Poll_timeout_counter Class Reference

Evaluate an expression for a maximum number of times.
`#include <poll_timeout_counter.h>`

Collaboration diagram for L4::Poll_timeout_counter:



Public Member Functions

- Poll_timeout_counter (unsigned counter_val)

  Constructor.
- void set (unsigned counter_val)

  Set the counter to a certain value.
- bool **test** (bool expression=true)

  Evaluate the expression for a maximum number of times.
- bool timed_out () const

  Indicator if the maximum number of tests was required.

15.172.1 Detailed Description

Evaluate an expression for a maximum number of times.
A typical use case is testing for a bit change in a hardware register for a maximum number of times (polling). For example:

```
Mmio_register_block regs;
Poll_timeout_counter i(3000000);
while (i.test(!(regs.read<l4_uint32_t>(0x04) & 1)))
  ;
```

The following usage is **wrong:**

```
...
Poll_timeout_counter i(3000000);
while (!i.test((regs.read<l4_uint32_t>(0x04) & 1)))
  ;
```

This loop would never terminate if the hardware register doesn't change!
Definition at line 34 of file poll_timeout_counter.h.

15.172.2 Constructor & Destructor Documentation

15.172.2.1 Poll_timeout_counter()

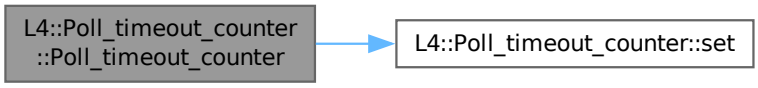
```
L4::Poll_timeout_counter::Poll_timeout_counter (
            unsigned counter_val)  [inline]
```

Constructor.

Parameters

counter_val	Maximum number of times to repeat the test.

Definition at line 42 of file poll_timeout_counter.h.
References set().
Here is the call graph for this function:



15.172.3 Member Function Documentation

15.172.3.1 set()

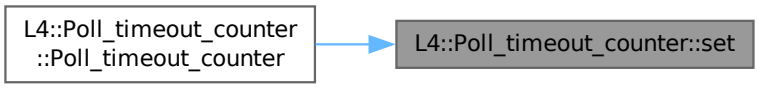
```
void L4::Poll_timeout_counter::set (
            unsigned counter_val)  [inline]
```

Set the counter to a certain value.

Parameters

counter_val	New counter value for maximum number of times to repeat the test.

Definition at line 53 of file poll_timeout_counter.h.
Referenced by Poll_timeout_counter().
Here is the caller graph for this function:



15.172.3.2 timed_out()

```
bool L4::Poll_timeout_counter::timed_out () const  [inline]
```

Indicator if the maximum number of tests was required.

Return values

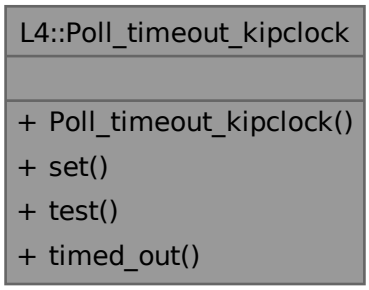
true,if	the maximum number of tests was required or if the counter was initialized to zero.

Definition at line 81 of file poll_timeout_counter.h.
The documentation for this class was generated from the following file:

- pkg/drivers-frst/include/poll_timeout_counter.h

15.173 L4::Poll_timeout_kipclock Class Reference

A polling timeout based on the L4Re clock.
`#include <poll_timeout_kipclock>`
Collaboration diagram for L4::Poll_timeout_kipclock:



Public Member Functions

- Poll_timeout_kipclock (unsigned poll_time_us)

  Initialise relative timeout in microseconds.
- void set (unsigned poll_time_us)

  (Re-)Set relative timeout in microseconds
- bool test (bool expression=true)

  Test whether timeout has expired.
- bool timed_out () const

  Query whether timeout has expired.

15.173.1 Detailed Description

A polling timeout based on the L4Re clock.
This class allows to conveniently add a timeout to a polling loop.
The original

```
while (device.read(State) & Busy)
  ;
```

is converted to

```
Poll_timeout_kipclock timeout(10000);
while (timeout.test(device.read(State) & Busy))
  ;
if (timeout.timed_out())
  printf("ERROR: Device does not respond.\n");
```

Definition at line 35 of file poll_timeout_kipclock.

15.173.2 Constructor & Destructor Documentation

15.173.2.1 Poll_timeout_kipclock()

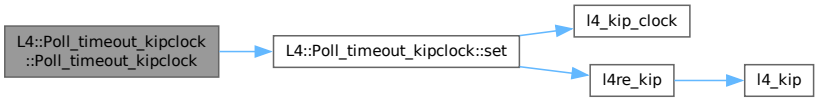
```
L4::Poll_timeout_kipclock::Poll_timeout_kipclock (
            unsigned poll_time_us)  [inline]
```

Initialise relative timeout in microseconds.

Parameters

poll_time_us	Polling timeout in microseconds.

Definition at line 42 of file poll_timeout_kipclock.
References set().
Here is the call graph for this function:



15.173.3 Member Function Documentation

15.173.3.1 set()

```
void L4::Poll_timeout_kipclock::set (
            unsigned poll_time_us)  [inline]
```

(Re-)Set relative timeout in microseconds

Parameters

poll_time_us	Polling timeout in microseconds.

Definition at line 51 of file poll_timeout_kipclock.
References l4_kip_clock(), and l4re_kip().
Referenced by Poll_timeout_kipclock().

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.175.1 Detailed Description

Interface for kernel objects that allow to receive IPC from them.
Such an object is for example an Ipc_gate (with server rights) or an Irq. Those objects can be bound to a thread that shall receive IPC from these objects via bind_thread() or bind_snd_destination().
Definition at line 30 of file rcv_endpoint.

15.175.2 Member Function Documentation

15.175.2.1 bind_snd_destination()

```
l4_msgtag_t L4::Rcv_endpoint::bind_snd_destination (
            Cap< Snd_destination > snd_dst,
            l4_umword_t label)  [inline]
```

Bind a send destination (a thread or thread group) to an IPC receive endpoint.

Parameters

snd_dst	Snd_destination object (a thread or thread group) that shall be bound to this receive endpoint. See bind_thread() and bind_snd_destination() for binding a thread or thread group object.
label	Label to assign to `this` receive endpoint. For IPC gates, the two least significant bits must be set to zero.

Returns

Syscall return tag containing one of the following return codes.

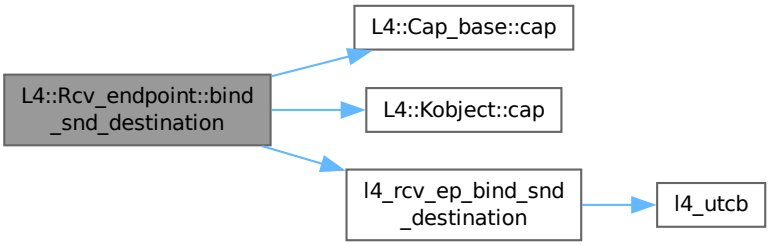
Return values

L4_EOK	Operation successful.
-L4_EINVAL	`snd_dst` is not a thread or thread group object or other arguments were malformed.
-L4_EPERM	No L4_CAP_FPAGE_S right on `snd_dst` or the capability used to invoke this operation.

Precondition

If this operation is invoked using an IPC gate capability without the L4_FPAGE_C_IPCGATE_SVR right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread bound to the IPC gate, blocking the caller if no thread or thread group is bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread or thread group. In this case, IPC already in flight will be delivered with the old label to the previously bound thread or thread group unless L4::Thread::modify_senders() is used to change these labels.
Definition at line 101 of file rcv_endpoint.
References L4::Cap_base::cap(), L4::Kobject::cap(), and l4_rcv_ep_bind_snd_destination().
Here is the call graph for this function:



15.175.2.2 bind_thread()

```
l4_msgtag_t L4::Rcv_endpoint::bind_thread (
             Ipc::Cap< Thread > t,
             l4_umword_t label)
```

Bind the IPC receive endpoint to a thread.

Parameters

t	Thread object this receive endpoint shall be bound to.
label	Label to assign to `this` receive endpoint. For IPC gates, the two least significant bits must be set to zero.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	Operation successful.
-L4_EINVAL	`t` is not a thread object or other arguments were malformed.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The invoked capability and the capability `t` both must have the permission L4_CAP_FPAGE_S.

Deprecated Use bind_snd_destination() instead.

Precondition

If this operation is invoked using an IPC gate capability without the L4_FPAGE_C_IPCGATE_SVR right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread the IPC gate is bound to, blocking the caller if the IPC gate was not bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless L4::Thread::modify_senders() is used to change these labels.
References bind_thread().

