Return values

l4_msgtag_t::label() = 1	The compared capabilities point to the same object with same considered permission.
l4_msgtag_t::label() = 0	The compared capabilities do **not** point to the same object or differ in the considered permission.

- For L4::Ipc_gate objects, only the permissions L4_CAP_FPAGE_W, L4_CAP_FPAGE_S, and L4_FPAGE_C_OBJ_RIGHT1 are considered for the comparison. Differences in other permissions are ignored.
- For other objects, only the permissions L4_CAP_FPAGE_W and L4_CAP_FPAGE_S are considered for the comparison. Differences in other permissions are ignored.

Note that having the L4_CAP_FPAGE_R permission is implicit in possessing the capability.
Definition at line 251 of file task.

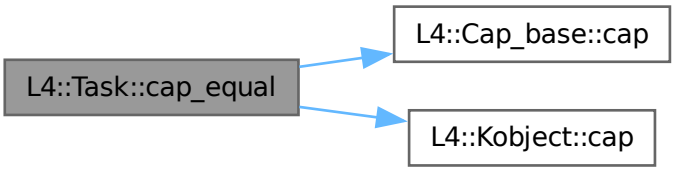
Here is the call graph for this function:



15.189.2.3 cap_valid()

```
l4_msgtag_t L4::Task::cap_valid (
            Cap< void > const & cap,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Check whether a capability is present (refers to an object).

Parameters

cap	Valid capability to check for presence.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

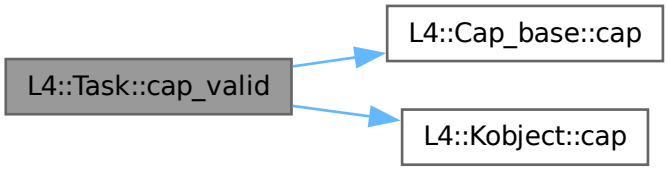
l4_msgtag_t::label() > 0	Capability is present (refers to an object).
l4_msgtag_t::label() == 0	No capability present (void object).

A capability is considered present when it refers to an existing kernel object.

Precondition

`cap` must be a valid capability (i.e. `cap.is_valid() == true`). If you are unsure about the validity of your capability use L4::Cap.validate() instead.

Definition at line 222 of file task.
References L4::Cap_base::cap(), and L4::Kobject::cap().
Here is the call graph for this function:



15.189.2.4 delete_obj()

```
l4_msgtag_t L4::Task::delete_obj (
            L4::Cap< void > obj,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Release capability and delete object.

Parameters

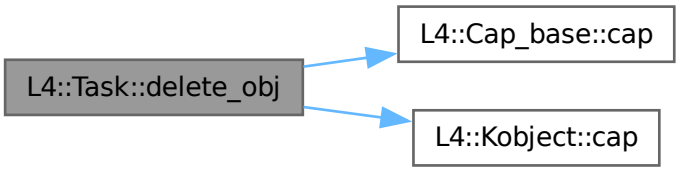
obj	Capability index of the object to delete.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag

If `obj` has the delete permission, initiates the deletion of the object. This implies that all capabilities for that object are gone afterwards. However, kernel-internally, objects are not destroyed until all other kernel objects holding a reference to it drop the reference. Hence, quota used by that object might not be freed immediately.
If `obj` does not have the delete permission, no error will be reported and only the capability `obj` is removed. (Note that, depending on the object's reference counter, this might still imply initiation of deletion.)
This operation is equivalent to unmap() with L4_FP_DELETE_OBJ flag.
Definition at line 180 of file task.
References L4::Cap_base::cap(), and L4::Kobject::cap().

Here is the call graph for this function:



15.189.2.5 map()

```
l4_msgtag_t L4::Task::map (
             Cap< Task > const & snd_task,
             l4_fpage_t const & snd_fpage,
             l4_umword_t snd_base,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Map resources available in the source task to a destination task.

Parameters

src_task	Capability index of the source task.
snd_fpage	Send flexpage that describes an area in the address space or object space of the source task.
snd_base	Send base that describes an offset in the receive window of the destination task. The lower bits contain additional map control flags (see l4_fpage_cacheability_opt_t for memory mappings, Attributes and additional permissions for object send items for object mappings, and L4_MAP_ITEM_GRANT; also see l4_map_control() and l4_map_obj_control()).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag. The function l4_error() shall be used to test if the map operation was successful.

Return values

L4_EOK	Operation successful (but see notes below).
-L4_EPERM	Insufficient permissions; see precondition.
-L4_EINVAL	Invalid source task capability.
-L4_IPC_SEMAPFAILED	The map operation failed due to limited quota.

Precondition

The invoked Task capability must have the permission L4_CAP_FPAGE_W.

This method allows for asynchronous transfer of capabilities, memory mappings, and IO-port mappings (on IA32) from one task to another. The destination task is the task referenced by the capability on which the map is invoked, and the receive window is the whole address space of that task. By specifying proper rights in the `snd_fpage` and `snd_base`, it is possible to remove rights during transfer.

Note

If the send flexpage is of type L4_FPAGE_OBJ, the L4_CAP_FPAGE_S right is removed from the transferred capability unless both the source and destination task capabilities possess the L4_CAP_FPAGE_S right themselves.

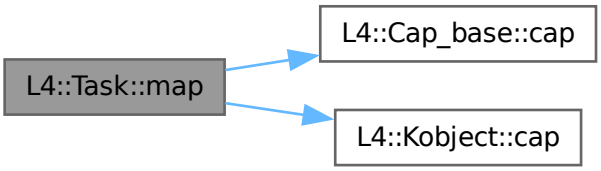
Even with l4_error() returning L4_EOK there might be cases where not all pages of the send flexpage were mapped respectively granted to the destination task, for instance, if the corresponding mapping in the destination task does already exist.

For more information on spaces and mappings, see Spaces and Mappings. The flexpage API is described in more detail at Flexpages.

Note

For peculiarities when using grant, see L4_MAP_ITEM_GRANT.

Definition at line 85 of file task.
References L4::Cap_base::cap(), and L4::Kobject::cap().
Here is the call graph for this function:



15.189.2.6 release_cap()

```
l4_msgtag_t L4::Task::release_cap (
            L4::Cap< void > cap,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Release object capability.

Parameters

cap	Capability index of the object to release.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

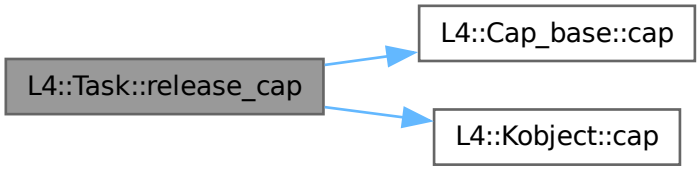
This operation unmaps the capability from `this` task. This operation is equivalent to unmapping a single object capability by specifying all object rights as unmap mask.

Note

If the reference counter of the kernel object referenced by `cap` goes down to zero, the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 201 of file task.
References L4::Cap_base::cap(), and L4::Kobject::cap().

Here is the call graph for this function:



15.189.2.7 unmap()

```
l4_msgtag_t L4::Task::unmap (
             l4_fpage_t const & fpage,
             l4_umword_t map_mask,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Revoke rights from the task.

Parameters

fpage	Flexpage that describes an area in one capability space of `this` task and the rights to revoke.
map_mask	Unmap mask, see l4_unmap_flags_t
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag

This method allows to revoke rights from the destination task. The rights to revoke are specified in the flexpage, see l4_fpage_rights(). For a flexpage describing IO ports or memory, it also revokes rights from all the tasks that got the rights delegated from the destination task (i.e., this operation does a recursive rights revocation). The capability is unmapped if certain rights are specified, see below for details. It is guaranteed that the rights revocation is completed before this function returns.
Note that this function cannot be used to revoke the reference counting permission (see L4_FPAGE_C_REF_CNT) or the IPC-gate server permission (see L4_FPAGE_C_IPCGATE_SVR) from object capabilities.
It depends on the platform and the object type which rights need to be specified in the `rights` field of `fpage` to unmap a capability:

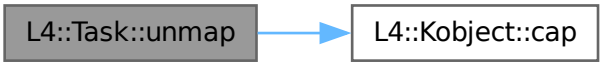
- An object capability is unmapped if and only if the L4_CAP_FPAGE_R right bit is set.
- An IO port is unmapped if and only if any right bit is set.
- Memory is unmapped if and only if the L4_FPAGE_RO right bit is set.

Note

Depending on the page-table features supported by the hardware, revocation of certain rights from a memory capability can be a no-op (i.e., the rights are not revoked). Further, revocation of certain rights may grant other rights which were not present before. For instance, on an architecture without support for NX, revoking X does nothing. For another example, revoking only X from an execute-only page grants read permission (because the mapping remains present in the page table).

If the reference counter of a kernel object referenced in `fpage` goes down to zero (as a result of deleting capabilities), the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 135 of file task.
References L4::Kobject::cap().
Here is the call graph for this function:



15.189.2.8 unmap_batch()

```
l4_msgtag_t L4::Task::unmap_batch (
            l4_fpage_t const * fpages,
            unsigned num_fpages,
            l4_umword_t map_mask,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Revoke rights from a task.

Parameters

fpages	An array of flexpages. Each item describes an area in one capability space of `this` task.
num_fpages	Number of fpages in the `fpages` array.
map_mask	Unmap mask, see l4_unmap_flags_t.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Revoke rights for an array of flexpages, see unmap for details.

Precondition

The caller needs to take care that `num_fpages` is not bigger than L4_UTCB_GENERIC_DATA_SIZE - 2.

Definition at line 154 of file task.

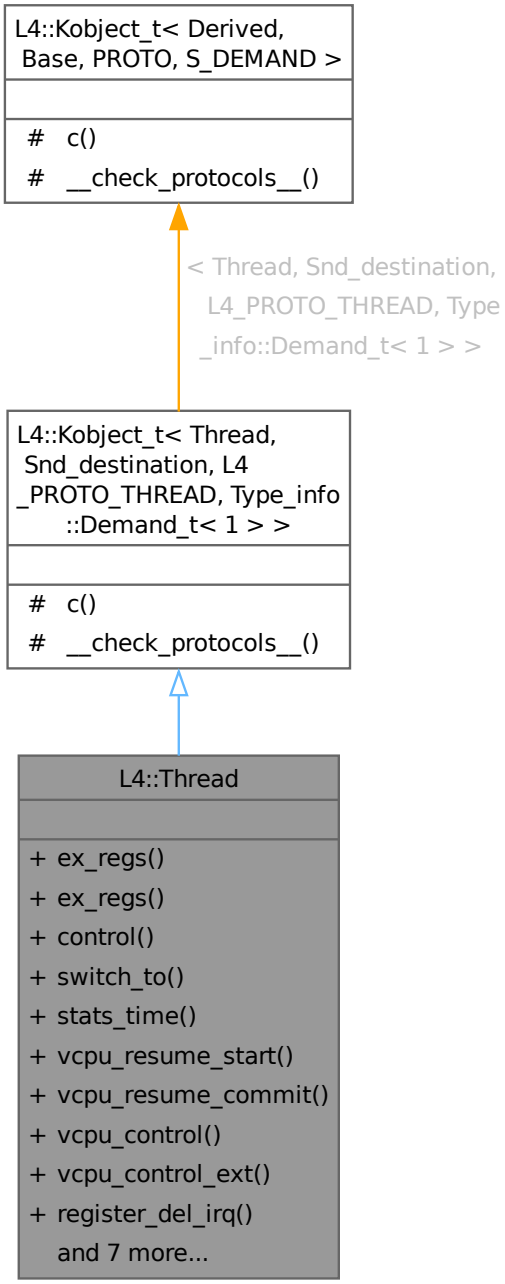
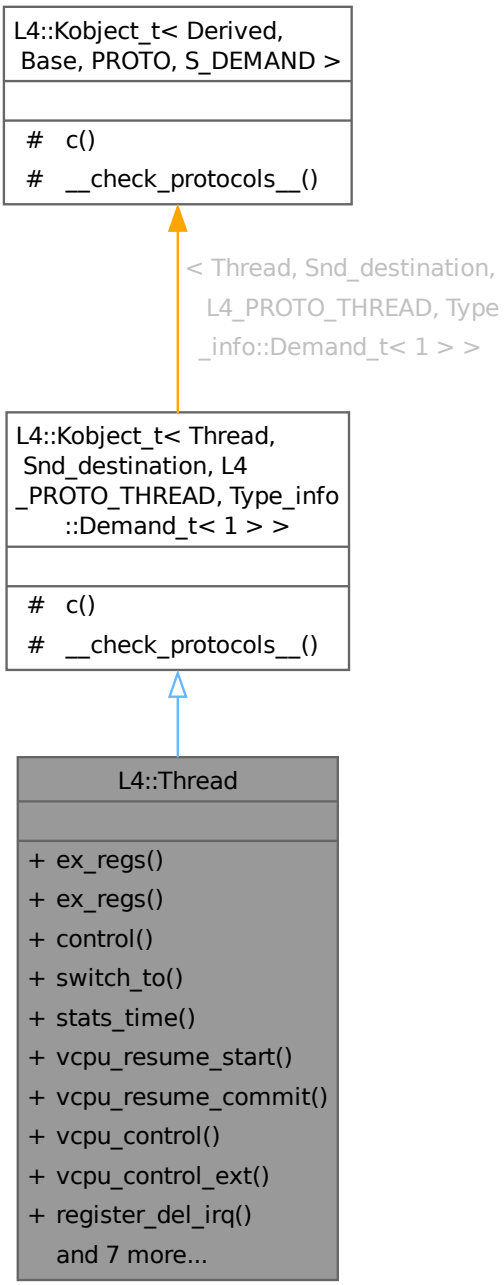
C++ L4 kernel thread interface, see Thread for the C interface.

`#include <thread>`

Inheritance diagram for L4::Thread:



Collaboration diagram for L4::Thread:



Data Structures

- class Attr

  Thread attributes used for control().
- class Modify_senders

  Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.

Public Member Functions

- l4_msgtag_t ex_regs (l4_addr_t ip, l4_addr_t sp, l4_umword_t flags, l4_utcb_t *utcb=l4_utcb()) noexcept

  Exchange basic thread registers.
- l4_msgtag_t ex_regs (l4_addr_t *ip, l4_addr_t *sp, l4_umword_t *flags, l4_utcb_t *utcb=l4_utcb()) noexcept

  Exchange basic thread registers and return previous values.
- l4_msgtag_t control (Attr const &attr) noexcept

  Commit the given thread-attributes object.
- l4_msgtag_t switch_to (l4_utcb_t *utcb=l4_utcb()) noexcept

  Switch execution to this thread.
- l4_msgtag_t stats_time (l4_kernel_clock_t *us, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get consumed time of thread in us.
- l4_msgtag_t vcpu_resume_start (l4_utcb_t *utcb=l4_utcb()) noexcept

  Resume from vCPU asynchronous IPC handler, start.
- l4_msgtag_t vcpu_resume_commit (l4_msgtag_t tag, l4_utcb_t *utcb=l4_utcb()) noexcept

  Resume from vCPU asynchronous IPC handler, commit.
- l4_msgtag_t vcpu_control (l4_addr_t vcpu_state, l4_utcb_t *utcb=l4_utcb()) noexcept

  Enable the vCPU feature for the thread.
- l4_msgtag_t vcpu_control_ext (l4_addr_t ext_vcpu_state, l4_utcb_t *utcb=l4_utcb()) noexcept

  Enable the extended vCPU feature for the thread.
- l4_msgtag_t register_del_irq (Cap< Irq > irq, l4_utcb_t *u=l4_utcb()) noexcept

  Register an IRQ that will trigger upon deletion events.
- l4_msgtag_t modify_senders (Modify_senders const &todo) noexcept

  Apply sender modification rules.
- l4_msgtag_t register_doorbell_irq (Cap< Irq > irq, l4_utcb_t *u=l4_utcb()) noexcept

  Register an IRQ that will trigger when a forwarded virtual interrupt is pending.
- l4_msgtag_t pf_trampoline_setup (l4_addr_t pf_tramp_state, l4_utcb_t *u=l4_utcb()) noexcept

  Setup page fault trampoline handler.
- l4_msgtag_t pf_trampoline_resume (l4_utcb_t *u=l4_utcb()) noexcept

  Resume from page fault trampoline handler.
- l4_msgtag_t pf_trampoline_reflect (l4_utcb_t *u=l4_utcb()) noexcept

  Page fault trampoline handler reflects page fault to exception handler.
- l4_msgtag_t pf_trampoline_disable (int *was_enabled=nullptr, l4_utcb_t *u=l4_utcb()) noexcept

  Disable the page fault trampoline handling for this thread.
- l4_msgtag_t pf_trampoline_enable (l4_utcb_t *u=l4_utcb()) noexcept

  Re-enable the page fault trampoline handling for this thread.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Thread, Snd_destination, L4_PROTO_THREAD, Type_info::Demand_t< 1 > >

- typedef Thread **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Thread > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Snd_destination::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Thread, Snd_destination, L4_PROTO_THREAD, Type_info::Demand_t< 1 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Static Protected Member Functions inherited from L4::Kobject_t< Thread, Snd_destination, L4_PROTO_THREAD, Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.190.1 Detailed Description

C++ L4 kernel thread interface, see Thread for the C interface.
The Thread class defines a thread of execution in the L4 context. Usually user-level and kernel threads are mapped 1:1 to each other. Thread kernel objects are created using a factory, see the L4::Factory API (L4::Factory::create()). Amongst other things an L4::Thread encapsulates:

- CPU state
  - General-purpose registers
  - Program counter
  - Stack pointer
- FPU state
- Scheduling parameters, see the L4::Scheduler API
- Execution state
  - Blocked, Runnable, Running

Thread objects provide an API for

- Thread configuration and manipulation
- Thread switching.

On ARM newly created threads run in EL0 by default and the exception level can be changed there with ex_regs().

Include File

```
#include <l4/sys/thread>
```

For the C interface see the Thread API. For more elaborated documentation on the vCPU feature see vCPU API.
Definition at line 52 of file thread.

15.190.2 Member Function Documentation

15.190.2.1 control()

```
l4_msgtag_t L4::Thread::control (
             Attr const & attr)  [inline], [noexcept]
```

Commit the given thread-attributes object.

Parameters

attr	the attribute object to commit to the thread.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	Operation successful.
-L4_EPERM	Insufficient permissions; see precondition.
-L4_EINVAL	Malformed thread-attributes.

Precondition

The invoked Thread capability must have the permission L4_CAP_FPAGE_S. When using Attr::bind(), also the respective Task capability must have the permission L4_CAP_FPAGE_S.

Definition at line 246 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:

15.190.2.2 ex_regs() [1/2]

```
l4_msgtag_t L4::Thread::ex_regs (
             l4_addr_t * ip,
             l4_addr_t * sp,
             l4_umword_t * flags,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Exchange basic thread registers and return previous values.

Parameters

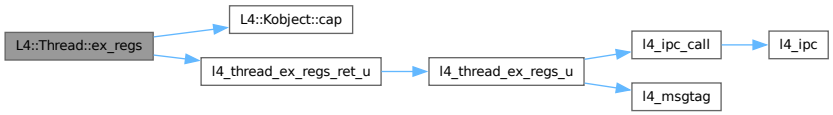
in,out	*ip*	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
in,out	*sp*	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
in,out	*flags*	Ex-regs flags, see L4_thread_ex_regs_flags, return previous CPU flags of the thread.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag. [out] parameters are only valid if the function returns successfully. Use l4_error() to check.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations

and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if L4_THREAD_EX_REGS_TRIGGER_EXCEPTION forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see L4_thread_ex_regs_flags_arm and L4_thread_ex_regs_flags_arm64.
The thread is started using L4::Scheduler::run_thread(). However, if at the time L4::Scheduler::run_thread() is called, the instruction pointer of the thread is invalid, a later call to ex_regs() with a valid instruction pointer might start the thread.
Definition at line 119 of file thread.
References L4::Kobject::cap(), and l4_thread_ex_regs_ret_u().
Here is the call graph for this function:



15.190.2.3 ex_regs() [2/2]

```
l4_msgtag_t L4::Thread::ex_regs (
             l4_addr_t ip,
             l4_addr_t sp,
             l4_umword_t flags,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Exchange basic thread registers.

Parameters

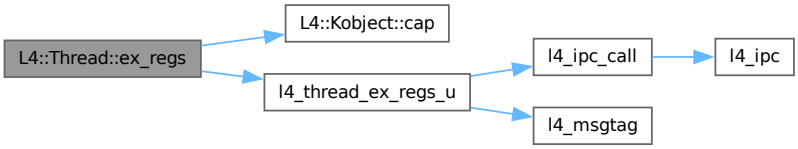
ip	New instruction pointer, use ~0UL to leave the instruction pointer unchanged.
sp	New stack pointer, use ~0UL to leave the stack pointer unchanged.
flags	Ex-regs flags, see L4_thread_ex_regs_flags.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if L4_THREAD_EX_REGS_TRIGGER_EXCEPTION forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see L4_thread_ex_regs_flags_arm and L4_thread_ex_regs_flags_arm64.
The thread is started using L4::Scheduler::run_thread(). However, if at the time L4::Scheduler::run_thread() is called, the instruction pointer of the thread is invalid, a later call to ex_regs() with a valid instruction pointer might start the thread.
Definition at line 84 of file thread.
References L4::Kobject::cap(), and l4_thread_ex_regs_u().

Here is the call graph for this function:



15.190.2.4 modify_senders()

```
l4_msgtag_t L4::Thread::modify_senders (
            Modify_senders const & todo)  [inline], [noexcept]
```

Apply sender modification rules.

Parameters

todo	Prepared sender modification rules.

Returns

System call return tag.

The modification rules are applied to all IPCs to the thread (whether directly or by IPC gate) that are already in flight, that is that the sender is already blocking on.
See Modify_senders for a detailed description when applying sender modification rules is required.

Note

Modifying the senders of a thread running on a different CPU core is not supported.

To ensure that no in-flight senders are missed, either the thread itself must execute modify_senders, or the thread executing the modify_senders must synchronize with the target thread. This synchronization must ensure the following:

1. Before modify_senders is executed the target thread must execute at least shortly (so that pending DRQs are handled).
2. The target thread must pause its IPC dispatch, until modify_senders is completed. In other words, the target thread must not be receive ready, because otherwise an IPC message with an unmodified label can be transferred to its UTCB or vCPU state.

Here is the call graph for this function:

15.190.2.6 pf_trampoline_enable()

```
l4_msgtag_t L4::Thread::pf_trampoline_enable (
             l4_utcb_t * u = l4_utcb())  [inline], [noexcept]
```

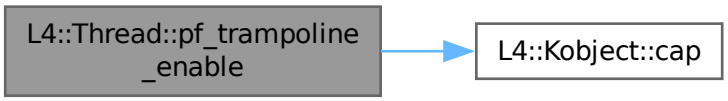
Re-enable the page fault trampoline handling for this thread.

Revert the effect of pf_trampoline_disable().

Parameters

u	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Definition at line 630 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:



15.190.2.7 pf_trampoline_reflect()

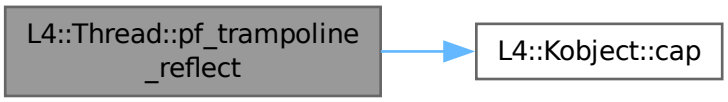
```
l4_msgtag_t L4::Thread::pf_trampoline_reflect (
            l4_utcb_t * u = l4_utcb())  [inline], [noexcept]
```

Page fault trampoline handler reflects page fault to exception handler.
Called by the trampoline page fault handler in case a page fault could not be resolved. The kernel will reflect the page fault as exception IPC to the exception handler of the faulting thread.

Parameters

u	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Definition at line 609 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:



15.190.2.8 pf_trampoline_resume()

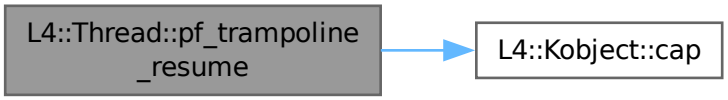
```
l4_msgtag_t L4::Thread::pf_trampoline_resume (
            l4_utcb_t * u = l4_utcb())  [inline], [noexcept]
```

Resume from page fault trampoline handler.
Called by the trampoline page fault handler after successfully resolving the page fault.

Parameters

u	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Definition at line 597 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:



15.190.2.9 pf_trampoline_setup()

```
l4_msgtag_t L4::Thread::pf_trampoline_setup (
             l4_addr_t pf_tramp_state,
             l4_utcb_t * u = l4_utcb())  [inline], [noexcept]
```

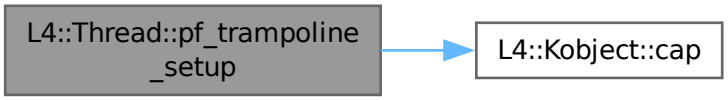
Setup page fault trampoline handler.
Instead of sending a page fault IPC to the pager, the kernel makes a single attempt to handle the page fault in the context of the faulting thread. For that purpose, the kernel saves the state of the faulting thread to the preallocated kernel-user memory `pf_tramp_state` and returns directly to the address of the page fault trampoline handler which is specified in l4_pf_trampoline_t::handler_ip. The page fault trampoline handler uses the stack and the stack pointer of the preempted context.
If the handler was able to resolve the page fault, it finishes using pf_trampoline_resume to resume to the preempted context.
If the page fault couldn't be resolved, the handler calls pf_trampoline_reflect which reflects the page fault to the exception handler of the thread.
If any page fault is triggered while the trampoline page fault handler is executed, a page fault IPC to the pager is generated.

Parameters

pf_tramp_state	State of the faulting thread at entry of page fault handler, see l4_pf_trampoline_t.
u	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Definition at line 585 of file thread.
References L4::Kobject::cap().

Here is the call graph for this function:



15.190.2.10 register_del_irq()

```
l4_msgtag_t L4::Thread::register_del_irq (
            Cap< Irq > irq,
            l4_utcb_t * u = l4_utcb())  [inline], [noexcept]
```

Register an IRQ that will trigger upon deletion events.

Parameters

irq	Capability index for the IRQ object to be triggered.
u	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag containing the return code.

Return values

-L4_BUSY	A deletion IRQ is already bound to this thread.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_W.

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion Irq can only be deregistered by deleting the Irq or the thread.
List of deletion events:

- deletion of one or several IPC gates bound to this thread.

When the deletion event is delivered, there is no indication about which IPC gate was deleted.

15.190.2.11 register_doorbell_irq()

```
l4_msgtag_t L4::Thread::register_doorbell_irq (
            Cap< Irq > irq,
            l4_utcb_t * u = l4_utcb())  [inline], [noexcept]
```

Register an IRQ that will trigger when a forwarded virtual interrupt is pending.

Parameters

irq	Capability index for the IRQ object to be triggered.
u	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

System call return tag containing the return code.

Return values

-L4_BUSY	A doorbell IRQ is already bound to this thread.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The capability `irq` must have the permission L4_CAP_FPAGE_W.

See Irq::bind_vcpu() for more details about how interrupts can be forwarded directly by the kernel to extended vCPU user mode.
In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered doorbell Irq can only be deregistered by deleting the Irq or the thread.

15.190.2.12 stats_time()

```
l4_msgtag_t L4::Thread::stats_time (
            l4_kernel_clock_t * us,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Get consumed time of thread in us.

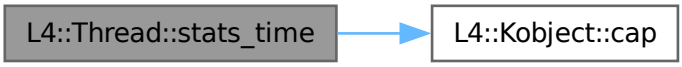
Parameters

out	*us*	Consumed time in µs.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

Definition at line 267 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:



15.190.2.13 switch_to()

```
l4_msgtag_t L4::Thread::switch_to (
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Switch execution to this thread.

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Note

The current time slice is inherited to this thread.

Definition at line 256 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:

15.190.2.14 vcpu_control()

```
l4_msgtag_t L4::Thread::vcpu_control (
              l4_addr_t vcpu_state,
              l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Enable the vCPU feature for the thread.

Parameters

vcpu_state	A virtual address pointing to a l4_vcpu_state_t. It must be a valid kernel-user-memory address (see L4::Task::add_ku_mem()).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

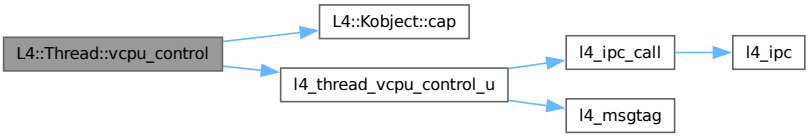
Syscall return tag.

This function enables the vCPU feature of `this` thread
The kernel-user memory starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of l4_vcpu_state_t.
The asynchronous IPC handling is described at vCPU API.

Note

Disabling of the vCPU feature is optional and currently not supported.

Definition at line 361 of file thread.
References L4::Kobject::cap(), and l4_thread_vcpu_control_u().
Here is the call graph for this function:



15.190.2.15 vcpu_control_ext()

```
l4_msgtag_t L4::Thread::vcpu_control_ext (
            l4_addr_t ext_vcpu_state,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Enable the extended vCPU feature for the thread.

Parameters

ext_vcpu_state	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see L4::Task::add_ku_mem()).
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT-x (VMX) or AMD's AMD-V (SVM).
This function enables the extended vCPU feature of `this` thread. Enabling the extended vCPU feature also enables the vCPU feature.
The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of L4_PAGESIZE. It includes the data of l4_vcpu_state_t at offset 0, the extended vCPU state at offset L4_VCPU↩_OFFSET_EXT_STATE, and, on some platforms, the extended vCPU information at offset L4_VCPU_OFFSET_↩EXT_INFOS.
On Intel's VT-x (VMX), the extended vCPU state is l4_vm_vmx_vcpu_vmcs_t and the extended vCPU information is l4_vm_vmx_vcpu_infos_t. Furthermore, the extended vCPU state needs to be associated with a vCPU context (see l4_vm_vmx_set_hw_vmcs()).
On AMD's AMD-V (SVM), the extended vCPU state is l4_vm_svm_vmcb_t.

Note

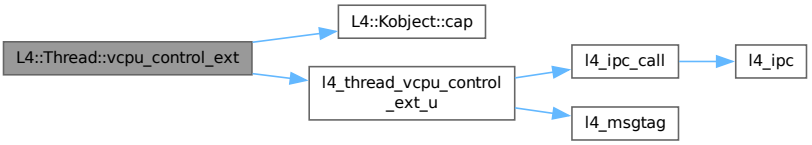
Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

Definition at line 401 of file thread.
References L4::Kobject::cap(), and l4_thread_vcpu_control_ext_u().

Here is the call graph for this function:



15.190.2.16 vcpu_resume_commit()

```
l4_msgtag_t L4::Thread::vcpu_resume_commit (
             l4_msgtag_t tag,
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Resume from vCPU asynchronous IPC handler, commit.

Parameters

tag	Tag to use, returned by l4_thread_vcpu_resume_start().
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag containing one of the following return codes.

Return values

0	Indicates a VM exit, provided that `thread` is in extended vCPU mode with virtual interrupts cleared.
1	Indicates an incoming IPC message, provided that the `thread` is in extended vCPU mode with virtual interrupts cleared.
-L4_EPERM	The user task capability set in the vCPU state is missing the L4_CAP_FPAGE_S right. On Intel's VT-x (VMX): The vCPU context capability set in the extended vCPU state is missing the L4_CAP_FPAGE_S right.
-L4_ENOENT	The user task capability set in the vCPU state is invalid.
-L4_EINVAL	`thread` is not the current running thread, or does not have the vCPU feature enabled. On Intel's VT-x (VMX): No vCPU context associated with the extended vCPU state.
-L4_EBUSY	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state is already active on a different CPU.
-L4_ENODEV	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state cannot be initialized or activated.
<0	A supplied mapping failed.

All flexpages in the UTCB (added with l4_sndfpage_add() after l4_thread_vcpu_resume_start()) are unconditionally mapped into the user task configured in the vCPU state.
To resume into another address space, the capability to the target Task (or L4::Vm) must be set in l4_vcpu_state_t::user_task together with L4_VCPU_F_USER_MODE. The capability selector must have all lower bits clear (see L4_CAP_MASK). The kernel adds the L4_SYSF_SEND flag there to indicate that the capability has been referenced in the kernel. Consecutive resumes will not reference the task capability again until all

lower bits are cleared again. To release a task use a different task capability or use an invalid capability with the L4_SYSF_REPLY flag set.
The asynchronous IPC handling is described at vCPU API.

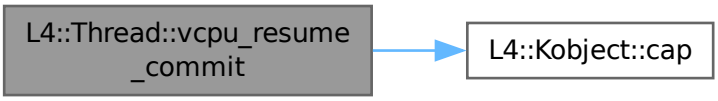
Definition at line 337 of file thread.
References L4::Kobject::cap().
Here is the call graph for this function:



15.190.2.17 vcpu_resume_start()

```
l4_msgtag_t L4::Thread::vcpu_resume_start (
             l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Resume from vCPU asynchronous IPC handler, start.

Parameters

utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Message tag to be used for l4_sndfpage_add() and l4_thread_vcpu_resume_commit()

The vCPU resume functionality is split in multiple functions to allow the specification of additional send-flexpages using l4_sndfpage_add().
The asynchronous IPC handling is described at vCPU API.

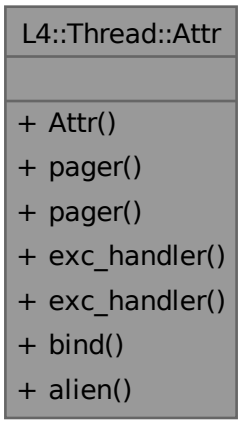
15.191 L4::Thread::Attr Class Reference

Thread attributes used for control().
`#include <thread>`

Collaboration diagram for L4::Thread::Attr:



Public Member Functions

- Attr (l4_utcb_t *utcb=l4_utcb()) noexcept
  Create a thread-attribute object with the given UTCB.
- void pager (Cap< void > const &pager) noexcept
  Set the pager capability index.
- Cap< void > pager () noexcept
  Get the capability index used for page-fault messages.
- void exc_handler (Cap< void > const &exc_handler) noexcept
  Set the exception-handler capability index.
- Cap< void > exc_handler () noexcept
  Get the capability index used for exception messages.
- void bind (l4_utcb_t *thread_utcb, Cap< Task > const &task) noexcept
  Bind the thread to a task.
- void alien (int on) noexcept
  Enable alien mode.

Friends

- class **L4::Thread**

15.191.1 Detailed Description

Thread attributes used for control().
This class is responsible for initializing various attributes of a thread in a UTCB for the control() method.

Note

Instantiation of this class starts the preparation of the UTCB. Do not invoke any non-Attr functions between the instantiation and the call to L4::Thread::control().

See also

Thread control for some more details.

Definition at line 137 of file thread.

15.191.2 Constructor & Destructor Documentation

15.191.2.1 Attr()

```
L4::Thread::Attr::Attr (
            l4_utcb_t * utcb = l4_utcb())  [inline], [explicit], [noexcept]
```

Create a thread-attribute object with the given UTCB.

Parameters

utcb	The UTCB to use for the later L4::Thread::control() function. Usually this is the UTCB of the calling thread. See l4_utcb().

Definition at line 151 of file thread.

15.191.3 Member Function Documentation

15.191.3.1 alien()

```
void L4::Thread::Attr::alien (
            int on)  [inline], [noexcept]
```

Enable alien mode.

Parameters

on	Boolean value defining the state of the feature.

For a thread in alien mode the kernel produces just an exception IPC for each IPC and exception caused by the alien thread instead of handling these events regularly. (Page faults of alien threads and interrupts occurring while the alien thread is running are always handled regularly.) While the alien thread is blocking, the exception handler can inspect and modify the state of the alien thread and potentially also the system call arguments. If the exception handler replies with L4_PROTO_ALLOW_SYSCALL as message tag, the kernel handles the next IPC or exception of the alien thread in a regular way. If the exception handler leaves certain thread state unchanged (in particular the instruction pointer), this will be the IPC or exception that caused the call of the exception handler. For a regularly processed IPC or exception of the alien thread the kernel also performs an exception IPC on kernel exit.
This feature can be used to attach a debugger to a thread and trace all object invocations and their results. It could also be used to handle other systems that use the same syscall instruction as L4Re.
Definition at line 227 of file thread.

15.191.3.2 bind()

```
void L4::Thread::Attr::bind (
            l4_utcb_t * thread_utcb,
            Cap< Task > const & task)  [inline], [noexcept]
```

Bind the thread to a task.

Parameters

thread_utcb	The thread's UTCB address within the task it shall be bound to. The address must be aligned (architecture dependent; at least word aligned) and it must point to at least L4_UTCB_OFFSET bytes of kernel-user memory.
task	The task the thread shall be bound to.

Precondition

The thread must not be bound to a task yet.

The capability `task` must have the permission L4_CAP_FPAGE_S, otherwise the later call to L4::Thread::control() with this Attr object will fail with L4_EPERM.

A thread may execute code in the context of a task if and only if the thread is bound to the task. To actually start execution, L4::Thread::ex_regs() needs to be used. Execution in the context of the task means that the code has access to all the task's resources (and only those). The executed code itself must be one of those resources. A thread can be bound at most once to a task.

Note

The UTCBs of different threads in the same task should not overlap in order to prevent data corruption.

Definition at line 221 of file thread.

15.191.3.3 exc_handler() [1/2]

```
Cap< void > L4::Thread::Attr::exc_handler ()  [inline], [noexcept]
```

Get the capability index used for exception messages.

Returns

The capability index used to send exception messages. At this capability index, there is a capability present in the task the thread is bound to.

Definition at line 192 of file thread.

15.191.3.4 exc_handler() [2/2]

```
void L4::Thread::Attr::exc_handler (
            Cap< void > const & exc_handler)  [inline], [noexcept]
```

Set the exception-handler capability index.

Parameters

exc_handler	The capability index that shall be used for exception messages. At this capability index, a capability must be present within the task the thread is bound to.

Definition at line 182 of file thread.
References exc_handler().
Referenced by exc_handler().

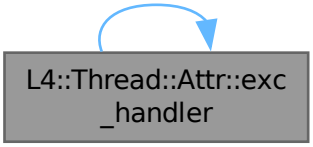
Here is the caller graph for this function:



15.191.3.5 pager() [1/2]

`Cap< void > L4::Thread::Attr::pager () [inline], [noexcept]`
Get the capability index used for page-fault messages.

Returns

The capability index used to send page-fault messages. At this capability index, there is a capability present in the task the thread is bound to.

Definition at line 171 of file thread.

15.191.3.6 pager() [2/2]

```
void L4::Thread::Attr::pager (
            Cap< void > const & pager) [inline], [noexcept]
```
Set the pager capability index.

Parameters

pager	The capability index that shall be used for page-fault messages. At this capability index, a capability must be present within the task the thread is bound to.

Definition at line 161 of file thread.
References pager().

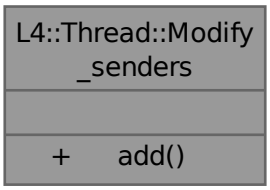
15.192 L4::Thread::Modify_senders Class Reference

Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.
`#include <thread>`
Collaboration diagram for L4::Thread::Modify_senders:



Public Member Functions

- int add (l4_umword_t match_mask, l4_umword_t match, l4_umword_t del_bits, l4_umword_t add_bits) noexcept

  Add a rule.

15.192.1 Detailed Description

Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.
Use the add() function to add modification rules, and use modify_senders() to commit. Do not use the UTCB in between as it is used by add() and modify_senders().
This mechanism shall be used to change the source object labels of every pending IPC of an IPC gate or an IRQ if the labels in such pending IPC become invalid for the receiving thread, potentially because:

- an IPC gate / IRQ was unbound from a thread, or
- an IPC gate / IRQ was removed, or
- the label of an IPC gate / IRQ bound to a thread was changed.

It is not required to perform the modify_sender mechanism after an IPC gate or an IRQ was bound to a thread for the first time.
Definition at line 451 of file thread.

15.192.2 Member Function Documentation

15.192.2.1 add()

```
int L4::Thread::Modify_senders::add (
             l4_umword_t match_mask,
             l4_umword_t match,
             l4_umword_t del_bits,
             l4_umword_t add_bits)  [inline], [noexcept]
```

Add a rule.

Parameters

match_mask	Bitmask of bits to match the label.
match	Bitmask that must be equal to the label after applying match_mask.
del_bits	Bits to be deleted from the label.
add_bits	Bits to be added to the label.

Returns

0 on success, <0 on error

In pseudo code: if ((sender_label & match_mask) == match) { sender_label = (sender_label & ~del_bits) | add_bits; }
Only the first match is applied.

  Helper to check for protocol conflicts.

15.193.1 Detailed Description

C++ L4 kernel thread group interface, see Thread groups for the C interface.
An L4 thread group is a collection of threads used as indirection for IPC gate and IRQ objects such that these objects can have multiple receivers, from which the kernel selects one according to a policy.
The primary use case for thread groups are multi-threaded servers and CPU core local IRQ / IPC delivery.
A thread can be bound to at most one thread group. Before binding a thread to a thread group, the thread must be bound to a task. All threads bound to the same thread group must belong to the same task.
Definition at line 34 of file thread_group.

15.193.2 Member Function Documentation

15.193.2.1 add()

```
l4_msgtag_t L4::Thread_group::add (
            Cap< Thread > thread,
            l4_utcb_t * utcb = l4_utcb())  [inline], [noexcept]
```

Add thread to a thread group.

Parameters

thread	Thread to add to the thread group.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag containing one of the following return codes.

Return values

L4_EOK	No error occurred.
-L4_EINVAL	`thread` is not a thread object.
-L4_EEXIST	`thread` already bound to this thread group.
-L4_EBUSY	`thread` already bound to a different thread group.

-L4_ENOENT	Thread group doesn't exist.

Additional Inherited Members

Public Member Functions inherited from L4::Type_info::Demand

- Demand (unsigned char caps=0, unsigned char flags=0, unsigned char mem=0, unsigned char ports=0) noexcept

  Make Demand object.
- bool no_demand () const noexcept
- Demand **operator|** (Demand const &rhs) const noexcept

  get the combined demand of this and rhs

Data Fields inherited from L4::Type_info::Demand

- unsigned char **caps**

  number of capability receive buffers.
- unsigned char **flags**

  flags, such as the need for timeouts (TBD).
- unsigned char **mem**

  size (2^mem bytes) of memory receive buffer.
- unsigned char **ports**

  number of IO-port receive buffers.

15.197.1 Detailed Description

template<unsigned char CAPS = 0, unsigned char FLAGS = 0, unsigned char MEM = 0, unsigned char PORTS = 0>
struct L4::Type_info::Demand_t< CAPS, FLAGS, MEM, PORTS >

Template type statically describing demand of receive buffers.

Template Parameters

CAPS	number of capability receive buffers needed.
FLAGS	flags, such as the need for timeouts (TBD).
MEM	size (2^MEM bytes) of memory receive window needed.
PORTS	number of IO-port receive windwows needed.

Definition at line 553 of file __typeinfo.h.

15.197.2 Member Enumeration Documentation

15.197.2.1 anonymous enum

```
template<unsigned char CAPS = 0, unsigned char FLAGS = 0, unsigned char MEM = 0, unsigned char
PORTS = 0>
anonymous enum
```

Enumerator

Caps	number of capability receive buffers.
Flags	flags, such as the need for timeouts.
Mem	size (2^MEM bytes) of memory receive window.
Ports	number of IO-port receive windows.

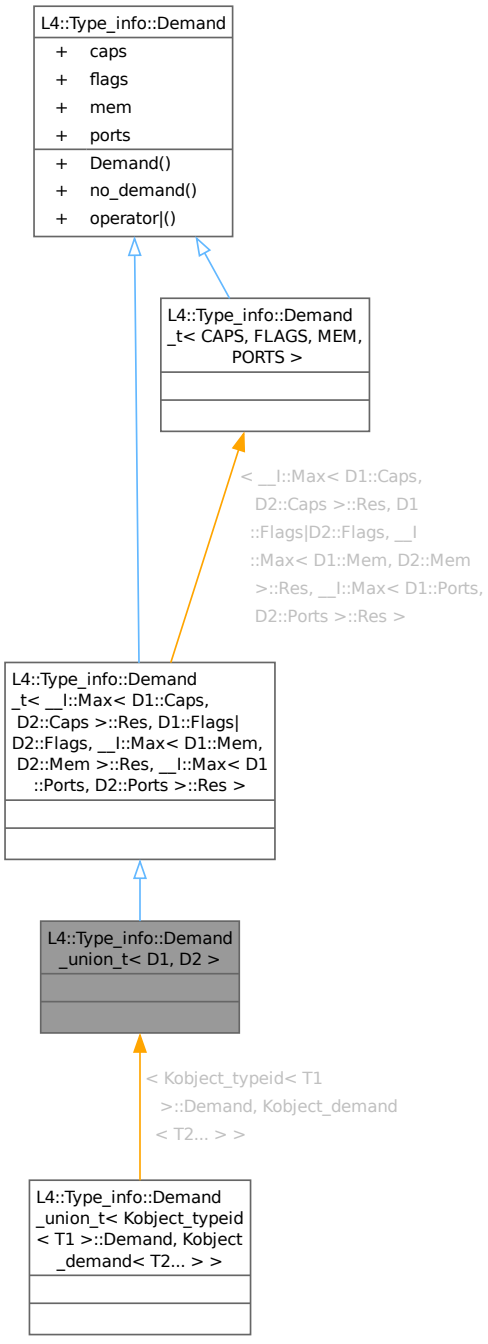
Definition at line 555 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

- l4/sys/__typeinfo.h

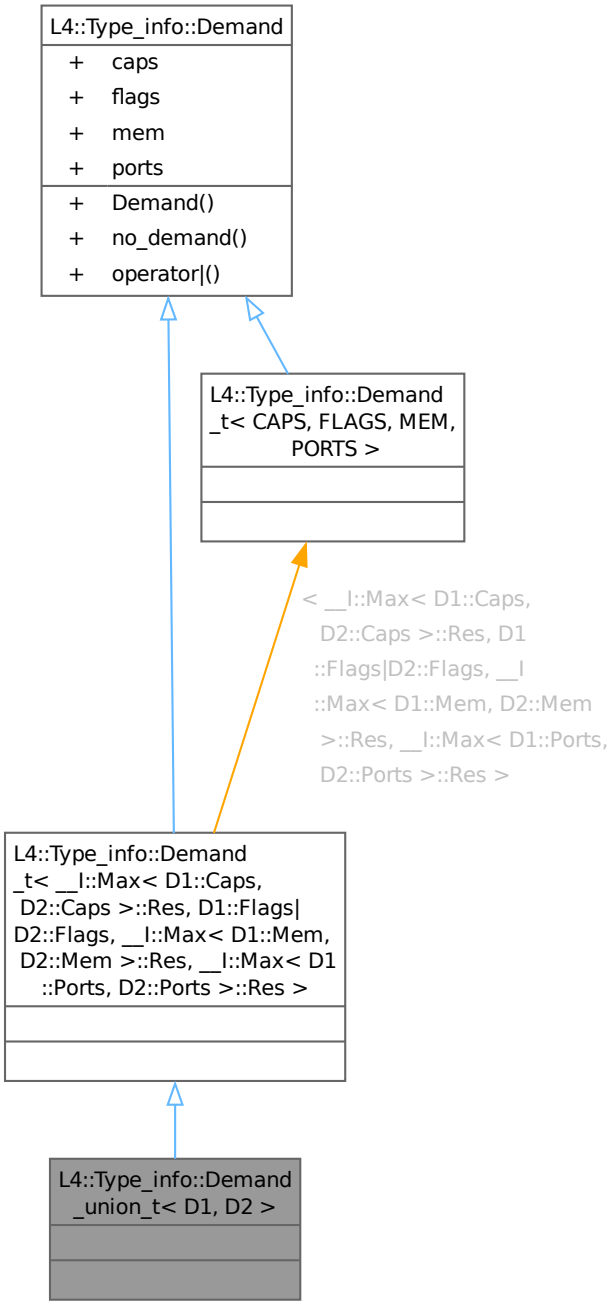
15.198 L4::Type_info::Demand_union_t< D1, D2 > Struct Template Reference

Template type statically describing the combination of two Demand object.
`#include <l4/sys/capability>`

Inheritance diagram for L4::Type_info::Demand_union_t< D1, D2 >:



Collaboration diagram for L4::Type_info::Demand_union_t< D1, D2 >:



Additional Inherited Members

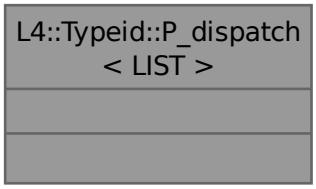
Collaboration diagram for L4::Typeid::P_dispatch< LIST >:



15.204.1 Detailed Description

template<typename LIST>
struct L4::Typeid::P_dispatch< LIST >

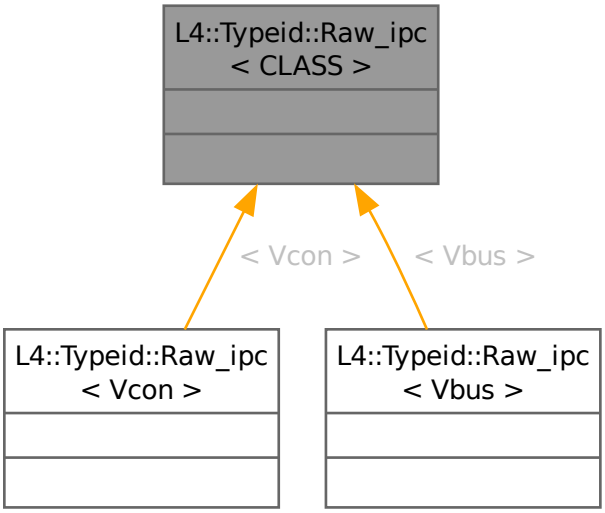
Use for protocol based dispatch stage.
Definition at line 308 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

- l4/sys/__typeinfo.h

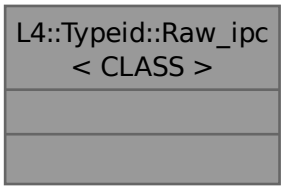
15.205 L4::Typeid::Raw_ipc< CLASS > Struct Template Reference

RPCs list for passing raw incoming IPC to the server object.

`#include <l4/sys/capability>`
Inheritance diagram for L4::Typeid::Raw_ipc< CLASS >:



Collaboration diagram for L4::Typeid::Raw_ipc< CLASS >:



15.205.1 Detailed Description

template<typename CLASS>
struct L4::Typeid::Raw_ipc< CLASS >

RPCs list for passing raw incoming IPC to the server object.

Template Parameters

CLASS	The type of the interface (e.g., L4::Icu)

This template allows to have fully handcrafted IPC protocols.
Definition at line 412 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

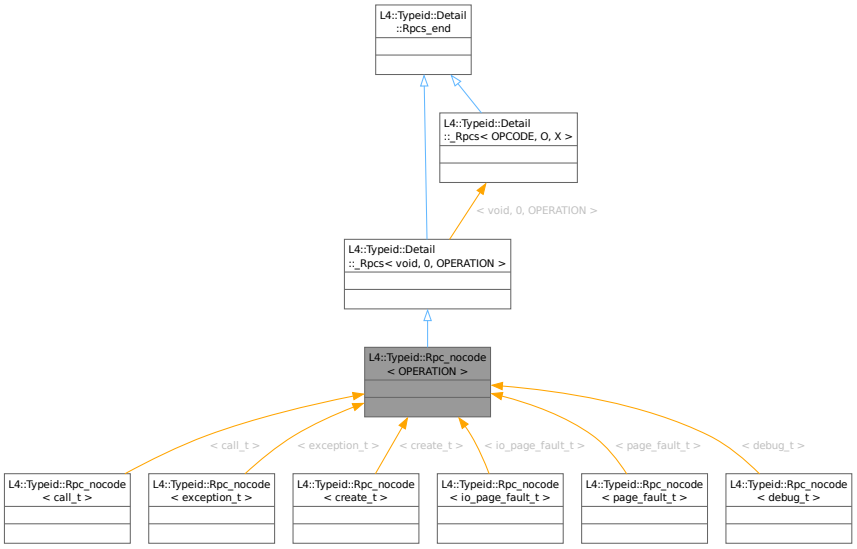
- l4/sys/__typeinfo.h

15.206 L4::Typeid::Rpc_nocode< OPERATION > Struct Template Reference

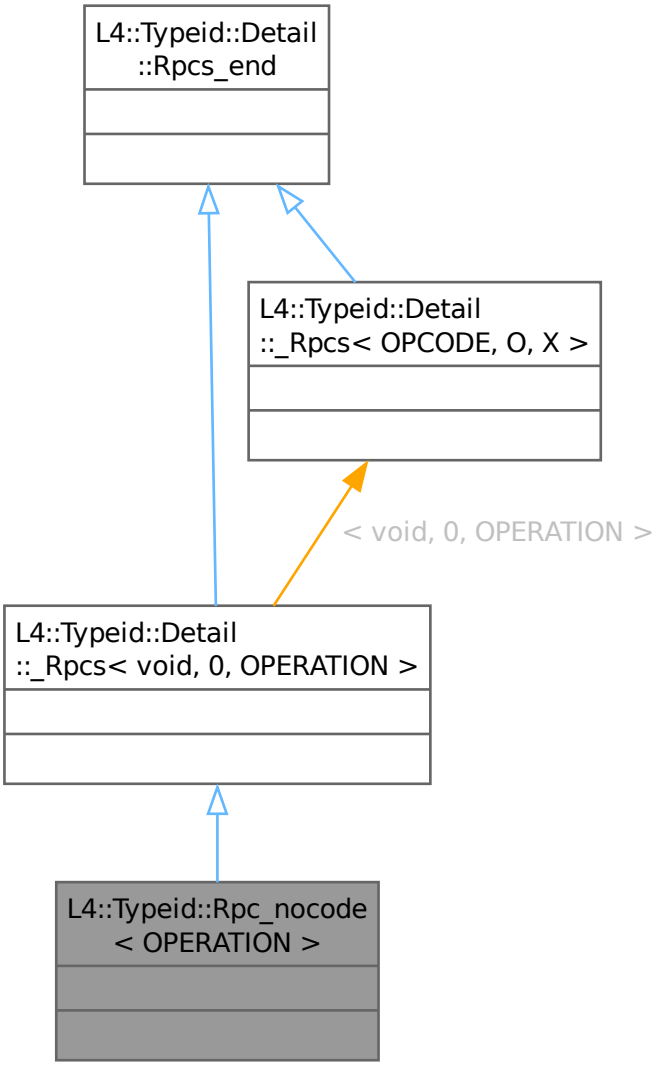
List of RPCs of an interface using a single operation without an opcode.

`#include <l4/sys/capability>`

Inheritance diagram for L4::Typeid::Rpc_nocode< OPERATION >:



Collaboration diagram for L4::Typeid::Rpc_nocode< OPERATION >:



15.206.1 Detailed Description

template<typename OPERATION>
struct L4::Typeid::Rpc_nocode< OPERATION >

List of RPCs of an interface using a single operation without an opcode.

Template Parameters

OPERATION	The RPC operation as defined by L4_RPC etc.

Definition at line 454 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

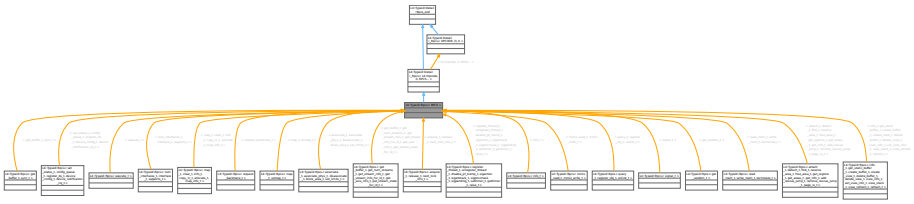
- l4/sys/__typeinfo.h

15.207 L4::Typeid::Rpcs< RPCS > Struct Template Reference

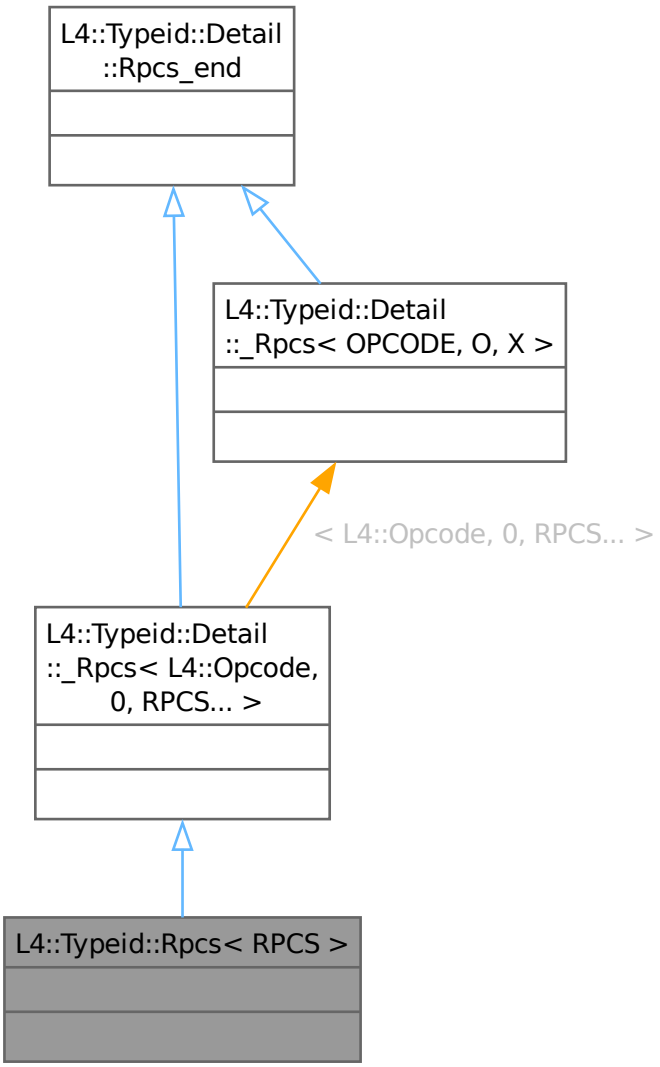
Standard list of RPCs of an interface.

`#include <l4/sys/capability>`

Inheritance diagram for L4::Typeid::Rpcs< RPCS >:



Collaboration diagram for L4::Typeid::Rpcs< RPCS >:



15.207.1 Detailed Description

template<typename ... RPCS>
struct L4::Typeid::Rpcs< RPCS >

Standard list of RPCs of an interface.

Template Parameters

RPCS	list of RPC types as defined by L4_RPC etc.

This is the default list for RPC functions of an interface, it uses L4::Opcode as opcode type and uses opcodes starting from 0.

Examples

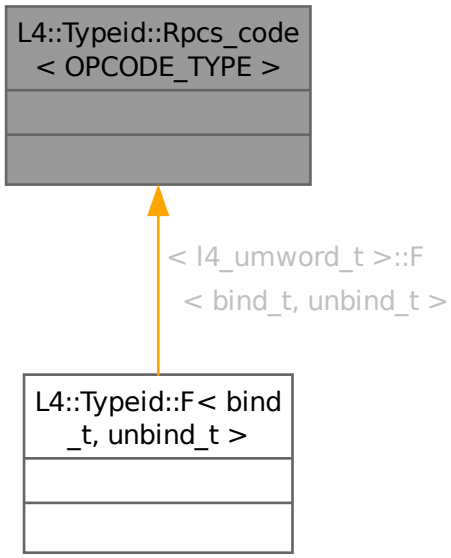
examples/clntsrv/src/shared.h.

Definition at line 428 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

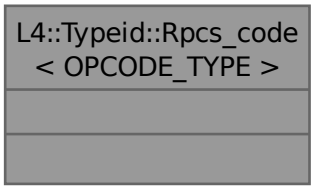
- l4/sys/__typeinfo.h

15.208 L4::Typeid::Rpcs_code< OPCODE_TYPE > Struct Template Reference

List of RPCs of an interface using a special opcode type.
`#include <l4/sys/capability>`
Inheritance diagram for L4::Typeid::Rpcs_code< OPCODE_TYPE >:



Collaboration diagram for L4::Typeid::Rpcs_code< OPCODE_TYPE >:



Data Structures

- struct F

15.208.1 Detailed Description

template<typename OPCODE_TYPE>
struct L4::Typeid::Rpcs_code< OPCODE_TYPE >

List of RPCs of an interface using a special opcode type.

Template Parameters

OPCODE_TYPE	The data type of the opcode.

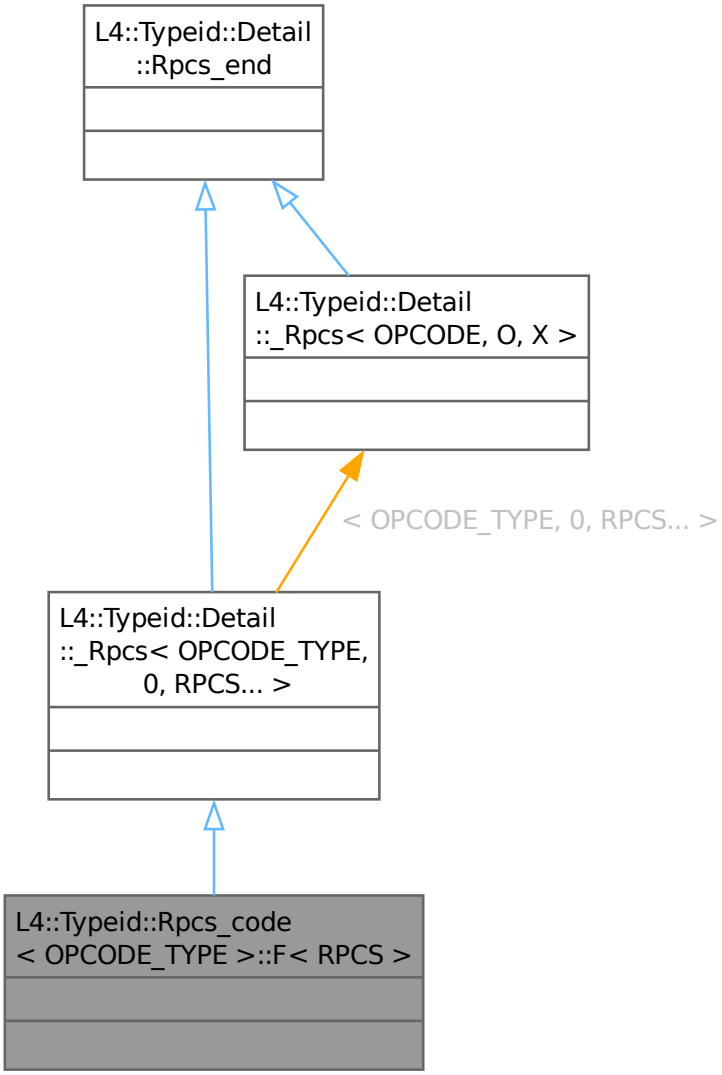
List for RPC functions of an interface, using OPCODE_TYPE as data type for the opcode, opcodes starting from 0.
Definition at line 439 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

- l4/sys/__typeinfo.h

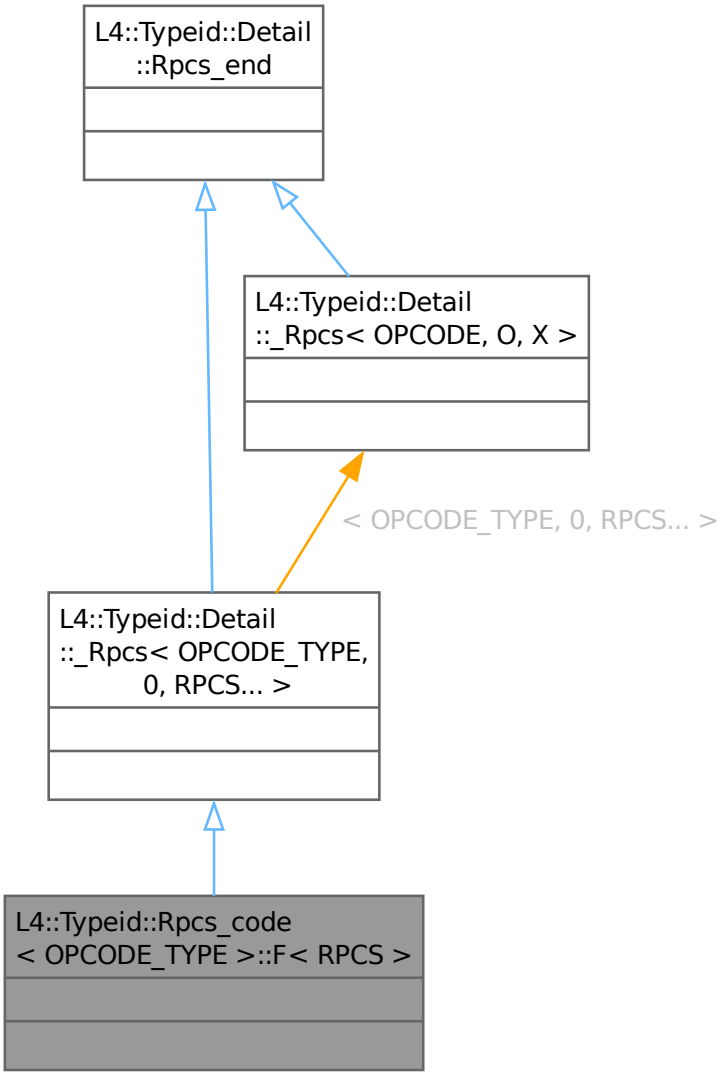
15.209 L4::Typeid::Rpcs_code< OPCODE_TYPE >::F< RPCS > Struct Template Reference

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Typeid::Rpcs_code< OPCODE_TYPE >::F< RPCS >:



Collaboration diagram for L4::Typeid::Rpcs_code< OPCODE_TYPE >::F< RPCS >:



15.209.1 Detailed Description

template<typename OPCODE_TYPE>
template<typename ... RPCS>
struct L4::Typeid::Rpcs_code< OPCODE_TYPE >::F< RPCS >

Template Parameters

RPCS	list of RPC types as defined by L4_RPC etc.

Definition at line 445 of file __typeinfo.h.
The documentation for this struct was generated from the following file:

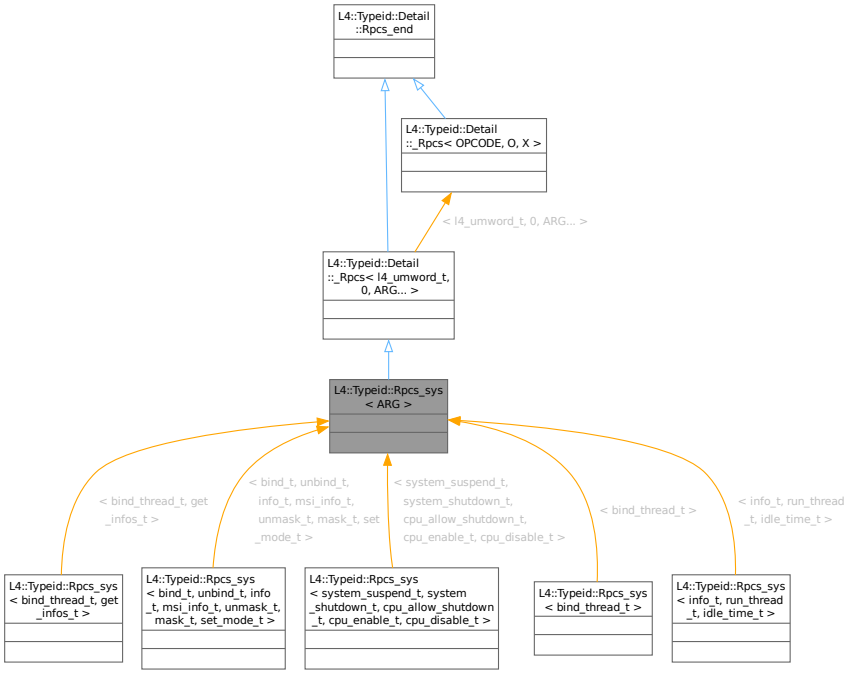
- l4/sys/__typeinfo.h

15.210 L4::Typeid::Rpcs_sys< ARG > Struct Template Reference

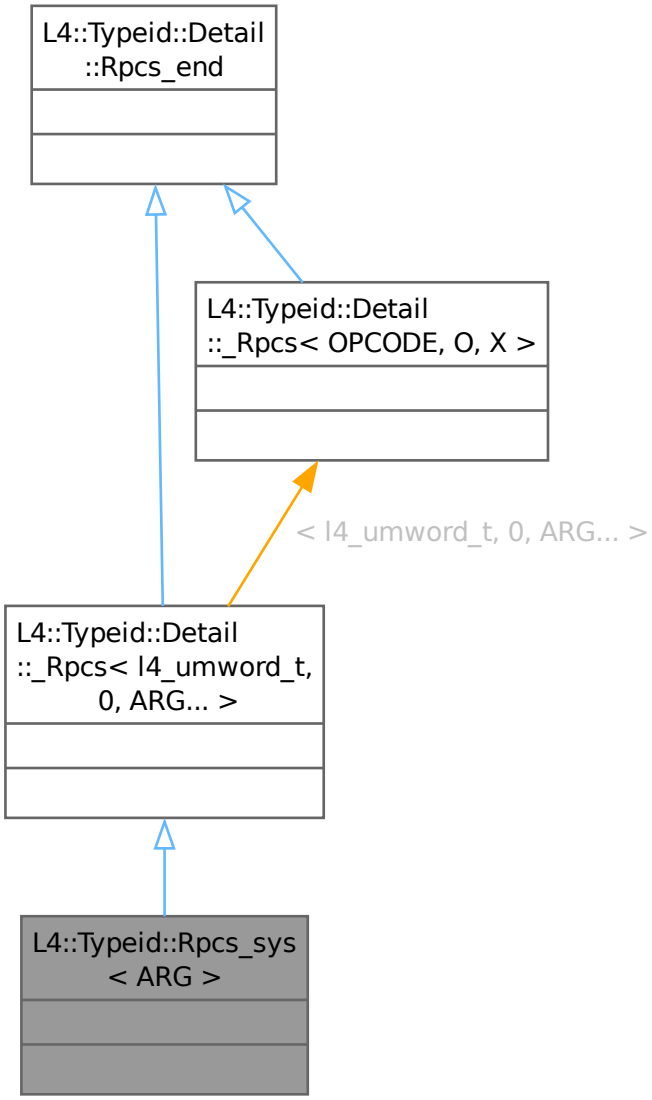
List of RPCs typically used for kernel interfaces.

`#include <l4/sys/capability>`

Inheritance diagram for L4::Typeid::Rpcs_sys< ARG >:



Collaboration diagram for L4::Typeid::Rpcs_sys< ARG >:



15.210.1 Detailed Description

template<typename ... ARG>
struct L4::Typeid::Rpcs_sys< ARG >

List of RPCs typically used for kernel interfaces.

Template Parameters

RPCS	list of RPC types as defined by L4_RPC etc.

This list of RPC functions uses l4_umword_t as type for the opcode as most kernel protocol do.
Definition at line 465 of file __typeinfo.h.

The documentation for this struct was generated from the following file:

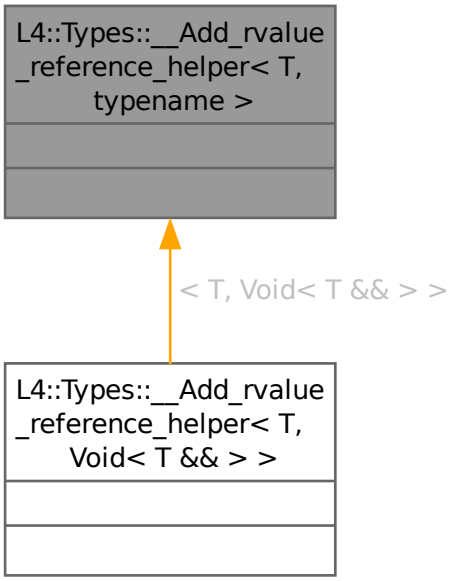
- l4/sys/__typeinfo.h

15.211 L4::Types::__Add_rvalue_reference_helper< T, typename > Struct Template Reference

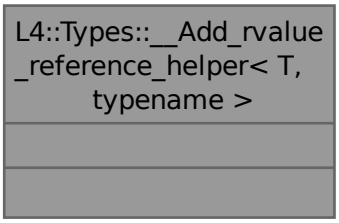
Helper template for Add_rvalue_reference.

`#include <types>`

Inheritance diagram for L4::Types::__Add_rvalue_reference_helper< T, typename >:



Collaboration diagram for L4::Types::__Add_rvalue_reference_helper< T, typename >:



15.211.1 Detailed Description

template<typename T, typename = void>
struct L4::Types::__Add_rvalue_reference_helper< T, typename >

Helper template for Add_rvalue_reference.
Definition at line 285 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

15.212 L4::Types::__Add_rvalue_reference_helper< T, Void< T && > > Struct Template Reference

Helper template for Add_rvalue_reference.

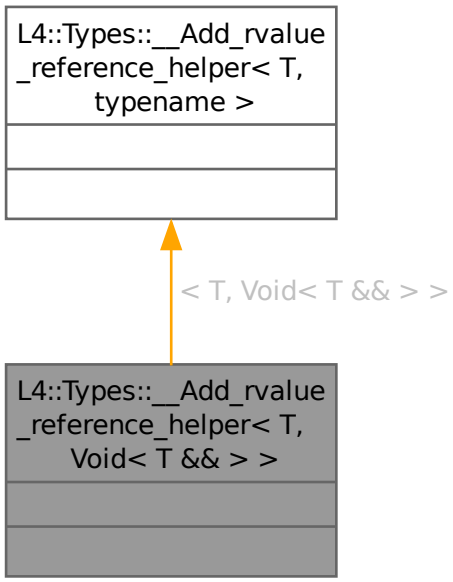
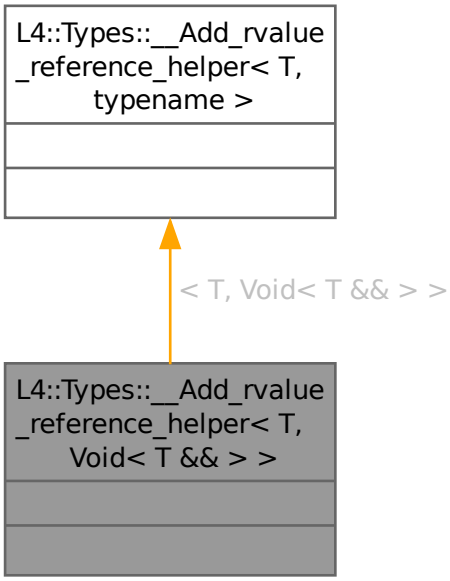
Inheritance diagram for L4::Types::__Add_rvalue_reference_helper< T, Void< T && > >:



Collaboration diagram for L4::Types::__Add_rvalue_reference_helper< T, Void< T && > >:



15.212.1 Detailed Description

template<typename T>
struct L4::Types::__Add_rvalue_reference_helper< T, Void< T && > >

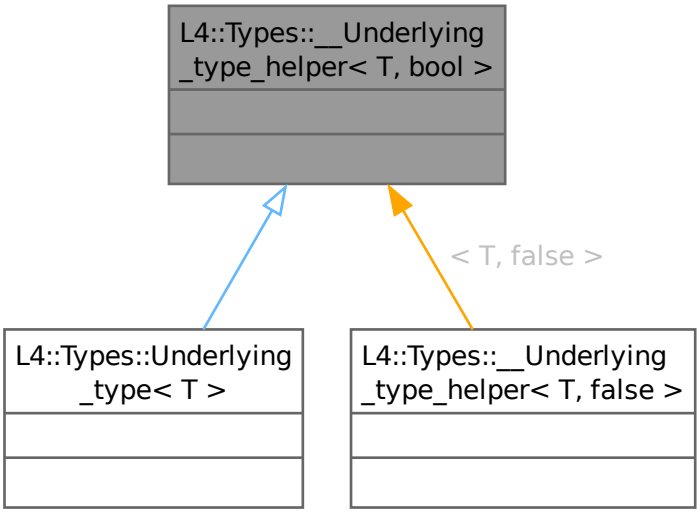
Helper template for Add_rvalue_reference.
Definition at line 289 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

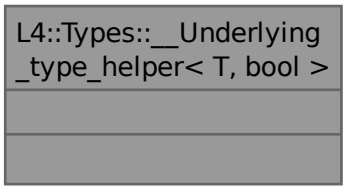
15.213 L4::Types::__Underlying_type_helper< T, bool > Struct Template Reference

Helper template for Underlying_type.
`#include <types>`

Inheritance diagram for L4::Types::__Underlying_type_helper< T, bool >:



Collaboration diagram for L4::Types::__Underlying_type_helper< T, bool >:



15.213.1 Detailed Description

template<typename T, bool = Is_enum<T>::value>
struct L4::Types::__Underlying_type_helper< T, bool >

Helper template for Underlying_type.

Note

The implementation relies on the intrinsic __underlying_type() compiler type trait that is provided by the mainstream C++ compilers. There is no fully portable and future-proof way of implementing this template (the only fragile and unmaintainable possibility is to evaluate all possible underlying types).

Template Parameters

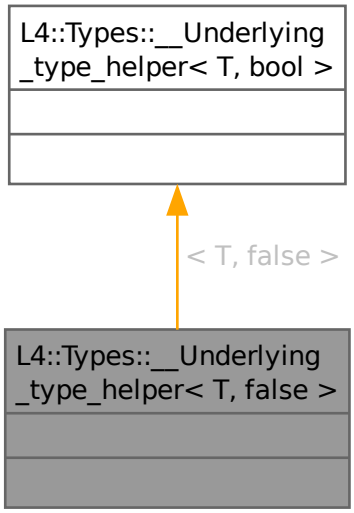
T	Enumeration type to get the underlying type of.

Definition at line 380 of file types.
The documentation for this struct was generated from the following file:

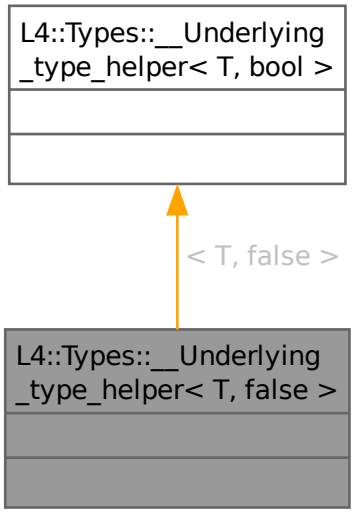
- l4/sys/cxx/types

15.214 L4::Types::__Underlying_type_helper< T, false > Struct Template Reference

Helper template for Underlying_type.
`#include <types>`
Inheritance diagram for L4::Types::__Underlying_type_helper< T, false >:



Collaboration diagram for L4::Types::__Underlying_type_helper< T, false >:



15.214.1 Detailed Description

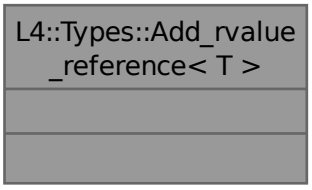
template<typename T>
struct L4::Types::__Underlying_type_helper< T, false >

Helper template for Underlying_type.
Definition at line 383 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

15.215 L4::Types::Add_rvalue_reference< T > Struct Template Reference

Create an rvalue reference of the given type.
`#include <types>`
Collaboration diagram for L4::Types::Add_rvalue_reference< T >:



15.215.1 Detailed Description

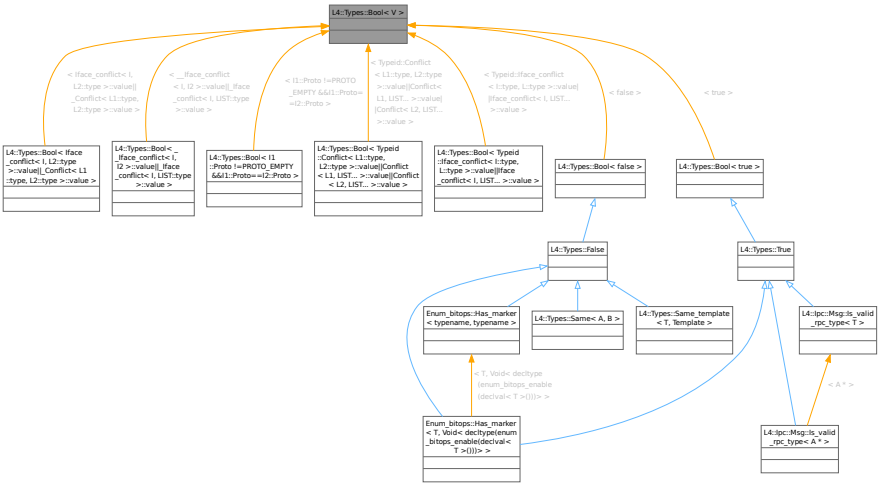
template<typename T>
struct L4::Types::Add_rvalue_reference< T >

Create an rvalue reference of the given type.
Definition at line 293 of file types.
The documentation for this struct was generated from the following file:

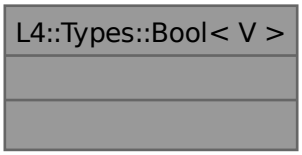
- l4/sys/cxx/types

15.216 L4::Types::Bool< V > Struct Template Reference

Boolean meta type.
`#include <types>`
Inheritance diagram for L4::Types::Bool< V >:



Collaboration diagram for L4::Types::Bool< V >:



Public Types

- using **type** = Bool<V>

  The meta type itself.