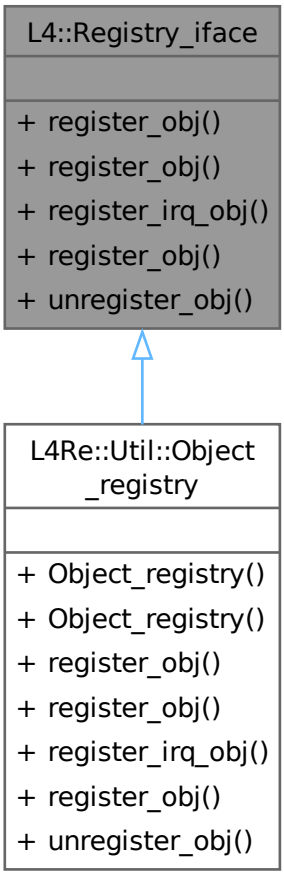
- l4/sys/rcv_endpoint

15.176 L4::Registry_iface Class Reference

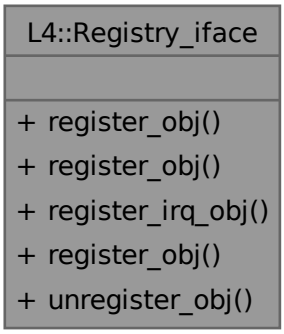
Abstract interface for object registries.

`#include <ipc_epiface>`

Inheritance diagram for L4::Registry_iface:



Collaboration diagram for L4::Registry_iface:



Public Member Functions

- virtual L4::Cap< void > register_obj (L4::Epiface *o, char const *service)=0

  Register an L4::Epiface for an IPC gate available in the applications environment under the name `service`.
- virtual L4::Cap< void > register_obj (L4::Epiface *o)=0

  Register o as server-side object for synchronous RPC.
- virtual L4::Cap< L4::Irq > register_irq_obj (L4::Epiface *o)=0

  Register o as server-side object for asynchronous IRQs.
- virtual L4::Cap< L4::Rcv_endpoint > register_obj (L4::Epiface *o, L4::Cap< L4::Rcv_endpoint > ep)=0

  Register o as server-side object for a pre-allocated capability.
- virtual void unregister_obj (L4::Epiface *o, bool unmap=true)=0

  Unregister the given object o from the server.

15.176.1 Detailed Description

Abstract interface for object registries.
An object registry allows to register L4::Epiface objects at a server loop either for synchronous RPC messages or for asynchronous IRQ messages.
Definition at line 440 of file ipc_epiface.

15.176.2 Member Function Documentation

15.176.2.1 register_irq_obj()

```
virtual L4::Cap< L4::Irq > L4::Registry_iface::register_irq_obj (
            L4::Epiface * o)  [pure virtual]
```

Register o as server-side object for asynchronous IRQs.

Parameters

o	Pointer to an Epiface object that shall be registered as server-side object for IRQs.

Return values

L4::Cap<L4::Irq>	Capability to a new IRQ object on success.
L4::Cap<L4::Irq>::Invalid	The allocation of the IRQ has failed.

After successful registration `o->obj_cap()` will be the capability of the allocated IRQ object.
The function may allocate a capability slot for the object. In that case unregister_obj() is responsible for freeing the slot as well.
Implemented in L4Re::Util::Object_registry.

15.176.2.2 register_obj() [1/3]

```
virtual L4::Cap< void > L4::Registry_iface::register_obj (
            L4::Epiface * o)  [pure virtual]
```

Register `o` as server-side object for synchronous RPC.

Parameters

o	Pointer to an Epiface object that shall be registered as server-side object for RPC.

Return values

L4::Cap<void>	A valid capability to a new IPC gate.
L4::Cap<void>::Invalid	The allocation of the IPC gate has failed.

After successful registration `o->obj_cap()` will be the capability of the allocated IPC gate.
The function may allocate a capability slot for the object. In that case unregister_obj() is responsible for freeing the slot as well.
Implemented in L4Re::Util::Object_registry.

15.176.2.3 register_obj() [2/3]

```
virtual L4::Cap< void > L4::Registry_iface::register_obj (
            L4::Epiface * o,
            char const * service)  [pure virtual]
```

Register an L4::Epiface for an IPC gate available in the applications environment under the name `service`.

Parameters

o	Pointer to an Epiface object that shall be registered.
service	Name of the capability that shall be used to connect `o` to as a server-side object.

Return values

L4::Cap<void>	The capability known as `service` on success.
L4::Cap<void>::Invalid	No capability with the given name found.

After a successful call to this function `o->obj_cap()` is equal to the capability in the environment with the name given by `service`.
Implemented in L4Re::Util::Object_registry.

15.176.2.4 register_obj() [3/3]

```
virtual L4::Cap< L4::Rcv_endpoint > L4::Registry_iface::register_obj (
            L4::Epiface * o,
            L4::Cap< L4::Rcv_endpoint > ep)  [pure virtual]
```

Register o as server-side object for a pre-allocated capability.

Parameters

o	Pointer to an Epiface object that shall be registered as server-side object.
ep	Capability to an already allocated capability where o shall be attached as server-side handler. The capability may point to an IPC gate or an IRQ.

Return values

L4::Cap<L4::Rcv_endpoint>	Capability ep on success.
L4::Cap<L4::Rcv_endpoint>::Invalid	The IRQ attach operation has failed.

After successful registration o->obj_cap() will be equal to ep.
Implemented in L4Re::Util::Object_registry.

15.176.2.5 unregister_obj()

```
virtual void L4::Registry_iface::unregister_obj (
            L4::Epiface * o,
            bool unmap = true)  [pure virtual]
```

Unregister the given object o from the server.

Parameters

o	Pointer to the Epiface object that shall be unregistered. The object must have been registered with any of the register methods if Registry_iface.
unmap	If true the capability o->obj_cap() shall be unmapped from the local object space.

The function always unmaps and frees the capability if it was allocated by either Registry_iface::register_irq_obj(L4::Epiface *), or by Registry_iface::register_obj(L4::Epiface *).
Implemented in L4Re::Util::Object_registry.

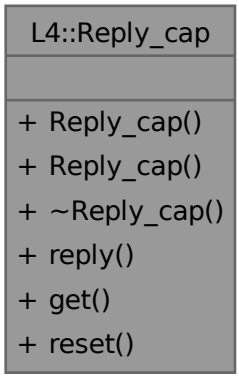
15.177 L4::Reply_cap Class Reference

An explicit reply capability.
#include <capability.h>

Collaboration diagram for L4::Reply_cap:



Public Member Functions

- constexpr **Reply_cap** () noexcept=default

  Construct an invalid reply capability.
- constexpr Reply_cap (Reply_cap_idx cap, Reply_cap_alloc *alloc) noexcept

  Construct a valid explicit reply capability.
- ~Reply_cap ()

  Destroy reply capability.
- l4_ret_t reply (l4_msgtag_t tag, l4_utcb_t *utcb=l4_utcb()) noexcept

  Reply with this reply capability.
- constexpr Reply_cap_idx get () const noexcept

  Get reply capability index.
- void reset (Reply_cap_idx cap=Reply_cap_idx(), Reply_cap_alloc *alloc=nullptr) noexcept

  Replace reply capability.

15.177.1 Detailed Description

An explicit reply capability.
Represents a use-once, explicit reply capability. If valid, the class will ensure that the caller will always get a reply. Once used, the reply capability slot will be immediately released to the associated reply capability allocator.
Definition at line 549 of file capability.h.

15.177.2 Constructor & Destructor Documentation

15.177.2.1 Reply_cap()

```
L4::Reply_cap::Reply_cap (
            Reply_cap_idx cap,
            Reply_cap_alloc * alloc)  [inline], [constexpr], [noexcept]
```

Construct a valid explicit reply capability.
The object will take ownership of the reply capability slot. It is returned to the allocator after being used.

Parameters

cap	The reply capability index
alloc	The associated reply capability allocator.

Definition at line 564 of file capability.h.
References Reply_cap().
Here is the call graph for this function:

15.177.2.2 ~Reply_cap()

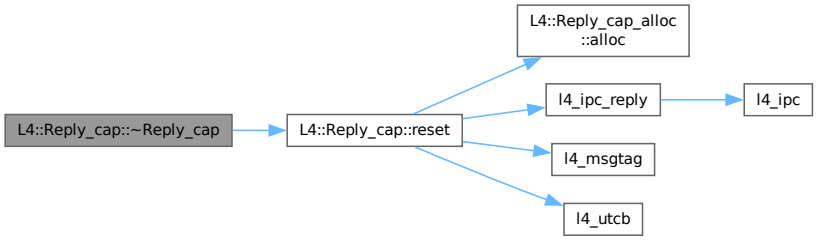
```
L4::Reply_cap::~Reply_cap ()  [inline]
```

Destroy reply capability.

Attention

If the reply capability is still valid, an L4_EDROPREPLY error reply is sent. See Reply_cap::reset().