15.216.1 Detailed Description

template<bool V>
struct L4::Types::Bool< V >

Boolean meta type.

Template Parameters

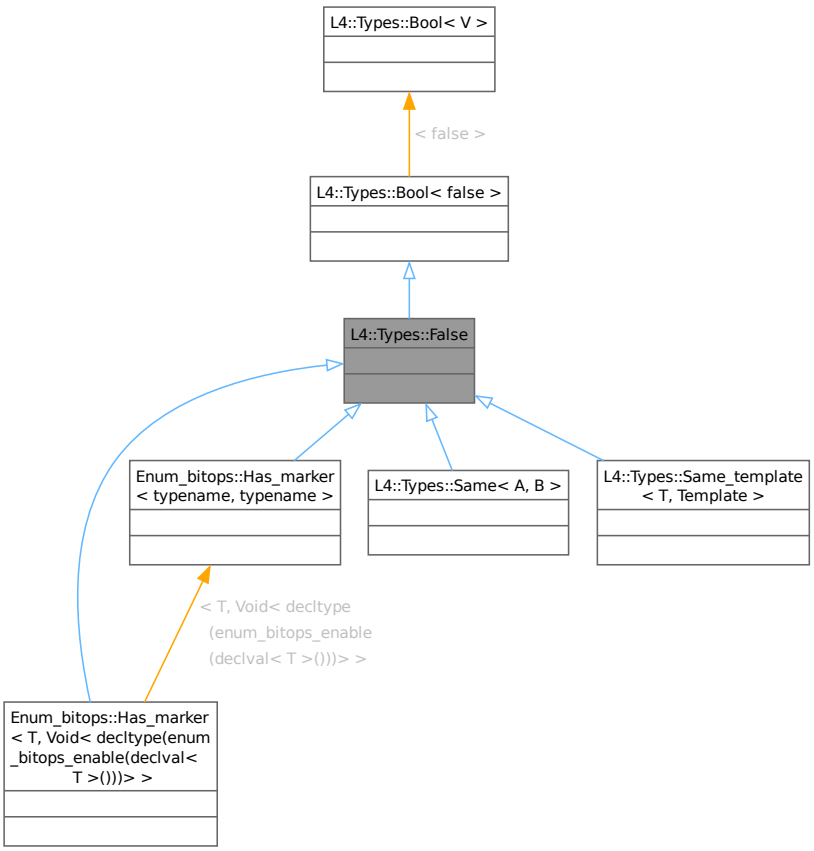
V	The boolean value

Definition at line 314 of file types.
The documentation for this struct was generated from the following file:

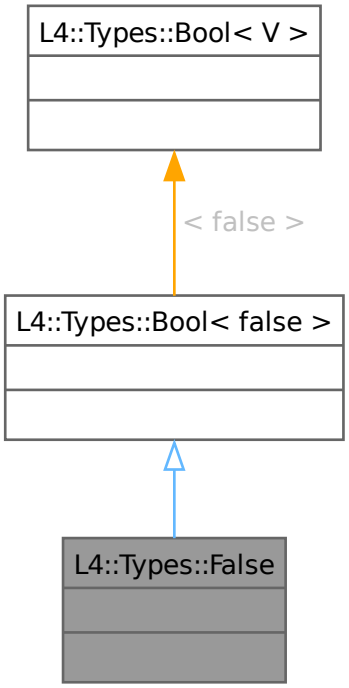
- l4/sys/cxx/types

15.217 L4::Types::False Struct Reference

False meta value.
`#include <types>`
Inheritance diagram for L4::Types::False:



Collaboration diagram for L4::Types::False:



Additional Inherited Members

Public Types inherited from L4::Types::Bool< false >

- using **type**

  The meta type itself.

15.217.1 Detailed Description

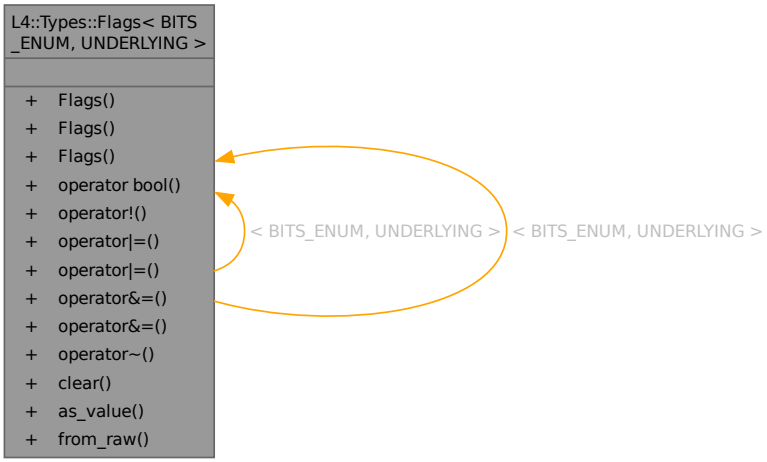
False meta value.
Definition at line 322 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

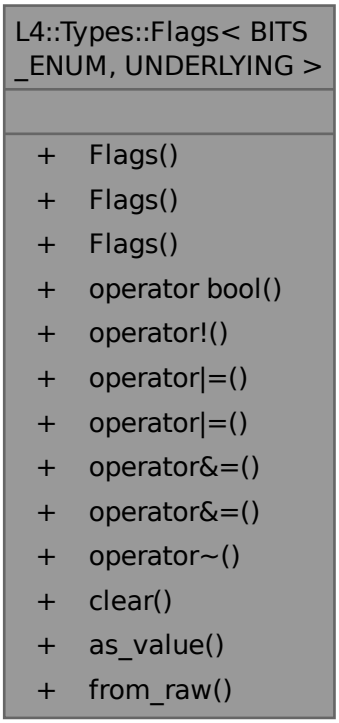
15.218 L4::Types::Flags< BITS_ENUM, UNDERLYING > Class Template Reference

Template for defining typical Flags bitmaps.
`#include <types>`

Inheritance diagram for L4::Types::Flags< BITS_ENUM, UNDERLYING >:



Collaboration diagram for L4::Types::Flags< BITS_ENUM, UNDERLYING >:



Public Types

- enum None_type { None }

The none type to get an empty bitmap.

- using **value_type** = UNDERLYING

  type of the underlying value

- using **bits_enum_type** = BITS_ENUM

  enum type defining a name for each bit

- using **type** = Flags<BITS_ENUM, UNDERLYING>

  the Flags<> type itself

Public Member Functions

- constexpr Flags (None_type) noexcept

  Make an empty bitmap.

- constexpr **Flags** () noexcept

  Make default Flags.

- constexpr Flags (BITS_ENUM e) noexcept

  Make flags from bit name.

- constexpr **operator bool** () const noexcept

  Support for `if (flags)` syntax (test for non-empty flags).

- constexpr bool **operator!** () const noexcept

  Support for `if (!flags)` syntax (test for empty flags).

- constexpr type & **operator|=** (type rhs) noexcept

  Support |= of two compatible Flags types.

- constexpr type & **operator|=** (bits_enum_type rhs)

  Support |= of Flags type and bit name.

- constexpr type & **operator&=** (type rhs)

  Support &= of two compatible Flags types.

- constexpr type & **operator&=** (bits_enum_type rhs)

  Support &= of Flags type and bit name.

- constexpr type **operator~** () const noexcept

  Support ~ for Flags types.

- constexpr type & clear (bits_enum_type flag) noexcept

  Clear the given flag.

- constexpr value_type **as_value** () const noexcept

  Get the underlying value.

Static Public Member Functions

- static constexpr type from_raw (value_type v) noexcept

  Make flags from a raw value of value_type.

Friends

- constexpr type **operator|** (type lhs, type rhs) noexcept

  Support | of two compatible Flags types.

- constexpr type **operator|** (type lhs, bits_enum_type rhs) noexcept

  Support | of Flags type and bit name.

- constexpr type **operator&** (type lhs, type rhs) noexcept

  Support & of two compatible Flags types.

- constexpr type **operator&** (type lhs, bits_enum_type rhs) noexcept

  Support & of Flags type and bit name.

15.218.1 Detailed Description

template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
class L4::Types::Flags< BITS_ENUM, UNDERLYING >

Template for defining typical Flags bitmaps.

Template Parameters

BITS_ENUM	enum type that defines a name for each bit in the bitmap. The values of the enum members must be the number of the bit (*not* a mask).
UNDERLYING	The underlying data type used to represent the bitmap.

The resulting data type provides a type-safe version that allows bitwise `and` and `or` operations with the BITS_↩ ENUM members. As well as, test for `0`or `!0`.
Example:

```
enum Test_flag
{
  Do_weak_tests,
  Do_strong_tests
};

using Test_flags = L4::Types::Flags<Test_flag>;

Test_flags x = Do_weak_tests;

if (x & Do_strong_tests) { ... }
x |= Do_strong_tests;
if (x & Do_strong_tests) { ... }
```

Definition at line 52 of file types.

15.218.2 Member Enumeration Documentation

15.218.2.1 None_type

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
enum L4::Types::Flags::None_type
```

The none type to get an empty bitmap.

Enumerator

None	Use this to get an empty bitmap.

Definition at line 68 of file types.

15.218.3 Constructor & Destructor Documentation

15.218.3.1 Flags() [1/2]

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
L4::Types::Flags< BITS_ENUM, UNDERLYING >::Flags (
             None_type )  [inline], [constexpr], [noexcept]
```

Make an empty bitmap.
Usually used for implicit conversion from `Flags::None`.

```
Flags x = Flags::None;
```

Definition at line 78 of file types.

15.218.3.2 Flags() [2/2]

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
L4::Types::Flags< BITS_ENUM, UNDERLYING >::Flags (
             BITS_ENUM e)  [inline], [constexpr], [noexcept]
```

Make flags from bit name.
Usually used for implicit conversion for a bit name.
```
Test_flags f = Do_strong_tests;
```
Definition at line 91 of file types.

15.218.4 Member Function Documentation

15.218.4.1 clear()

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
type & L4::Types::Flags< BITS_ENUM, UNDERLYING >::clear (
            bits_enum_type flag)  [inline], [constexpr], [noexcept]
```
Clear the given flag.

Parameters

flag	The flag that shall be cleared.

`flags.clear(The_flag)` is a shortcut for `flags &= ~Flags(The_flag)`.
Definition at line 149 of file types.

15.218.4.2 from_raw()

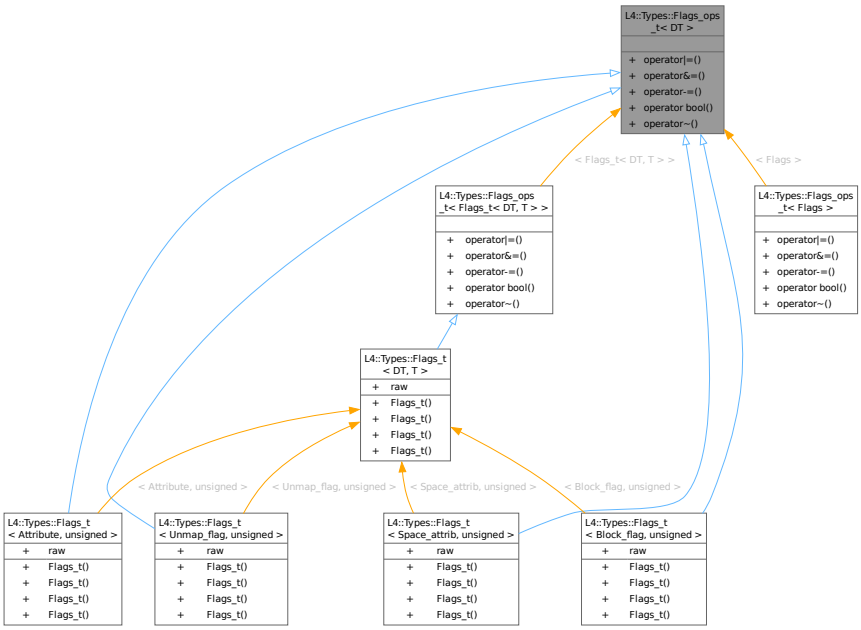
```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
constexpr type L4::Types::Flags< BITS_ENUM, UNDERLYING >::from_raw (
            value_type v)  [inline], [static], [constexpr], [noexcept]
```
Make flags from a raw value of *value_type*.
This function may be used for example in C wrapper code.
Definition at line 100 of file types.
The documentation for this class was generated from the following file:

- l4/sys/cxx/types

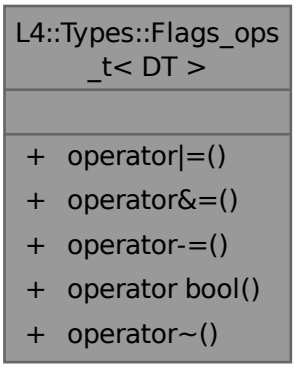
15.219 L4::Types::Flags_ops_t< DT > Struct Template Reference

Mixin class to define a set of friend bitwise operators on `DT`.
`#include <types>`

Inheritance diagram for L4::Types::Flags_ops_t< DT >:



Collaboration diagram for L4::Types::Flags_ops_t< DT >:



Public Member Functions

- constexpr DT & **operator|=** (DT const r)

  bitwise or assignment for DT
- constexpr DT & **operator&=** (DT const r)

  bitwise and assignment for DT
- constexpr DT & **operator-=** (DT const r)

  Bitwise difference (clear bits) assignment for DT.
- constexpr **operator bool** () const

  explicit conversion to bool for tests

- constexpr DT **operator∼** () const

  bitwise negation for DT

Friends

- constexpr DT **operator|** (DT l, DT r)

  bitwise or for DT
- constexpr DT **operator&** (DT l, DT r)

  bitwise and for DT
- constexpr DT **operator-** (DT l, DT r)

  Bitwise difference (clear bits) for DT.
- constexpr bool **operator==** (DT l, DT r)

  equality for DT
- constexpr bool **operator!=** (DT l, DT r)

  inequality for DT

15.219.1 Detailed Description

template<typename DT>
struct L4::Types::Flags_ops_t< DT >

Mixin class to define a set of friend bitwise operators on `DT`.

Template Parameters

DT	The type usually inheriting from Flags_ops_t with a member *raw* of enum or integral type.

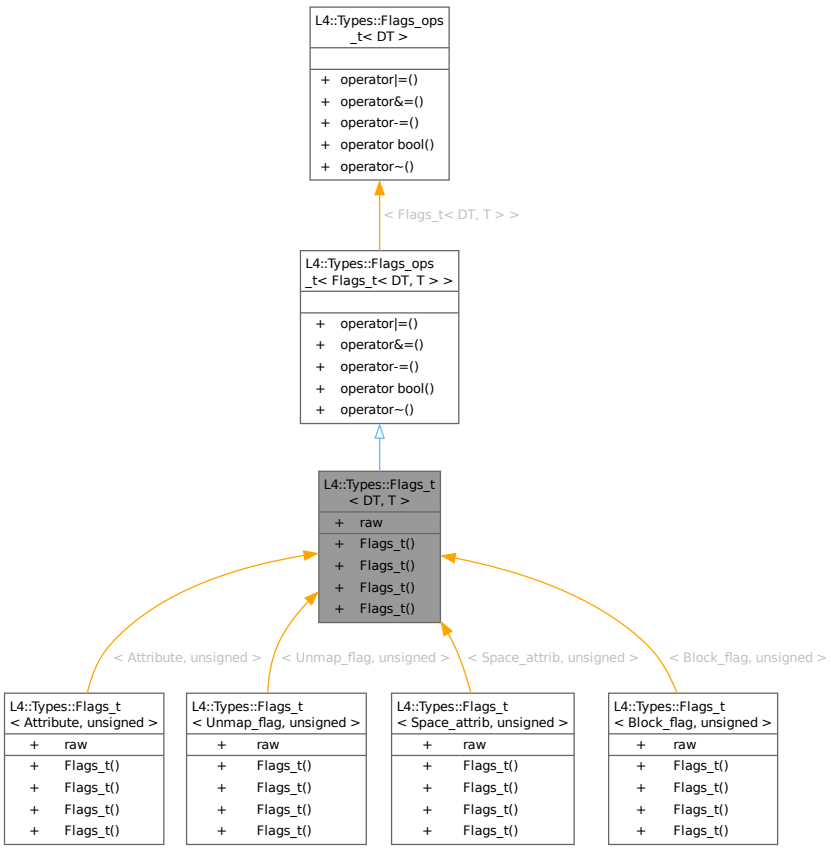
Definition at line 203 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

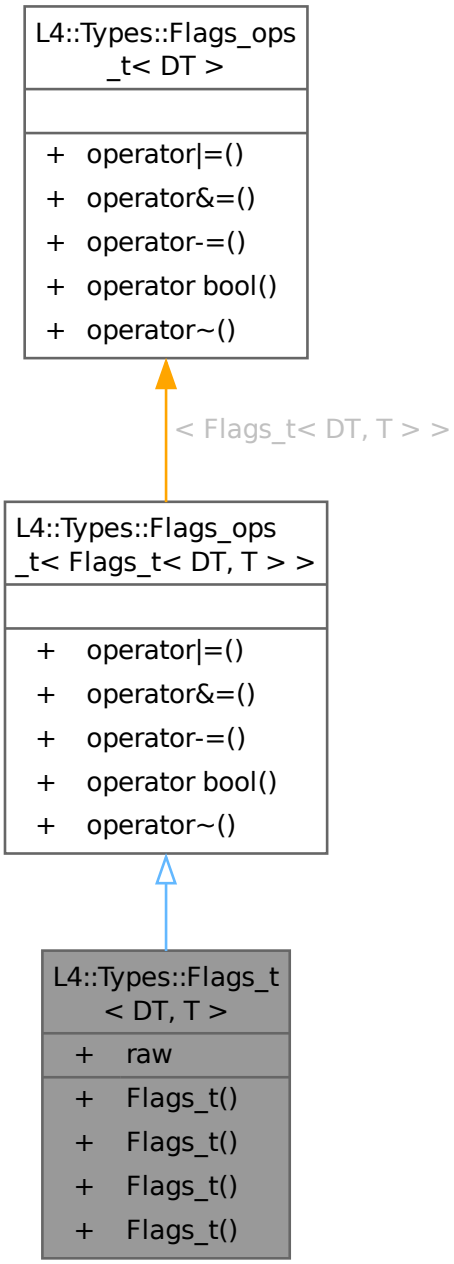
15.220 L4::Types::Flags_t< DT, T > Struct Template Reference

Template type to define a flags type with bitwise operations.
`#include <types>`

Inheritance diagram for L4::Types::Flags_t< DT, T >:



Collaboration diagram for L4::Types::Flags_t< DT, T >:



Public Types

- enum None_type { None }

  The none type to get an empty value.

Public Member Functions

- constexpr **Flags_t** ()=default

Default constructor with no flag set.

- constexpr **Flags_t** (None_type)

  Constructor to create an empty value.
- constexpr **Flags_t** (DT f)

  Initialization from determinator type.
- constexpr **Flags_t** (T f)

  Explicit initialization from the underlying type.

Public Member Functions inherited from L4::Types::Flags_ops_t< Flags_t< DT, T > >

- constexpr DT & **operator|=** (DT const r)

  bitwise or assignment for DT
- constexpr DT & **operator&=** (DT const r)

  bitwise and assignment for DT
- constexpr DT & **operator-=** (DT const r)

  Bitwise difference (clear bits) assignment for DT.
- constexpr **operator bool** () const

  explicit conversion to bool for tests
- constexpr DT **operator~** () const

  bitwise negation for DT

Data Fields

- T **raw** = 0

  Raw integral value.

15.220.1 Detailed Description

template<typename DT, typename T>
struct L4::Types::Flags_t< DT, T >

Template type to define a flags type with bitwise operations.

Template Parameters

DT	determinator type to make the resulting type unique (unused).
T	underlying type used to store the bits, usually an integral type.

Definition at line 264 of file types.

15.220.2 Member Enumeration Documentation

15.220.2.1 None_type

```
template<typename DT, typename T>
enum L4::Types::Flags_t::None_type
```

The none type to get an empty value.

Enumerator

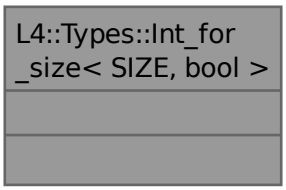
None	Use this to get an empty value.

Definition at line 267 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

15.221 L4::Types::Int_for_size< SIZE, bool > Struct Template Reference

Metafunction to get an unsigned integral type for the given size.
Collaboration diagram for L4::Types::Int_for_size< SIZE, bool >:



15.221.1 Detailed Description

template<unsigned SIZE, bool = true>
struct L4::Types::Int_for_size< SIZE, bool >

Metafunction to get an unsigned integral type for the given size.

Template Parameters

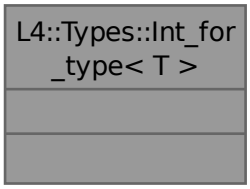
SIZE	The size of the integer in bytes.

Definition at line 161 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

15.222 L4::Types::Int_for_type< T > Struct Template Reference

Metafunction to get an integral type of the same size as `T`.
`#include <types>`
Collaboration diagram for L4::Types::Int_for_type< T >:



Public Types

- using **type** = typename Int_for_size<sizeof(T)>::type

The resulting unsigned integer type with the size like `T`.

15.222.1 Detailed Description

template<typename T>
struct L4::Types::Int_for_type< T >

Metafunction to get an integral type of the same size as `T`.

Template Parameters

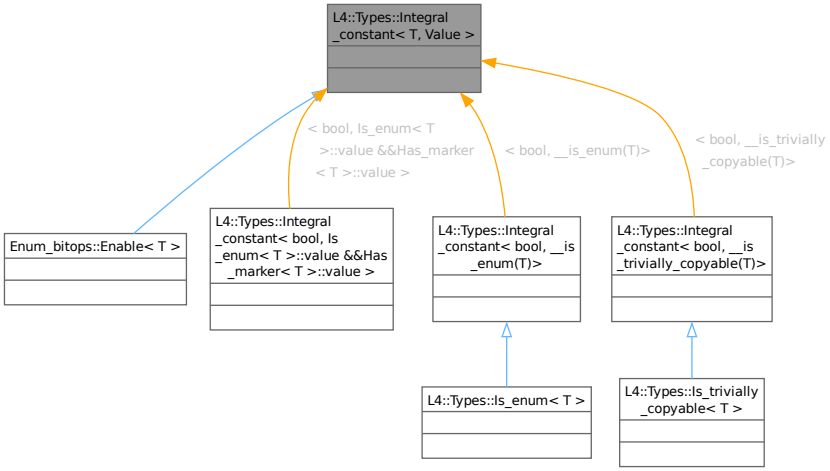
T	The type for which an unsigned integral type with the same size is needed.

Definition at line 188 of file types.
The documentation for this struct was generated from the following file:

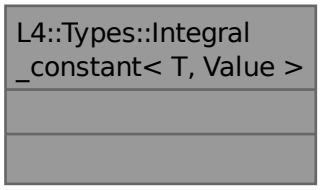
- l4/sys/cxx/types

15.223 L4::Types::Integral_constant< T, Value > Struct Template Reference

Wrapper for a static constant of the given type.
`#include <types>`
Inheritance diagram for L4::Types::Integral_constant< T, Value >:



Collaboration diagram for L4::Types::Integral_constant< T, Value >:



15.223.1 Detailed Description

template<typename T, T Value>
struct L4::Types::Integral_constant< T, Value >

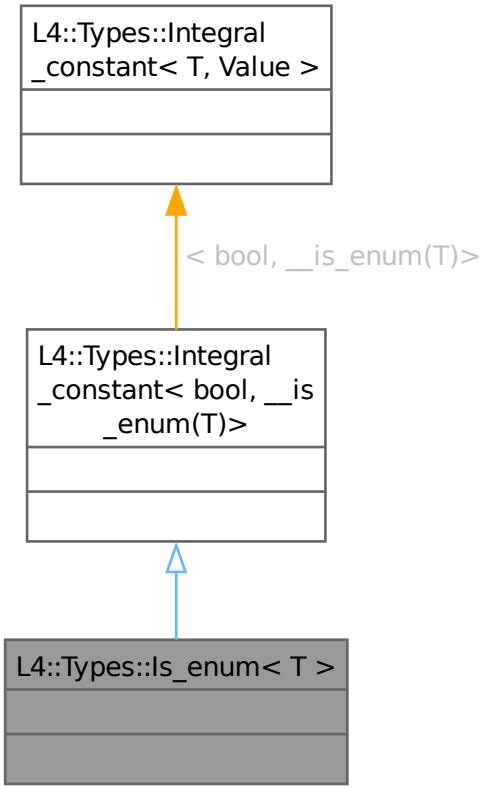
Wrapper for a static constant of the given type.
Definition at line 330 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

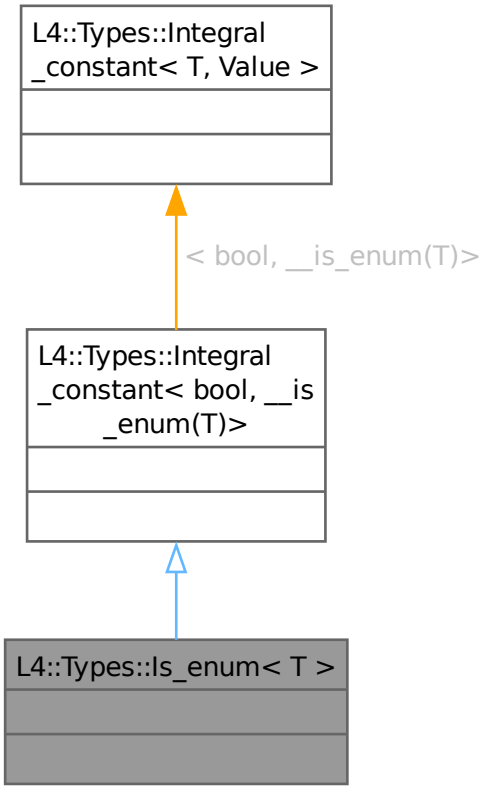
15.224 L4::Types::Is_enum< T > Struct Template Reference

Check whether the given type is an enumeration type.
`#include <types>`

Inheritance diagram for L4::Types::Is_enum< T >:



Collaboration diagram for L4::Types::Is_enum< T >:



15.224.1 Detailed Description

template<typename T>
struct L4::Types::Is_enum< T >

Check whether the given type is an enumeration type.

Note

The implementation relies on the intrinsic __is_enum() compiler type trait that is provided by the mainstream C++ compilers. There is no fully portable and future-proof way of implementing this template (the only fragile and unmaintainable possibility is to exclude all other types to identify the enumeration type).

Template Parameters

T	Type to check whether it is an enumeration type.

Definition at line 350 of file types.
The documentation for this struct was generated from the following file:

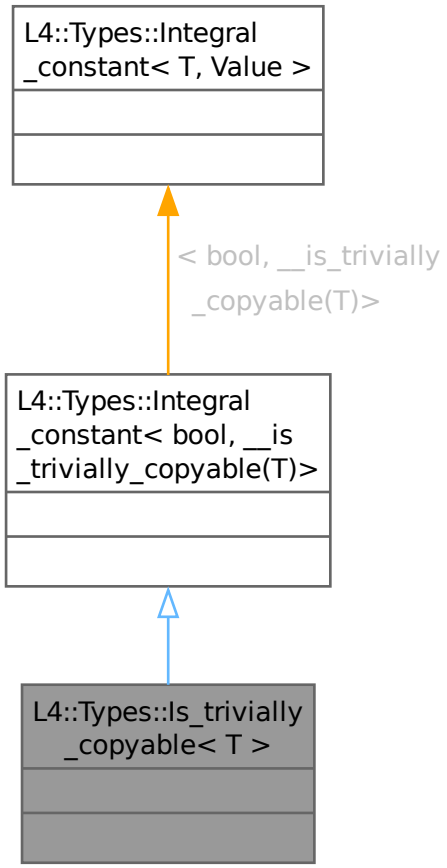
- l4/sys/cxx/types

15.225 L4::Types::Is_trivially_copyable< T > Struct Template Reference

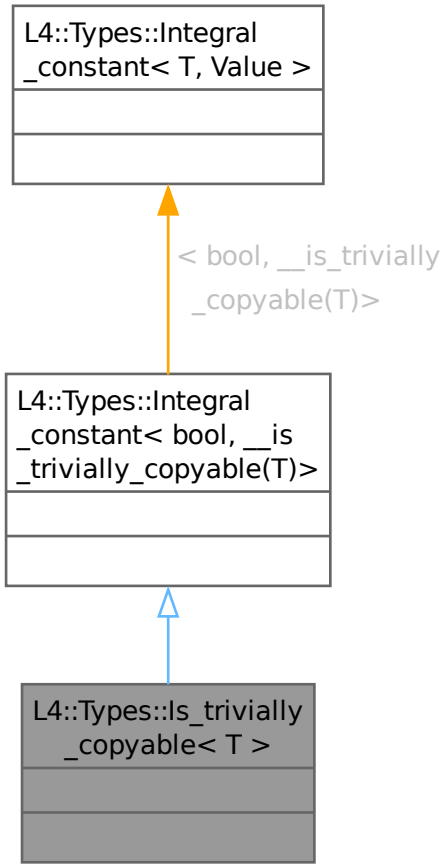
Check whether the given type is trivially copyable.

`#include <types>`

Inheritance diagram for L4::Types::Is_trivially_copyable< T >:



Collaboration diagram for L4::Types::Is_trivially_copyable< T >:



15.225.1 Detailed Description

template<typename T>
struct L4::Types::Is_trivially_copyable< T >

Check whether the given type is trivially copyable.
Objects of such types may be safely copied with memcpy() or serialized to/from binary files.

Template Parameters

T	Type to check whether it is trivially copyable.

Definition at line 361 of file types.
The documentation for this struct was generated from the following file:

- l4/sys/cxx/types

15.226 L4::Types::Same< A, B > Struct Template Reference

Compare two data types for equality.

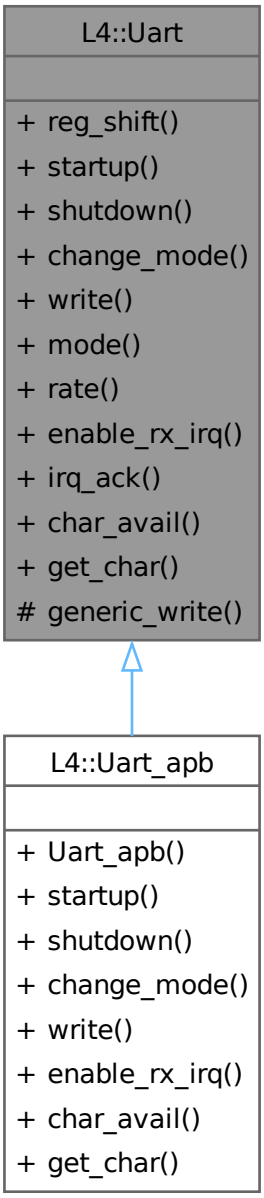
15.230 L4::Uart Class Reference

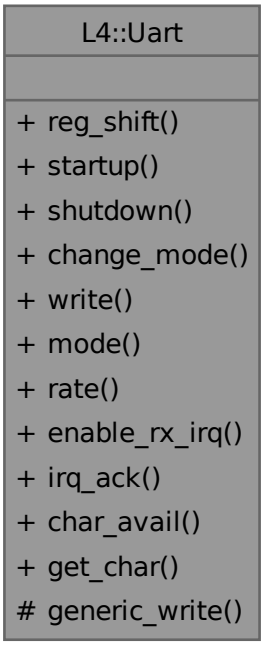
Uart driver abstraction.

`#include <uart_base.h>`

Inheritance diagram for L4::Uart:



Collaboration diagram for L4::Uart:



Public Member Functions

- virtual bool reg_shift (unsigned char ∗shift)) const

  Provide the reg_shift value for the UART's registers.
- virtual bool startup (Io_register_block const ∗regs)=0

  Start the UART driver.
- virtual void shutdown ()=0

  Terminate the UART driver.
- virtual bool change_mode (Transfer_mode m, Baud_rate r)=0

  Set certain parameters of the UART.
- virtual int write (char const ∗s, unsigned long count, bool blocking=true) const =0

  Transmit a number of characters.
- Transfer_mode mode () const

  Return the transfer mode.
- Baud_rate rate () const

  Return the baud rate.
- virtual bool enable_rx_irq (bool=true)

  Enable the receive IRQ.
- virtual void **irq_ack** ()

  Acknowledge a received interrupt.
- virtual int char_avail () const =0

  Check if there is at least one character available for reading from the UART.
- virtual int get_char (bool blocking=true) const =0

  Read a character from the UART.

Protected Member Functions

- template<typename Uart_driver, bool Timeout_guard = true>
  int generic_write (char const *s, unsigned long count, bool blocking=true) const

  Internal function transmitting each character one-after-another and finally waiting that the transmission did actually finish.

15.230.1 Detailed Description

Uart driver abstraction.
Definition at line 22 of file uart_base.h.

15.230.2 Member Function Documentation

15.230.2.1 change_mode()

```
virtual bool L4::Uart::change_mode (
             Transfer_mode m,
             Baud_rate r)  [pure virtual]
```

Set certain parameters of the UART.

Parameters

m	UART mode. Depends on the hardware.
r	Baud rate.

Return values

true	Mode setting succeeded (or was not performed at all).
false	Mode setting failed for some reason.

Note

Some drivers don't perform any mode setting at all and just return true.

Implemented in L4::Uart_apb.

15.230.2.2 char_avail()

```
virtual int L4::Uart::char_avail () const  [pure virtual]
```

Check if there is at least one character available for reading from the UART.

Returns

0 if there is no character available for reading, !=0 otherwise.

Implemented in L4::Uart_apb.

15.230.2.3 enable_rx_irq()

```
virtual bool L4::Uart::enable_rx_irq (
             bool  = true)  [inline], [virtual]
```

Enable the receive IRQ.

Return values

true	The RX IRQ was successfully enabled / disabled.
false	The RX IRQ couldn't be enabled / disabled. The driver does not support this operation.

Reimplemented in L4::Uart_apb.
Definition at line 115 of file uart_base.h.

15.230.2.4 generic_write()

```
template<typename Uart_driver, bool Timeout_guard = true>
int L4::Uart::generic_write (
             char const * s,
             unsigned long count,
             bool blocking = true) const  [inline], [protected]
```

Internal function transmitting each character one-after-another and finally waiting that the transmission did actually finish.

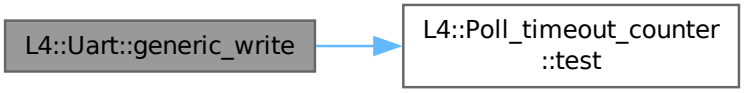
Parameters

s	Buffer containing the characters.
count	The number of characters to transmit.
blocking	If true, wait until there is space in the transmit buffer and also wait until every character was successful transmitted. Otherwise do not wait.

Returns

The number of successful written characters.

Definition at line 155 of file uart_base.h.
References L4::Poll_timeout_counter::test().
Here is the call graph for this function:



15.230.2.5 get_char()

```
virtual int L4::Uart::get_char (
             bool blocking = true) const  [pure virtual]
```

Read a character from the UART.

Parameters

blocking	If true, wait until a character is available for reading. Otherwise do not wait and just return -1 if no character is available.

Returns

The actual character read from the UART.

Implemented in L4::Uart_apb.

15.230.2.6 mode()

```
Transfer_mode L4::Uart::mode () const  [inline]
```

Return the transfer mode.

Returns

The transfer mode.

Definition at line 97 of file uart_base.h.

15.230.2.7 rate()

```
Baud_rate L4::Uart::rate () const  [inline]
```

Return the baud rate.

Returns

The baud rate.

Definition at line 104 of file uart_base.h.

15.230.2.8 reg_shift()

```
virtual bool L4::Uart::reg_shift (
            unsigned char * shift) const  [inline], [virtual]
```

Provide the reg_shift value for the UART's registers.

Parameters

out	*shift*	Register shift to be used for the UART's registers.

Return values

false	The output argument is not valid.
true	The output argument is valid.

Definition at line 47 of file uart_base.h.

15.230.2.9 shutdown()

```
virtual void L4::Uart::shutdown ()  [pure virtual]
```

Terminate the UART driver.
This includes disabling of interrupts.
Implemented in L4::Uart_apb.

15.230.2.10 startup()

```
virtual bool L4::Uart::startup (
            Io_register_block const * regs)  [pure virtual]
```

Start the UART driver.

Parameters

regs	IO register block of the UART.

Return values

true	Startup succeeded.
false	Startup failed.

Implemented in L4::Uart_apb.

15.230.2.11 write()

```
virtual int L4::Uart::write (
             char const * s,
             unsigned long count,
             bool blocking = true) const  [pure virtual]
```

Transmit a number of characters.

Parameters

s	Buffer containing the characters.
count	Number of characters to transmit.
blocking	If true, wait until there is space in the transmit buffer and also wait until every character was successful transmitted. Otherwise do not wait.

Returns

The number of successfully written characters.

Implemented in L4::Uart_apb.
The documentation for this class was generated from the following file:

15.231.1 Detailed Description

Driver for the Advanced Peripheral Bus (APB) UART from the Cortex-M System Design Kit (CMSDK).
Definition at line 17 of file uart_apb.h.

15.231.2 Member Function Documentation

15.231.2.1 change_mode()

```
bool L4::Uart_apb::change_mode (
            Transfer_mode m,
            Baud_rate r)  [override], [virtual]
```

Set certain parameters of the UART.

Parameters

m	UART mode. Depends on the hardware.
r	Baud rate.

Return values

true	Mode setting succeeded (or was not performed at all).
false	Mode setting failed for some reason.

Note

Some drivers don't perform any mode setting at all and just return true.

Implements L4::Uart.

15.231.2.2 char_avail()

```
int L4::Uart_apb::char_avail () const  [override], [virtual]
```

Check if there is at least one character available for reading from the UART.

Returns

0 if there is no character available for reading, !=0 otherwise.

Implements L4::Uart.

15.231.2.3 enable_rx_irq()

```
bool L4::Uart_apb::enable_rx_irq (
            bool )  [override], [virtual]
```

Enable the receive IRQ.

Return values

true	The RX IRQ was successfully enabled / disabled.
false	The RX IRQ couldn't be enabled / disabled. The driver does not support this operation.

Reimplemented from L4::Uart.

15.231.2.4 get_char()

```
int L4::Uart_apb::get_char (
            bool blocking = true) const  [override], [virtual]
```

Read a character from the UART.

Parameters

blocking	If true, wait until a character is available for reading. Otherwise do not wait and just return -1 if no character is available.

Returns

The actual character read from the UART.

Implements L4::Uart.

15.231.2.5 shutdown()

```
void L4::Uart_apb::shutdown ()  [override], [virtual]
```

Terminate the UART driver.
This includes disabling of interrupts.
Implements L4::Uart.

15.231.2.6 startup()

```
bool L4::Uart_apb::startup (
            Io_register_block const * regs)  [override], [virtual]
```

Start the UART driver.

Parameters

regs	IO register block of the UART.

Return values

true	Startup succeeded.
false	Startup failed.

Implements L4::Uart.

15.231.2.7 write()

```
int L4::Uart_apb::write (
            char const * s,
            unsigned long count,
            bool blocking = true) const  [override], [virtual]
```

Transmit a number of characters.

Parameters

s	Buffer containing the characters.
count	Number of characters to transmit.
blocking	If true, wait until there is space in the transmit buffer and also wait until every character was successful transmitted. Otherwise do not wait.

Returns

The number of successfully written characters.

Implements L4::Uart.

  Destruction.

Public Member Functions inherited from L4::Exception_tracer

- void const *const * **pc_array** () const noexcept

  Get the array containing the call trace.
- int **frame_count** () const noexcept

  Get the number of entries that are valid in the call trace.

Additional Inherited Members

Protected Member Functions inherited from L4::Base_exception

- **Base_exception** () noexcept

Create a base exception.

Protected Member Functions inherited from L4::Exception_tracer

- **Exception_tracer** () noexcept

  Create a back trace.

15.232.1 Detailed Description

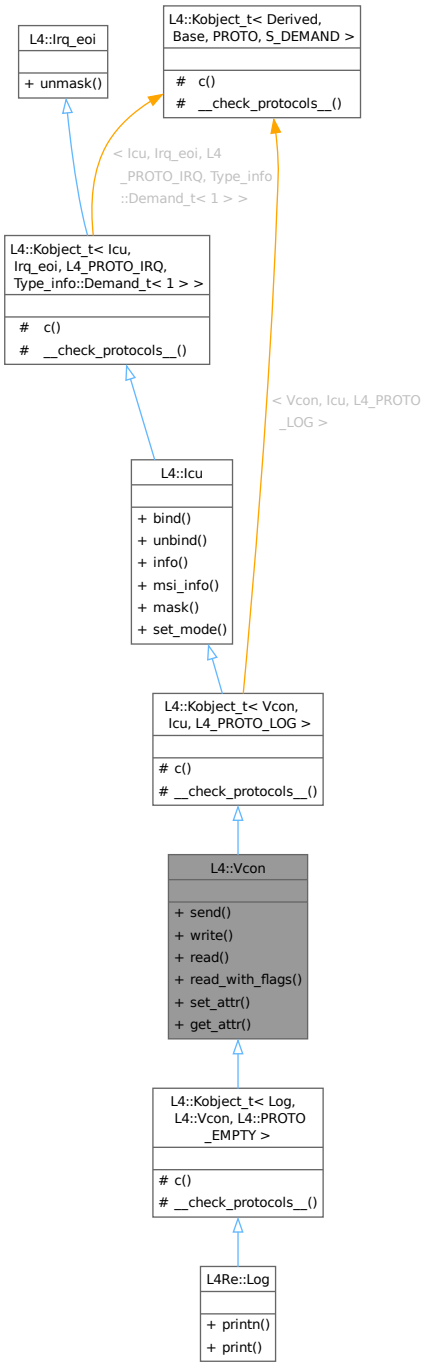
Exception for an unknown condition.
This error is usually used when a server returns an unknown return state to the client, this may indicate incompatible messages used by the client and the server.
Definition at line 208 of file exceptions.
The documentation for this class was generated from the following file:

- l4/cxx/exceptions

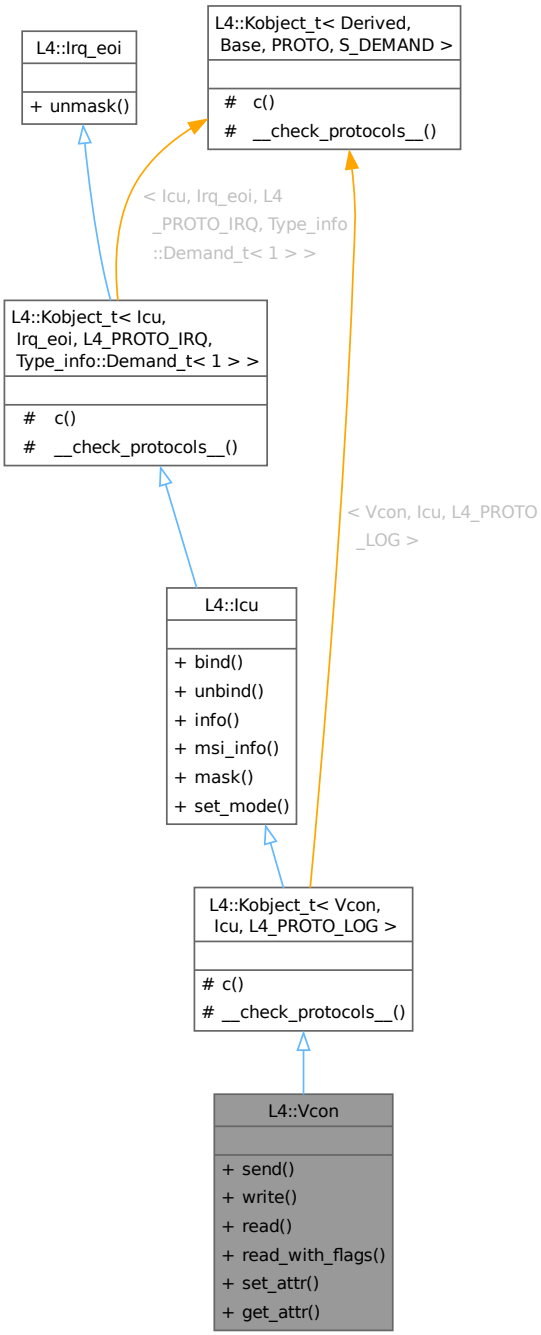
15.233 L4::Vcon Class Reference

C++ L4 Vcon interface, see Virtual Console for the C interface.
`#include <vcon>`

Inheritance diagram for L4::Vcon:



Collaboration diagram for L4::Vcon:



Public Member Functions

- l4_msgtag_t send (char const *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Send data to `this` virtual console.
- long write (char const *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Write data to `this` virtual console.
- int read (char *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Read data from `this` virtual console.

- int read_with_flags (char *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Read data from `this` virtual console which also returns flags.
- l4_msgtag_t set_attr (l4_vcon_attr_t const *attr, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Set the attributes of `this` virtual console.
- l4_msgtag_t get_attr (l4_vcon_attr_t *attr, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Get attributes of `this` virtual console.

Public Member Functions inherited from L4::Icu

- l4_msgtag_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t info (l4_icu_info_t *info, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get information about the ICU features.
- l4_msgtag_t msi_info (l4_umword_t irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info)

  Get MSI info about IRQ.
- l4_msgtag_t mask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Mask an IRQ line.
- l4_msgtag_t set_mode (unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb=l4_utcb()) noexcept

  Set interrupt mode.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Vcon, Icu, L4_PROTO_LOG >

- typedef Vcon **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Vcon > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Icu::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.233.1 Detailed Description

C++ L4 Vcon interface, see Virtual Console for the C interface.
L4::Vcon is a virtual console for simple character-based input and output. The interrupt for read events is provided by the virtual key interrupt.
The Vcon interface inherits from L4::Icu and L4::Irq_eoi for managing the virtual key interrupt which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

A server implementing the virtual console protocol has a queue for input events. When the first input event is added to the empty queue, the virtual key interrupt is triggered. Further events are added to the queue without generating further interrupts. The queue is emptied when a client reads all queued input events.

Include File

```
#include <l4/sys/vcon>
```

See the Virtual Console for the C interface.
Definition at line 45 of file vcon.

15.233.2 Member Function Documentation

15.233.2.1 get_attr()

```
l4_msgtag_t L4::Vcon::get_attr (
            l4_vcon_attr_t * attr,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Get attributes of `this` virtual console.

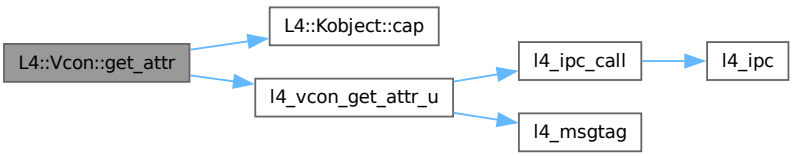
Parameters

out	*attr*	Attribute structure. Contains the attributes after a successful call of this function.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

Definition at line 151 of file vcon.
References L4::Kobject::cap(), and l4_vcon_get_attr_u().
Here is the call graph for this function:



15.233.2.2 read()

```
int L4::Vcon::read (
            char * buf,
            unsigned size,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Read data from `this` virtual console.

Parameters

`out`	*buf*	Pointer to data buffer.
	size	Size of the data buffer in bytes.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

-L4_EPERM	Insufficient permissions; see precondition.
>size	More bytes to read, `size` bytes are in the buffer `buf`.
<=size	Number of bytes read.

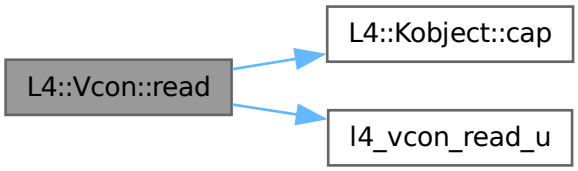
Precondition

The invoked Vcon capability must have the permission L4_CAP_FPAGE_W.

Note

Size must not exceed L4_VCON_READ_SIZE.

Definition at line 98 of file vcon.
References L4::Kobject::cap(), and l4_vcon_read_u().
Here is the call graph for this function:



15.233.2.3 read_with_flags()

```
int L4::Vcon::read_with_flags (
            char * buf,
            unsigned size,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Read data from `this` virtual console which also returns flags.

Parameters

out	*buf*	Pointer to data buffer.
	size	Size of the data buffer in bytes.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

-L4_EPERM	Insufficient permissions; see precondition.
>size	More bytes to read, `size` bytes are in the buffer `buf`.
<=size	Number of bytes read.

Precondition

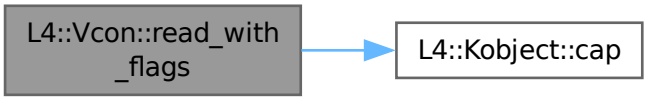
The invoked Vcon capability must have the permission L4_CAP_FPAGE_W.

If this function returns a positive value the caller can check the L4_VCON_READ_STAT_BREAK flag bit for a break condition. The bytes read can be obtained by masking the return value with L4_VCON_READ_SIZE_MASK.
If a break condition is signaled, it is always the first event in the transmitted content, i.e. all characters supplied by this read call follow the break condition.

Note

Size must not exceed L4_VCON_READ_SIZE.

Definition at line 125 of file vcon.
References L4::Kobject::cap().
Here is the call graph for this function:



15.233.2.4 send()

```
l4_msgtag_t L4::Vcon::send (
            char const * buf,
            unsigned size,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Send data to `this` virtual console.

Parameters

buf	Pointer to the data buffer.
size	Size of the data buffer in bytes.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

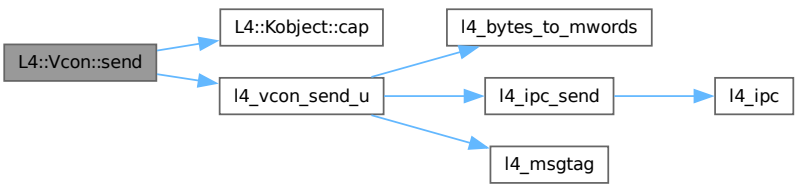
Returns

Syscall return tag

Note

Size must not exceed L4_VCON_WRITE_SIZE, a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use l4_ipc_error() to check for send errors, do not use l4_error(), as l4_error() will always return an error.

Definition at line 65 of file vcon.
References L4::Kobject::cap(), and l4_vcon_send_u().
Here is the call graph for this function:



15.233.2.5 set_attr()

```
l4_msgtag_t L4::Vcon::set_attr (
            l4_vcon_attr_t const * attr,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Set the attributes of `this` virtual console.

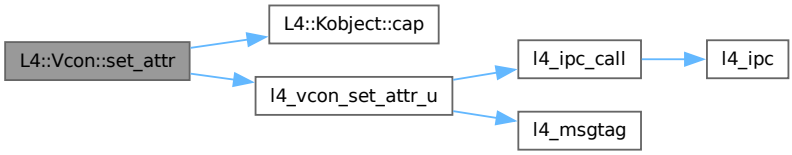
Parameters

attr	Attribute structure with the attributes for the virtual console.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Returns

Syscall return tag.

Definition at line 138 of file vcon.
References L4::Kobject::cap(), and l4_vcon_set_attr_u().
Here is the call graph for this function:



15.233.2.6 write()

```
long L4::Vcon::write (
            char const * buf,
            unsigned size,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Write data to `this` virtual console.

Parameters

buf	Pointer to the data buffer.
size	Size of the data buffer in bytes.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to l4_utcb.

Return values

<0	Error.
>=0	Number of bytes written to the virtual console.

Definition at line 79 of file vcon.
References L4::Kobject::cap(), and l4_vcon_write_u().

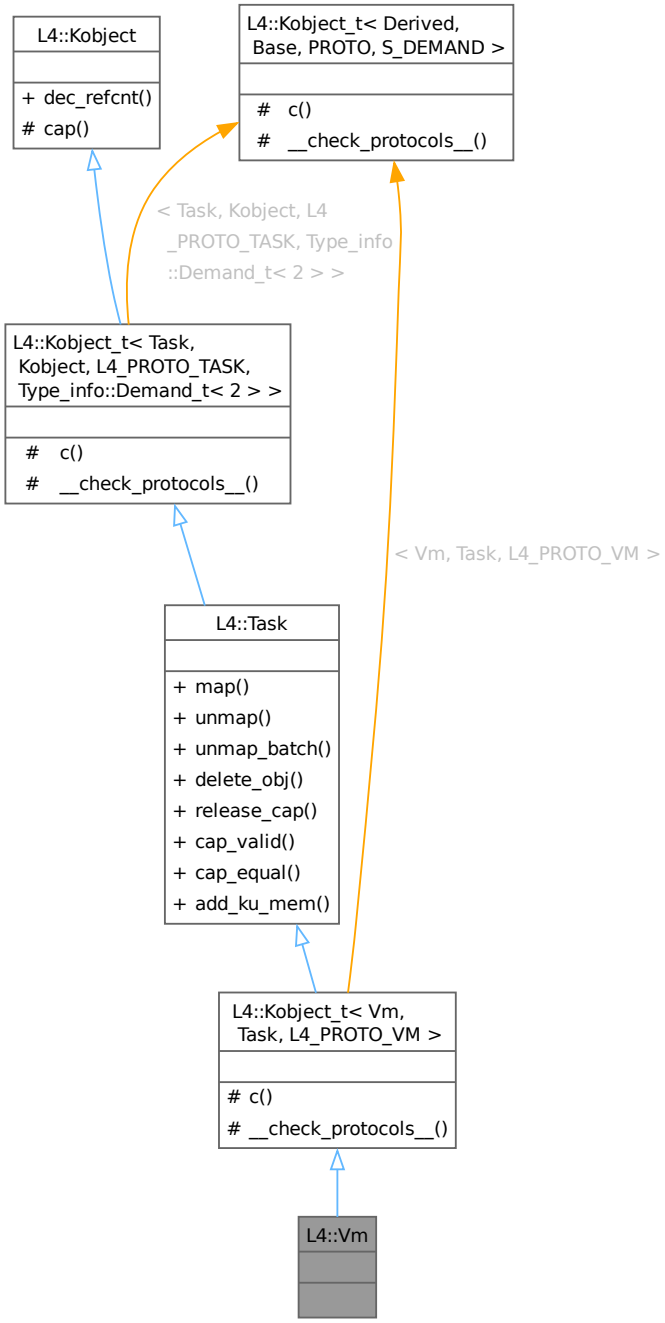
15.234 L4::Vm Class Reference

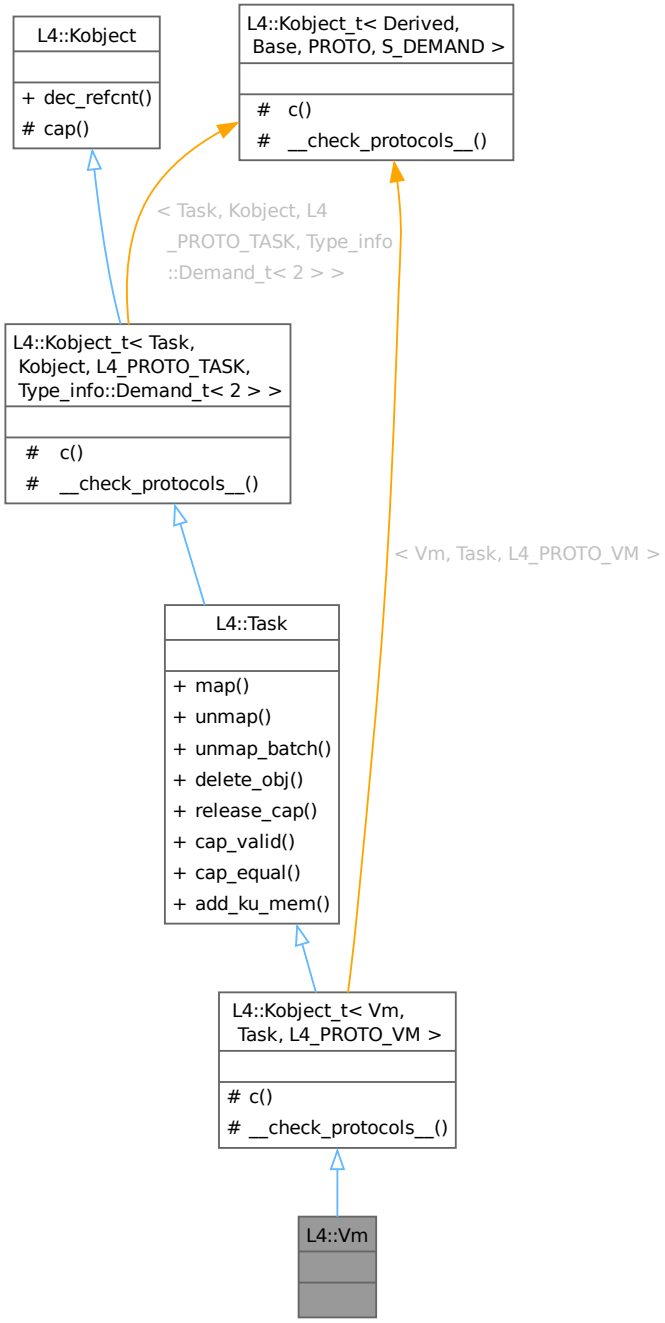
Virtual machine host address space.

`#include <vm>`

Inheritance diagram for L4::Vm:



Collaboration diagram for L4::Vm:



Additional Inherited Members

Public Member Functions inherited from L4::Task

- l4_msgtag_t map (Cap< Task > const &src_task, l4_fpage_t const &snd_fpage, l4_umword_t snd_base, l4_utcb_t *utcb=l4_utcb()) noexcept

  Map resources available in the source task to a destination task.
- l4_msgtag_t unmap (l4_fpage_t const &fpage, l4_umword_t map_mask, l4_utcb_t *utcb=l4_utcb()) noexcept

  Revoke rights from the task.

- l4_msgtag_t unmap_batch (l4_fpage_t const *fpages, unsigned num_fpages, l4_umword_t map_mask, l4_utcb_t *utcb=l4_utcb()) noexcept

  Revoke rights from a task.
- l4_msgtag_t delete_obj (L4::Cap< void > obj, l4_utcb_t *utcb=l4_utcb()) noexcept

  Release capability and delete object.
- l4_msgtag_t release_cap (L4::Cap< void > cap, l4_utcb_t *utcb=l4_utcb()) noexcept

  Release object capability.
- l4_msgtag_t cap_valid (Cap< void > const &cap, l4_utcb_t *utcb=l4_utcb()) noexcept

  Check whether a capability is present (refers to an object).
- l4_msgtag_t cap_equal (Cap< void > const &cap_a, Cap< void > const &cap_b, l4_utcb_t *utcb=l4_utcb()) noexcept

  Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).
- l4_msgtag_t add_ku_mem (l4_fpage_t *fpage, l4_utcb_t *utcb=l4_utcb()) noexcept

  Add kernel-user memory.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Protected Types inherited from L4::Kobject_t< Vm, Task, L4_PROTO_VM >

- typedef Vm **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Vm > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Task::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Task, Kobject, L4_PROTO_TASK, Type_info::Demand_t< 2 > >

- typedef Task **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Task > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Vm, Task, L4_PROTO_VM >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject_t< Task, Kobject, L4_PROTO_TASK, Type_info::Demand_t< 2 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Vm, Task, L4_PROTO_VM >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Task, Kobject, L4_PROTO_TASK, Type_info::Demand_t< 2 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

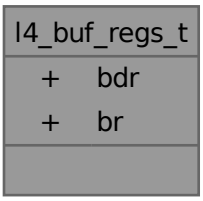
15.234.1 Detailed Description

Virtual machine host address space.
L4::Vm is a specialisation of L4::Task, used for virtual machines. The microkernel employs an appropriate page-table format for hosting VMs, such as ePT on VT-x. On Arm, it offers a call to make the virtual GICC area available to the VM.
Definition at line 30 of file vm.
The documentation for this class was generated from the following file:

- l4/sys/vm

15.235 l4_buf_regs_t Struct Reference

Encapsulation of the buffer-registers block in the UTCB.
`#include <utcb.h>`
Collaboration diagram for l4_buf_regs_t:



Data Fields

- l4_umword_t bdr

  Buffer descriptor.
- l4_umword_t **br** [L4_UTCB_GENERIC_BUFFERS_SIZE]

  Buffer registers.

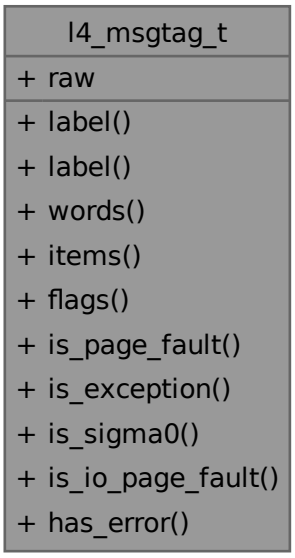
15.243 l4_msgtag_t Struct Reference

Message tag data structure.

`#include <types.h>`

Collaboration diagram for l4_msgtag_t:



Public Member Functions

- long **label** () const L4_NOTHROW

  Get the protocol value.
- void **label** (long v) L4_NOTHROW

  Set the protocol value.
- unsigned **words** () const L4_NOTHROW

  Get the number of untyped words.
- unsigned **items** () const L4_NOTHROW

  Get the number of typed items.
- unsigned flags () const L4_NOTHROW

  Get the flags value.
- bool **is_page_fault** () const L4_NOTHROW

  Test if protocol indicates page-fault protocol.
- bool **is_exception** () const L4_NOTHROW

  Test if protocol indicates exception protocol.
- bool **is_sigma0** () const L4_NOTHROW

  Test if protocol indicates sigma0 protocol.
- bool **is_io_page_fault** () const L4_NOTHROW

  Test if protocol indicates IO-page-fault protocol.
- bool has_error () const L4_NOTHROW

  Test if flags indicate an error.

Data Fields

- l4_mword_t **raw**

  raw value

15.243.1 Detailed Description

Message tag data structure.

Include File

```
#include <l4/sys/types.h>
```

Describes the details of an IPC operation, in particular which parts of the UTCB have to be transmitted, and also flags to enable real-time and FPU extensions.
The message tag also contains a user-defined label that could be used to specify a protocol ID. Some negative values are reserved for kernel protocols such as page faults and exceptions.
The type must be treated completely opaque.

Examples

examples/libs/l4re/c++/shared_ds/ds_srv.cc, examples/libs/l4re/streammap/server.cc, examples/sys/aliens/main.c, examples/sys/ipc/ipc_example.c, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

  register state at entry of PF handler

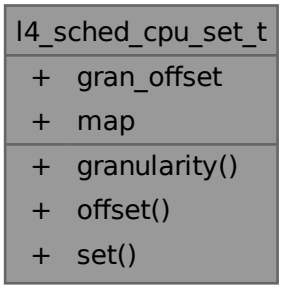
15.245.1 Detailed Description

State for page fault trampoline handler.
Definition at line 84 of file pf_trampoline.h.
The documentation for this struct was generated from the following file:

- l4/sys/pf_trampoline.h

15.246 l4_sched_cpu_set_t Struct Reference

CPU sets.
`#include <scheduler.h>`
Collaboration diagram for l4_sched_cpu_set_t:



Public Member Functions

- unsigned char granularity () const
- unsigned offset () const
- void set (unsigned char granularity, unsigned offset)

  Set offset and granularity.

Data Fields

- l4_umword_t gran_offset

  Combination of granularity and offset.
- l4_umword_t **map**

  Bitmap of CPUs.

15.246.1 Detailed Description

CPU sets.

Examples

examples/sys/migrate/thread_migrate.cc.

Definition at line 58 of file scheduler.h.

15.246.2 Member Function Documentation

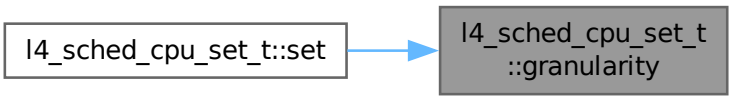
15.246.2.1 granularity()

```
unsigned char l4_sched_cpu_set_t::granularity () const  [inline]
```

Returns

Get granularity value

Definition at line 81 of file scheduler.h.
References gran_offset.
Referenced by set().
Here is the caller graph for this function:



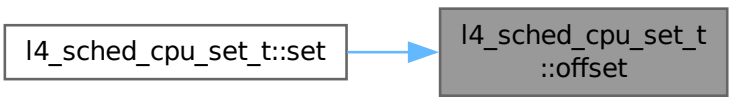
15.246.2.2 offset()

```
unsigned l4_sched_cpu_set_t::offset () const  [inline]
```

Returns

Get offset value

Definition at line 83 of file scheduler.h.
References gran_offset.
Referenced by set().
Here is the caller graph for this function:



15.246.2.3 set()

```
void l4_sched_cpu_set_t::set (
             unsigned char granularity,
             unsigned offset)  [inline]
```

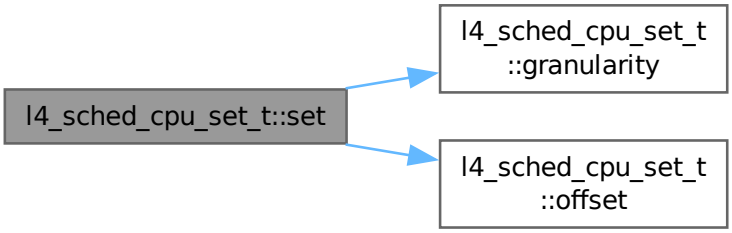
Set offset and granularity.

Parameters

granularity	Granularity in log2 notation.
offset	Offset. Must be a multiple of 2^granularity.

Definition at line 90 of file scheduler.h.

References gran_offset, granularity(), and offset().
Here is the call graph for this function:



15.246.3 Field Documentation

15.246.3.1 gran_offset

```
l4_umword_t l4_sched_cpu_set_t::gran_offset
```

Combination of granularity and offset.
The granularity defines how many CPUs each bit in map describes. And the offset is the number of the first CPU described by the first bit in the bitmap.

Precondition

offset must be a multiple of 2^granularity.

MSB	LSB
8bit granularity	24bit offset ..

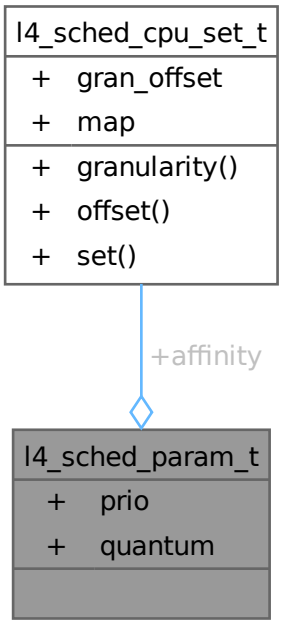
Definition at line 72 of file scheduler.h.
Referenced by granularity(), L4::Scheduler::info(), l4_sched_cpu_set(), offset(), and set().
The documentation for this struct was generated from the following file:

- l4/sys/scheduler.h

15.247 l4_sched_param_t Struct Reference

Scheduler parameter set.
`#include <scheduler.h>`

Collaboration diagram for l4_sched_param_t:



Data Fields

- l4_sched_cpu_set_t **affinity**

  CPU affinity.
- l4_umword_t prio

  Priority for scheduling.
- l4_umword_t **quantum**

  Timeslice in micro seconds.

15.247.1 Detailed Description

Scheduler parameter set.

Examples

examples/sys/aliens/main.c, examples/sys/migrate/thread_migrate.cc, examples/sys/singlestep/main.c, examples/sys/start-with-exc/main.c, and examples/sys/utcb-ipc/main.c.

Definition at line 173 of file scheduler.h.

15.247.2 Field Documentation

15.247.2.1 prio

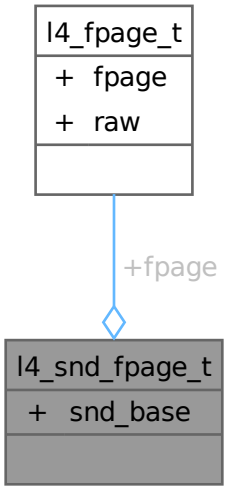
```
l4_umword_t l4_sched_param_t::prio
```

Priority for scheduling.
The kernel supports priorities for userland threads in the range of 1..255. Priority 0 is reserved for the kernel.
Definition at line 182 of file scheduler.h.
Referenced by l4_sched_param().
The documentation for this struct was generated from the following file:

- l4/sys/scheduler.h

15.248 l4_snd_fpage_t Struct Reference

Send-flexpage types.
`#include <__l4_fpage.h>`
Collaboration diagram for l4_snd_fpage_t:



Data Fields

- l4_umword_t **snd_base**

  Offset in receive window (send base).
- l4_fpage_t **fpage**

  Source flexpage descriptor.

15.248.1 Detailed Description

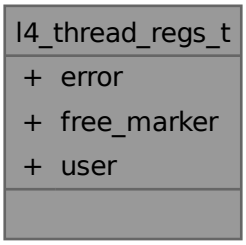
Send-flexpage types.
Definition at line 99 of file __l4_fpage.h.
The documentation for this struct was generated from the following file:

- l4/sys/__l4_fpage.h

15.249 l4_thread_regs_t Struct Reference

Encapsulation of the thread-control-register block of the UTCB.
`#include <utcb.h>`

Collaboration diagram for l4_thread_regs_t:



Data Fields

- l4_umword_t error

  System call error code (see l4_ipc_tcr_error_t).
- l4_umword_t free_marker

  Kernel free marker.
- l4_umword_t **user** [3]

  User values (ignored and preserved by the kernel).

15.249.1 Detailed Description

Encapsulation of the thread-control-register block of the UTCB.
Definition at line 164 of file utcb.h.

15.249.2 Field Documentation

15.249.2.1 error

```
l4_umword_t l4_thread_regs_t::error
```

System call error code (see l4_ipc_tcr_error_t).
If the kernel indicates an error in the message tag (see l4_msgtag_has_error() and l4_msgtag_t::has_error()), the kernel writes the error code to this field.
Definition at line 171 of file utcb.h.

15.249.2.2 free_marker

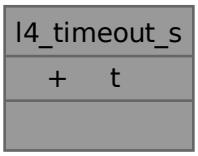
```
l4_umword_t l4_thread_regs_t::free_marker
```

Kernel free marker.
The kernel sets this field to zero as soon as it is guaranteed that the kernel does not use the UTCB anymore for the bound thread. This usually happens while a thread is deleted. However, it is not defined when exactly the kernel sets the field. In particular, the point in time is not necessarily related to any IPC.
Userland may use this field for determining if a UTCB can be re-used for another thread. Note that, in order to make use of that feature, userland has to set this field to a non-zero value when a thread is bound with this UTCB.
Definition at line 185 of file utcb.h.
The documentation for this struct was generated from the following file:

- l4/sys/utcb.h

15.250 l4_timeout_s Struct Reference

Basic timeout specification.
`#include <__timeout.h>`
Collaboration diagram for l4_timeout_s:



Data Fields

- l4_uint16_t **t**

  timeout value

15.250.1 Detailed Description

Basic timeout specification.
If bit 15 == 0, basically a floating point number with 10 bits mantissa and 5 bits exponent (t = m∗2^e).
If the mantissa is zero, the exponent encodes special values, see L4_IPC_TIMEOUT_0 and L4_IPC_TIMEOUT_NEVER.
If bit 15 == 1 the timeout is absolute and the lower 6 bits encode the index of the UTCB buffer register(s) holding the absolute 64-bit timeout value. On 32-bit systems, two consecutive UTCB buffer registers are used.
Definition at line 40 of file __timeout.h.
The documentation for this struct was generated from the following file:

- l4/sys/__timeout.h

15.251 l4_timeout_t Union Reference

Timeout pair.
`#include <__timeout.h>`

Collaboration diagram for l4_timeout_t:

  raw value
- struct {
  l4_timeout_s **rcv**
  receive timeout
  l4_timeout_s **snd**
  send timeout
  } **p**

  combined timeout

15.251.1 Detailed Description

Timeout pair.
For IPC there are usually a send and a receive timeout. So this structure contains a pair of timeouts.
Definition at line 52 of file __timeout.h.
The documentation for this union was generated from the following file:

- l4/sys/__timeout.h

15.252 l4_vcon_attr_t Struct Reference

Vcon attribute structure.
`#include <vcon.h>`

Collaboration diagram for l4_vcon_attr_t:

Public Member Functions

- void set_raw ()

  Set terminal attributes to disable all special processing.

Data Fields

- l4_umword_t **i_flags**

  input flags
- l4_umword_t **o_flags**

  output flags
- l4_umword_t **l_flags**

  local flags

15.252.1 Detailed Description

Vcon attribute structure.
The flags members can be a combination of their respective enums.

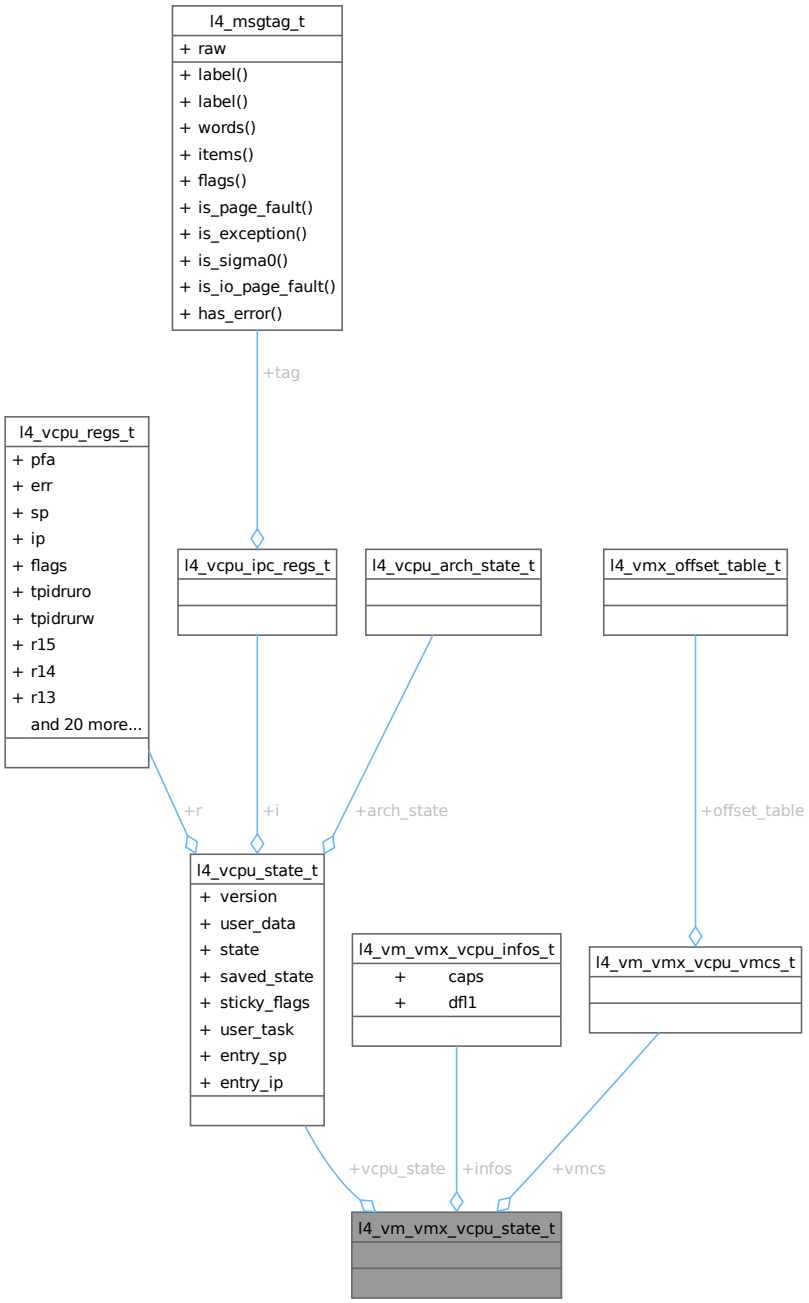
15.264 l4_vm_vmx_vcpu_state_t Struct Reference

VMX vCPU state.
`#include <__vm-vmx.h>`

Collaboration diagram for l4_vm_vmx_vcpu_state_t:



15.264.1 Detailed Description

VMX vCPU state.
This is a specialization of the generic vCPU state for VMX. This data structure represents the following memory layout:

- 0x000 - 0x1ff: Standard vCPU state (with padding). See l4_vcpu_state_t.
- 0x200 - 0x3ff: VMX information members (with padding). See l4_vm_vmx_vcpu_infos_t.
- 0x400 - 0xfff: VMX software VMCS. See l4_vm_vmx_vcpu_vmcs_t.

Note

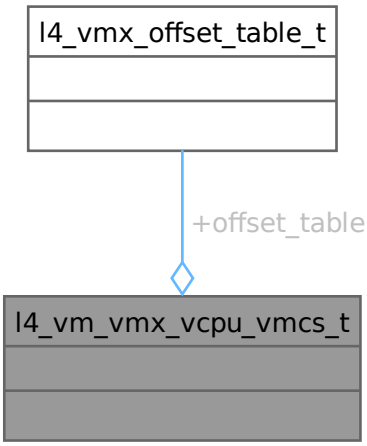
The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

Definition at line 267 of file __vm-vmx.h.
The documentation for this struct was generated from the following file:

- l4/sys/__vm-vmx.h

15.265 l4_vm_vmx_vcpu_vmcs_t Struct Reference

VMX software VMCS.
`#include <__vm-vmx.h>`
Collaboration diagram for l4_vm_vmx_vcpu_vmcs_t:



15.265.1 Detailed Description

VMX software VMCS.
This data structure represents the following memory layout:

- 0x000 - 0x007: Reserved (ignored by the kernel). In the hardware VMCS, the revision identifier and the abort indicator are stored in this area. Hereby we simply ignore these two entries.
- 0x008 - 0x00f: User space data (ignored by the kernel). This currently stores the pointer to a different software VMCS whose content has been loaded to this software VMCS.
- 0x010 - 0x013: VMCS field index of the software-defined CR2 field in the software VMCS.
- 0x014 - 0x017: Reserved.
- 0x018 - 0x01f: Capability of the vCPU context, i.e. the hardware VMCS object (with padding).
- 0x020 - 0x047: Software VMCS field offset table. See l4_vmx_offset_table_t.
- 0x048 - 0x0bf: Reserved.
- 0x0c0 - 0xabf: Software VMCS fields (with padding).
- 0xac0 - 0xbff: Software VMCS fields dirty bitmap (with padding).

Note

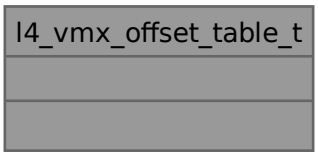
The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

Definition at line 205 of file __vm-vmx.h.
The documentation for this struct was generated from the following file:

- l4/sys/__vm-vmx.h

15.266 l4_vmx_offset_table_t Struct Reference

Software VMCS field offset table.
`#include <__vm-vmx.h>`
Collaboration diagram for l4_vmx_offset_table_t:



15.266.1 Detailed Description

Software VMCS field offset table.
This data structure represents the following memory layout:

- 0x00 - 0x02: 3 offsets for 16-bit fields.
- 0x03: Reserved.
- 0x04 - 0x06: 3 offsets for 64-bit fields.
- 0x07: Reserved.
- 0x08 - 0x0a: 3 offsets for 32-bit fields.
- 0x0b: Reserved.
- 0x0c - 0x0e: 3 offsets for natural-width fields.
- 0x0f: Reserved.
- 0x10 - 0x12: 3 limits for 16-bit fields.
- 0x13: Reserved.
- 0x14 - 0x16: 3 limits for 64-bit fields.
- 0x17: Reserved.
- 0x18 - 0x1a: 3 limits for 32-bit fields.
- 0x1b: Reserved.
- 0x1c - 0x1e: 3 limits for natural-width fields.

- 0x1f: Reserved.
- 0x20 - 0x23: 4 index shifts.
- 0x24: Offset of the first software VMCS field.
- 0x25: Size of the software VMCS fields.
- 0x26 - 0x27: Reserved.

The offsets/limits in each size category are in the following order:

- Control fields.
- Read-only fields.
- Guest fields.

The index shifts are in the following order:

- 16-bit.
- 64-bit.
- 32-bit.
- Natural-width.