Definition at line 574 of file capability.h.
References reset().
Here is the call graph for this function:



15.177.3 Member Function Documentation

15.177.3.1 get()

```
Reply_cap_idx L4::Reply_cap::get () const  [inline], [constexpr], [noexcept]
```

Get reply capability index.
This method must not be used to send a reply. Use Reply_cap::reply() instead that does the proper reply capability lifetime management.
Definition at line 632 of file capability.h.

15.177.3.2 reply()

```
l4_ret_t L4::Reply_cap::reply (
            l4_msgtag_t tag,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Reply with this reply capability.
Disposes the reply capability after the reply was sent. Can be used only once. If the reply object is not valid, no message is sent.

Parameters

tag	Message tag for reply. The UTCB must have been prepared.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

0	Success
-(L4_EIPC_LO	+ L4_IPC_ENOT_EXISTENT) Reply capability not valid
<0	Other IPC error

Definition at line 609 of file capability.h.
References L4_IPC_BOTH_TIMEOUT_0, L4_IPC_ENOT_EXISTENT, l4_ipc_error(), l4_ipc_reply(), and l4_ipc_to_errno().

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.181.1 Detailed Description

C++ interface of the Scheduler kernel object, see Scheduler for the C interface.
The Scheduler interface allows a client to manage CPU resources. The API provides functions to query scheduler information, check the online state of CPUs, query CPU idle time and to start threads on defined CPU sets.
The scheduler offers IRQ number 0, which triggers when the number of online cores changes, e.g. due to hotplug events.
The Scheduler interface inherits from L4::Icu and L4::Irq_eoi for managing the scheduler virtual device IRQ which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

It depends on the platform, which hotplug events actually trigger the IRQ. Many platforms only support triggering the IRQ when a CPU core different from the boot CPU goes online.

Include File

```
#include <l4/sys/scheduler>
```

Definition at line 46 of file scheduler.

15.181.2 Member Function Documentation

15.181.2.1 idle_time()

```
l4_msgtag_t L4::Scheduler::idle_time (
            l4_sched_cpu_set_t const & cpus,
            l4_kernel_clock_t * us)
```

Query the idle time (in µs) of a CPU.

Parameters

	cpus	Set of CPUs to query. Only the idle time of the first selected CPU in `cpus.map` is queried.
`out`	*us*	Idle time of queried CPU in µs.

Return values

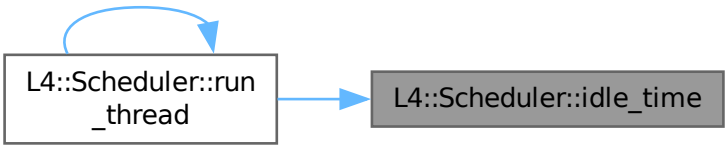
0	Success.
-L4_EINVAL	Invalid CPU requested in cpu set.

This function retrieves the idle time in µs of the first selected CPU in `cpus.map`. The idle time is the accumulated time a CPU has spent in the idle thread since its last reset. To calculate a load estimate `l` one has to retrieve the idle time at the beginning (`i1`) and the end (`i2`) of a known time interval `t`. The load is then calculated as l = 1 - (i2 - i1)/t.
The idle time is only defined for online CPUs. Reading the idle time from offline CPUs is undefined and may result in either getting -L4_EINVAL or calculating an estimated (incorrect) load of 1.

Note

The idle time statistics of remote CPUs is updated on context switch events only, hence may not be up-to-date when requested cross-CPU. To get up-to-date idle time you should use a thread running on the same CPU of which the idle time is requested.

Referenced by run_thread().
Here is the caller graph for this function:



15.181.2.2 info()

```
l4_msgtag_t L4::Scheduler::info (
             l4_umword_t * cpu_max,
             l4_sched_cpu_set_t * cpus,
             l4_umword_t * sched_classes = nullptr,
             l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Get scheduler information.

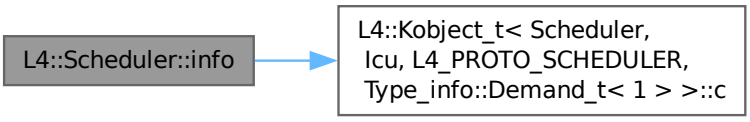
Parameters

`out`	*cpu_max*	Maximum number of CPUs ever available. Optional, can be nullptr.
`in,out`	*cpus*	*cpus.offset* is first CPU of interest. *cpus.granularity* (see l4_sched_cpu_set_t). *cpus.map* Bitmap of online CPUs. Must not be nullptr.
`out`	*sched_classes*	A bitmap of available scheduling classes (see L4_scheduler_classes). Pass nullptr to omit this information.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

Definition at line 74 of file scheduler.
References L4::Kobject_t< Scheduler, Icu, L4_PROTO_SCHEDULER, Type_info::Demand_t< 1 > >::c(), l4_sched_cpu_set_t::gran_offset, and l4_sched_cpu_set_t::map.
Here is the call graph for this function:



15.181.2.3 is_online()

```
bool L4::Scheduler::is_online (
            l4_umword_t cpu,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Query if a CPU is online.

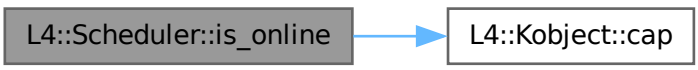
Parameters

cpu	CPU number whose online status should be queried.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

true	The CPU is online.
false	The CPU is offline

Definition at line 154 of file scheduler.
References L4::Kobject::cap().
Here is the call graph for this function:



15.181.2.4 run_thread()

```
l4_msgtag_t L4::Scheduler::run_thread (
            Ipc::Cap< Thread > thread,
            l4_sched_param_t const & sp)
```

Run a thread on a Scheduler.

Parameters

thread	Capability of the thread to run.
sp	Scheduling parameters.

Return values

0	Success.
-L4_EINVAL	Invalid size of the scheduling parameter.

This function launches a thread on a CPU determined by the scheduling parameter `sp.affinity`. A thread can be intentionally stopped by migrating it on an offline or an invalid CPU. The thread is only guaranteed to run if the CPU it is migrated to is currently online.

Note

If the target CPU is currently not online, there is no guarantee that the thread will ever run, even if the CPU comes online later on.

A scheduler may impose a policy with regard to selecting CPUs. However the scheduler is required to ensure the following two properties:

- Two threads with disjoint CPU sets must be scheduled to different CPUs.
- Two threads with identical CPU sets selecting only a single CPU must be scheduled to the same CPU.

References idle_time(), L4_SCHEDULER_IDLE_TIME_OP, and run_thread().
Referenced by run_thread().

15.182.1 Detailed Description

C++ Kernel-provided semaphore interface, see Kernel-provided semaphore for the C interface.
This is the interface for kernel-provided semaphore objects. The object provides the classical functions `up()` and `down()` for counting the semaphore and blocking. The semaphore is a Triggerable with respect to the `up()` function, this means that a semaphore can be bound to an interrupt line at an ICU (L4::Icu) and incoming interrupts increment the semaphore counter.
The `down()` method decrements the semaphore counter and blocks if the counter is already zero. Blocking on a semaphore may—as all blocking operations—either return successfully, or be aborted due to an expired timeout provided to the `down()` operation, or due to an L4::Thread::ex_regs() operation with the L4_THREAD_EX_REGS_CANCEL flag set.
A semaphore object is initialized with counter value 0.
The main reason for using a semaphore instead of an L4::Irq is to ensure that incoming trigger signals do not interfere with any open-wait operations, as used for example in a server loop.
Note that this is a kernel-level semaphore primitive that shall be used to implement user-level, application-usable synchronization primitives. For example, use pthread_mutex functions in applications if possible. When implementing a synchronization primitive, please ensure to only use L4::Semaphore in the case of contention, and use atomic operations for the non-contended case.
Definition at line 51 of file semaphore.

15.182.2 Member Function Documentation

15.182.2.1 down()

```
l4_msgtag_t L4::Semaphore::down (
             l4_timeout_t timeout = L4_IPC_NEVER,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Semaphore down operation.

Parameters

timeout	Timeout for blocking the semaphore down operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag. Use l4_error() to check for errors.

Return values

-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The invoked Semaphore capability must have the permission L4_CAP_FPAGE_S.