All offsets/limits/sizes are represented in a 64-byte granule.
The offsets (after being multiplied by 64) are indexes in the values array in l4_vm_vmx_vcpu_vmcs_t and bit indexes in the dirty_bitmap array in l4_vm_vmx_vcpu_vmcs_t.
The limits (after being multiplied by 64) represent the range of the available indexes.

Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

15.267.1 Detailed Description

template<unsigned MAX_BITS = 32>
struct L4drivers::Mmio_register_block< MAX_BITS >

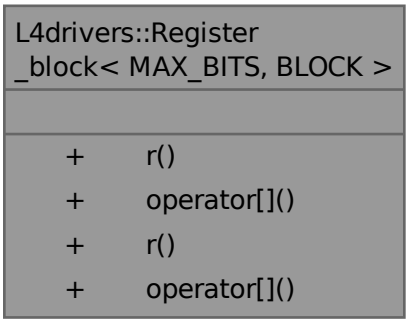
An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order.
Definition at line 45 of file hw_mmio_register_block.
The documentation for this struct was generated from the following file:

- pkg/drivers-frst/include/hw_mmio_register_block

15.268 L4drivers::Register_block< MAX_BITS, BLOCK > Class Template Reference

Handles a reference to a register block of the given maximum access width.
`#include <hw_register_block>`

Collaboration diagram for L4drivers::Register_block< MAX_BITS, BLOCK >:



Public Member Functions

- template<unsigned BITS>
  Ro_register_tmpl< BITS, Block > r (unsigned offset) const

  Read only access to register at offset offset.
- Ro_register operator[ ] (unsigned offset) const

  Read only access to register at offset offset.
- template<unsigned BITS>
  Register_tmpl< BITS, Block > r (unsigned offset)

  Read/write access to register at offset offset.
- Register operator[ ] (unsigned offset)

  Read/write access to register at offset offset.

15.268.1 Detailed Description

template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩ BITS> >>
class L4drivers::Register_block< MAX_BITS, BLOCK >

Handles a reference to a register block of the given maximum access width.
Register block.

Template Parameters

MAX_BITS	Maximum access width for the registers in this block.
BLOCK	Type implementing the register accesses (`read<>()`, `write<>()`, `modify<>()`, `set<>()`, and `clear<>()`).

Provides access to registers in this block via r<WIDTH>() and operator[]().
Example usage:

```
void test()
{
  // create a register block reference for max. 16bit accesses, using a
  // MMIO register block implementation (at address 0x1000).
  Hw::Register_block<16> regs = new Hw::Mmio_register_block<16>(0x1000);

  // Alternatively it is allowed to use an implementation that allows
  // wider access than actually needed.
```

```
  Hw::Register_block<16> regs = new Hw::Mmio_register_block<32>(0x1000);

  // read a 16bit register at offset 8byte
  unsigned short x = regs.r<16>(8);
  unsigned short x1 = regs[8];      // alternative

  // read an 8bit register at offset 0byte
  unsigned v = regs.r<8>(0);

  // do a 16bit write to register at offset 2byte (four variants)
  regs[2] = 22;
  regs.r<16>(2) = 22;
  regs[2].write(22);
  regs.r<16>().write(22);

  // do an 8bit write (two variants)
  regs.r<8>(0) = 9;
  regs.r<8>(0).write(9);

  // do 16bit read-modify-write (two variants)
  regs[4].modify(0xf, 3); // clear 4 lowest bits and set them to 3
  regs.r<16>(4).modify(0xf, 3);

  // do 8bit read-modify-write
  regs.r<8>(0).modify(0xf, 3);

  // fails to compile, because of too wide access
  // (32 bit access but regs is Hw::Register_block<16>)
  unsigned long v = regs.r<32>(4)
}
```

Definition at line 330 of file hw_register_block.

15.268.2 Member Function Documentation

15.268.2.1 operator[]() [1/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩
BITS> >>
Register L4drivers::Register_block< MAX_BITS, BLOCK >::operator[] (
             unsigned offset)  [inline]
```

Read/write access to register at offset *offset*.

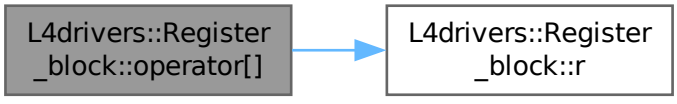
Parameters

offset	The offset of the register within the register file.

Returns

register object allowing read and write access with width *MAX_BITS*.

Definition at line 385 of file hw_register_block.
References r().
Here is the call graph for this function:



15.268.2.2 operator[]() [2/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩
BITS> >>
Ro_register L4drivers::Register_block< MAX_BITS, BLOCK >::operator[] (
            unsigned offset) const  [inline]
```

Read only access to register at offset *offset*.

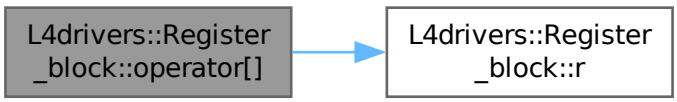
Parameters

offset	The offset of the register within the register file.

Returns

register object allowing read only access with width *MAX_BITS*.

Definition at line 365 of file hw_register_block.
References r().
Here is the call graph for this function:



15.268.2.3 r() [1/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩
BITS> >>
template<unsigned BITS>
Register_tmpl< BITS, Block > L4drivers::Register_block< MAX_BITS, BLOCK >::r (
            unsigned offset)  [inline]
```

Read/write access to register at offset *offset*.

Template Parameters

BITS	the access width in bits for the register.

Parameters

offset	The offset of the register within the register file.

Returns

register object allowing read and write access with width *BITS*.

Definition at line 376 of file hw_register_block.

15.268.2.4 r() [2/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩
BITS> >>
template<unsigned BITS>
Ro_register_tmpl< BITS, Block > L4drivers::Register_block< MAX_BITS, BLOCK >::r (
            unsigned offset) const  [inline]
```

Read only access to register at offset *offset*.

Template Parameters

BITS	the access width in bits for the register.

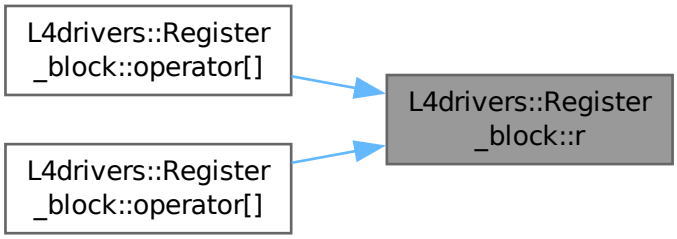
Parameters

offset	The offset of the register within the register file.

Returns

register object allowing read only access with width *BITS*.

Definition at line 357 of file hw_register_block.
Referenced by operator[ ](), and operator[ ]().
Here is the caller graph for this function:



The documentation for this class was generated from the following file:

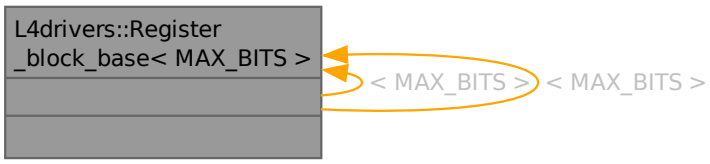
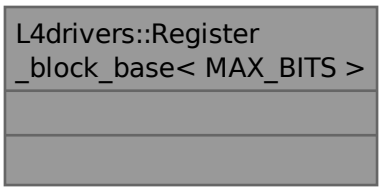
15.269 L4drivers::Register_block_base< MAX_BITS > Struct Template Reference

Abstract register block interface.

Inheritance diagram for L4drivers::Register_block_base< MAX_BITS >:



Collaboration diagram for L4drivers::Register_block_base< MAX_BITS >:



15.269.1 Detailed Description

template<unsigned MAX_BITS = 32>
struct L4drivers::Register_block_base< MAX_BITS >

Abstract register block interface.

Template Parameters

MAX_BITS	The maximum access width for the registers.

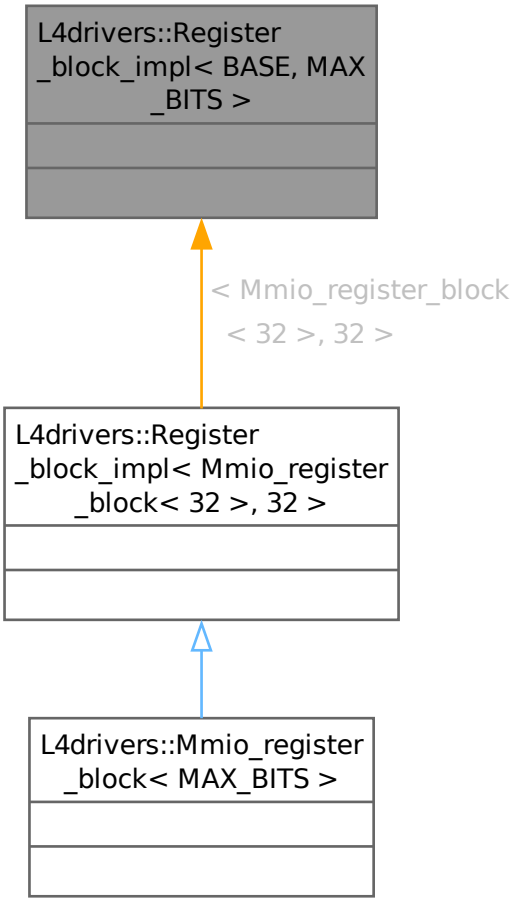
This interfaces is based on virtual do_read_<xx> and do_write_<xx> methods that have to be implemented up to the maximum access width.
Definition at line 72 of file hw_register_block.
The documentation for this struct was generated from the following file:

- pkg/drivers-frst/include/hw_register_block

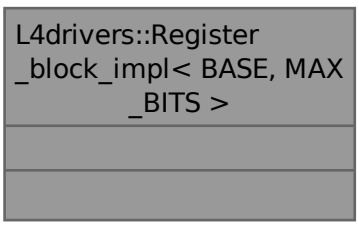
15.270 L4drivers::Register_block_impl< BASE, MAX_BITS > Struct Template Reference

Implementation helper for register blocks.

Inheritance diagram for L4drivers::Register_block_impl< BASE, MAX_BITS >:



Collaboration diagram for L4drivers::Register_block_impl< BASE, MAX_BITS >:



15.270.1 Detailed Description

template<typename BASE, unsigned MAX_BITS = 32>
struct L4drivers::Register_block_impl< BASE, MAX_BITS >

Implementation helper for register blocks.

Parameters

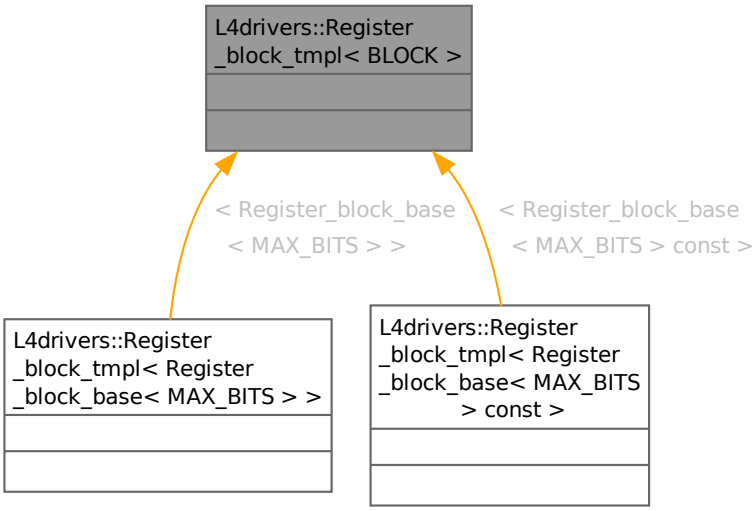
BASE	The class implementing read<> and write<> template functions for accessing the registers. This class must inherit from Register_block_impl.
MAX_BITS	The maximum access width for the register file. Supported values are 8, 16, 32, or 64.

This template allows easy implementation of register files by providing read<> and write<> template functions, see Mmio_register_block as an example.
Definition at line 455 of file hw_register_block.
The documentation for this struct was generated from the following file:

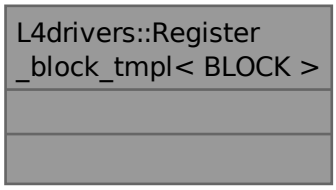
- pkg/drivers-frst/include/hw_register_block

15.271 L4drivers::Register_block_tmpl< BLOCK > Class Template Reference

Helper template that translates to the Register_block_base interface.
`#include <hw_register_block>`
Inheritance diagram for L4drivers::Register_block_tmpl< BLOCK >:



Collaboration diagram for L4drivers::Register_block_tmpl< BLOCK >:



15.271.1 Detailed Description

template<typename BLOCK>
class L4drivers::Register_block_tmpl< BLOCK >

Helper template that translates to the Register_block_base interface.

Template Parameters

BLOCK	The type of the Register_block_base interface to use.

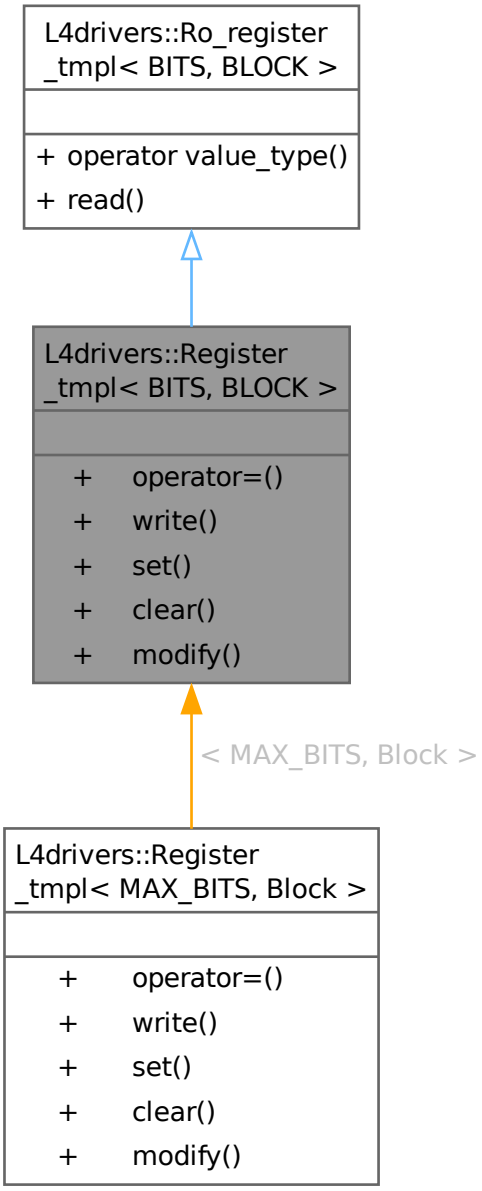
This helper translates read<T>(), write<T>(), set<T>(), clear<T>(), and modify<T>() calls to BLOCK::do_read_<xx> and BLOCK::do_write_<xx>.
Definition at line 156 of file hw_register_block.
The documentation for this class was generated from the following file:

- pkg/drivers-frst/include/hw_register_block

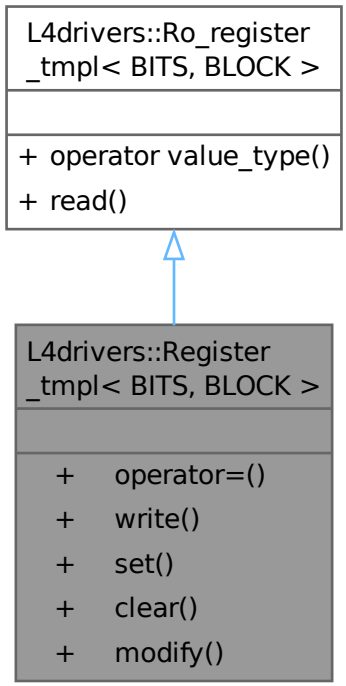
15.272 L4drivers::Register_tmpl< BITS, BLOCK > Class Template Reference

Single hardware register inside a Register_block_base interface.
`#include <hw_register_block>`

Inheritance diagram for L4drivers::Register_tmpl< BITS, BLOCK >:



Collaboration diagram for L4drivers::Register_tmpl< BITS, BLOCK >:



Public Member Functions

- Register_tmpl & operator= (value_type val)
  write val into the hardware register.
- void write (value_type val)
  write val into the hardware register.
- value_type set (value_type set_bits)
  set bits in set_bits in the hardware register.
- value_type clear (value_type clear_bits)
  clears bits in clear_bits in the hardware register.
- value_type modify (value_type clear_bits, value_type set_bits)
  clears bits in clear_bits and sets bits in set_bits in the hardware register.

Public Member Functions inherited from L4drivers::Ro_register_tmpl< BITS, BLOCK >

- operator value_type () const
  read the value from the hardware register.
- value_type read () const
  read the value from the hardware register.

15.272.1 Detailed Description

template<unsigned BITS, typename BLOCK>
class L4drivers::Register_tmpl< BITS, BLOCK >

Single hardware register inside a Register_block_base interface.

Template Parameters

BITS	The access width for the register in bits.
BLOCK	the type of the Register_block_base interface.

Note

Objects of this type must be used only in temporary contexts not in global, class, or object scope.

Definition at line 237 of file hw_register_block.

15.272.2 Member Function Documentation

15.272.2.1 clear()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Register_tmpl< BITS, BLOCK >::clear (
             value_type clear_bits)  [inline]
```

clears bits in *clear_bits* in the hardware register.

Parameters

clear_bits	bits to be cleared within the hardware register.

This is a read-modify-write function that does a logical and of the old value from the register with the negated value of *clear_bits*.

```
unsigned old_value = read();
write(old_value & ~clear_bits);
```

Definition at line 290 of file hw_register_block.
Referenced by L4drivers::Register_tmpl< MAX_BITS, Block >::clear().
Here is the caller graph for this function:

15.272.2.2 modify()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Register_tmpl< BITS, BLOCK >::modify (
             value_type clear_bits,
             value_type set_bits)  [inline]
```

clears bits in *clear_bits* and sets bits in *set_bits* in the hardware register.

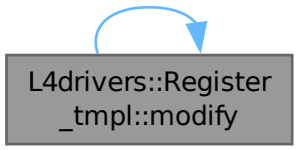
Parameters

clear_bits	bits to be cleared within the hardware register.
set_bits	bits to set in the hardware register.

This is a read-modify-write function that first does a logical and of the old value from the register with the negated value of *clear_bits* and then does a logical or with *set_bits*.

```
unsigned old_value = read();
write((old_value & ~clear_bits) | set_bits);
```

Definition at line 308 of file hw_register_block.
Referenced by L4drivers::Register_tmpl< MAX_BITS, Block >::modify().
Here is the caller graph for this function:



15.272.2.3 operator=()

```
template<unsigned BITS, typename BLOCK>
Register_tmpl & L4drivers::Register_tmpl< BITS, BLOCK >::operator= (
            value_type val)  [inline]
```

write *val* into the hardware register.

Parameters

val	the value to write into the hardware register.

Definition at line 252 of file hw_register_block.

15.272.2.4 set()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Register_tmpl< BITS, BLOCK >::set (
            value_type set_bits)  [inline]
```

set bits in *set_bits* in the hardware register.

Parameters

set_bits	bits to be set within the hardware register.

This is a read-modify-write function that does a logical or of the old value from the register with *set_bits*.

```
unsigned old_value = read();
write(old_value | set_bits);
```

Definition at line 274 of file hw_register_block.
Referenced by L4drivers::Register_tmpl< MAX_BITS, Block >::set().

Here is the caller graph for this function:

15.272.2.5 write()

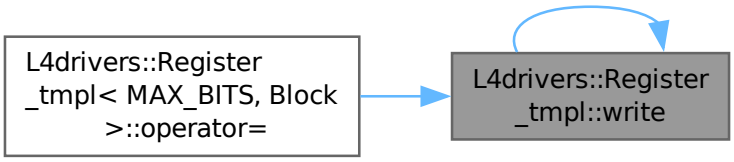
```
template<unsigned BITS, typename BLOCK>
void L4drivers::Register_tmpl< BITS, BLOCK >::write (
             value_type val)  [inline]
```

write *val* into the hardware register.

Parameters

val	the value to write into the hardware register.

Definition at line 259 of file hw_register_block.
Referenced by L4drivers::Register_tmpl< MAX_BITS, Block >::operator=(), and L4drivers::Register_tmpl< MAX_BITS, Block >::writ
Here is the caller graph for this function:



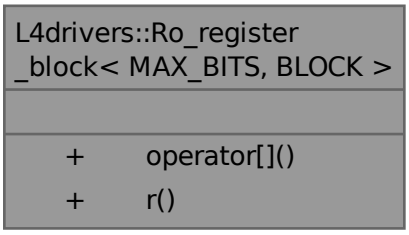
The documentation for this class was generated from the following file:

- pkg/drivers-frst/include/hw_register_block

15.273 L4drivers::Ro_register_block< MAX_BITS, BLOCK > Class Template Reference

Handles a reference to a read only register block of the given maximum access width.
`#include <hw_register_block>`

Collaboration diagram for L4drivers::Ro_register_block< MAX_BITS, BLOCK >:



Public Member Functions

- Ro_register operator[ ] (unsigned offset) const

  Read only access to register at offset offset.
- template<unsigned BITS>
  Ro_register_tmpl< BITS, Block > r (unsigned offset) const

  Read only access to register at offset offset.

15.273.1 Detailed Description

template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩ BITS> const >>
class L4drivers::Ro_register_block< MAX_BITS, BLOCK >

Handles a reference to a read only register block of the given maximum access width.

Template Parameters

MAX_BITS	Maximum access width for the registers in this block.
BLOCK	Type implementing the register accesses (read<>()),

Provides read only access to registers in this block via r<WIDTH>() and operator[ ]().
Definition at line 404 of file hw_register_block.

15.273.2 Member Function Documentation

15.273.2.1 operator[]()

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩
BITS> const >>
Ro_register L4drivers::Ro_register_block< MAX_BITS, BLOCK >::operator[ ] (
            unsigned offset) const  [inline]
```

Read only access to register at offset *offset*.

Parameters

offset	The offset of the register within the register file.

Returns

register object allowing read only access with width *MAX_BITS*.

Definition at line 426 of file hw_register_block.

15.273.2.2 r()

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↩
BITS> const >>
template<unsigned BITS>
Ro_register_tmpl< BITS, Block > L4drivers::Ro_register_block< MAX_BITS, BLOCK >::r (
            unsigned offset) const  [inline]
```

Read only access to register at offset *offset*.

Template Parameters

BITS	the access width in bits for the register.

Parameters

offset	The offset of the register within the register file.

Returns

register object allowing read only access with width *BITS*.

Definition at line 436 of file hw_register_block.
The documentation for this class was generated from the following file:

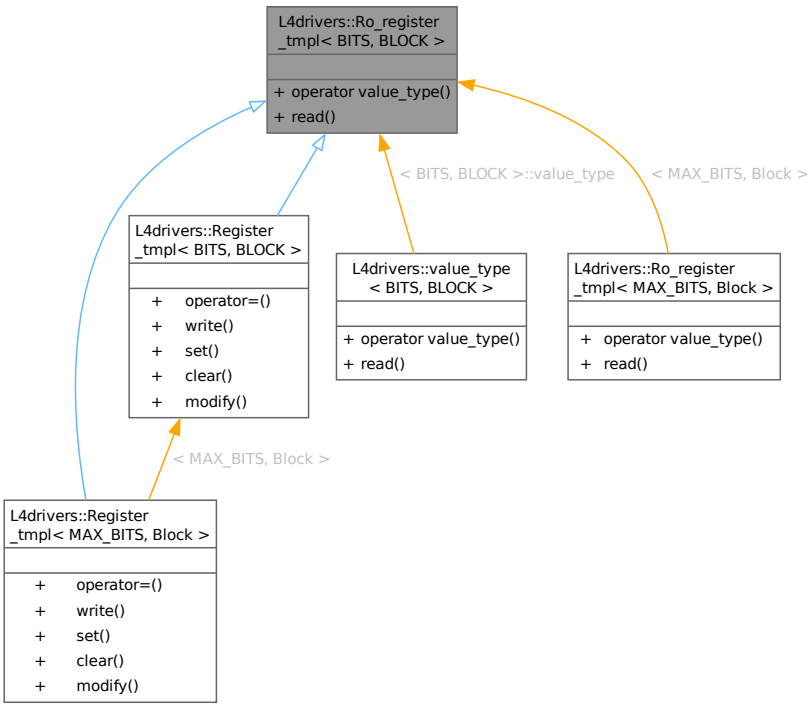
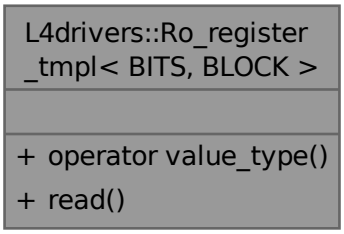
15.274 L4drivers::Ro_register_tmpl< BITS, BLOCK > Class Template Reference

Single read only register inside a Register_block_base interface.
`#include <hw_register_block>`

Inheritance diagram for L4drivers::Ro_register_tmpl< BITS, BLOCK >:



Collaboration diagram for L4drivers::Ro_register_tmpl< BITS, BLOCK >:



Public Member Functions

- operator value_type () const

  read the value from the hardware register.
- value_type read () const

  read the value from the hardware register.

15.274.1 Detailed Description

template<unsigned BITS, typename BLOCK>
class L4drivers::Ro_register_tmpl< BITS, BLOCK >

Single read only register inside a Register_block_base interface.

Template Parameters

BITS	The access with of the register in bits.
BLOCK	The type for the Register_block_base interface.

Note

Objects of this type must be used only in temporary contexts not in global, class, or object scope.

Allows simple read only access to a hardware register.
Definition at line 201 of file hw_register_block.

15.274.2 Member Function Documentation

15.274.2.1 operator value_type()

```
template<unsigned BITS, typename BLOCK>
L4drivers::Ro_register_tmpl< BITS, BLOCK >::operator value_type () const  [inline]
```

read the value from the hardware register.

Returns

value read from the hardware register.

Definition at line 217 of file hw_register_block.

15.274.2.2 read()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Ro_register_tmpl< BITS, BLOCK >::read () const  [inline]
```

read the value from the hardware register.

Returns

value from the hardware register.

Definition at line 224 of file hw_register_block.
Referenced by L4drivers::value_type< BITS, BLOCK >::operator value_type(), and L4drivers::value_type< BITS, BLOCK >::read().

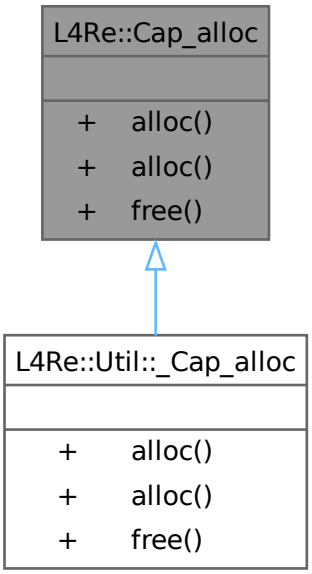
15.275 L4Re::Cap_alloc Class Reference

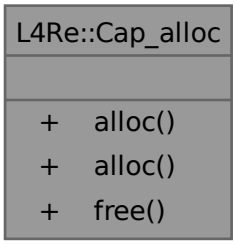
Capability allocator interface.

`#include <cap_alloc>`

Inheritance diagram for L4Re::Cap_alloc:



Collaboration diagram for L4Re::Cap_alloc:



Public Member Functions

- virtual L4::Cap< void > alloc () noexcept=0

  Allocate a capability.

- template<typename T>
  L4::Cap< T > alloc () noexcept

  Allocate a capability.

- virtual void free (L4::Cap< void > cap, l4_cap_idx_t task=L4_BASE_TASK_CAP, unsigned unmap_↩ flags=L4_FP_ALL_SPACES) noexcept=0

  Free a capability.

15.275.1 Detailed Description

Capability allocator interface.
Definition at line 30 of file cap_alloc.

15.275.2 Member Function Documentation

15.275.2.1 alloc() [1/2]

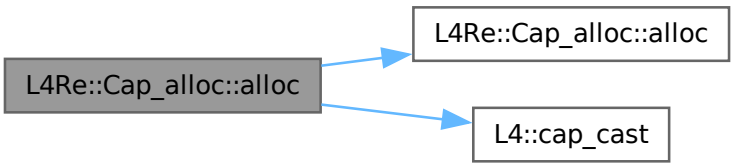
```
template<typename T>
L4::Cap< T > L4Re::Cap_alloc::alloc ()  [inline], [noexcept]
```

Allocate a capability.

Returns

Capability of type T

Definition at line 55 of file cap_alloc.
References alloc(), and L4::cap_cast().
Here is the call graph for this function:



15.275.2.2 alloc() [2/2]

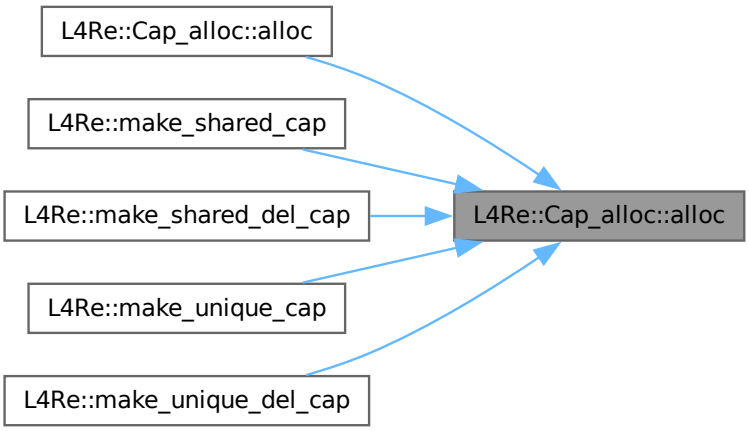
```
virtual L4::Cap< void > L4Re::Cap_alloc::alloc ()  [pure virtual], [noexcept]
```

Allocate a capability.

Returns

Capability of type void

Implemented in L4Re::Util::_Cap_alloc, and L4Re::Util::_Cap_alloc.
Referenced by alloc(), L4Re::make_shared_cap(), L4Re::make_shared_del_cap(), L4Re::make_unique_cap(), and L4Re::make_unique_del_cap().
Here is the caller graph for this function:



15.275.2.3 free()

```
virtual void L4Re::Cap_alloc::free (
            L4::Cap< void > cap,
            l4_cap_idx_t task = L4_BASE_TASK_CAP,
            unsigned unmap_flags = L4_FP_ALL_SPACES)  [pure virtual], [noexcept]
```

Free a capability.

Parameters

cap	Capability to free.
task	If set, task to unmap the capability from.
unmap_flags	Flags for unmap, see l4_unmap_flags_t.

Implemented in L4Re::Util::_Cap_alloc.
References L4_BASE_TASK_CAP, and L4Re::L4_FP_ALL_SPACES.
The documentation for this class was generated from the following file:

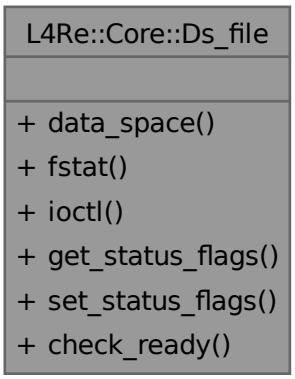
15.277 L4Re::Core::Ds_file Class Reference

Implementation for files backed by an L4Re::Dataspace abstraction.
`#include <ds_file.h>`
Collaboration diagram for L4Re::Core::Ds_file:



Public Member Functions

- L4::Cap< L4Re::Dataspace > data_space () noexcept override

  Get an L4Re::Dataspace object for the file.
- int fstat (struct stat64 *buf) const noexcept override

  Get status information for the file.
- int ioctl (unsigned long, va_list) noexcept override

  The famous IO control.
- int get_status_flags () const noexcept override

  Get file status flags (fcntl F_GETFL).
- int set_status_flags (long) noexcept override

  Set file status flags (fcntl F_SETFL).
- bool check_ready (Ready_type rt) noexcept override

  Check whether the file is ready for an I/O operation/condition.

15.277.1 Detailed Description

Implementation for files backed by an L4Re::Dataspace abstraction.
Definition at line 17 of file ds_file.h.

15.277.2 Member Function Documentation

15.277.2.1 check_ready()

```
bool L4Re::Core::Ds_file::check_ready (
            Ready_type rt)  [inline], [override], [virtual], [noexcept]
```

Check whether the file is ready for an I/O operation/condition.
By definition, a dataspace-backed file is always ready for reading. If the file has write permissions, it is also always ready for writing.

Parameters

rt	Type of the I/O operation/condition to be ready.

Returns

Always true for reading. True for writing if writable. Always false otherwise.

Implements L4Re::Vfs::Generic_file.
Definition at line 65 of file ds_file.h.

15.277.2.2 data_space()

```
L4::Cap< L4Re::Dataspace > L4Re::Core::Ds_file::data_space ()  [inline], [override], [virtual],
[noexcept]
```

Get an L4Re::Dataspace object for the file.
This is used as a backend for POSIX mmap and mmap2 functions.

Note

mmap is not possible if the function returns an invalid capability.

Returns

A capability to an L4Re::Dataspace that represents the file contents in an L4Re way.

Implements L4Re::Vfs::Regular_file.
Definition at line 40 of file ds_file.h.

15.277.2.3 fstat()

```
int L4Re::Core::Ds_file::fstat (
            struct stat64 * buf) const  [override], [virtual], [noexcept]
```

Get status information for the file.
This is the backend for POSIX fstat, stat, fstat64 and friends.

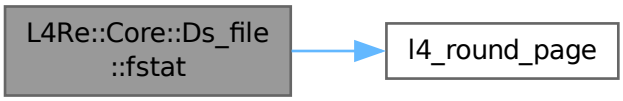
Parameters

out	*buf*	This buffer is filled with the status information.

Returns

0 on success, or <0 on error.

Implements L4Re::Vfs::Generic_file.
Definition at line 27 of file ds_file_impl.h.
References L4_PAGESIZE, and l4_round_page().
Here is the call graph for this function:



15.277.2.4 get_status_flags()

```
int L4Re::Core::Ds_file::get_status_flags () const  [inline], [override], [virtual], [noexcept]
```

Get file status flags (fcntl F_GETFL).
This function is used by the fcntl implementation for the F_GETFL command.

Returns

flags such as O_RDONLY, O_WRONLY, O_RDWR, O_DIRECT, O_ASYNC, O_NOATIME, O_NONBLOCK, or <0 on error.

Implements L4Re::Vfs::Generic_file.
Definition at line 48 of file ds_file.h.

15.277.2.5 ioctl()

```
int L4Re::Core::Ds_file::ioctl (
            unsigned long cmd,
            va_list args)  [override], [virtual], [noexcept]
```

The famous IO control.
Backend for POSIX generic object invocation ioctl.

Parameters

cmd	The ioctl command.
args	The arguments for the ioctl, usually some kind of pointer.

Returns

>=0 on success, or <0 on error.

Implements L4Re::Vfs::Special_file.
Definition at line 192 of file ds_file_impl.h.

15.277.2.6 set_status_flags()

```
int L4Re::Core::Ds_file::set_status_flags (
            long flags)  [inline], [override], [virtual], [noexcept]
```

Set file status flags (fcntl F_SETFL).
This function is used by the fcntl implementation for the F_SETFL command.

Parameters

flags	The file status flags to set. This must be a combination of O_RDONLY, O_WRONLY, O_RDWR, O_↩ APPEND, O_ASYNC, O_DIRECT, O_NOATIME, O_NONBLOCK.

Note

Creation flags such as O_CREAT, O_EXCL, O_NOCTTY, O_TRUNC are ignored.

Returns

0 on success, or <0 on error.

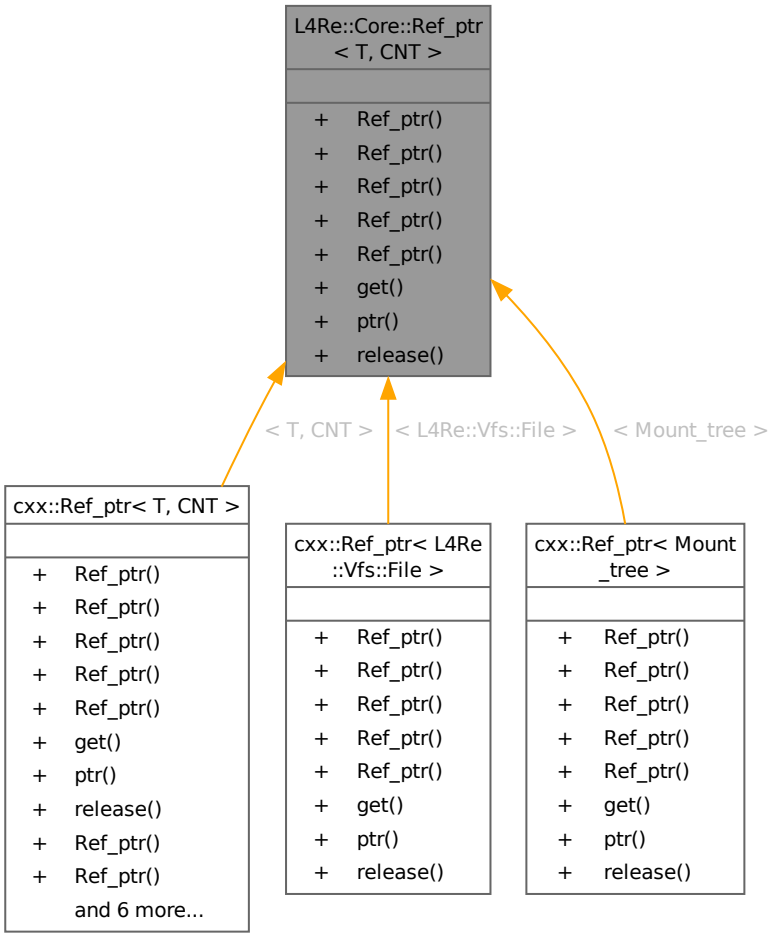
Implements L4Re::Vfs::Generic_file.
Definition at line 51 of file ds_file.h.
The documentation for this class was generated from the following files:

- l4/l4re_vfs/impl/ds_file.h
- l4/l4re_vfs/impl/ds_file_impl.h

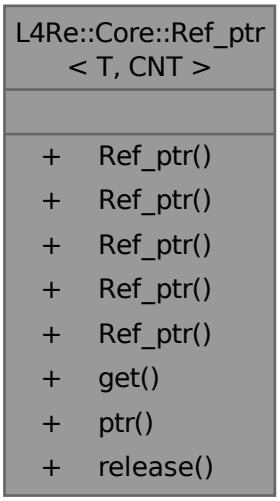
15.278 L4Re::Core::Ref_ptr< T, CNT > Class Template Reference

A reference-counting pointer with automatic cleanup.
`#include <ref_ptr>`

Inheritance diagram for L4Re::Core::Ref_ptr< T, CNT >:



Collaboration diagram for L4Re::Core::Ref_ptr< T, CNT >:



Public Member Functions

- **Ref_ptr** () noexcept

  Default constructor creates a pointer with no managed object.
- Ref_ptr (Wp const &o) noexcept

  Create a shared pointer from a weak pointer.
- **Ref_ptr** (decltype(nullptr) n) noexcept

  allow creation from `nullptr`
- template<typename X>
  Ref_ptr (X *o) noexcept

  Create a shared pointer from a raw pointer.
- Ref_ptr (T *o, bool d) noexcept

  Create a shared pointer from a raw pointer without creating a new reference.
- T * get () const noexcept

  Return a raw pointer to the object this shared pointer points to.
- T * ptr () const noexcept

  Return a raw pointer to the object this shared pointer points to.
- T * release () noexcept

  Release the shared pointer without removing the reference.

15.278.1 Detailed Description

template<typename T = void, template< typename X > class CNT = Default_ref_counter>
class L4Re::Core::Ref_ptr< T, CNT >

A reference-counting pointer with automatic cleanup.

Template Parameters

T	Type of object the pointer points to.
CNT	Type of management class that manages the life time of the object.

This pointer is similar to the standard C++-11 shared_ptr but it does the reference counting directly in the object being pointed to, so that no additional management structures need to be allocated from the heap.
Classes that use this pointer type must implement two functions:

```
int remove_ref()
```

is called when a reference is removed and must return 0 when there are no further references to the object.

```
void add_ref()
```

is called when another ref_ptr to the object is created.
Ref_obj provides a simple implementation of this interface from which classes may inherit.
Definition at line 70 of file ref_ptr.

15.278.2 Constructor & Destructor Documentation

15.278.2.1 Ref_ptr() [1/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
            Wp const & o)  [inline], [noexcept]
```

Create a shared pointer from a weak pointer.
Increases references.
Definition at line 88 of file ref_ptr.

15.278.2.2 Ref_ptr() [2/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
template<typename X>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
            X * o)  [inline], [explicit], [noexcept]
```

Create a shared pointer from a raw pointer.
In contrast to C++11 shared_ptr it is safe to use this constructor multiple times and have the same reference counter.
Definition at line 101 of file ref_ptr.

15.278.2.3 Ref_ptr() [3/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
            T * o,
            bool d)  [inline], [noexcept]
```

Create a shared pointer from a raw pointer without creating a new reference.

Parameters

o	Pointer to the object.
d	Dummy parameter to select this constructor at compile time. The value may be true or false.

This is the counterpart to release().
Definition at line 114 of file ref_ptr.

15.278.3 Member Function Documentation

15.278.3.1 get()

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::get () const  [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.
This does not release the pointer or decrease the reference count.
Definition at line 121 of file ref_ptr.

15.278.3.2 ptr()

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::ptr () const  [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.
This does not release the pointer or decrease the reference count.
Definition at line 127 of file ref_ptr.

15.278.3.3 release()

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::release ()  [inline], [noexcept]
```

Release the shared pointer without removing the reference.

Returns

A raw pointer to the managed object.

Definition at line 138 of file ref_ptr.
The documentation for this class was generated from the following file:

- l4/cxx/ref_ptr

15.279 L4Re::Dataspace Class Reference

Interface for memory-like objects.
`#include <dataspace>`

Inheritance diagram for L4Re::Dataspace:

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.279.1 Detailed Description

Interface for memory-like objects.
Dataspaces are a central abstraction provided by L4Re. A dataspace is an abstraction for any thing that is available via usual memory access instructions. A dataspace can be a file, as well as the memory-mapped registers of a device, or anonymous memory, such as a heap.
The dataspace interface defines a set of methods that allow any kind of dataspace to be attached (mapped) to the virtual address space of an L4 task and then be accessed via memory-access instructions. The L4Re::Rm interface can be used to attach a dataspace to a virtual address space of a task paged by a certain instance of a region map.

Include File

```
#include <l4/re/dataspace>
```

Examples

examples/libs/l4re/c++/mem_alloc/ma+rm.cc, examples/libs/l4re/c++/shared_ds/ds_clnt.cc, and examples/libs/l4re/c++/shared_

Definition at line 50 of file dataspace.

15.279.2 Member Function Documentation

15.279.2.1 allocate()

```
l4_ret_t L4Re::Dataspace::allocate (
            Offset offset,
            Size size)
```

Allocate a range in the dataspace.

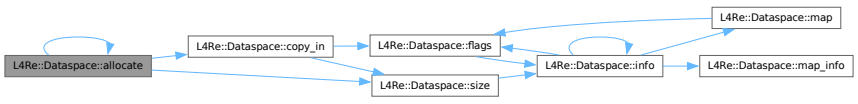
Parameters

offset	Offset in the dataspace, in bytes.
size	Size of the range, in bytes.

Return values

L4_EOK	Success
-L4_ERANGE	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
-L4_ENOMEM	Not enough memory available.
<0	IPC errors

On success, at least the given range is guaranteed to be allocated. The dataspace manager may also allocate more memory due to page granularity.
The memory is allocated with the same rights as the dataspace capability.
References allocate(), copy_in(), and size().
Referenced by allocate().
Here is the call graph for this function:



Here is the caller graph for this function:

15.279.2.2 clear()

```
l4_ret_t L4Re::Dataspace::clear (
            Offset offset,
            Size size)
```

Clear parts of a dataspace.

Parameters

offset	Offset within dataspace (in bytes).
size	Size of region to clear (in bytes).

Return values

>=0	Success.
-L4_ERANGE	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
-L4_EACCESS	No L4_CAP_FPAGE_W right on dataspace capability.
<0	IPC errors

Zeroes out the memory. Depending on the type of memory the memory could also be deallocated and replaced by a shared zero-page.

            Offset dst_offs,
            L4::Ipc::Cap< Dataspace > src,
            Offset src_offs,
            Size size)
```

Copy contents from another dataspace.

Parameters

dst_offs	Offset in destination dataspace.
src	Source dataspace to copy from.
src_offs	Offset in the source dataspace.
size	Size to copy (in bytes).

Return values

L4_EOK	Success
-L4_EACCESS	No L4_CAP_FPAGE_W right on the destination dataspace.
-L4_EINVAL	Invalid parameter supplied.
<0	IPC errors

The copy operation may use copy-on-write mechanisms. The operation may also fail if both dataspaces are not from the same dataspace manager or the dataspace managers do not cooperate.

15.279.2.6 map()

```
l4_ret_t Dataspace::map (
            Dataspace::Offset offset,
            Dataspace::Flags flags,
            Dataspace::Map_addr local_addr,
            Dataspace::Map_addr min_addr,
```

```
Dataspace::Map_addr max_addr,
L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid) const  [noexcept]
```

Request a flexpage mapping from the dataspace.

Parameters

offset	Offset to start within dataspace
flags	Dataspace flags, see L4Re::Dataspace::F::Flags.
local_addr	Local address to map to.
min_addr	Defines start of receive window. (Rounded down to page size.)
max_addr	Defines end of receive window. (Rounded up to page size.)
dst	Optional destination task of the mapping. If invalid, the callers task is implicitly the destination.

Return values

L4_EOK	Success
-L4_ERANGE	Invalid offset.
-L4_EPERM	Insufficient permission to map with requested rights.
<0	IPC errors

The map call will attempt to map the largest possible flexpage that covers the given local address and still fits into the region defined by `min_addr` and `max_addr`. If the given region is invalid or does not overlap the local address, the smallest valid page size is used.

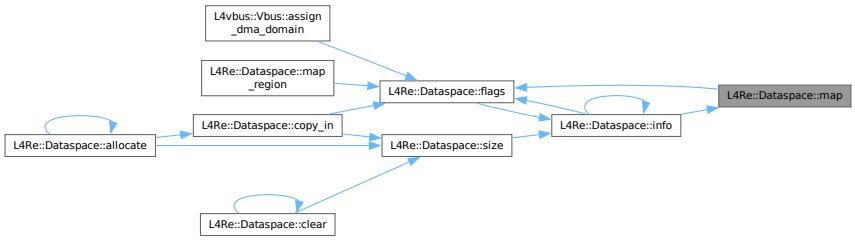
Here is the caller graph for this function:



15.279.2.7 map_info()

```
long L4Re::Dataspace::map_info (
```

```
l4_addr_t * start_addr,
l4_addr_t * end_addr)  [inline]
```

Get mapping range of dataspace.
In case of a MMU-less system, the dataspace must be mapped at the correct address in the task because virtual and physical address must match. This method returns the start and end address of the physically contiguous buffer backing the dataspace.
On MMU-enabled system any page aligned address is permissible. On such systems the method is just a stub.

Parameters

out	*start_addr*	Start address of dataspace.
out	*end_addr*	End address (inclusive) of dataspace.

Return values

>0	Start/end address have been set and need to be obeyed.
0	No constraint of mapping address.
-L4_EPERM	Cannot infer mapping address. Dataspace not mappable.
<0	IPC errors.

Definition at line 306 of file dataspace.

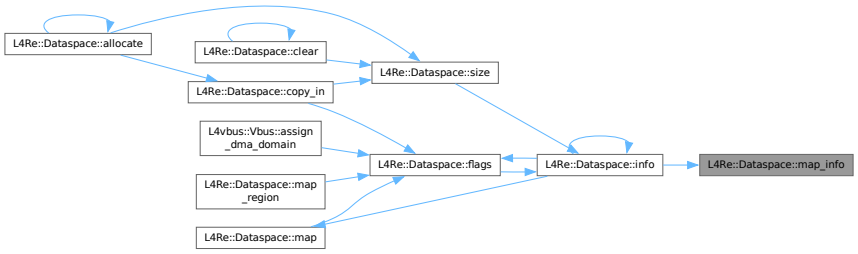
Here is the caller graph for this function:



15.279.2.8 map_region()

```
l4_ret_t Dataspace::map_region (
            Dataspace::Offset offset,
            Dataspace::Flags flags,
            Dataspace::Map_addr min_addr,
            Dataspace::Map_addr max_addr,
            L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid) const  [noexcept]
```

Map a part of a dataspace into a local memory area.

Parameters

offset	Offset to start within dataspace.
flags	Dataspace flags, see L4Re::Dataspace::F::Flags.
min_addr	(Inclusive) start of the receive area.

max_addr	(Exclusive) end of receive area.
dst	Optional destination task of the mapping. If invalid, the callers task is implicitly the destination.

Return values

L4_EOK	Success
-L4_ERANGE	Invalid offset or receive area larger than the dataspace.
-L4_EPERM	Insufficient permission to map with requested rights.
<0	IPC errors

This is a convenience function which maps flexpages consecutively into the given memory area in the local task. The area is expected to be filled completely. If the dataspace is not large enough to provide the mappings for the entire size of the area, then an error is returned. Mappings may or may not have been already established at that point.
`offset` and `min_addr` are rounded down to the next `L4_PAGESIZE` boundary when necessary. `max_addr` is rounded up to the page boundary. If the resulting maximum address is less or equal than the minimum address, then the function is a noop.

- l4_ret_t map (L4::Ipc::Cap< L4Re::Dataspace > src, L4Re::Dataspace::Offset offset, Dma_size *size, Dma_addr *dma_addr, Dma_addr dma_max=-1, Attributes attrs=Search_addr, unsigned char align=L4_SUPERPAGESHIFT)

  Map the given part of this data space into the DMA address space.
- l4_ret_t unmap (Dma_addr dma_addr, Dma_size size, Attributes attrs, Direction dir)

  Unmap the given part of this data space from the DMA address space.
- l4_ret_t unmap (Dma_addr dma_addr, Dma_size size, Unmap_flags flags=Unmap_flags())

  Unmap the given part of this data space from the DMA address space.

15.284.1 Detailed Description

Managed DMA Address Space.
A managed Dma_space represents the L4Re abstraction of an DMA address space of one or several devices. Devices are assigned to a managed Dma_space by binding the Dma_space to the respective DMA domain (see L4vbus::Vbus::assign_dma_domain()), which might link the Dma_space with a kernel DMA space. Note that several DMA domains can be bound to the same Dma_space. Whenever a device needs direct access to parts of an L4Re::Dataspace, that part of the data space must be mapped to the managed Dma_space that is assigned to that device. Binding to DMA domains must happen before mapping. After the DMA accesses to the memory are finished the memory must be unmapped from the device's DMA address space.
Mapping to a managed DMA address space, using map(), makes the given parts of the data space visible to the associated device at the returned DMA address. As long as the memory is mapped into a DMA space it is 'pinned' and cannot be subject to dynamic memory management such as swapping.
unmap() is the reverse operation to map() and unmaps the given data-space part for the DMA address space.
Definition at line 50 of file dma_space.

15.284.3.1 Attribute

```
enum L4Re::Dma_space::Attribute :  unsigned
```

Attributes used for the memory region.

See also

Attributes

Enumerator

Search_addr	Search for suitable address. A spot for the whole mapping is searched, starting from the passed start address. Without this flag, the start address is taken literally. Can be combined with Attribute::Partial_map. If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), the flag has no effect. The Dma_space::map() call will always return the physical address.
Partial_map	Truncate mapping if it does not fit. If there is not enough room after the chosen start address, truncate the mapping instead of failing.
Reserve	Reserve a region instead of mapping pages. If set, the dataspace argument of Dma_space::map() is ignored. Use the Attribute::Replace flag to place dataspace mappings in a reserved region later. The reservation is released with Dma_space::unmap() carrying Unmap_flag::Cancel_reservation. If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), Dma_space::map() will always fail with -L4_EPERM if this flag is present.
Replace	Replace mappings. The pages in the map region are replaced with mappings from the dataspace. Without this flag, existing mappings cause Dma_space::map() to fail. Areas previously claimed by Dma_space_mgr::block_area() are never replaced and still cause Dma_space::map() to fail. If combined with Attribute::Reserve, no dataspace mapping is established. Instead, the reservation reference count is increased. Only after the matching number of Dma_space::unmap(↩ Cancel_reservation) calls, the reservation is released. If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), the flag has no effect. The Dma_space::map() call will always return the physical address. Cannot be combined with Attribute::Search_addr or Attribute::Partial_map.

Definition at line 78 of file dma_space.

15.284.3.2 Direction

`enum L4Re::Dma_space::Direction`
Direction of the DMA transfers.

Deprecated Ignored by the API. Use function overloads without the direction parameter instead.

Enumerator

Bidirectional	device reads and writes to the memory
To_device	device reads the memory
From_device	device writes to the memory
None	device is coherently connected to the memory

Definition at line 66 of file dma_space.

15.284.3.3 Unmap_flag

`enum L4Re::Dma_space::Unmap_flag : unsigned`
Flags used by Dma_space::unmap().

See also

Unmap_flags

Enumerator

Cancel_reservation	Cancel a prior Attribute::Reserve claim instead of unmapping a dataspace mapping. Without this flag, unmap() releases one dataspace mapping that was previously established by map() (with or without Attribute::Replace). With this flag, unmap() releases one previous Attribute::Reserve claim and does not touch any active dataspace mappings in the range.

Definition at line 282 of file dma_space.

15.284.4 Member Function Documentation

15.284.4.1 map() [1/2]

```
l4_ret_t L4Re::Dma_space::map (
             L4::Ipc::Cap< L4Re::Dataspace > src,
             L4Re::Dataspace::Offset offset,
             Dma_size * size,
             Dma_addr * dma_addr,
             Dma_addr dma_max = -1,
             Attributes attrs = Search_addr,
             unsigned char align = L4_SUPERPAGESHIFT)  [inline]
```

Map the given part of this data space into the DMA address space.

Parameters

in	*src*	Source data space (that describes the memory).
in	*offset*	The offset (bytes) within src. Must be zero in case Attribute::Reserve is passed in attrs.
in,out	*size*	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call map() again with a new offset and the remaining size.
in,out	*dma_addr*	The DMA address to use for DMA with the associated device. Either taken literally (in which case it must be page aligned) or used as starting address if Attribute::Search_addr is passed.
in	*dma_max*	Highest allowed DMA address of the mapping (inclusive).
in	*attrs*	The attributes used for this DMA mapping (a combination of Dma_space::Attribute values).
in	*align*	Alignment of mapping (log2 based). Only used if Attribute::Search_addr is passed.

Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	The specified region overlaps an existing mapping/blocking or no space left in search area.
-L4_EPERM	Insufficient permissions; see precondition.

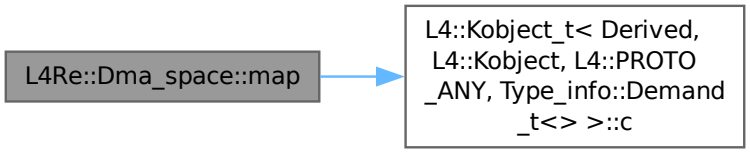
-L4_EINVAL	The capability `src` is invalid or does not refer to a valid dataspace.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.
-L4_ERANGE	`offset` is larger than the size of the dataspace.

The DMA mapping is created writable if capability `src` has the permission L4_CAP_FPAGE_W. Otherwise, a read-only DMA mapping is established.
If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), Dma_space::map() will always return the physical address. The caller should therefore be prepared that a desired DMA address is ignored.

Note

Dma_space_mgr::associate() or Dma_space_mgr::associate_phys() must be called prior to mapping memory. Usually this is done implicitly when binding the managed Dma_space to a DMA domain (see L4vbus::Vbus::assign_dma_domain()).

Definition at line 260 of file dma_space.
References L4::Kobject_t< Derived, L4::Kobject, L4::PROTO_ANY, Type_info::Demand_t<> >::c(), L4_SUPERPAGESHIFT, and Search_addr.
Here is the call graph for this function:



15.284.4.2 map() [2/2]

```
l4_ret_t L4Re::Dma_space::map (
             L4::Ipc::Cap< L4Re::Dataspace > src,
             L4Re::Dataspace::Offset offset,
             l4_size_t * size,
             Attributes attrs,
             Direction dir,
             Dma_addr * dma_addr)  [inline]
```

Map the given part of this data space into the DMA address space.
A suitable address in the DMA task will be chosen automatically.

Parameters

`in`	*src*	Source data space (that describes the memory).
`in`	*offset*	The offset (bytes) within `src`.
`in,out`	*size*	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call map() again with a new offset and the remaining size.
`in`	*attrs*	The attributes used for this DMA mapping (a combination of Dma_space::Attribute values). The Search_addr attribute is forced by this overload!

in	*dir*	The direction of the DMA transfer issued with this mapping. The same value must later be passed to unmap(). (ignored)
out	*dma_addr*	The DMA address to use for DMA with the associated device.

Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	The specified region overlaps an existing mapping.
-L4_EINVAL	The capability src is invalid or does not refer to a valid dataspace.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.
-L4_ERANGE	offset is larger than the size of the dataspace.

The DMA mapping is created writable if capability src has the permission L4_CAP_FPAGE_W. Otherwise, a read-only DMA mapping is established.

Note

Dma_space_mgr::associate() or Dma_space_mgr::associate_phys() must be called prior to mapping memory. Usually this is done implicitly when binding the managed Dma_space to a DMA domain (see L4vbus::Vbus::assign_dma_domain()).

Deprecated Use the other overload without dir parameter.

Definition at line 190 of file dma_space.
References map(), and Search_addr.
Referenced by map().
Here is the call graph for this function:

Here is the caller graph for this function:

15.284.4.3 unmap() [1/2]

```
l4_ret_t L4Re::Dma_space::unmap (
             Dma_addr dma_addr,
             Dma_size size,
             Attributes attrs,
             Direction dir)  [inline]
```

Unmap the given part of this data space from the DMA address space.
The calls to map() and unmap() must be balanced. That is, each page of a mapping that was established by `map()` previously must be unmapped exactly once.
Sub-ranges that do not currently hold a mapping are silently skipped. That is, unmapping the same region too often, is not treated as an error.

Parameters

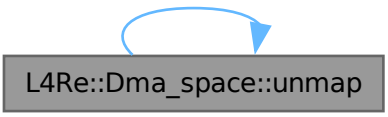
dma_addr	The DMA address (returned by Dma_space::map()).
size	The size (bytes) of the memory region to unmap.
attrs	The attributes for the unmap (currently none, ignored).
dir	The direction of the finished DMA operation (ignored).

Return values

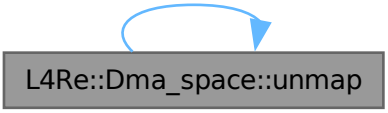
L4_EOK	Operation successful.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.

Deprecated Use the overload without `attrs` and `dir` because they are ignored.

Definition at line 326 of file dma_space.
References unmap().
Referenced by unmap().
Here is the call graph for this function:



Here is the caller graph for this function:



15.284.4.4 unmap() [2/2]

```
l4_ret_t L4Re::Dma_space::unmap (
             Dma_addr dma_addr,
             Dma_size size,
             Unmap_flags flags = Unmap_flags())  [inline]
```

Unmap the given part of this data space from the DMA address space.
The calls to map() and unmap() must be balanced. That is, each page of a mapping that was established by `map()` previously must be unmapped exactly once. Likewise, every Attribute::Reserve claim must be released by exactly one unmap() call carrying Unmap_flag::Cancel_reservation.
Sub-ranges that do not currently hold a claim of the requested kind are silently skipped. That is, unmapping the same region too often, is not treated as an error. This behaviour applies both to actual mappings, as well as reservations.

Parameters

dma_addr	The DMA address (returned by Dma_space::map()).
size	The size (bytes) of the memory region to unmap.
flags	A combination of Dma_space::Unmap_flag values.

Return values

L4_EOK	Operation successful.
-L4_EPERM	The range overlaps with a privileged Dma_space_mgr::block_area() claim.
-L4_EINVAL	Invalid arguments. Can be caused by unknown `flags`, size of 0 or an address overflow.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.

Definition at line 358 of file dma_space.
References L4::Kobject_t< Derived, L4::Kobject, L4::PROTO_ANY, Type_info::Demand_t<> >::c().

  Attributes used when blocking an area.
- using **Space_attribs** = L4::Types::Flags_t<Space_attrib, unsigned>

  Attributes used when associating the DMA space.
- using **Block_flags** = L4::Types::Flags_t<Block_flag, unsigned>

  Attributes used when blocking an area.

Public Member Functions

- l4_ret_t associate (L4::Ipc::Cap< Dma_space > dma_space, L4::Ipc::Cap< L4::Task > dma_task, Space_attribs attr)

Associate a (kernel) DMA space for a device to a Dma_space.

- l4_ret_t associate_phys (L4::Ipc::Cap< Dma_space > dma_space, Space_attribs attr)

  Register a Dma_space to use for DMA.
- l4_ret_t disassociate (L4::Ipc::Cap< Dma_space > dma_space)

  Disassociate the (kernel) DMA space from this Dma_space.
- l4_ret_t block_area (L4::Ipc::Cap< Dma_space > dma_space, L4::Ipc::In_out< Dma_addr * > addr, Dma↩ _size size, Dma_addr max_addr=-1, Block_flags flags=Block_flags(), unsigned char align=L4_SUPERPAGESHIFT)

  Block an area in a Dma_space.
- l4_ret_t set_limits (L4::Ipc::Cap< Dma_space > dma_space, Dma_addr min_addr, Dma_addr max_addr)

  Set lower and upper bound of DMA addresses.

15.285.1 Detailed Description

A privileged interface to manage Dma_space associations for the clients.
This interface is provided as a singleton by Moe.
Definition at line 375 of file dma_space.

15.285.2 Member Enumeration Documentation

15.285.2.1 Block_flag

```
enum L4Re::Dma_space_mgr::Block_flag :  unsigned
```

Attributes used when blocking an area.

See also

Block_flags

Enumerator

Search_addr	Search suitable address. With this flag, the start address is taken as a lower bound. Without the flag, `start` and `size` are taken literally.

Definition at line 408 of file dma_space.

15.285.2.2 Space_attrib

```
enum L4Re::Dma_space_mgr::Space_attrib :  unsigned
```

Attributes assigned to the DMA space when associated with a specific device.

See also

Space_attribs

Enumerator

Identity_map	Request identity mappings. This is needed if some devices are not connected to an IOMMU and need physical addresses.

Definition at line 388 of file dma_space.

15.285.3 Member Function Documentation

15.285.3.1 associate()

```
l4_ret_t L4Re::Dma_space_mgr::associate (
            L4::Ipc::Cap< Dma_space > dma_space,
```

```
L4::Ipc::Cap< L4::Task > dma_task,
Space_attribs attr)
```

Associate a (kernel) DMA space for a device to a Dma_space.

Parameters

in	*dma_space*	The Dma_space to associate the (kernel) DMA space with.
in	*dma_task*	The (kernel) DMA space used for the device that shall be associated with this DMA space.
in	*attr*	Attributes for this DMA space. See L4Re::Dma_space::Space_attrib.

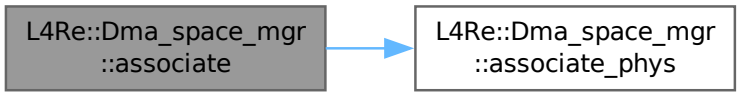
Return values

L4_EOK	Operation successful.
-L4_EBUSY	The Dma_space is already associated.
-L4_EINVAL	Invalid arguments, e.g. no `dma_task` capability passed. In particular, when Space_attrib::Identity_map is requested, the Dma_space must not have any pre-existing blockings (see Dma_space_mgr::block_area()) and must not have custom address limits set (see Dma_space_mgr::set_limits()).
-L4_ENOENT	Invalid `dma_space` was passed.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The `dma_space` and `dma_task` capabilities must have the permission L4_CAP_FPAGE_W.

References associate_phys().
Here is the call graph for this function:



15.285.3.2 associate_phys()

```
l4_ret_t L4Re::Dma_space_mgr::associate_phys (
L4::Ipc::Cap< Dma_space > dma_space,
Space_attribs attr)
```

Register a Dma_space to use for DMA.
This function should be used, in case no IOMMU is present or configured. The CPU's physical memory is used as DMA address space.

Parameters

in	*dma_space*	The Dma_space to register.
in	*attr*	Attributes for the provided DMA space. Currently not used; must be the default-constructed Space_attribs() value.

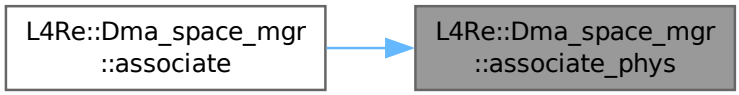
Return values

L4_EOK	Operation successful.
-L4_EBUSY	The Dma_space is already associated.
-L4_EINVAL	Invalid arguments, for example a non-zero `attr`, pre-existing blockings on `dma_space` (see Dma_space_mgr::block_area()), or custom address limits set on `dma_space` (see Dma_space_mgr::set_limits()).
-L4_ENOENT	Invalid `dma_space` was passed.
-L4_ENOMEM	Not enough memory to allocate internal datastructures.
-L4_EPERM	Insufficient permissions; see precondition.

Precondition

The `dma_space` capability must have the permission L4_CAP_FPAGE_W.

Referenced by associate().
Here is the caller graph for this function:



15.285.3.3 block_area()

```
l4_ret_t L4Re::Dma_space_mgr::block_area (
             L4::Ipc::Cap< Dma_space > dma_space,
             L4::Ipc::In_out< Dma_addr * > addr,
             Dma_size size,
             Dma_addr max_addr = -1,
             Block_flags flags = Block_flags(),
             unsigned char align = L4_SUPERPAGESHIFT)  [inline]
```

Block an area in a Dma_space.
The blocked area cannot be used for mappings in the given `dma_space` after the call. The call will fail if there are already mappings in the requested range. It is allowed to add block areas before associate() or associate_phys() has been called.
Blocked areas are allowed to overlap.

Parameters

in	*dma_space*	The Dma_space to add blocked areas.

in,out	*addr*	The DMA address of the blocked area. Either taken literally (in which case it must be page aligned) or as start address if Block_flag::Search_addr is passed.
in	*size*	Size of the blocked region. Must be page aligned.
in	*max_addr*	Highest allowed DMA address of the region (inclusive).
in	*flags*	The attributes used for this blocking (a combination of Dma_space_mgr::Block_flag values).
in	*align*	The log2 alignment of the blocked area. Only used if Block_flag::Search_addr is passed.

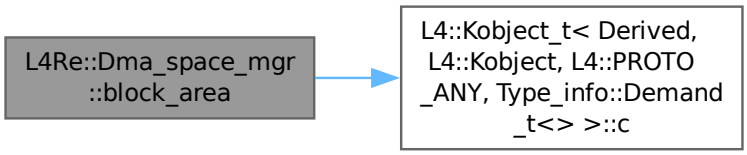
Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	The specified region overlaps an existing mapping or no space left for the blocking.
-L4_EINVAL	Invalid address, alignment or flag passed. Block_flag::Search_addr passed but dma_space is not associated yet.
-L4_EPERM	Dma_space is associated with physical DMA domain or insufficient permissions; see precondition.
-L4_ENOMEM	There is not enough memory to allocate internal data structures.

Precondition

The dma_space capability must have the permission L4_CAP_FPAGE_W.

Definition at line 542 of file dma_space.
References L4::Kobject_t< Derived, L4::Kobject, L4::PROTO_ANY, Type_info::Demand_t<> >::c(), and L4_SUPERPAGESHIFT.
Here is the call graph for this function:



15.285.3.4 disassociate()

```
l4_ret_t L4Re::Dma_space_mgr::disassociate (
            L4::Ipc::Cap< Dma_space > dma_space)
```

Disassociate the (kernel) DMA space from this Dma_space.

Parameters

in	*dma_space*	The Dma_space to de-register.

Return values

L4_EOK	Operation successful.
-L4_ENOENT	Invalid `dma_space` was passed or disassociate() called without prior calling associate()/associate_phys().
-L4_EPERM	Insufficient permissions; see precondition.

Attention

This will remove all mappings, reservations and blockings from `dma_space`.

Precondition

The `dma_space` capability must have the permission L4_CAP_FPAGE_W.

References disassociate().
Referenced by disassociate().
Here is the call graph for this function:

Here is the caller graph for this function:

15.285.3.5 set_limits()

```
l4_ret_t L4Re::Dma_space_mgr::set_limits (
             L4::Ipc::Cap< Dma_space > dma_space,
             Dma_addr min_addr,
             Dma_addr max_addr)
```

Set lower and upper bound of DMA addresses.
Mappings and blockings are only allowed in the given range.

If multiple Dma_spaces share the same kernel DMA space (i.e., were associated by passing the same `dma_task` to associate()), all DMA address allocations, reservations and blockings performed through any of these Dma_spaces use the intersection of all their individual limits. Tightening the limits on one Dma_space therefore also constrains all other Dma_spaces sharing the same DMA task; loosening the limits on one Dma_space has no effect beyond what the most-restrictive peer Dma_space allows.

Parameters

`in`	*dma_space*	The Dma_space whose limits shall be changed.
`in`	*min_addr*	The lowest usable address in the Dma_space.
`in`	*max_addr*	The highest usable address in the Dma_space (inclusive).

Return values

L4_EOK	Operation successful.
-L4_EADDRNOTAVAIL	There are existing mappings or blocking outside the bounds.
-L4_EPERM	Dma_space is associated with physical DMA domain or insufficient permissions; see precondition.
-L4_EINVAL	Invalid address passed.

Precondition

The `dma_space` capability must have the permission L4_CAP_FPAGE_W.

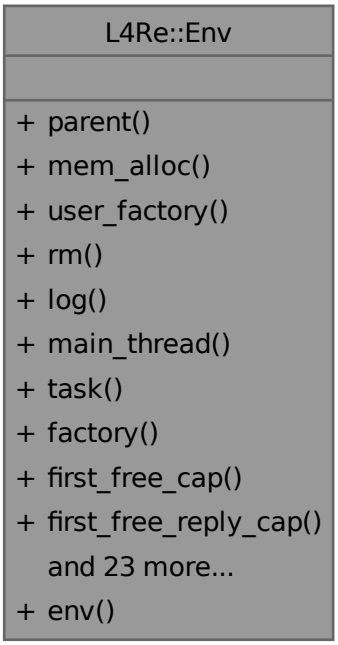
The documentation for this class was generated from the following file:

- l4/re/dma_space

15.286 L4Re::Env Class Reference

C++ interface of the initial environment that is provided to an L4 task.
`#include <env>`

Collaboration diagram for L4Re::Env:



Public Types

- typedef l4re_env_cap_entry_t **Cap_entry**

  C++ type for an entry in the initial objects array.

Public Member Functions

- L4::Cap< Parent > parent () const noexcept

  Object-capability to the parent.
- L4::Cap< Mem_alloc > mem_alloc () const noexcept

  Object-capability to the memory allocator.
- L4::Cap< L4::Factory > **user_factory** () const noexcept

  Object-capability to the user-level object factory.
- L4::Cap< Rm > rm () const noexcept

  Object-capability to the region map.
- L4::Cap< Log > log () const noexcept

  Object-capability to the logging service.
- L4::Cap< L4::Thread > main_thread () const noexcept

  Object-capability of the first user thread.
- L4::Cap< L4::Task > task () const noexcept

  Object-capability of the user task.
- L4::Cap< L4::Factory > factory () const noexcept

  Object-capability to the factory object available to the task.
- l4_cap_idx_t first_free_cap () const noexcept

  *First available object capability index (**not** shifted by L4_CAP_SHIFT).*

- l4_umword_t first_free_reply_cap () const noexcept

  *First available reply capability index (**not** shifted by L4_CAP_SHIFT).*
- l4_fpage_t utcb_area () const noexcept

  UTCB area of the task.
- l4_addr_t first_free_utcb () const noexcept

  First free UTCB.
- Cap_entry const * initial_caps () const noexcept

  Get a pointer to the first entry in the initial objects array.
- Cap_entry const * get (char const *name, unsigned l) const noexcept

  Get the Cap_entry for the object named name.
- template<typename T>
  L4::Cap< T > get_cap (char const *name, unsigned l) const noexcept

  Get the capability index for the object named name.
- template<typename T>
  L4::Cap< T > get_cap (char const *name) const noexcept

  Get the capability index for the object named name.
- void parent (L4::Cap< Parent > const &c) noexcept

  Set parent object-capability.
- void mem_alloc (L4::Cap< Mem_alloc > const &c) noexcept

  Set memory allocator object-capability.
- void rm (L4::Cap< Rm > const &c) noexcept

  Set region map object-capability.
- void log (L4::Cap< Log > const &c) noexcept

  Set log object-capability.
- void main_thread (L4::Cap< L4::Thread > const &c) noexcept

  Set object-capability of first user thread.
- void factory (L4::Cap< L4::Factory > const &c) noexcept

  Set factory object-capability.
- void first_free_cap (l4_cap_idx_t c) noexcept

  *Set first available object capability index (**not** shifted by L4_CAP_SHIFT).*
- void first_free_reply_cap (l4_umword_t c) noexcept

  *Set first available reply capability index (**not** shifted by L4_CAP_SHIFT).*
- void utcb_area (l4_fpage_t utcbs) noexcept

  Set UTCB area of the task.
- void first_free_utcb (l4_addr_t u) noexcept

  Set first free UTCB.
- L4::Cap< L4::Scheduler > scheduler () const noexcept

  Get the scheduler capability for the task.
- void scheduler (L4::Cap< L4::Scheduler > const &c) noexcept

  Set the scheduler capability.
- L4::Cap< Itas > itas () const noexcept

  Object-capability to the ITAS services.
- void itas (L4::Cap< Itas > const &c) noexcept

  Set the ITAS capability.
- L4::Cap< Dbg_events > dbg_events () const noexcept

  Object-capability to a debugger events service.
- void dbg_events (L4::Cap< Dbg_events > const &dbg_events) noexcept

  Set the dbg_events capability.
- void initial_caps (Cap_entry *first) noexcept

  Set the pointer to the first Cap_entry in the initial objects array.

Static Public Member Functions

- static Env const * env () noexcept

  Returns the initial environment for the current task.

15.286.1 Detailed Description

C++ interface of the initial environment that is provided to an L4 task.
The initial environment is provided to each L4 task that is started by an L4Re conform loader, such as the Moe root task. The initial environment provides access to a set of initial capabilities and some additional information about the available resources, such as free UTCBs (see Virtual Registers) and available entries in capability table (provided by the micro kernel).
Each of the initial capabilities is stored at a fixed index in the task's capability table and the L4 runtime environment provides convenience functions to retrieve the capabilities. See the table below for an comprehensive overview.

Name	Object Type	Convenience Function
parent	L4Re::Parent	L4Re::Env::parent()
user_factory	L4::Factory	L4Re::Env::user_factory()
log	L4Re::Log	L4Re::Env::log()
main_thread	L4::Thread	L4Re::Env::main_thread()
rm	L4Re::Rm	L4Re::Env::rm()
factory	L4::Factory	L4Re::Env::factory()
task	L4::Task	L4Re::Env::task()
scheduler	L4::Scheduler	L4Re::Env::scheduler()
itas	L4Re::Itas	L4Re::Env::itas()

Additional information found in the initial environment is:

- First free entry in capability table
- The UTCB area (as flexpage)
- First free UTCB (address in the UTCB area)

Include File

```
#include <l4/re/env>
```

For an explanation of the default task capabilities see l4_default_caps_t.
For the C interface refer to Initial Environment.
Definition at line 78 of file env.

15.286.2 Member Function Documentation

15.286.2.1 dbg_events() [1/2]

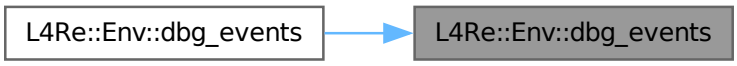
`L4::Cap< Dbg_events > L4Re::Env::dbg_events () const [inline], [noexcept]`
Object-capability to a debugger events service.

Returns

Dbg_events object-capability

This capability can be invalid.
Definition at line 336 of file env.
Referenced by dbg_events().

Here is the caller graph for this function:



15.286.2.2 dbg_events() [2/2]

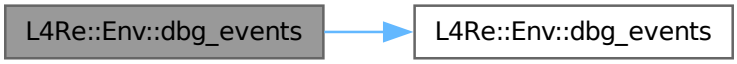
```
void L4Re::Env::dbg_events (
            L4::Cap< Dbg_events > const & dbg_events)  [inline], [noexcept]
```

Set the dbg_events capability.

Parameters

dbg_events	is the capability to be set for the debug events service.

Note that the capability can be invalid.
Definition at line 346 of file env.
References dbg_events().
Here is the call graph for this function:



15.286.2.3 env()

```
Env const * L4Re::Env::env ()  [inline], [static], [noexcept]
```

Returns the initial environment for the current task.

Returns

Pointer to the initial environment class.

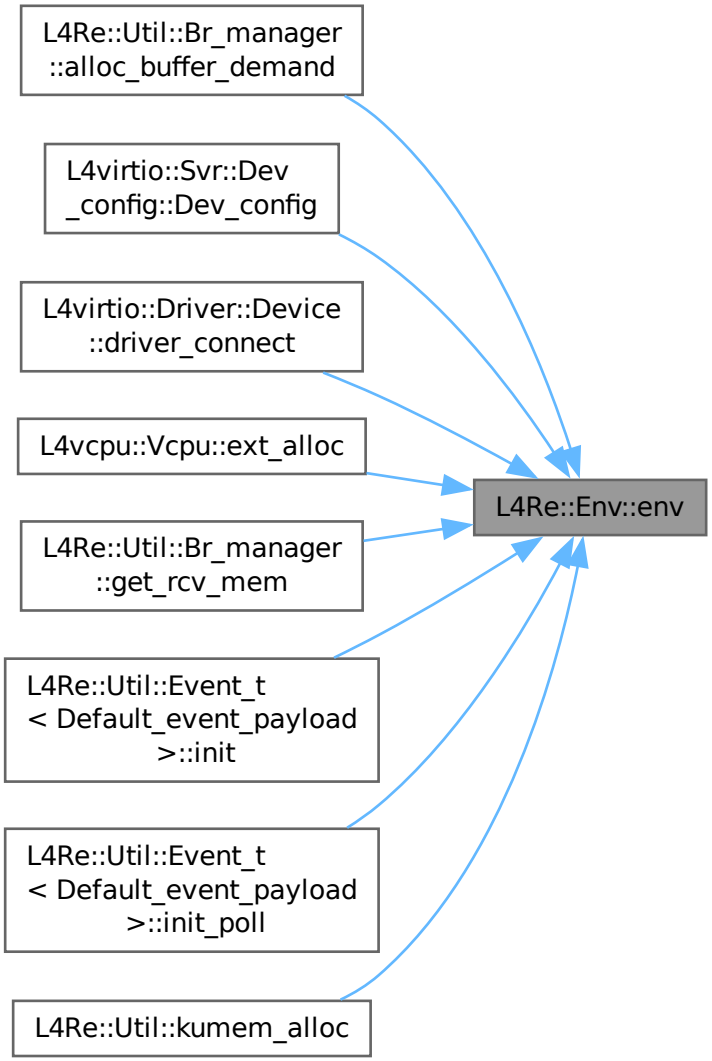
A typical use of this function is L4Re::Env::env()-><member>()

Examples

examples/clntsrv/src/client.cc, examples/libs/l4re/c++/mem_alloc/ma+rm.cc, examples/libs/l4re/c++/shared_ds/ds_clnt.cc, examples/libs/l4re/c++/shared_ds/ds_srv.cc, examples/libs/l4re/streammap/client.cc, and examples/sys/migrate/thread_migrate

Definition at line 96 of file env.
Referenced by L4Re::Util::Br_manager::alloc_buffer_demand(), L4virtio::Svr::Dev_config::Dev_config(), L4virtio::Driver::Device::driver
L4vcpu::Vcpu::ext_alloc(), L4Re::Util::Br_manager::get_rcv_mem(), L4Re::Util::Event_t< Default_event_payload >::init(), L4Re::Util::Event_t< Default_event_payload >::init_poll(), and L4Re::Util::kumem_alloc().

Here is the caller graph for this function:



15.286.2.4 factory() [1/2]

`L4::Cap< L4::Factory > L4Re::Env::factory () const [inline], [noexcept]`

Object-capability to the factory object available to the task.

Returns

Factory object-capability

Definition at line 148 of file env.

15.286.2.5 factory() [2/2]

```
void L4Re::Env::factory (
            L4::Cap< L4::Factory > const & c) [inline], [noexcept]
```

Set factory object-capability.

Parameters

c	Factory object-capability

Definition at line 265 of file env.

15.286.2.6 first_free_cap() [1/2]