This method decrements the semaphore counter by one, or blocks if the counter is already zero, until either a timeout or cancel condition hits or the counter is increased by an `up()` operation.
Definition at line 89 of file semaphore.
References L4::Kobject::cap(), and L4_IPC_NEVER.
Here is the call graph for this function:

15.182.2.2 up()

```
l4_msgtag_t L4::Semaphore::up (
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Semaphore up operation (wrapper for trigger()).

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

Syscall return tag for a send-only operation, this means there is no return value except L4_MSGTAG_ERROR indicating success or failure of the send operation. Use l4_ipc_error() to check for errors and **do not** use l4_error().

Increases the semaphore counter by one if it is smaller than an unspecified limit. The unspecified limit is guaranteed to be at least 2^31-1.
Definition at line 67 of file semaphore.
References L4::Triggerable::trigger().
Here is the call graph for this function:

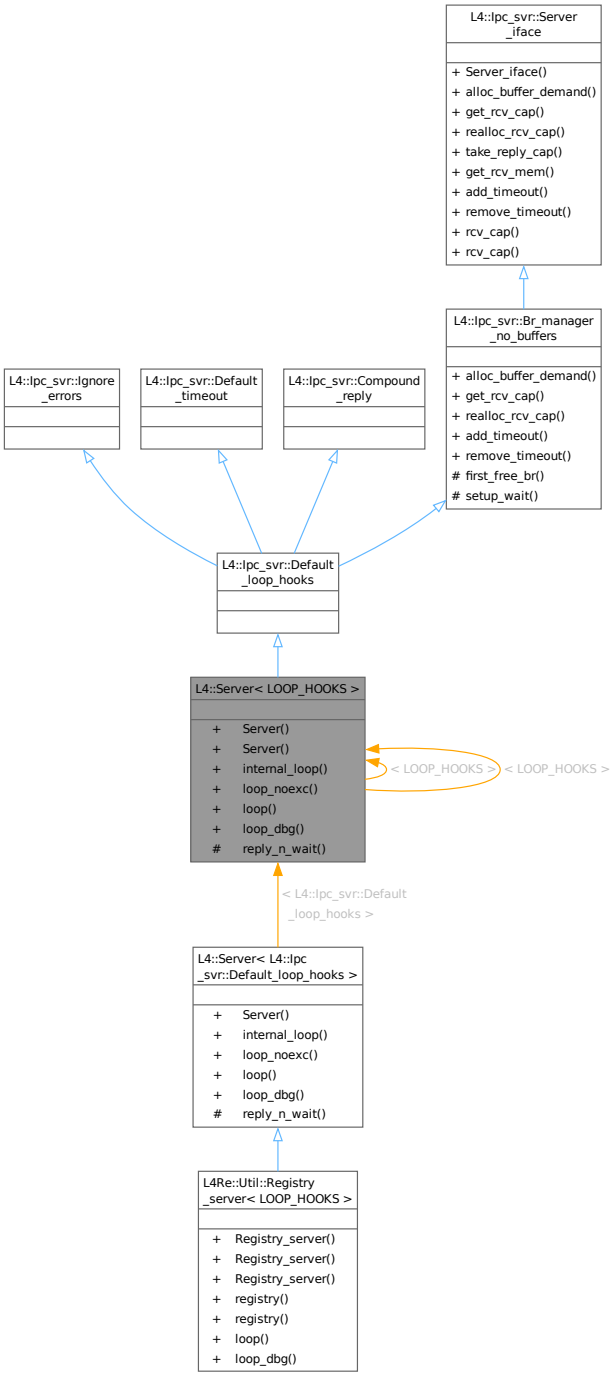
15.183 L4::Server< LOOP_HOOKS > Class Template Reference

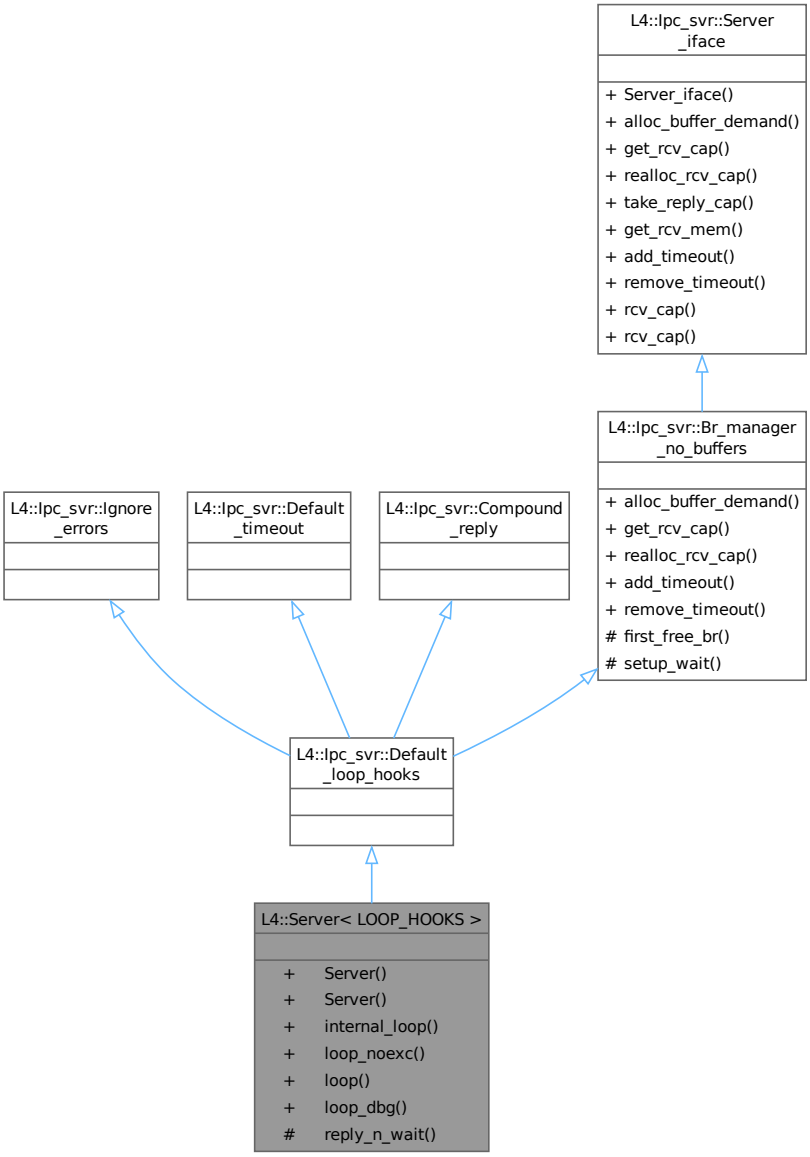
Basic server loop for handling client requests.

#include <ipc_server_loop>

Inheritance diagram for L4::Server< LOOP_HOOKS >:



Collaboration diagram for L4::Server< LOOP_HOOKS >:



Public Member Functions

- Server (l4_utcb_t ∗)

  Initializes the server loop.
- **Server** ()

  Initializes the server loop.
- template<typename DISPATCH>
  L4_NORETURN void internal_loop (DISPATCH dispatch, l4_utcb_t ∗)

  The server loop.
- template<typename R>
  L4_NORETURN void **loop_noexc** (R r, l4_utcb_t ∗u=l4_utcb())

  Server loop without exception handling.
- template<typename EXC, typename R>
  L4_NORETURN void loop (R r, l4_utcb_t ∗u=l4_utcb())

Server loop with internal exception handling.

- template<typename EXC, typename R, typename Printer>
  L4_NORETURN void loop_dbg (R r, Printer p, l4_utcb_t *u=l4_utcb())

  Server loop with internal exception handling including message printing.

Public Member Functions inherited from L4::Ipc_svr::Br_manager_no_buffers

- int alloc_buffer_demand (Demand const &demand) override

  Tells the server to allocate buffers for the given demand.
- L4::Cap< void > **get_rcv_cap** (int) const override

  Returns L4::Cap<void>::Invalid, we have no buffer management.
- int **realloc_rcv_cap** (int) override

  Returns -L4_ENOMEM, we have no buffer management.
- int **add_timeout** (Timeout *, l4_kernel_clock_t) override

  Returns -L4_ENOSYS, we have no timeout queue.
- int **remove_timeout** (Timeout *) override

  Returns -L4_ENOSYS, we have no timeout queue.

Public Member Functions inherited from L4::Ipc_svr::Server_iface

- **Server_iface** ()

  Make a server interface.
- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.
- virtual cxx::Result< Mem_window > get_rcv_mem () noexcept

  Take the current memory receive window.
- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Protected Member Functions

- l4_msgtag_t **reply_n_wait** (l4_msgtag_t reply, l4_umword_t *p, l4_utcb_t *)

  Internal implementation for reply and wait.

Protected Member Functions inherited from L4::Ipc_svr::Br_manager_no_buffers

- unsigned **first_free_br** () const

  Returns 1 as first free buffer.
- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode)

  Setup wait function for the server loop (Server<>).

Additional Inherited Members

Public Types inherited from L4::Ipc_svr::Server_iface

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

15.183.1 Detailed Description

template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
class L4::Server< LOOP_HOOKS >

Basic server loop for handling client requests.

Parameters

LOOP_HOOKS	the server inherits from LOOP_HOOKS and calls the hooks defined in LOOP_↩ HOOKS in the server loop. See Ipc_svr::Default_loop_hooks, Ipc_svr::Ignore_errors, Ipc_svr::Default_timeout, Ipc_svr::Compound_reply, and Ipc_svr::Br_manager_no_buffers.

This is basically a simple server loop that uses a single message buffer for receiving requests and sending replies. The dispatcher determines how incoming messages are handled.
Definition at line 307 of file ipc_server_loop.

15.183.2 Constructor & Destructor Documentation

15.183.2.1 Server()

```
template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
L4::Server< LOOP_HOOKS >::Server (
            l4_utcb_t * )  [inline], [explicit]
```

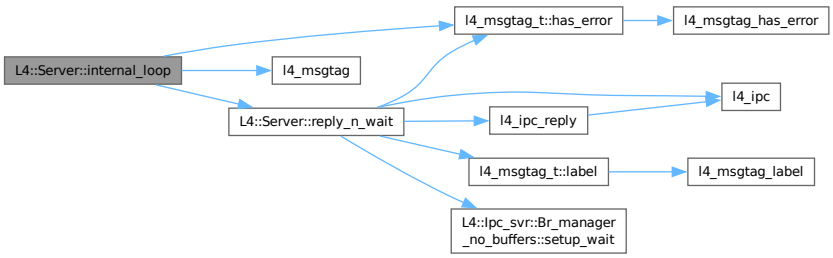
Initializes the server loop.
Note that this variant is deprecated. The UTCB can be specified with the server loop function (l4_utcb() is the default). (2021-10)
Definition at line 319 of file ipc_server_loop.

15.183.3 Member Function Documentation

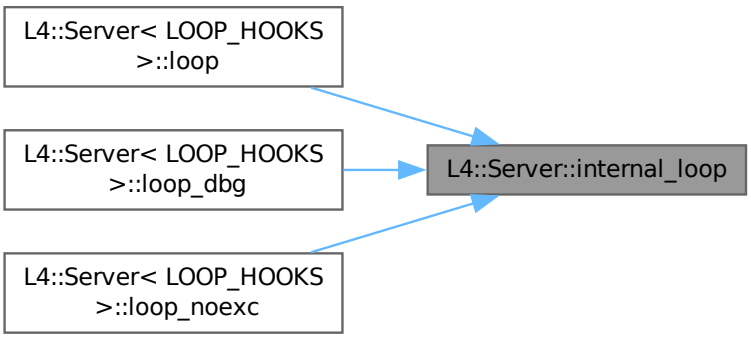
15.183.3.1 internal_loop()

```
template<typename L>
template<typename DISPATCH>
L4_NORETURN void L4::Server< L >::internal_loop (
            DISPATCH dispatch,
            l4_utcb_t * utcb)  [inline]
```

The server loop.
This function usually never returns, it waits for incoming messages calls the dispatcher, sends a reply and waits again.
Definition at line 424 of file ipc_server_loop.
References l4_msgtag_t::has_error(), L4_ENOREPLY, l4_msgtag(), and reply_n_wait().
Referenced by loop(), loop_dbg(), and loop_noexc().
Here is the call graph for this function:



Here is the caller graph for this function:



15.183.3.2 loop()

```
template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
template<typename EXC, typename R>
L4_NORETURN void L4::Server< LOOP_HOOKS >::loop (
             R r,
             l4_utcb_t * u = l4_utcb())  [inline]
```

Server loop with internal exception handling.
This server loop translates L4::Runtime_error exceptions into negative error return codes sent to the caller.
Definition at line 355 of file ipc_server_loop.

15.183.3.3 loop_dbg()

```
template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
template<typename EXC, typename R, typename Printer>
L4_NORETURN void L4::Server< LOOP_HOOKS >::loop_dbg (
             R r,
             Printer p,
             l4_utcb_t * u = l4_utcb())  [inline]
```

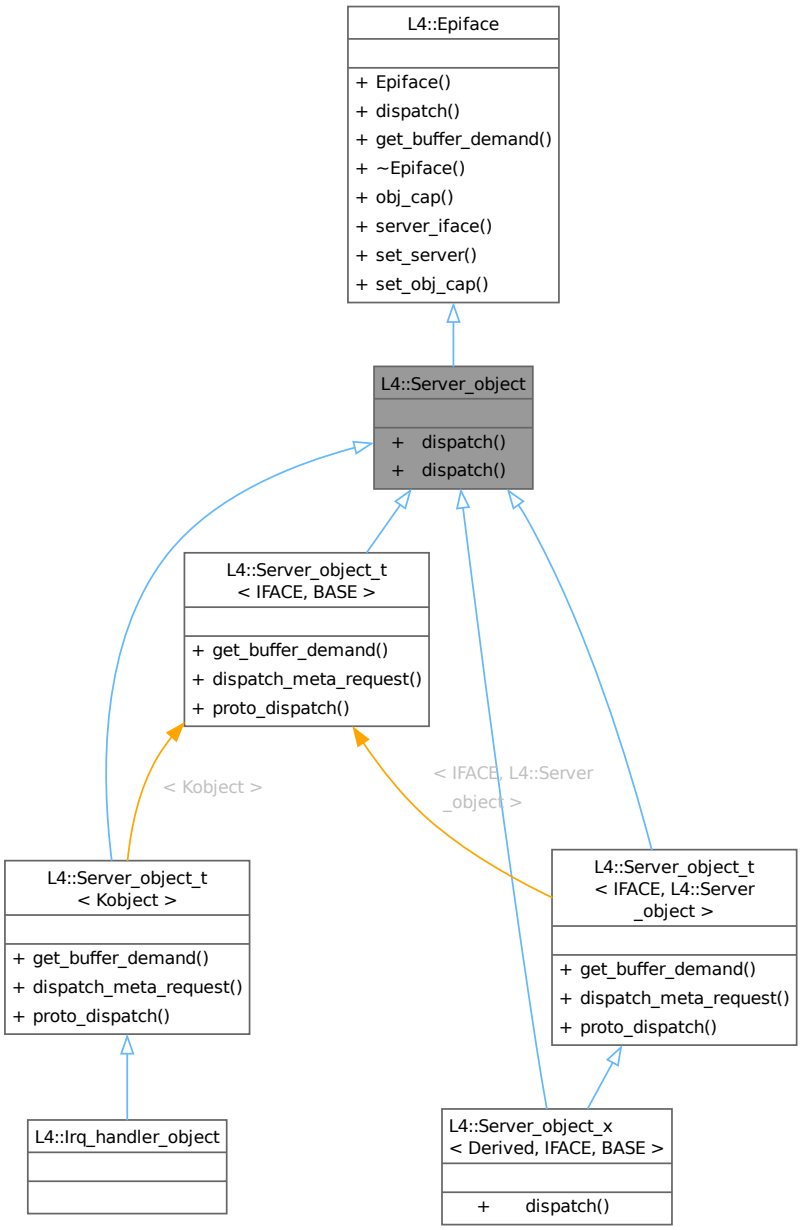
Server loop with internal exception handling including message printing.
Exceptions are translated into error codes, just like in loop(). In addition, error messages are printed using the Printer argument.
Definition at line 368 of file ipc_server_loop.
The documentation for this class was generated from the following file:

- l4/sys/cxx/ipc_server_loop

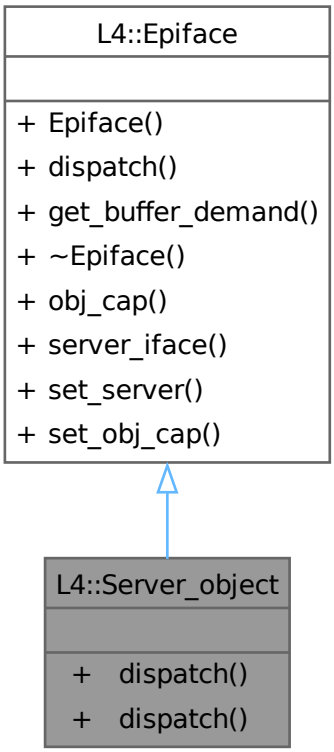
15.184 L4::Server_object Class Reference

Abstract server object to be used with L4::Server and L4::Basic_registry.
`#include <ipc_server>`

Inheritance diagram for L4::Server_object:



Collaboration diagram for L4::Server_object:



Public Member Functions

- virtual int dispatch (unsigned long rights, lpc::Iostream &ios)=0

  The abstract handler for client requests to the object.
- l4_msgtag_t dispatch (l4_msgtag_t tag, unsigned rights, l4_utcb_t *utcb) override

  The abstract handler for client requests to the object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual Demand get_buffer_demand () const =0

  Get the server-side receive buffer demand for this object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

15.184.1 Detailed Description

Abstract server object to be used with L4::Server and L4::Basic_registry.

Note

Usually L4::Server_object_t is used as a base class when writing server objects.

This server object provides an abstract interface that is used by the L4::Registry_dispatcher model. You can derive subclasses from this interface and implement application specific server objects.
Definition at line 38 of file ipc_server.

15.184.2 Member Function Documentation

15.184.2.1 dispatch() [1/2]