```
l4_cap_idx_t L4Re::Env::first_free_cap () const  [inline], [noexcept]
```

First available object capability index (***not*** shifted by L4_CAP_SHIFT).

Returns

First available object capability index (*not* shifted).

First object capability index (*not* shifted) available for use for in the application.
Definition at line 158 of file env.

15.286.2.7 first_free_cap() [2/2]

```
void L4Re::Env::first_free_cap (
            l4_cap_idx_t c)  [inline], [noexcept]
```

Set first available object capability index (***not*** shifted by L4_CAP_SHIFT).

Parameters

c	First object capability index (*not* shifted) available to the application.

Definition at line 273 of file env.

15.286.2.8 first_free_reply_cap() [1/2]

```
l4_umword_t L4Re::Env::first_free_reply_cap () const  [inline], [noexcept]
```

First available reply capability index (***not*** shifted by L4_CAP_SHIFT).

Returns

First available reply capability index (*not* shifted).

First reply capability index (*not* shifted) for use for in the application.
Definition at line 168 of file env.

15.286.2.9 first_free_reply_cap() [2/2]

```
void L4Re::Env::first_free_reply_cap (
            l4_umword_t c)  [inline], [noexcept]
```

Set first available reply capability index (***not*** shifted by L4_CAP_SHIFT).

Parameters

c	First reply capability index (*not* shifted) available to the application.

Definition at line 281 of file env.

15.286.2.10 first_free_utcb() [1/2]

```
l4_addr_t L4Re::Env::first_free_utcb () const  [inline], [noexcept]
```

First free UTCB.

Returns

object-capability

First free UTCB within the UTCB area available for the application to use.
Definition at line 183 of file env.

15.286.2.11 first_free_utcb() [2/2]

```
void L4Re::Env::first_free_utcb (
            l4_addr_t u)  [inline], [noexcept]
```

Set first free UTCB.

Parameters

u	First UTCB available for the application to use.

Definition at line 293 of file env.

15.286.2.12 get()

```
Cap_entry const * L4Re::Env::get (
            char const * name,
            unsigned l) const  [inline], [noexcept]
```

Get the Cap_entry for the object named *name*.

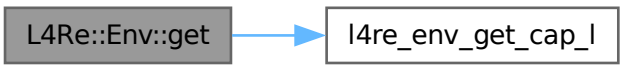
Parameters

name	is the name of the object.
l	is the length of the name, thus *name* might not be zero terminated.

Returns

A pointer to the Cap_entry for the object named *name*, or NULL if no such object was found.

Definition at line 201 of file env.
References l4re_env_get_cap_l().
Referenced by get_cap().
Here is the call graph for this function:



Here is the caller graph for this function:

15.286.2.13 get_cap() [1/2]

```
template<typename T>
L4::Cap< T > L4Re::Env::get_cap (
            char const * name) const  [inline], [noexcept]
```

Get the capability index for the object named *name*.

Parameters

name	is the name of the object (zero terminated).

Returns

A capability index for the object named *name*, or an invalid capability selector if no such object was found.

Definition at line 228 of file env.
References get_cap().
Here is the call graph for this function:

15.286.2.14 get_cap() [2/2]

```
template<typename T>
L4::Cap< T > L4Re::Env::get_cap (
            char const * name,
            unsigned l) const  [inline], [noexcept]
```

Get the capability index for the object named *name*.

Parameters

name	is the name of the object.
l	is the length of the name, thus *name* might not be zero terminated.

Returns

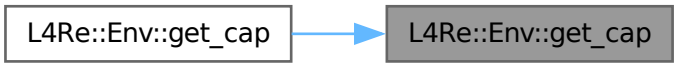
A capability index for the object named *name*, or an invalid capability selector if no such object was found.

Examples

examples/clntsrv/src/client.cc, examples/libs/l4re/c++/shared_ds/ds_clnt.cc, and examples/libs/l4re/streammap/client.cc.

Definition at line 213 of file env.
References get(), and L4_ENOENT.
Referenced by get_cap().
Here is the call graph for this function:

Here is the caller graph for this function:



15.286.2.15 initial_caps() [1/2]

```
Cap_entry const * L4Re::Env::initial_caps () const  [inline], [noexcept]
```

Get a pointer to the first entry in the initial objects array.

Returns

A pointer to the first entry in the initial objects array.

Definition at line 190 of file env.

15.286.2.16 initial_caps() [2/2]

```
void L4Re::Env::initial_caps (
            Cap_entry * first)  [inline], [noexcept]
```

Set the pointer to the first Cap_entry in the initial objects array.

Parameters

first	is the first element in the array.

Definition at line 353 of file env.

15.286.2.17 itas() [1/2]

```
L4::Cap< Itas > L4Re::Env::itas () const  [inline], [noexcept]
```

Object-capability to the ITAS services.

Returns

ITAS object-capability

Attention: this capability might be invalid, depending on the system configuration. Regular applications must not use it directly as it is an implementation detail of the L4Re libc that is subject to change without notice!
Definition at line 320 of file env.

15.286.2.18 itas() [2/2]

```
void L4Re::Env::itas (
            L4::Cap< Itas > const & c)  [inline], [noexcept]
```

Set the ITAS capability.

Parameters

c	is the capability to be set as ITAS.

Definition at line 327 of file env.

15.286.2.19 log() [1/2]

```
L4::Cap< Log > L4Re::Env::log () const  [inline], [noexcept]
```

Object-capability to the logging service.
Might be invalid if there is no logging service available to the application!

Returns

Log object-capability

Definition at line 130 of file env.

15.286.2.20 log() [2/2]

```
void L4Re::Env::log (
            L4::Cap< Log > const & c)  [inline], [noexcept]
```

Set log object-capability.

Parameters

c	Log object-capability

Definition at line 253 of file env.

15.286.2.21 main_thread() [1/2]

```
L4::Cap< L4::Thread > L4Re::Env::main_thread () const  [inline], [noexcept]
```

Object-capability of the first user thread.

Returns

Object-capability of the first user thread.

Definition at line 136 of file env.

15.286.2.22 main_thread() [2/2]

```
void L4Re::Env::main_thread (
            L4::Cap< L4::Thread > const & c)  [inline], [noexcept]
```

Set object-capability of first user thread.

Parameters

c	First thread's object-capability

Definition at line 259 of file env.

15.286.2.23 mem_alloc() [1/2]

```
L4::Cap< Mem_alloc > L4Re::Env::mem_alloc () const  [inline], [noexcept]
```

Object-capability to the memory allocator.

Returns

Memory allocator object-capability

Examples

examples/libs/l4re/c++/shared_ds/ds_srv.cc.

Definition at line 109 of file env.

15.286.2.24 mem_alloc() [2/2]

```
void L4Re::Env::mem_alloc (
            L4::Cap< Mem_alloc > const & c)  [inline], [noexcept]
```

Set memory allocator object-capability.

Parameters

c	Memory allocator object-capability

Definition at line 241 of file env.

15.286.2.25 parent() [1/2]

```
L4::Cap< Parent > L4Re::Env::parent () const  [inline], [noexcept]
```

Object-capability to the parent.

Returns

Parent object-capability

Definition at line 103 of file env.

15.286.2.26 parent() [2/2]

```
void L4Re::Env::parent (
            L4::Cap< Parent > const & c)  [inline], [noexcept]
```

Set parent object-capability.

Parameters

c	Parent object-capability

Definition at line 235 of file env.

15.286.2.27 rm() [1/2]

```
L4::Cap< Rm > L4Re::Env::rm () const  [inline], [noexcept]
```

Object-capability to the region map.

Returns

Region map object-capability

Examples

examples/libs/l4re/c++/shared_ds/ds_clnt.cc, and examples/libs/l4re/c++/shared_ds/ds_srv.cc.

Definition at line 120 of file env.

15.286.2.28 rm() [2/2]

```
void L4Re::Env::rm (
            L4::Cap< Rm > const & c)  [inline], [noexcept]
```

Set region map object-capability.

Parameters

c	Region map object-capability

Definition at line 247 of file env.

15.286.2.29 scheduler() [1/2]

```
L4::Cap< L4::Scheduler > L4Re::Env::scheduler () const  [inline], [noexcept]
```

Get the scheduler capability for the task.

Returns

The capability index for the default scheduler used for this task.

Definition at line 301 of file env.

15.286.2.30 scheduler() [2/2]

```
void L4Re::Env::scheduler (
            L4::Cap< L4::Scheduler > const & c)  [inline], [noexcept]
```

Set the scheduler capability.

Parameters

c	is the capability to be set as scheduler.

Definition at line 308 of file env.

15.286.2.31 task()

```
L4::Cap< L4::Task > L4Re::Env::task () const  [inline], [noexcept]
```

Object-capability of the user task.

Returns

Object-capability of the user task.

Definition at line 142 of file env.
Referenced by L4Re::Util::Br_manager::get_rcv_mem().

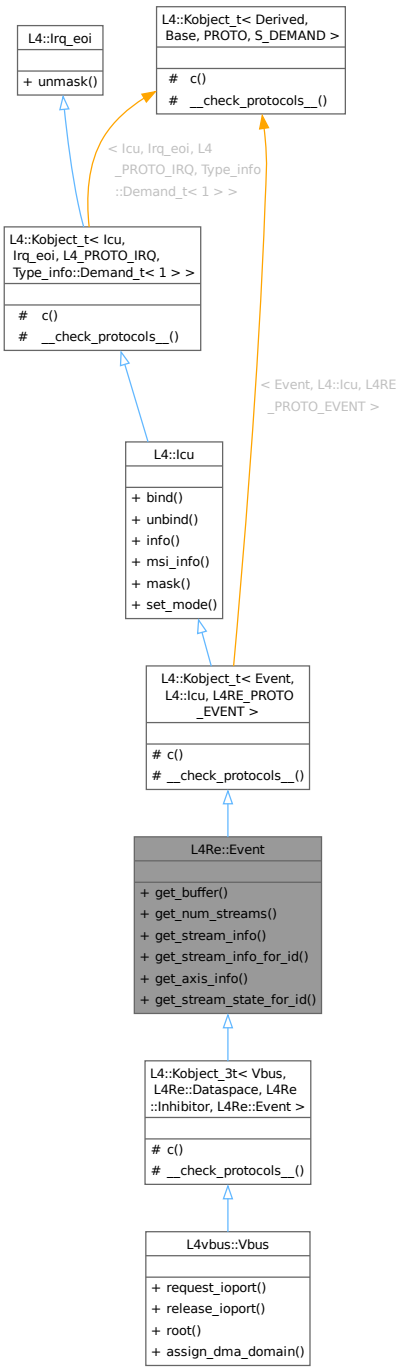
15.287 L4Re::Event Class Reference

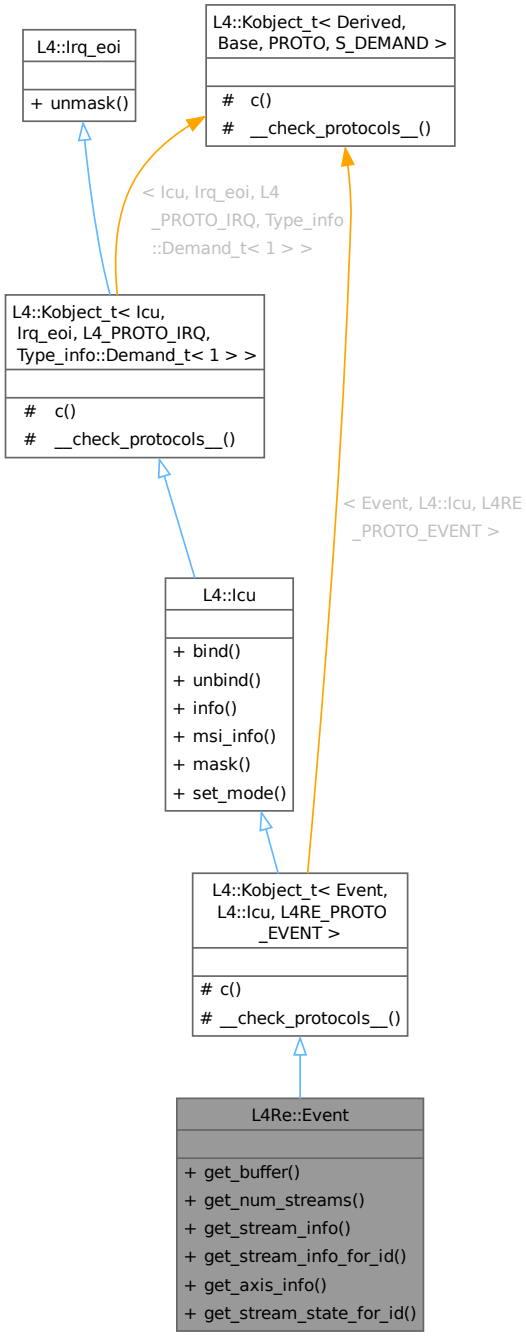
Event class.

```
#include <event>
```

Inheritance diagram for L4Re::Event:



Collaboration diagram for L4Re::Event:



Public Member Functions

- l4_ret_t get_buffer (L4::Ipc::Out< L4::Cap< Dataspace > > ds)

  Get event signal buffer.
- l4_ret_t get_num_streams ()

  Get number of event streams.
- l4_ret_t get_stream_info (int idx, Event_stream_info *info)

  Get event stream infos.

- l4_ret_t get_stream_info_for_id (l4_umword_t stream_id, Event_stream_info *info)

  Get event stream infos.
- l4_ret_t get_axis_info (l4_umword_t stream_id, unsigned naxes, unsigned const *axis, Event_absinfo *info) const noexcept

  Get event stream axis infos.
- l4_ret_t get_stream_state_for_id (l4_umword_t stream_id, Event_stream_state *state)

  Get event stream state.

Public Member Functions inherited from L4::Icu

- l4_msgtag_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t info (l4_icu_info_t *info, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get information about the ICU features.
- l4_msgtag_t msi_info (l4_umword_t irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info)

  Get MSI info about IRQ.
- l4_msgtag_t mask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Mask an IRQ line.
- l4_msgtag_t set_mode (unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb=l4_utcb()) noexcept

  Set interrupt mode.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Event, L4::Icu, L4RE_PROTO_EVENT >

- typedef Event **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Event > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Icu::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- typedef Icu **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Icu > **__Iface**

  The interface description for the derived class.

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.290.1 Detailed Description

Set of inhibitor locks, which inhibit specific actions when held.
This interface provides access to a set of inhibitor locks, each determined by an ID that is specific to the Inhibitor object. Each individual lock shall prevent, a specific (implementation defined) action to be executed, as long as the lock is held.
For example there can be an inhibitor lock to prevent a transition to suspend-to-RAM state and a different one to prevent shutdown.
A client shall take an inhibitor lock if it needs to execute code before the action is taken. For example a lock-screen application shall grab an inhibitor lock for the suspend action to be able to lock the screen before the system goes to sleep.
Inhibitor locks are usually closely related to specific events. Usually a server automatically subscribes a client holding a lock to the corresponding event. The server shall send the event to inform the client that an action is pending. Upon reception of the event, the client is supposed to release the corresponding inhibitor lock.
Definition at line 38 of file inhibitor.

15.290.2 Member Enumeration Documentation

15.290.2.1 anonymous enum

```
anonymous enum
```

Enumerator

Name_max	The maximum length of a lock's name.

Definition at line 42 of file inhibitor.

15.290.3 Member Function Documentation

15.290.3.1 acquire()

```
l4_ret_t L4Re::Inhibitor::acquire (
            l4_umword_t id,
            L4::Ipc::String<> reason)
```

Acquire a specific inhibitor lock.

Parameters

id	ID of the inhibitor lock that the client intends to acquire
reason	The reason why you need the lock. Used for informing the user or debugging.

Return values

0	Success
-L4_ENODEV	The specified `id` does not exist.

References acquire().
Referenced by acquire().

Here is the caller graph for this function:

15.290.3.2 next_lock_info()

```
l4_ret_t L4Re::Inhibitor::next_lock_info (
            char * name,
            unsigned len,
```

```
            l4_mword_t current_id = -1,
            l4_utcb_t * utcb = l4_utcb())  [inline]
```

Get information for the next available inhibitor lock.

Parameters

name	A pointer to a buffer for the name of the lock.
len	The length of the available buffer (usually Name_max is used).
current_id	The ID of the last available lock, use -1 to get the first lock.
utcb	The UTCB to use for the message.

Return values

>0	The ID of the next available lock if there is one (in this case `name` shall contain the name of the inhibitor lock).
-L4_ENODEV	There are no more locks.

Definition at line 84 of file inhibitor.
References L4::Kobject_t< Inhibitor, L4::Kobject, L4RE_PROTO_INHIBITOR >::c().

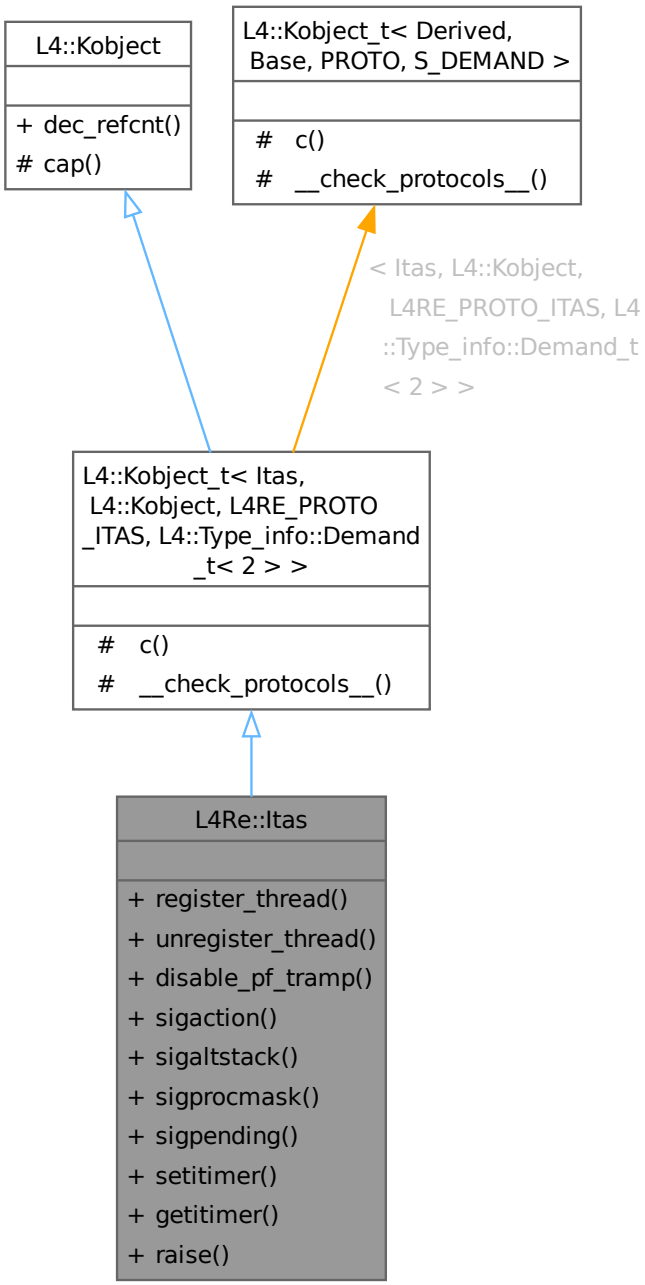
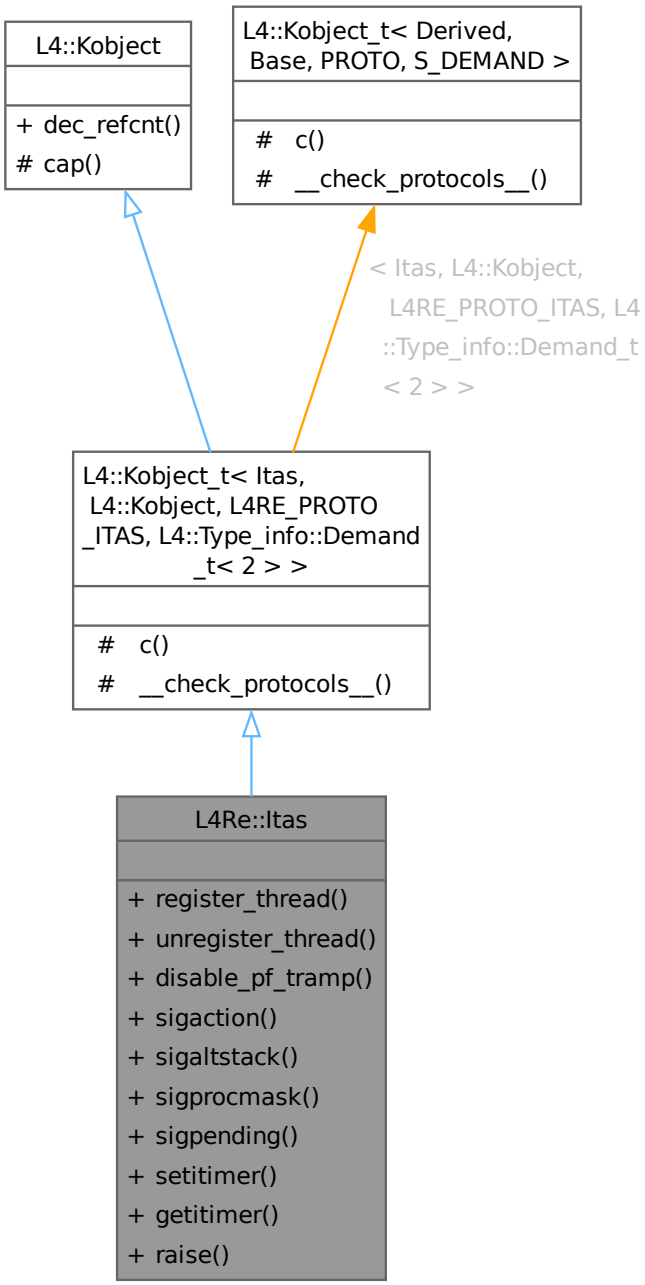
15.291 L4Re::Itas Class Reference

Interface to the ITAS.
`#include <itas>`

Inheritance diagram for L4Re::Itas:



Collaboration diagram for L4Re::Itas:



Public Types

- enum : unsigned { Ignore_sigaction = ~0U }

Public Member Functions

- l4_ret_t register_thread (L4::Ipc::Cap< L4::Thread > parent, L4::Ipc::Cap< L4::Thread > thread_cap, l4_addr_t thread_utcb)

  Register new thread.

- l4_ret_t unregister_thread (L4::Ipc::Cap< L4::Thread > thread)

  Unregister a thread.
- l4_ret_t disable_pf_tramp ()

  Disable page fault trampolines for the whole process.
- l4_ret_t sigaction (int signum, const struct sigaction *act, struct sigaction *oldact)

  Examine and change a POSIX signal action.
- l4_ret_t sigaltstack (L4::Ipc::Cap< L4::Thread > thread, const struct sigaltstack *ss, struct sigaltstack *oss)

  Examine or set alternate POSIX signal stack.
- l4_ret_t sigprocmask (L4::Ipc::Cap< L4::Thread > thread, int how, sigset_t const *set, sigset_t *oldset)

  Examine or set process signal mask.
- l4_ret_t sigpending (L4::Ipc::Cap< L4::Thread > thread, sigset_t *set)

  Query pending signals.
- l4_ret_t setitimer (int which, const struct itimerval *new_value, struct itimerval *old_value)

  Set process interval timer.
- l4_ret_t getitimer (int which, struct itimerval *curr_value)

  Get process interval timer.
- l4_ret_t raise (L4::Ipc::Cap< L4::Thread > thread, int sig)

  Send a signal to the calling thread.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Itas, L4::Kobject, L4RE_PROTO_ITAS, L4::Type_info::Demand_t< 2 > >

- typedef Itas **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Itas > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Itas, L4::Kobject, L4RE_PROTO_ITAS, L4::Type_info::Demand_t< 2 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

  Helper to check for protocol conflicts.

15.291.1 Detailed Description

Interface to the ITAS.
This is an internal interface between libc and the l4re_itas. Do not use it. It is subject to change.
Definition at line 30 of file itas.

15.291.2 Member Enumeration Documentation

15.291.2.1 anonymous enum

```
anonymous enum :  unsigned
```

Enumerator

Ignore_sigaction	Ignore new action of `sigaction()` call.

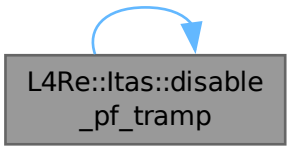
Definition at line 76 of file itas.

15.291.3 Member Function Documentation

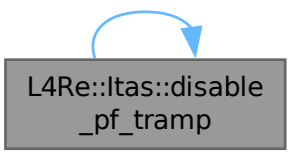
15.291.3.1 disable_pf_tramp()

```
l4_ret_t L4Re::Itas::disable_pf_tramp ()
```

Disable page fault trampolines for the whole process.
Once disabled, page faults of all threads of the process (including threads registered in the future) are reflected as page fault IPC to the pager instead of being handled by an in-thread trampoline handler. This also stops the ITAS from handing out its page_in() helper function to be called directly from within the client thread.
This operation cannot be reverted.
References disable_pf_tramp().
Referenced by disable_pf_tramp().
Here is the call graph for this function:



Here is the caller graph for this function:



15.291.3.2 getitimer()

```
l4_ret_t L4Re::Itas::getitimer (
            int which,
            struct itimerval * curr_value)
```

Get process interval timer.
See IEEE Std 1003.1-2017 getitimer() for details.

Parameters

in	*which*	Timer type (ITIMER_REAL).
out	*curr_value*	Old timer value.

References getitimer().
Referenced by getitimer().
Here is the call graph for this function:

Here is the caller graph for this function:

15.291.3.3 raise()

```
l4_ret_t L4Re::Itas::raise (
            L4::Ipc::Cap< L4::Thread > thread,
            int sig)
```

Send a signal to the calling thread.

Parameters

in	*thread*	Thread cap of the calling thread.
in	*sig*	Signal that shall be raised.

References raise().

Referenced by raise().
Here is the call graph for this function:

Here is the caller graph for this function:

15.291.3.4 register_thread()

```
l4_ret_t L4Re::Itas::register_thread (
            L4::Ipc::Cap< L4::Thread > parent,
            L4::Ipc::Cap< L4::Thread > thread_cap,
            l4_addr_t thread_utcb)
```

Register new thread.
Makes the newly created thread known to ITAS. The ITAS will do the `thread_cap->control()` to bind the thread to the task and attach the gates for pager and exception handler.

Parameters

parent	The capability of the thread that created the new thread.
thread_cap	The capability of the new thread.
thread_utcb	The address of the allocated UTCB of the new thread.

15.291.3.5 setitimer()

```
l4_ret_t L4Re::Itas::setitimer (
            int which,
            const struct itimerval * new_value,
            struct itimerval * old_value)
```

Set process interval timer.
See IEEE Std 1003.1-2017 setitimer() for details.

Parameters

in	*which*	Timer type (ITIMER_REAL).
in	*new_value*	New timer value.
out	*old_value*	Old timer value.

Referenced by sigpending().
Here is the caller graph for this function:

15.291.3.6 sigaction()

```
l4_ret_t L4Re::Itas::sigaction (
            int signum,
            const struct sigaction * act,
            struct sigaction * oldact)
```

Examine and change a POSIX signal action.
See IEEE Std 1003.1-2024 sigaction() for the behaviour of the method.
If act->sa_flags is Ignore_sigaction, the new action is ignored.

Parameters

in	*signum*	Signal number to be examined and/or modified.
in	*act*	New signal action.
out	*oldact*	Old signal action.

References sigaction(), and sigaltstack().
Referenced by sigaction().

Here is the caller graph for this function:

15.291.3.7 sigaltstack()

```
l4_ret_t L4Re::Itas::sigaltstack (
            L4::Ipc::Cap< L4::Thread > thread,
            const struct sigaltstack * ss,
            struct sigaltstack * oss)
```

Examine or set alternate POSIX signal stack.
See IEEE Std 1003.1-2024 sigaltstack() for the behaviour of the method.
If `ss->ss_flags` is -1, the new sigaltstack will be ignored.

Parameters

in	*thread*	Thread cap of the thread whose sigaltstack is examined and/or modified.
in	*ss*	The new sigaltstack.
out	*oss*	The old sigaltstack.

References sigaltstack(), and sigprocmask().
Referenced by sigaction(), and sigaltstack().

l4_ret_t L4Re::Itas::sigpending (
            L4::Ipc::Cap< L4::Thread > thread,
            sigset_t * set)
```

Query pending signals.
See IEEE Std 1003.1-2024 sigpending() for details.

Parameters

in	*thread*	Thread cap of the thread whose pending signal are examined.
out	*set*	Pending signals of thread.

References setitimer().

Referenced by sigprocmask().
Here is the call graph for this function:

Here is the caller graph for this function:

15.291.3.9 sigprocmask()

```
l4_ret_t L4Re::Itas::sigprocmask (
            L4::Ipc::Cap< L4::Thread > thread,
            int how,
            sigset_t const * set,
            sigset_t * oldset)
```

Examine or set process signal mask.
See IEEE Std 1003.1-2024 sigprocmask() for the behaviour or the method.
If `how` is -1, the signal mask is left unchanged.

Parameters

in	*thread*	Thread cap of the thread whose signal mask is examined and/or modified.
in	*how*	Operation (`SIG_BLOCK`, `SIG_UNBLOCK`, `SIG_SETMASK` or -1).
in	*set*	The new signal mask.
out	*oldset*	The old signal mask.

References sigpending().

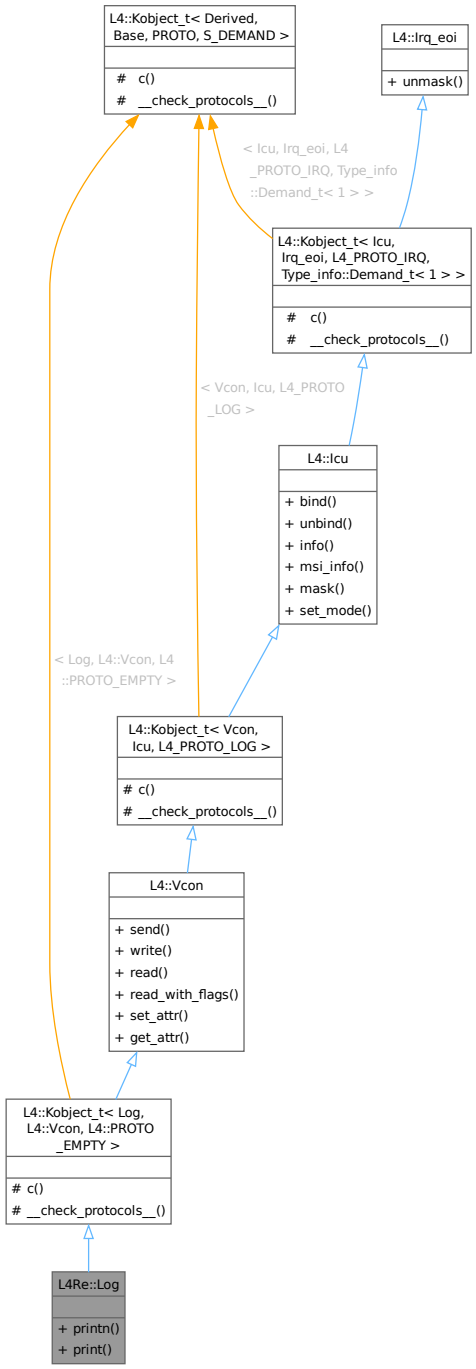
15.292 L4Re::Log Class Reference

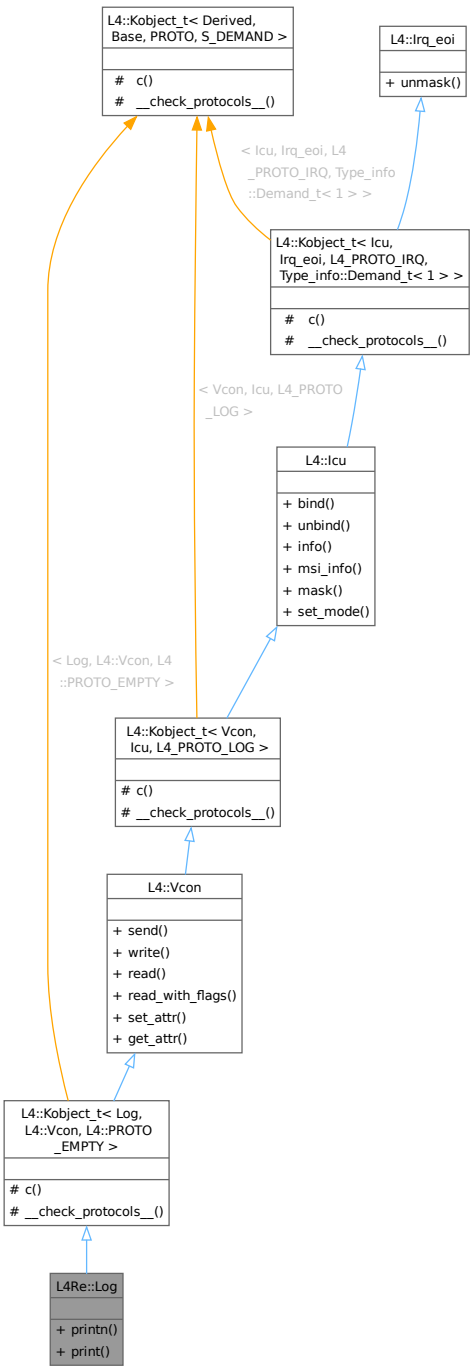
Log interface class.

`#include <log>`

Inheritance diagram for L4Re::Log:



Collaboration diagram for L4Re::Log:



Public Member Functions

- void printn (char const *string, unsigned len) const noexcept

  Print string with length len, NULL characters don't matter.
- void print (char const *string) const noexcept

  Print NULL-terminated string.

Public Member Functions inherited from L4::Vcon

- l4_msgtag_t send (char const *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept
  Send data to `this` virtual console.
- long write (char const *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept
  Write data to `this` virtual console.
- int read (char *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept
  Read data from `this` virtual console.
- int read_with_flags (char *buf, unsigned size, l4_utcb_t *utcb=l4_utcb()) const noexcept
  Read data from `this` virtual console which also returns flags.
- l4_msgtag_t set_attr (l4_vcon_attr_t const *attr, l4_utcb_t *utcb=l4_utcb()) const noexcept
  Set the attributes of `this` virtual console.
- l4_msgtag_t get_attr (l4_vcon_attr_t *attr, l4_utcb_t *utcb=l4_utcb()) const noexcept
  Get attributes of `this` virtual console.

Public Member Functions inherited from L4::Icu

- l4_msgtag_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept
  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept
  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t info (l4_icu_info_t *info, l4_utcb_t *utcb=l4_utcb()) noexcept
  Get information about the ICU features.
- l4_msgtag_t msi_info (l4_umword_t irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info)
  Get MSI info about IRQ.
- l4_msgtag_t mask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept
  Mask an IRQ line.
- l4_msgtag_t set_mode (unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb=l4_utcb()) noexcept
  Set interrupt mode.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept
  Unmask the given interrupt line.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Log, L4::Vcon, L4::PROTO_EMPTY >

- typedef Log **Class**
  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Log > **__Iface**
  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Vcon::__Iface_list > **__Iface_list**
  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Vcon, Icu, L4_PROTO_LOG >

- typedef Vcon **Class**
  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Vcon > **__Iface**
  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Icu::__Iface_list > **__Iface_list**
  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- typedef Icu **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Icu > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Irq_eoi::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Log, L4::Vcon, L4::PROTO_EMPTY >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject_t< Vcon, Icu, L4_PROTO_LOG >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Static Protected Member Functions inherited from L4::Kobject_t< Log, L4::Vcon, L4::PROTO_EMPTY >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Vcon, Icu, L4_PROTO_LOG >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.292.1 Detailed Description

Log interface class.
Definition at line 33 of file log.

15.292.2 Member Function Documentation

15.292.2.1 print()

```
void L4Re::Log::print (
            char const * string) const  [noexcept]
```

Print NULL-terminated string.

Parameters

string	string to print

15.292.2.2 printn()

```
void L4Re::Log::printn (
            char const * string,
            unsigned len) const  [noexcept]
```

Print string with length len, NULL characters don't matter.

Parameters

string	string to print
len	length of string

The documentation for this class was generated from the following file:

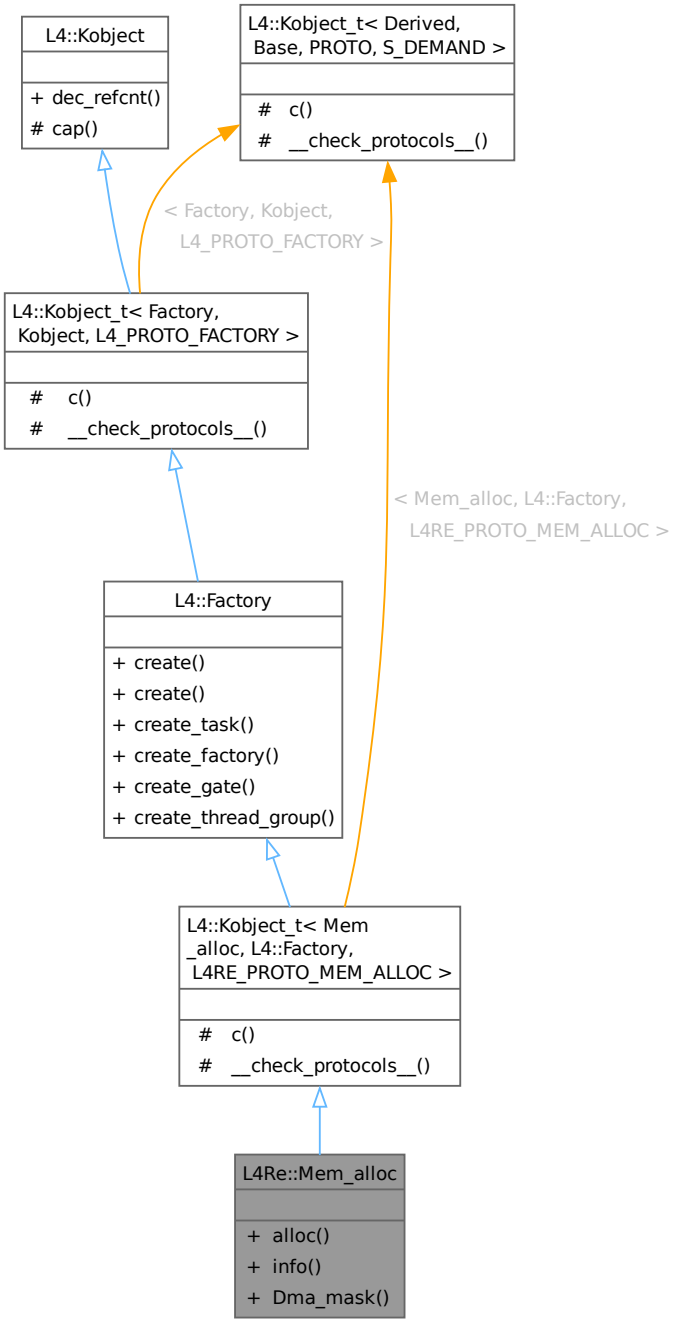
15.293 L4Re::Mem_alloc Class Reference

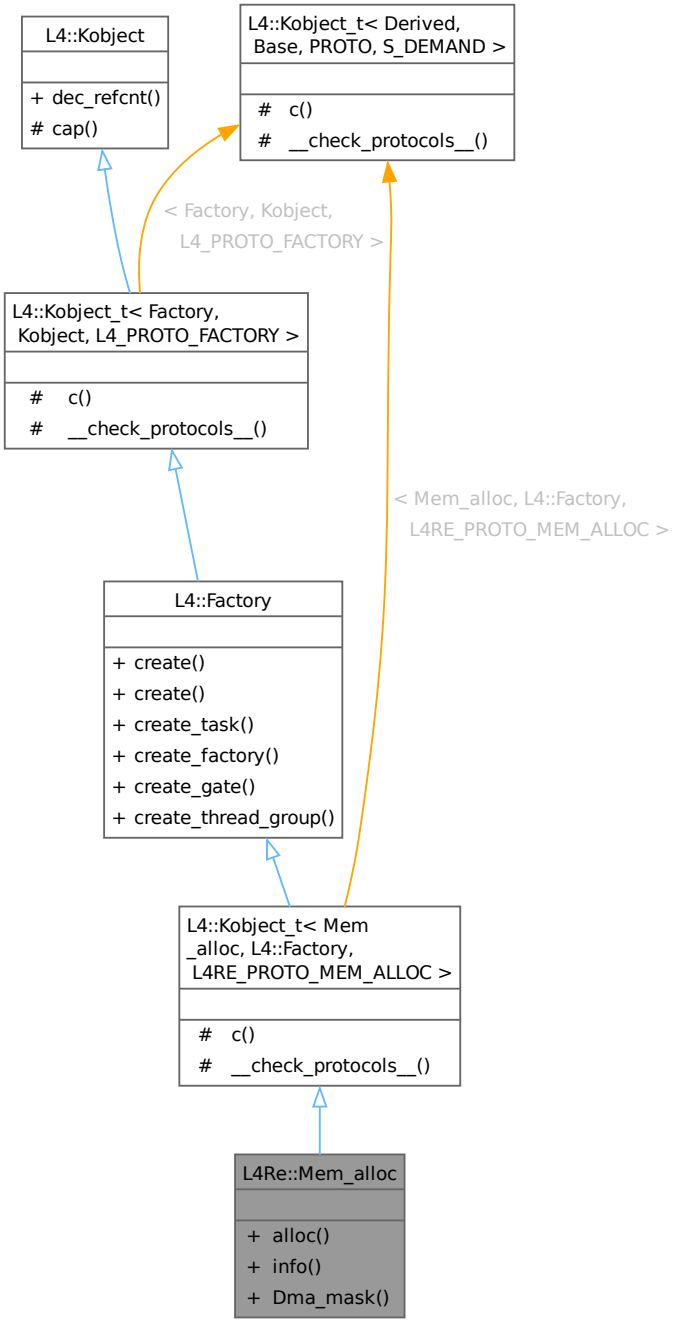
Memory allocation interface.