```
l4_msgtag_t L4::Server_object::dispatch (
            l4_msgtag_t tag,
            unsigned rights,
            l4_utcb_t * utcb)  [inline], [override], [virtual]
```

The abstract handler for client requests to the object.

Parameters

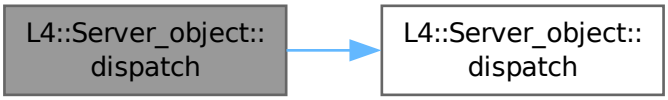
tag	The message tag for this invocation.
rights	The rights bits in the invoked capability.
utcb	The UTCB used for the invocation.

Return values

-L4_ENOREPLY	No reply message is sent.
<0	Error, reply with error code.
>=0	Success, reply with return value.

This function must be implemented by application specific server objects.
Implements L4::Epiface.
Definition at line 60 of file ipc_server.
References dispatch().

Here is the call graph for this function:



15.184.2.2 dispatch() [2/2]

```
virtual int L4::Server_object::dispatch (
            unsigned long rights,
            Ipc::Iostream & ios)  [pure virtual]
```

The abstract handler for client requests to the object.

Parameters

rights	The rights bits in the invoked capability.
ios	The Ipc::Iostream for reading the request and writing the reply.

Return values

-L4_ENOREPLY	Instructs the server loop to not send a reply.
<0	Error, reply with error code.
>=0	Success, reply with return value.

This function must be implemented by application specific server objects. The implementation must unmarshall data from the stream (`ios`) and create a reply by marshalling to the stream (`ios`). For details about the IPC stream see IPC stream operators.

Note

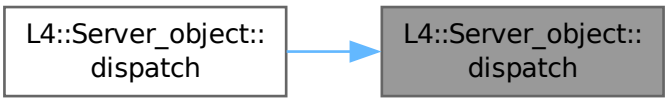
You need to extract the complete message from the *ios* stream before inserting any reply data or before doing any function call that may use the UTCB. Otherwise, the incoming message may get lost.

Implemented in L4::Server_object_x< Derived, IFACE, BASE >.

Examples

examples/libs/l4re/c++/shared_ds/ds_srv.cc, and examples/libs/l4re/streammap/server.cc.

Referenced by dispatch().
Here is the caller graph for this function:



The documentation for this class was generated from the following file:

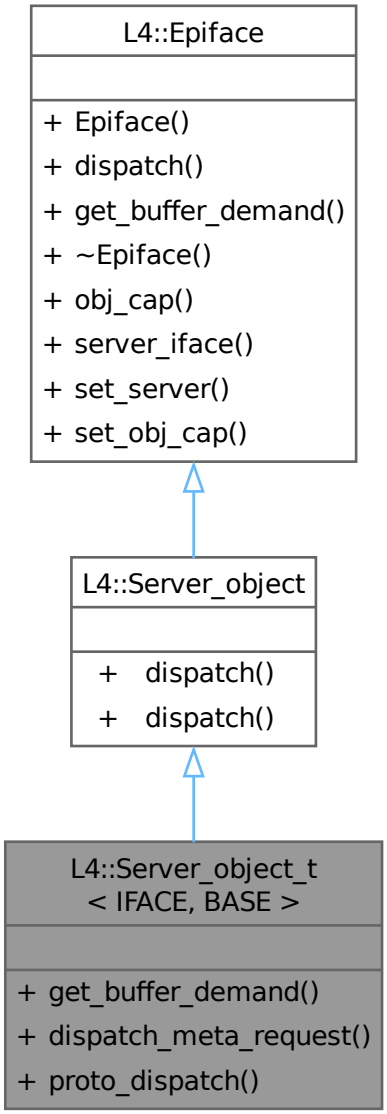
Collaboration diagram for L4::Server_object_t< IFACE, BASE >:



Public Types

- typedef IFACE **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Member Functions

- BASE::Demand get_buffer_demand () const override
- int dispatch_meta_request (L4::Ipc::Iostream &ios)

  Implementation of the meta protocol based on IFACE.

Public Member Functions inherited from L4::Server_object

- virtual int dispatch (unsigned long rights, Ipc::Iostream &ios)=0

  The abstract handler for client requests to the object.
- l4_msgtag_t dispatch (l4_msgtag_t tag, unsigned rights, l4_utcb_t *utcb) override

  The abstract handler for client requests to the object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Static Public Member Functions

- template<typename THIS>
  static int proto_dispatch (THIS *self, l4_umword_t rights, L4::Ipc::Iostream &ios)

  Implementation of protocol-based dispatch for this server object.

15.185.1 Detailed Description

template<typename IFACE, typename BASE = L4::Server_object>
struct L4::Server_object_t< IFACE, BASE >

Base class (template) for server implementing server objects.

Template Parameters

IFACE	The IPC interface class that defines the interface that shall be implemented.
BASE	The server object base class (usually L4::Server_object).

Examples

examples/libs/l4re/c++/shared_ds/ds_srv.cc, and examples/libs/l4re/streammap/server.cc.

Definition at line 80 of file ipc_server.

15.185.2 Member Function Documentation

15.185.2.1 dispatch_meta_request()

```
template<typename IFACE, typename BASE = L4::Server_object>
int L4::Server_object_t< IFACE, BASE >::dispatch_meta_request (
            L4::Ipc::Iostream & ios)  [inline]
```

Implementation of the meta protocol based on *IFACE*.

Parameters

ios	The IO stream used for receiving the message.

This function can be used to handle incoming L4_PROTO_META protocol requests. The implementation uses the L4::Type_info of *IFACE* to handle the requests. Call this function in the implementation of Server_object::dispatch() when the received message tag has protocol L4_PROTO_META (L4::Meta::Protocol).
Definition at line 99 of file ipc_server.

15.185.2.2 get_buffer_demand()

```
template<typename IFACE, typename BASE = L4::Server_object>
BASE::Demand L4::Server_object_t< IFACE, BASE >::get_buffer_demand () const  [inline], [override],
[virtual]
```

Returns

the server-side buffer demand based in *IFACE*.

Implements L4::Epiface.
Definition at line 86 of file ipc_server.

15.185.2.3 proto_dispatch()

```
template<typename IFACE, typename BASE = L4::Server_object>
template<typename THIS>
int L4::Server_object_t< IFACE, BASE >::proto_dispatch (
            THIS * self,
            l4_umword_t rights,
            L4::Ipc::Iostream & ios)  [inline], [static]
```

Implementation of protocol-based dispatch for this server object.

Parameters

self	The this pointer for the object (inherits from Server_object_t).
rights	The rights from the received IPC (forwarded to p_dispatch()).
ios	The message stream for the incoming and the reply message.

Server objects may call this function from their dispatch() function. This function reads the protocol ID from the message tag and uses the p_dispatch code to dispatch to overloaded p_dispatch functions of self.
Definition at line 114 of file ipc_server.
References l4_msgtag_t::label(), and L4::Kobject_typeid< T >::proto_dispatch().
Referenced by L4::Server_object_x< Derived, IFACE, BASE >::dispatch().

Here is the call graph for this function:

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Public Member Functions inherited from L4::Server_object_t< IFACE, L4::Server_object >

- L4::Server_object::Demand get_buffer_demand () const override
- int dispatch_meta_request (L4::Ipc::Iostream &ios)

  Implementation of the meta protocol based on IFACE.

Additional Inherited Members

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Types inherited from L4::Server_object_t< IFACE, L4::Server_object >

- typedef IFACE **Interface**

  Data type of the IPC interface definition.

Static Public Member Functions inherited from L4::Server_object_t< IFACE, L4::Server_object >

- static int proto_dispatch (THIS *self, l4_umword_t rights, L4::Ipc::Iostream &ios)

  Implementation of protocol-based dispatch for this server object.

15.186.1 Detailed Description

template<typename Derived, typename IFACE, typename BASE = L4::Server_object>
struct L4::Server_object_x< Derived, IFACE, BASE >

Helper class to implement p_dispatch based server objects.

Template Parameters

Derived	The data type of your server object class.

IFACE	The data type providing the interface definition for the object.
BASE	Optional data-type of the base server object (usually L4::Server_object)

This class implements the standard dispatch() function of L4::Server_object and forwards incoming messages to a set of overloaded p_dispatch() functions. There must be a p_dispatch() function in Derived for each interface provided by IFACE with the signature

```
int p_dispatch(Iface *, unsigned rights, L4::Ipc::Iostream &)
```

that is called for messages with protocol == Iface::Protocol.
Example signature for L4Re::Dataspace is:

```
int p_dispatch(L4Re::Dataspace *, unsigned, L4::Ipc::Iostream &)
```

Definition at line 143 of file ipc_server.
The documentation for this struct was generated from the following file:

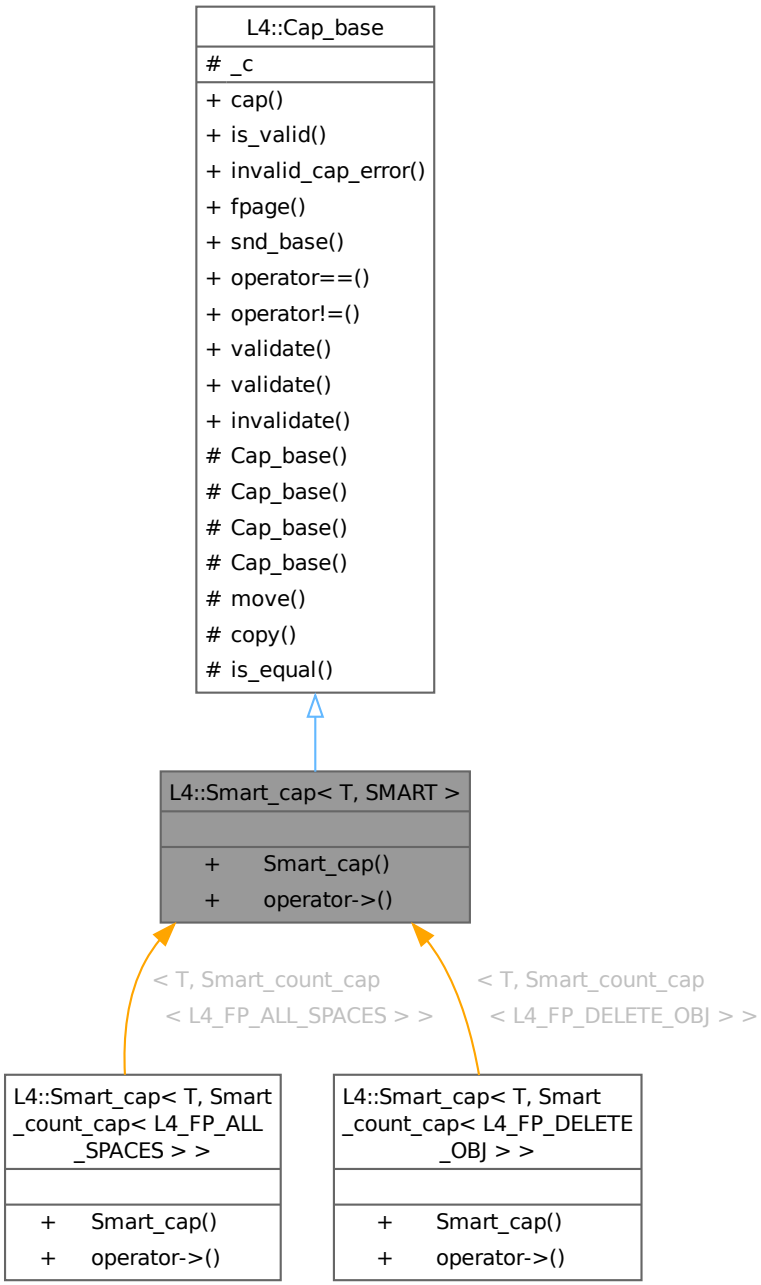
- l4/cxx/ipc_server

15.187 L4::Smart_cap< T, SMART > Class Template Reference

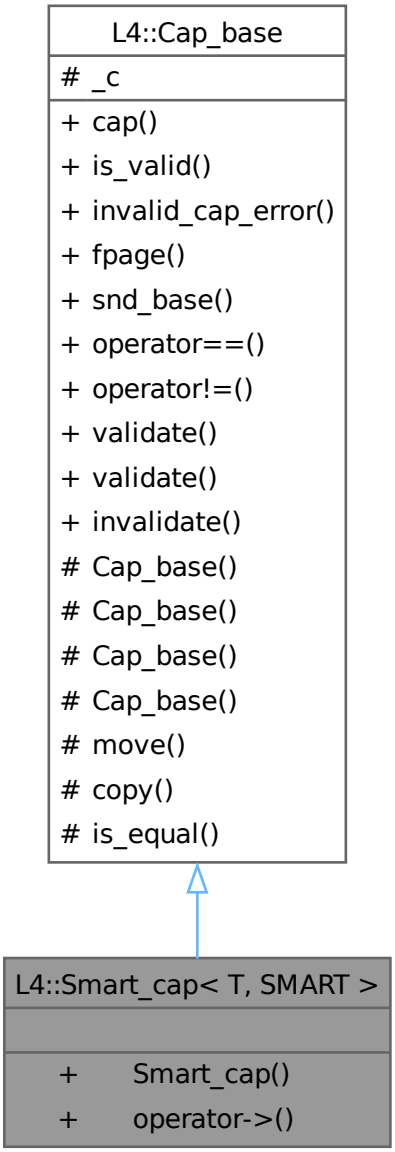
Smart capability class.

```
#include <smart_capability>
```

Inheritance diagram for L4::Smart_cap< T, SMART >:



Collaboration diagram for L4::Smart_cap< T, SMART >:



Public Member Functions

- template<typename O>
  Smart_cap (Cap< O > const &p) noexcept

  Internal constructor, use to generate a capability from a `this` pointer.
- Cap< T > **operator->** () const noexcept

  Member access of a `T`.

Public Member Functions inherited from L4::Cap_base

- l4_cap_idx_t cap () const noexcept

Return capability selector.

- bool is_valid () const noexcept

  Test whether the capability is a valid capability index (i.e., L4_INVALID_CAP_BIT is not set).
- int **invalid_cap_error** () const noexcept

  Return the transported error code in an invalid capability selector.
- l4_fpage_t fpage (unsigned rights=L4_CAP_FPAGE_RWS) const noexcept

  Return flexpage for the capability.
- l4_umword_t snd_base (unsigned grant=L4_MAP_ITEM_MAP, l4_cap_idx_t base=L4_INVALID_CAP) const noexcept

  Return send base.
- bool **operator==** (Cap_base const &o) const noexcept

  Test if two capabilities are equal.
- bool **operator!=** (Cap_base const &o) const noexcept

  Test if two capabilities are not equal.
- l4_msgtag_t validate (l4_utcb_t *u=l4_utcb()) const noexcept

  Check whether a capability is present (refers to an object).
- l4_msgtag_t validate (Cap< Task > task, l4_utcb_t *u=l4_utcb()) const noexcept

  Check whether a capability is present (refers to an object).
- void **invalidate** () noexcept

  Set this capability to invalid (L4_INVALID_CAP).

Additional Inherited Members

Public Types inherited from L4::Cap_base

- enum No_init_type { No_init }

  Special value for uninitialized capability objects.
- enum Cap_type { Invalid = L4_INVALID_CAP }

  Invalid capability type.

Protected Member Functions inherited from L4::Cap_base

- Cap_base (l4_cap_idx_t c) noexcept

  Generate a capability from its C representation.
- **Cap_base** (Cap_type cap) noexcept

  Constructor to create an invalid capability.
- Cap_base (l4_default_caps_t cap) noexcept

  Initialize capability with one of the default capabilities.
- **Cap_base** () noexcept

  Create an uninitialized instance.
- bool move (Cap_base const &src) const noexcept

  Replace this capability with the contents of `src`.
- bool copy (Cap_base const &src) const noexcept

  Copy a capability.
- bool is_equal (Cap_base const &other) const noexcept

  Test whether this capability points to the same object with the same permissions as `other`.

Protected Attributes inherited from L4::Cap_base

- l4_cap_idx_t **_c**

  The C representation of a capability selector.

15.187.1 Detailed Description

template<typename T, typename SMART>
class L4::Smart_cap< T, SMART >

Smart capability class.
Definition at line 25 of file smart_capability.

15.187.2 Constructor & Destructor Documentation

15.187.2.1 Smart_cap()

```
template<typename T, typename SMART>
template<typename O>
L4::Smart_cap< T, SMART >::Smart_cap (
             Cap< O > const & p)  [inline], [noexcept]
```

Internal constructor, use to generate a capability from a `this` pointer.

Attention

This constructor is only useful to generate a capability from the `this` pointer of an object that is an L4::Kobject. Do `never` use this constructor for something else!

Parameters

p	The `this` pointer of the Kobject or derived object

Definition at line 62 of file smart_capability.
The documentation for this class was generated from the following file:

- l4/sys/smart_capability

15.188 L4::String Class Reference

A null-terminated string container class.

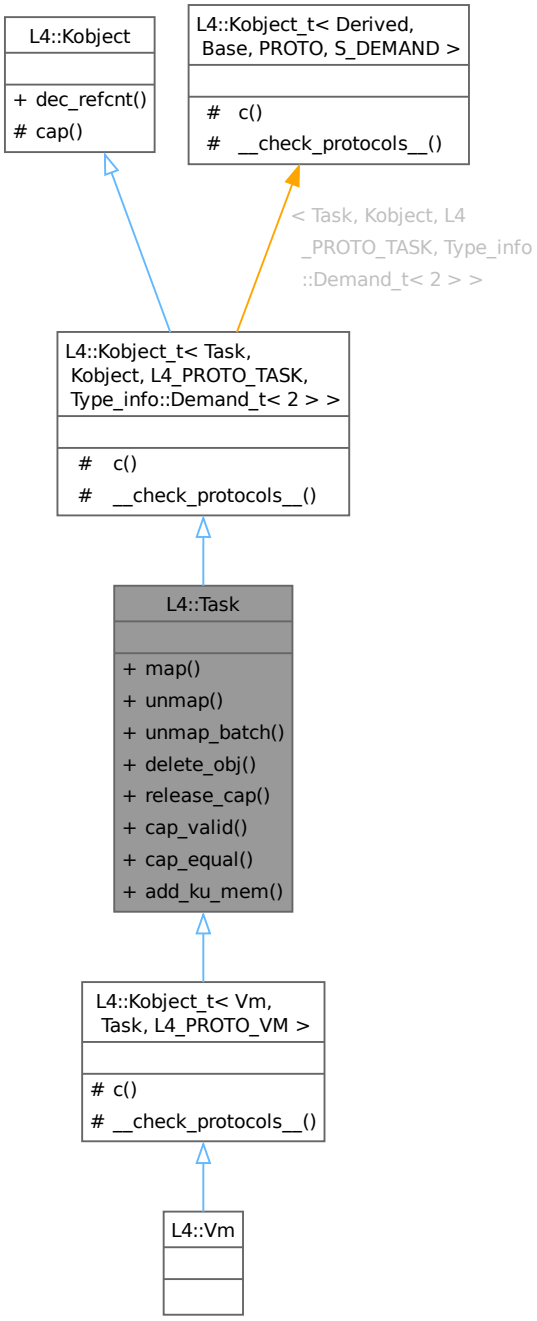
15.189 L4::Task Class Reference

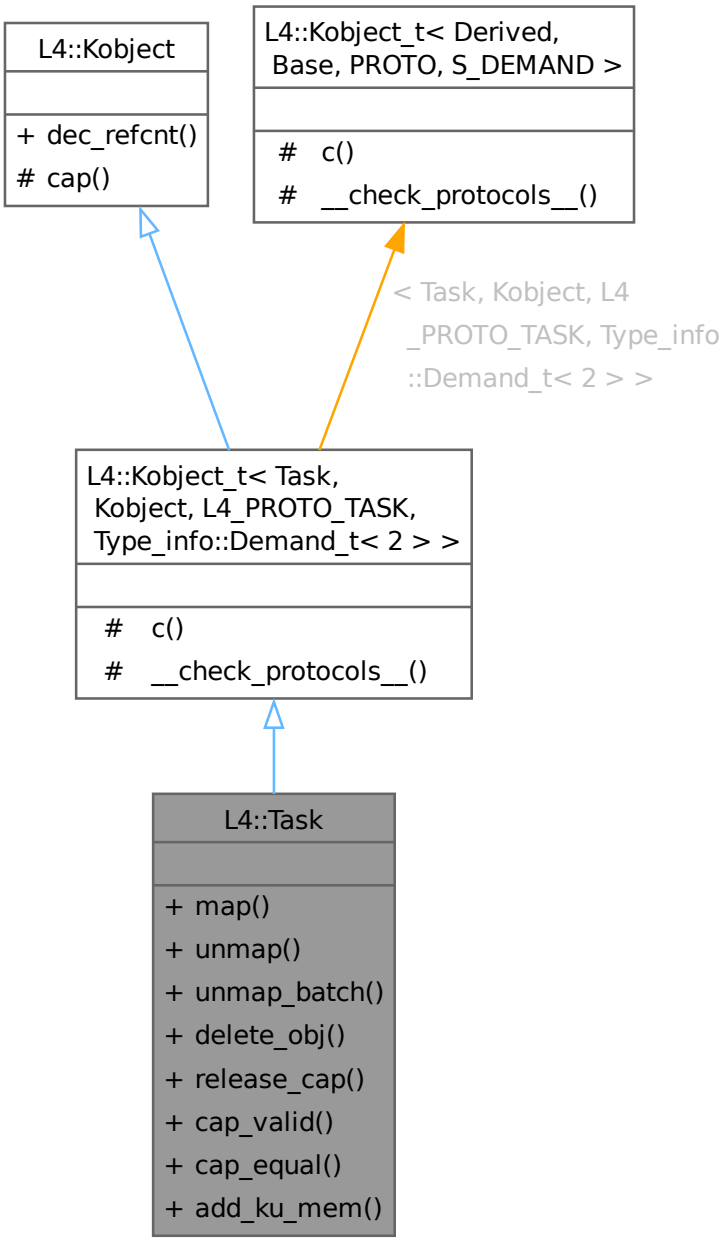
C++ interface of the Task kernel object, see Task for the C interface.

`#include <task>`

Inheritance diagram for L4::Task:



Collaboration diagram for L4::Task:



Public Member Functions

- l4_msgtag_t map (Cap< Task > const &src_task, l4_fpage_t const &snd_fpage, l4_umword_t snd_base, l4_utcb_t *utcb=l4_utcb()) noexcept

  Map resources available in the source task to a destination task.
- l4_msgtag_t unmap (l4_fpage_t const &fpage, l4_umword_t map_mask, l4_utcb_t *utcb=l4_utcb()) noexcept

  Revoke rights from the task.
- l4_msgtag_t unmap_batch (l4_fpage_t const *fpages, unsigned num_fpages, l4_umword_t map_mask, l4_utcb_t *utcb=l4_utcb()) noexcept

Revoke rights from a task.

- l4_msgtag_t delete_obj (L4::Cap< void > obj, l4_utcb_t *utcb=l4_utcb()) noexcept

  Release capability and delete object.

- l4_msgtag_t release_cap (L4::Cap< void > cap, l4_utcb_t *utcb=l4_utcb()) noexcept

  Release object capability.

- l4_msgtag_t cap_valid (Cap< void > const &cap, l4_utcb_t *utcb=l4_utcb()) noexcept

  Check whether a capability is present (refers to an object).

- l4_msgtag_t cap_equal (Cap< void > const &cap_a, Cap< void > const &cap_b, l4_utcb_t *utcb=l4_utcb()) noexcept

  Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).

- l4_msgtag_t add_ku_mem (l4_fpage_t *fpage, l4_utcb_t *utcb=l4_utcb()) noexcept

  Add kernel-user memory.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Task, Kobject, L4_PROTO_TASK, Type_info::Demand_t< 2 > >

- typedef Task **Class**

  The target interface type (inheriting from Kobject_t).

- typedef Typeid::Iface< PROTO, Task > **__Iface**

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Task, Kobject, L4_PROTO_TASK, Type_info::Demand_t< 2 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Task, Kobject, L4_PROTO_TASK, Type_info::Demand_t< 2 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.189.1 Detailed Description

C++ interface of the Task kernel object, see Task for the C interface.
The L4::Task class represents a combination of the address spaces provided by the L4Re micro kernel. A task consists of at least a memory address space and an object address space. On IA32 there is also an IO-port address space associated with an L4::Task.
L4::Task objects are created using the L4::Factory interface.

Include File

```
#include <l4/sys/task>
```

Definition at line 33 of file task.

15.189.2 Member Function Documentation

15.189.2.1 add_ku_mem()

```
l4_msgtag_t L4::Task::add_ku_mem (
            l4_fpage_t * fpage,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Add kernel-user memory.

Parameters

in,out	*fpage*	Flexpage describing the virtual area the memory goes to. On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag

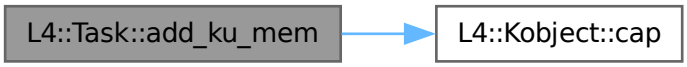
Kernel-user memory (ku_mem) is memory that is shared between the kernel and user-space. It is needed for the UTCB area of threads (see L4::Thread::Attr::bind()) and for (extended) vCPU state. Note that existing kernel-user memory cannot be unmapped or mapped somewhere else.

Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page (L4_PAGESIZE). A portable implementation should not depend on allocations greater than 16KiB to succeed.

This function is only guaranteed to work on L4::Task objects. It might or might not work on L4::Vm objects or on L4Re::Dma_space objects but there is no practical use for adding kernel-user memory to L4::Vm objects or to L4Re::Dma_space objects.

Definition at line 281 of file task.
References L4::Kobject::cap().
Here is the call graph for this function:



15.189.2.2 cap_equal()

```
l4_msgtag_t L4::Task::cap_equal (
            Cap< void > const & cap_a,
            Cap< void > const & cap_b,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).

Parameters

cap_a	Capability selector for the first capability to compare.
cap_b	Capability selector for the second capability to compare.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.