`#include <mem_alloc>`

Inheritance diagram for L4Re::Mem_alloc:



Collaboration diagram for L4Re::Mem_alloc:



Data Structures

- struct Stats

  Statistics about memory-allocator.

Public Types

- enum Mem_alloc_flags : unsigned long {
  Continuous = 0x01 , Pinned = 0x02 , Super_pages = 0x04 , Fixed_paddr = 0x08 ,

Dma_mask_bits = 0x3f0 , Invert_dma_mask = 0x400 }

Flags for the allocator.

Public Member Functions

- l4_ret_t alloc (long size, L4::Cap< Dataspace > mem, unsigned long flags=0, unsigned long align=0, l4_addr_t paddr=0, char const *type=nullptr) const noexcept

  Allocate anonymous memory.
- long info (Stats &stats)

  Get allocator information.

Public Member Functions inherited from L4::Factory

- S create (Cap< void > target, long obj, l4_utcb_t *utcb=l4_utcb()) noexcept

  Generic create call to the factory.
- template<typename OBJ>
  S create (Cap< OBJ > target, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create call for typed capabilities.
- l4_msgtag_t create_task (Cap< Task > const &target_cap, l4_fpage_t *utcb_area, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new task.
- l4_msgtag_t create_factory (Cap< Factory > const &target_cap, unsigned long limit, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new factory.
- l4_msgtag_t create_gate (Cap< void > const &target_cap, Cap< Snd_destination > const &snd_dst_cap, l4_umword_t label, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new IPC gate, optionally bound to a send destination (a thread or thread group).
- l4_msgtag_t create_thread_group (Cap< Thread_group > const &target_cap, unsigned policy, l4_utcb_t *utcb=l4_utcb()) noexcept

  Create a new thread group.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Static Public Member Functions

- static L4_CONSTEXPR unsigned Dma_mask (unsigned bits)

  Constrain allocations to physical addresses below given bits.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Mem_alloc, L4::Factory, L4RE_PROTO_MEM_ALLOC >

- typedef Mem_alloc **Class**

  The target interface type (inheriting from Kobject_t).

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Mem_alloc, L4::Factory, L4RE_PROTO_MEM_ALLOC >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Factory, Kobject, L4_PROTO_FACTORY >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.293.1 Detailed Description

Memory allocation interface.
The memory-allocator API is the basic API to allocate memory from the L4Re subsystem. The memory is allocated in terms of dataspaces (see L4Re::Dataspace). The provided dataspaces have at least the property that data written to such a dataspace is available as long as the dataspace is not freed or the data is not overwritten. In particular, the memory backing a dataspace from an allocator need not be allocated instantly, but may be allocated lazily on demand.
A memory allocator can provide dataspaces with additional properties, such as physically contiguous memory, pre-allocated memory, or pinned memory. To request memory with an additional property the L4Re::Mem_alloc::alloc() method provides a flags parameter. If the concrete implementation of a memory allocator does not support or allow allocation of memory with a certain property, the allocation may be refused.
Definition at line 52 of file mem_alloc.

15.293.2 Member Enumeration Documentation

15.293.2.1 Mem_alloc_flags

```
enum L4Re::Mem_alloc::Mem_alloc_flags : unsigned long
```

Flags for the allocator.

They describe requested properties of the allocated memory. Support of these properties by the dataspace provider is optional.

Enumerator

Continuous	Allocate physically contiguous memory.
Pinned	Deprecated, use L4Re::Dma_space instead.
Super_pages	Allocate super pages.
Fixed_paddr	Allocate at fixed physical address. Only honored on no-MMU systems. Will fail on MMU systems.
Dma_mask_bits	See Dma_mask().
Invert_dma_mask	Effectively says to allocate above the Dma_mask().

Definition at line 62 of file mem_alloc.

15.293.3 Member Function Documentation

15.293.3.1 alloc()

```
l4_ret_t L4Re::Mem_alloc::alloc (
            long size,
            L4::Cap< Dataspace > mem,
            unsigned long flags = 0,
            unsigned long align = 0,
            l4_addr_t paddr = 0,
            char const * type = nullptr) const  [noexcept]
```

Allocate anonymous memory.

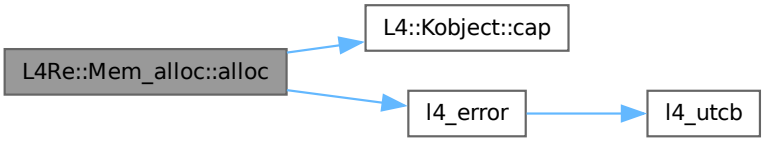
Parameters

	size	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if `size` is a negative value and `flags` set the Mem_alloc_flags::Continuous bit, the allocator tries to allocate as much memory as possible leaving an amount of at least `-size` bytes within the associated quota.
`out`	*mem*	Capability slot where the capability to the dataspace is received.
	flags	Special dataspace properties, see Mem_alloc_flags
	align	Log2 alignment of dataspace if supported by allocator, will be at least L4_PAGESHIFT, with Super_pages flag set at least L4_SUPERPAGESHIFT
	paddr	The physical address where the dataspace should be allocated if Mem_alloc_flags::Fixed flag is set.
	type	Allocate the dataspace from a typed memory with the given name. Otherwise the dataspace is allocated from untyped memory.

Return values

0	Success
-L4_EINVAL	Invalid `size`, `flags` or `align`.
-L4_ENOMEM	Not enough memory available.
-L4_EPERM	Dma_mask() passed in `flags` but factory lacks the *DMA constraints* permission.
-L4_ERANGE	Given size not supported.
<0	IPC error

Definition at line 23 of file mem_alloc_impl.h.
References L4::Kobject::cap(), Fixed_paddr, L4_EINVAL, and l4_error().
Here is the call graph for this function:



15.293.3.2 Dma_mask()

```
L4_CONSTEXPR unsigned L4Re::Mem_alloc::Dma_mask (
            unsigned bits)  [inline], [static]
```

Constrain allocations to physical addresses below given bits.
Requires the Mem_alloc_flags::Continuous flag to be set. Requires a factory that holds the *DMA constraints* permission.
Definition at line 80 of file mem_alloc.
References L4_CONSTEXPR, L4_INLINE, and L4_UNLIKELY.

15.293.3.3 info()

```
long L4Re::Mem_alloc::info (
            Stats & stats)
```

Get allocator information.

Parameters

`out`	*stats*	Allocator information

Return values

0	Success
<0	IPC error

References info(), and L4_INLINE_RPC.
Referenced by info().

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following files:

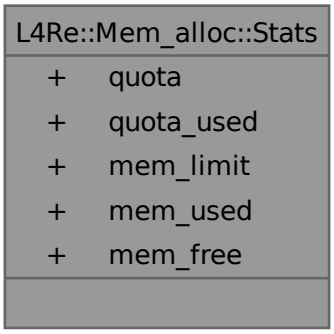
- l4/re/mem_alloc
- l4/re/impl/mem_alloc_impl.h

15.294 L4Re::Mem_alloc::Stats Struct Reference

Statistics about memory-allocator.

`#include <mem_alloc>`

Collaboration diagram for L4Re::Mem_alloc::Stats:



Data Fields

- l4_size_t quota

  Memory quota of this allocator.
- l4_size_t quota_used

  Amount of currently used quota of this allocator.
- l4_size_t mem_limit

  Maximum amount of memory that can be allocated by this allocator.
- l4_size_t mem_used

  Amount of currently allocated memory.
- l4_size_t mem_free

  Amount of memory that is still available for allocation.

15.294.1 Detailed Description

Statistics about memory-allocator.
Definition at line 95 of file mem_alloc.

15.294.2 Field Documentation

15.294.2.1 mem_free

`l4_size_t L4Re::Mem_alloc::Stats::mem_free`
Amount of memory that is still available for allocation.
This field can be lower than `mem_limit - mem_used`. In this case the system may be over-committed and there is globally not enough memory left. Also, if the quota is already used up for sub-factories (see `quota_used`), there may be not enough quota left.
Definition at line 147 of file mem_alloc.

15.294.2.2 mem_limit

`l4_size_t L4Re::Mem_alloc::Stats::mem_limit`
Maximum amount of memory that can be allocated by this allocator.
Will never exceed the `quota` but may be smaller if the system has less memory installed.
Definition at line 123 of file mem_alloc.

15.294.2.3 mem_used

`l4_size_t L4Re::Mem_alloc::Stats::mem_used`
Amount of currently allocated memory.
This field represents the amount of memory that is in use by this allocator. It recursively includes the memory used by sub-factories, if any.
Will never exceed `mem_limit` or `quota_used`.

Note

Dataspaces may allocate memory lazily! As such, the field will increase only after pages have been allocated to a dataspace.

Definition at line 137 of file mem_alloc.

15.294.2.4 quota

`l4_size_t L4Re::Mem_alloc::Stats::quota`
Memory quota of this allocator.
Strictly limits the amount of memory that can be allocated. This may be larger than there is actual physical memory available. In particular, the root factory has an artificial quota and returns -1 in this field.
Definition at line 104 of file mem_alloc.

15.294.2.5 quota_used

`l4_size_t L4Re::Mem_alloc::Stats::quota_used`

Amount of currently used quota of this allocator.

The amount of used quota is not necessarily linked to the current memory usage. See `mem_used` for this information. The quota of a factory is immediately and fully accounted to the parent factory quota.

This value may even exceed `mem_limit` if the system is over-committed.

Definition at line 115 of file mem_alloc.

The documentation for this struct was generated from the following file:

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.295.1 Detailed Description

Interface for memory-like address space accessible via IPC.
This interface defines methods for indirect access to MMIO regions.
Memory mapped IO (MMIO) is used by device drivers to control hardware devices. Access to MMIO regions is assigned to user-level device drivers via mappings of memory pages.
However, there are hardware platforms where MMIO regions for different devices share the same memory page. With respect to security and safety, it is often not allowed to map a memory page to multiple device drivers because the driver of one device could then influence operation of another device, which violates security boundaries.
A solution to that problem is to implement a third (trusted) component that gets exclusive access to the shared memory page, and that drivers can access via IPC with the Mmio_space protocol. This proxy-component can then enforce an access policy.

Include File

```
#include <l4/re/mmio_space>
```

15.295.2 Member Enumeration Documentation

15.295.2.1 Access_width

`enum L4Re::Mmio_space::Access_width`
Actual size of the value to read or write.

Enumerator

Wd_8bit	Value is a byte.
Wd_16bit	Value is a 2-byte word.
Wd_32bit	Value is a 4-byte word.
Wd_64bit	Value is a 8-byte word.

Definition at line 49 of file mmio_space.

15.295.3 Member Function Documentation

15.295.3.1 mmio_read()

```
l4_ret_t L4Re::Mmio_space::mmio_read (
             Addr addr,
             char width,
             l4_uint64_t * value)
```

Read a value from the given address.

Parameters

	addr	Device virtual address to read from. The address must be aligned relative to the access width.
	width	Access width of value to be read, see Access_width.
out	*value*	Return value. If width is smaller than 64 bit,the upper bits are guaranteed to be 0.

Return values

L4_EOK	Success.
-L4_EPERM	Insufficient read rights.
-L4_EINVAL	Address does not exist or cannot be accessed with the given width.

- l4_ret_t query (char const *name, unsigned len, L4::Cap< void > const &cap, int timeout=To_default, l4_umword_t *local_id=0, bool iterate=true) const noexcept

  Query the name space for a named object.

- l4_ret_t register_obj (char const *name, L4::Ipc::Cap< void > obj, unsigned flags=Rw) const noexcept

  Register an object with a name.

- l4_ret_t unlink (char const *name)

  Remove an entry from the name space.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Namespace, L4::Kobject, L4RE_PROTO_NAMESPACE, L4::Type_info::Demand_t< 1 > >

- typedef Namespace **Class**

  The target interface type (inheriting from Kobject_t).

- typedef Typeid::Iface< PROTO, Namespace > **__Iface**

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Namespace, L4::Kobject, L4RE_PROTO_NAMESPACE, L4::Type_info::Demand_t< 1 > >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Namespace, L4::Kobject, L4RE_PROTO_NAMESPACE, L4::Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.296.1 Detailed Description

Name-space interface.
All name space objects must provide this interface. However, it is not mandatory that a name space object allows to register new capabilities.
The name lookup is done iteratively, this means the hierarchical names are resolved component wise by the client itself.
Definition at line 49 of file namespace.

15.296.2 Member Enumeration Documentation

15.296.2.1 Query_result_flags

enum L4Re::Namespace::Query_result_flags
Flags returned by query IPC, only used internally.

Enumerator

Partly_resolved	Name was only partly resolved.

Definition at line 77 of file namespace.

15.296.2.2 Query_timeout

enum L4Re::Namespace::Query_timeout
Timeout values for query operation.

Enumerator

To_default	Default timeout.
To_non_blocking	Expect callee to answer immediately.

Definition at line 83 of file namespace.

15.296.2.3 Register_flags

enum L4Re::Namespace::Register_flags
Flags for registering name spaces.

Enumerator

Ro	Read-only.
Rw	Read-write.
Rs	Read-only + strong.
Rws	Read-write + strong.
Strong	Strong.
Trusted	Obsolete, do not use.
Link	Obsolete, do not use.
Overwrite	If entry already exists, overwrite it.

Definition at line 57 of file namespace.

15.296.3 Member Function Documentation

15.296.3.1 query() [1/2]

```
l4_ret_t L4Re::Namespace::query (
             char const * name,
             L4::Cap< void > const & cap,
             int timeout = To_default,
             l4_umword_t * local_id = 0,
             bool iterate = true) const  [noexcept]
```

Query the name space for a named object.

Parameters

in	*name*	String to query (without any leading slashes).
out	*cap*	Capability slot where the received capability will be put.
in	*timeout*	Timeout of query in milliseconds. The client will only wait if a name has already been registered with the server but no object has yet been attached.
out	*local_id*	If given, L4_RCV_ITEM_LOCAL_ID will be set for the IPC from the name space, so that if the capability that was received is a local item, the capability ID will be returned with this parameter.
in	*iterate*	If true, the client will try to resolve names by iteratively calling the name spaces until the name is fully resolved.

Return values

0	Name could be fully resolved.
>0	Name could only be partly resolved. The number of remaining characters is returned.
-L4_ENOENT	Entry could not be found.
-L4_EAGAIN	Entry exists but no object is yet attached. Try again later.
<0	IPC errors, see l4_error_code_t.

Definition at line 114 of file namespace_impl.h.

15.296.3.2 query() [2/2]

```
l4_ret_t L4Re::Namespace::query (
            char const * name,
            unsigned len,
            L4::Cap< void > const & cap,
            int timeout = To_default,
            l4_umword_t * local_id = 0,
            bool iterate = true) const  [noexcept]
```

Query the name space for a named object.
The query string does not necessarily need to be null-terminated.

Parameters

in	*len*	Length of the string to query without any terminating null characters.
in	*name*	String to query (without any leading slashes).
out	*cap*	Capability slot where the received capability will be put.
in	*timeout*	Timeout of query in milliseconds. The client will only wait if a name has already been registered with the server but no object has yet been attached.
out	*local_id*	If given, L4_RCV_ITEM_LOCAL_ID will be set for the IPC from the name space, so that if the capability that was received is a local item, the capability ID will be returned with this parameter.
in	*iterate*	If true, the client will try to resolve names by iteratively calling the name spaces until the name is fully resolved.

Return values

0	Name could be fully resolved.
>0	Name could only be partly resolved. The number of remaining characters is returned.
-L4_ENOENT	Entry could not be found.
-L4_EAGAIN	Entry exists but no object is yet attached. Try again later.

15.296.3.3 register_obj()

```
l4_ret_t L4Re::Namespace::register_obj (
            char const * name,
```

```
L4::Ipc::Cap< void > obj,
unsigned flags = Rw) const  [inline], [noexcept]
```

Register an object with a name.

Parameters

name	Name under which the object should be registered.
obj	Capability to object to register. An invalid capability may be given to only reserve the name for later use.
flags	Flags to assign to the entry, see L4Re::Namespace::Register_flags. Note that the rights that are assigned to a capability are not only determined by the rights given in these flags but also by the rights with which the `obj` capability was mapped to the name space.

Return values

0	Object was successfully registered with *name*.
-L4_EEXIST	Name already registered.
-L4_EPERM	Insufficient permissions; see precondition.
-L4_ENOMEM	Server has insufficient resources.
-L4_EINVAL	Invalid parameter.
<0	IPC errors, see l4_error_code_t.

Precondition

The invoked Namespace capability must have the permission L4_CAP_FPAGE_W.

Definition at line 167 of file namespace.

15.296.3.4 unlink()

```
l4_ret_t L4Re::Namespace::unlink (
            char const * name)  [inline]
```

Remove an entry from the name space.

Parameters

name	Name of the entry to remove.

Return values

0	Entry successfully removed.
-L4_ENOENT	Given name does not exist.
-L4_EPERM	Insufficient permissions; see precondition.
-L4_EACCESS	Name cannot be removed.
<0	IPC errors, see l4_error_code_t.

Precondition

The invoked Namespace capability must have the permission L4_CAP_FPAGE_W.

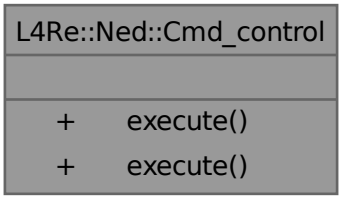
15.297 L4Re::Ned::Cmd_control Class Reference

Direct control interface for Ned.
`#include <cmd_control>`
Collaboration diagram for L4Re::Ned::Cmd_control:



Public Member Functions

- long execute (L4::Ipc::String<> cmd) noexcept

  Execute the given Lua code.
- long execute (L4::Ipc::String<> cmd, L4::Ipc::String< char > *result) noexcept

  Execute the given Lua code.

15.297.1 Detailed Description

Direct control interface for Ned.
Definition at line 19 of file cmd_control.

15.297.2 Member Function Documentation

15.297.2.1 execute() [1/2]

```
long L4Re::Ned::Cmd_control::execute (
            L4::Ipc::String<> cmd)  [inline], [noexcept]
```

Execute the given Lua code.

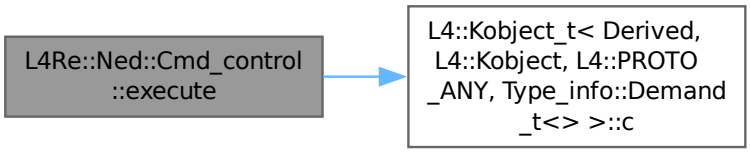
Parameters

in	*cmd*	String with Lua code to execute.

Return values

L4_EOK	Code was successfully executed.
-L4_EINVAL	Code could not be parsed.
-L4_EIO	Error during code execution.

The code is executed using the global Lua state of ned which is retained between successive calls to execute. Thus you may define data in one call to execute and use it in a subsequent call.
This function does not return any results from the execution of the Lua code itself.
Definition at line 42 of file cmd_control.
References L4::Kobject_t< Derived, L4::Kobject, L4::PROTO_ANY, Type_info::Demand_t<> >::c().
Here is the call graph for this function:



15.297.2.2 execute() [2/2]

```
long L4Re::Ned::Cmd_control::execute (
            L4::Ipc::String<> cmd,
            L4::Ipc::String< char > * result)  [inline], [noexcept]
```

Execute the given Lua code.

Parameters

in	*cmd*	String with Lua code to execute.
out	*result*	The first return value of the Lua code block as string.

Return values

L4_EOK	Code was successfully executed.
-L4_EINVAL	Code could not be parsed.
-L4_EIO	Error during code execution.

The code is executed using the global Lua state of ned which is retained between successive calls to execute. Thus

you may define data in one call to execute and use it in a subsequent call.
Definition at line 64 of file cmd_control.

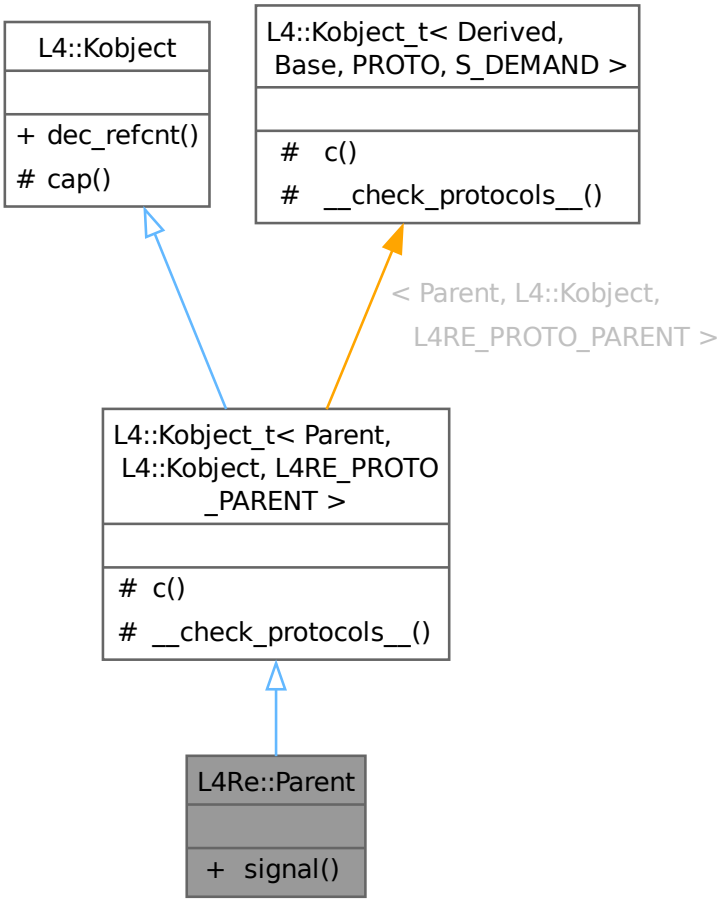
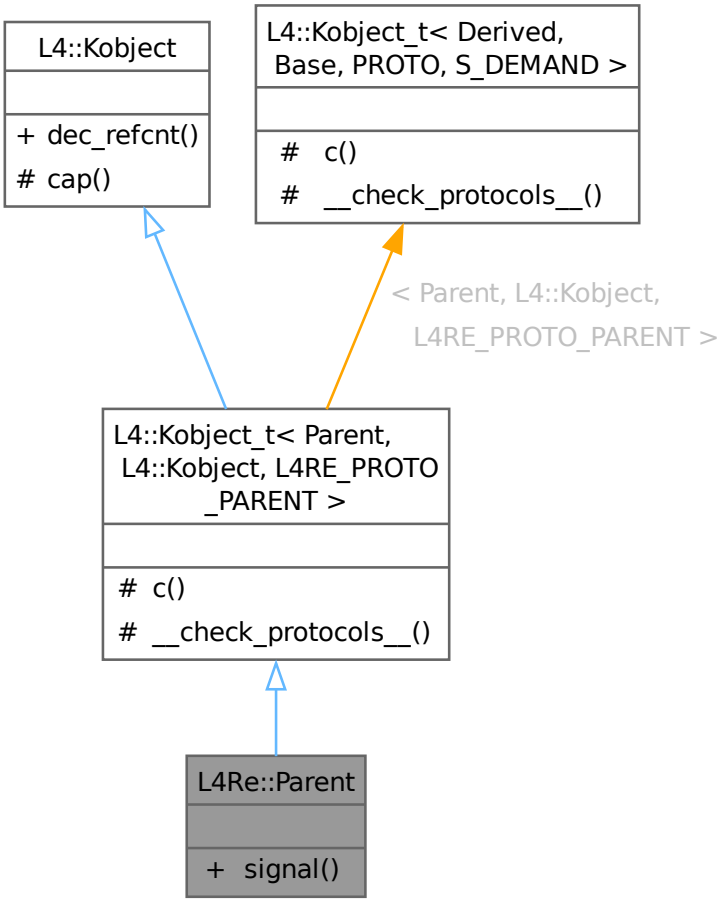
15.298 L4Re::Parent Class Reference

Parent interface.
`#include <parent>`

Inheritance diagram for L4Re::Parent:



Collaboration diagram for L4Re::Parent:



Public Member Functions

- l4_ret_t signal (unsigned long sig, unsigned long val)

  Send a signal to the parent.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Parent, L4::Kobject, L4RE_PROTO_PARENT >

- typedef Parent **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Parent > **__Iface**

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Parent, L4::Kobject, L4RE_PROTO_PARENT >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Parent, L4::Kobject, L4RE_PROTO_PARENT >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.298.1 Detailed Description

Parent interface.

See also

Parent API for more details about the purpose.

Definition at line 42 of file parent.

15.298.2 Member Function Documentation

15.298.2.1 signal()

```
l4_ret_t L4Re::Parent::signal (
             unsigned long sig,
             unsigned long val)
```

Send a signal to the parent.

Parameters

sig	Signal to send
val	Value of the signal

Return values

0	Success
<0	IPC error

Note

The implementations of this interface in Moe and Ned only recognize the signal 0, in which case they will terminate the application from which the interface was invoked and not return. In this case, `val` is treated as the application's return code. For any other value of `sig`, the method just returns successfully.

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.299.1 Detailed Description

Low-bandwidth interface for random number generators.
The interface offers an ICU interface where a client can register an interrupt to get notified when entropy is available. Support for notifications is optional. If a service does not implement notification, it must return 0 for the number of interrupts in the info() call. The notification interrupt must have index 0.

Include File

```
#include <l4/re/random>
```

Definition at line 33 of file random.

15.299.2 Member Function Documentation

15.299.2.1 get_random()

```
long L4Re::Random::get_random (
            l4_size_t size,
            L4::Ipc::Array< char, unsigned long > * buffer)
```

Get a random number.

Parameters

	size	Number of bytes of entropy requested.
out	*buffer*	Buffer containing the random number. Each byte in the buffer contains 8 bits of randomness.

Return values

>=0	Actual size of the returned random number in bytes. This may be less than the requested size. The return value may also be 0 if temporarily no entropy is available.
-L4_EIO	Source of randomness permanently unavailable.
<0	IPC error.

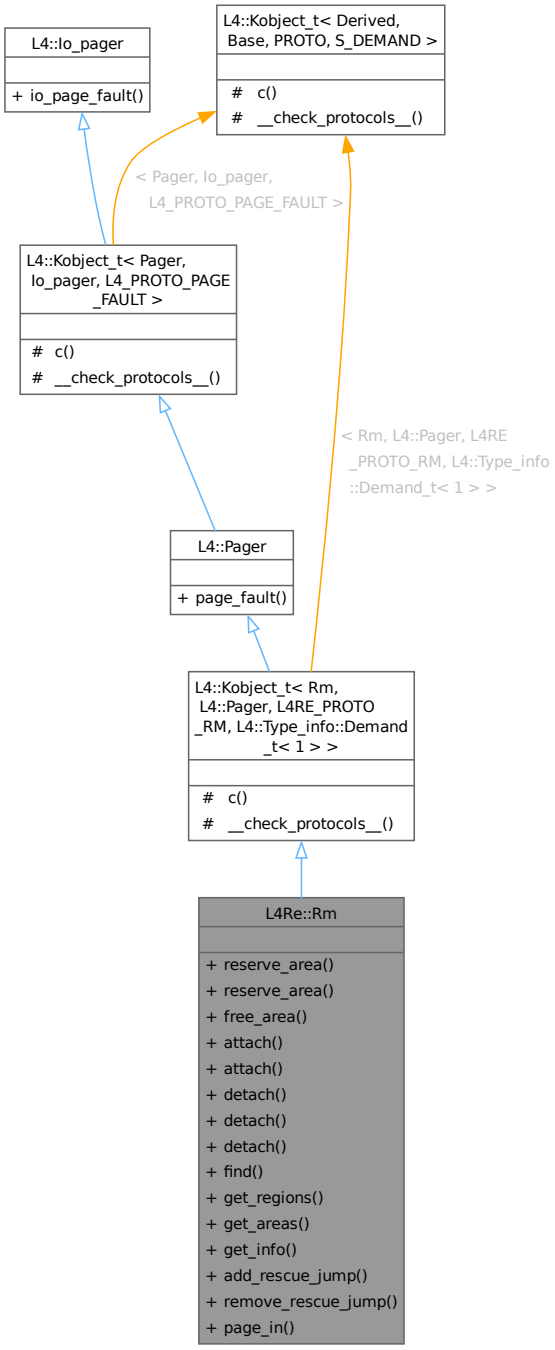
This function should never block. It should immediately return as much entropy as is available. If the call returns less than the requested bytes and a notification interrupt was installed, then the service triggers an interrupt as soon as the remaining entropy is available. That means that when an interrupt is triggered, the service must guarantee that the next call to get_random() returns at least the number of missing bytes for the call that initially triggered the notification.
If get_random() is called while a notification is pending, then the behaviour is implementation-defined.
The documentation for this struct was generated from the following file:

- l4/re/random

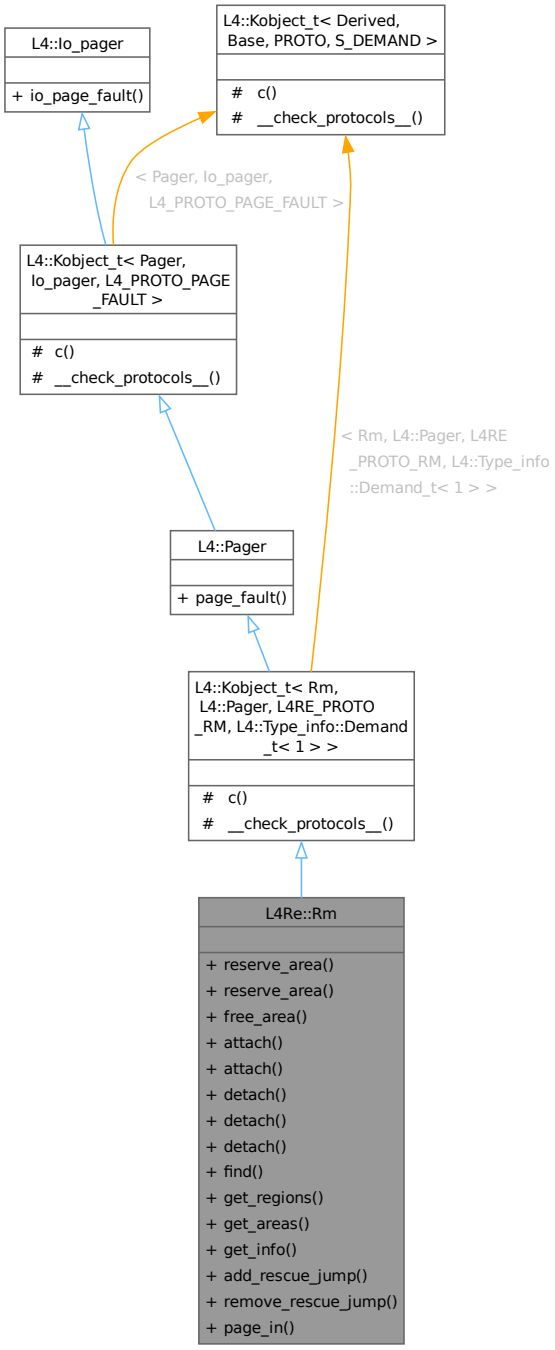
15.300 L4Re::Rm Class Reference

Region map.
`#include <l4/re/rm>`

Inheritance diagram for L4Re::Rm:



Collaboration diagram for L4Re::Rm:



Data Structures

- struct F

  Rm flags definitions.
- class Unique_region

  Unique region.
- struct Region

  A region is a range of virtual addresses which is backed by content.

- struct Area

  An area is a range of virtual addresses which is reserved, see L4Re::Rm::reserve_area().

Public Types

- enum Detach_result {
  Detached_ds = 0 , Kept_ds = 1 , Split_ds = 2 , **Detach_result_mask** = 3 ,
  Detach_again = 4 , Unmapped_range = 8 }

  Result values for detach operation.
- enum Region_flag_shifts { Caching_shift = Dataspace::F::Caching_shift }

  Region flag shifts.
- enum Detach_flags { Detach_exact = 1 , Detach_overlap = 2 }

  Flags for detach operation.
- typedef l4_ret_t(* **page_in_fn**) (l4_addr_t min_addr, l4_addr_t max_addr, Region_flags rights)

  In-thread eager paging function.
- typedef L4::Typeid::Rpcs< attach_t, detach_t, find_t, reserve_area_t, free_area_t, get_regions_t, get_areas_t, get_info_t, add_rescue_jump_t, remove_rescue_jump_t, page_in_t > **Rpcs**

  Eager paging RPC call.

Public Member Functions

- l4_ret_t reserve_area (l4_addr_t *start, unsigned long size, Flags flags=Flags(0), unsigned char align=L4_PAGESHIFT) const noexcept

  Reserve the given area in the region map.
- template<typename T>
  l4_ret_t reserve_area (T **start, unsigned long size, Flags flags=Flags(0), unsigned char align=L4_PAGESHIFT) const noexcept

  Reserve the given area in the region map.
- l4_ret_t free_area (l4_addr_t addr)

  Free an area from the region map.
- l4_ret_t attach (l4_addr_t *start, unsigned long size, Flags flags, L4::Ipc::Cap< Dataspace > mem, Offset offs=0, unsigned char align=L4_PAGESHIFT, L4::Cap< L4::Task > const task=L4::Cap< L4::Task >::Invalid, char const *name=nullptr, Offset backing_offset=0) const noexcept

  Attach a data space to a region.
- template<typename T>
  l4_ret_t attach (T **start, unsigned long size, Flags flags, L4::Ipc::Cap< Dataspace > mem, Offset offs=0, unsigned char align=L4_PAGESHIFT, L4::Cap< L4::Task > const task=L4::Cap< L4::Task >::Invalid, char const *name=nullptr, Offset backing_offset=0) const noexcept

  Attach a data space to a region.
- l4_ret_t detach (l4_addr_t addr, L4::Cap< Dataspace > *mem, L4::Cap< L4::Task > const &task=This_task) const noexcept

  Detach and unmap a region from the address space.
- l4_ret_t detach (void *addr, L4::Cap< Dataspace > *mem, L4::Cap< L4::Task > const &task=This_task) const noexcept

  Detach and unmap a region from the address space.
- l4_ret_t detach (l4_addr_t start, unsigned long size, L4::Cap< Dataspace > *mem, L4::Cap< L4::Task > const &task=This_task) const noexcept

  Detach and unmap all parts of the regions within the specified interval.
- l4_ret_t find (l4_addr_t *addr, unsigned long *size, Offset *offset, L4Re::Rm::Flags *flags, L4::Cap< Dataspace > *m) noexcept

  Find a region given an address and size.
- l4_ret_t get_regions (l4_addr_t start, L4::Ipc::Array_ref< Region > &regions)

  Return the list of regions whose starting addresses are higher or equal to `start` in the address space managed by this region map.

- long get_areas (l4_addr_t start, L4::Ipc::Array_ref< Area > &areas)

  Return the list of areas whose starting addresses are higher or equal to `start` in the address space managed by this region map.
- l4_ret_t get_info (l4_addr_t addr, L4::Ipc::String< char > &name, Offset &backing_offset)

  Return auxiliary information of a region.
- l4_ret_t add_rescue_jump (l4_addr_t pc_begin, l4_addr_t pc_end, l4_addr_t rescue_pc)

  Register a rescue jump for a range of program counters.
- l4_ret_t remove_rescue_jump (l4_addr_t pc)

  Remove a previously registered rescue jump.
- l4_ret_t page_in (l4_addr_t start, unsigned long size, Region_flags rights, L4::Cap< L4::Task > dst=L4::Cap< L4::Task >::Invalid) const noexcept

  Allocate and map pages for the given region.

Public Member Functions inherited from L4::Pager

- l4_msgtag_t page_fault (l4_umword_t pfa, l4_umword_t pc, L4::Ipc::Rcv_fpage rwin, L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)

  Page-fault protocol message.

Public Member Functions inherited from L4::Io_pager

- l4_msgtag_t io_page_fault (l4_fpage_t io_pfa, l4_umword_t pc, L4::Ipc::Rcv_fpage rwin, L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)

  IO page fault protocol message.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Rm, L4::Pager, L4RE_PROTO_RM, L4::Type_info::Demand_t< 1 > >

Region map.

See also

Region map API .

Definition at line 81 of file rm.

15.300.2 Member Enumeration Documentation

15.300.2.1 Detach_flags

`enum L4Re::Rm::Detach_flags`
Flags for detach operation.

Enumerator

Detach_exact	Do an unmap of the exact region given.
Detach_overlap	Do an unmap of all overlapping regions.

Definition at line 223 of file rm.

15.300.2.2 Detach_result

`enum L4Re::Rm::Detach_result`
Result values for detach operation.

Enumerator

Detached_ds	Detached data space.
Kept_ds	Kept data space.
Split_ds	Split data space, and done.
Detach_again	Detached data space, more to do.
Unmapped_range	The region mananager has already unmapped the pages.

Definition at line 89 of file rm.

15.300.2.3 Region_flag_shifts

enum L4Re::Rm::Region_flag_shifts
Region flag shifts.

Enumerator

Caching_shift	Start of Rm cache bits.

Definition at line 102 of file rm.

15.300.3 Member Function Documentation

15.300.3.1 add_rescue_jump()

```
l4_ret_t L4Re::Rm::add_rescue_jump (
             l4_addr_t pc_begin,
             l4_addr_t pc_end,
             l4_addr_t rescue_pc)
```

Register a rescue jump for a range of program counters.
If a synchronous exception (e.g. a SIGSEGV with SEGV_MAPERR) is raised by an instruction whose program counter lies in the half-open range `[pc_begin, pc_end)`, execution is diverted to `rescue_pc` instead of delivering the signal to the application.
The registered rescue jumps must not overlap.

Parameters

pc_begin	Inclusive start of the instruction range.
pc_end	Exclusive end of the instruction range.
rescue_pc	Program counter to jump to on a fault in the range.

Return values

0	Success
-L4_EINVAL	Invalid arguments (e.g. `pc_begin >= pc_end`).
-L4_EEXIST	The given range overlaps with an already registered rescue jump.
-L4_ENOMEM	Out of memory.
<0	IPC errors

Referenced by get_info().

15.300.3.2 attach() [1/2]

```
l4_ret_t L4Re::Rm::attach (
            l4_addr_t * start,
            unsigned long size,
            Rm::Flags flags,
            L4::Ipc::Cap< Dataspace > mem,
            Rm::Offset offs = 0,
            unsigned char align = L4_PAGESHIFT,
            L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
            char const * name = nullptr,
            Rm::Offset backing_offset = 0) const  [noexcept]
```

Attach a data space to a region.

Parameters

in,out	*start*	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If L4Re::Rm::F::Search_addr is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If L4Re::Rm::F::In_area is given the value is used as a selector for the area (see L4Re::Rm::reserve_area) to attach the data space to.
	size	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	flags	The flags control how and with which rights the dataspace is attached to the region. See L4Re::Rm::F::Attach_flags and L4Re::Rm::F::Region_flags. The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty.
	mem	Data space.
	offs	Offset into the data space to use.
	align	Alignment of the virtual region, log2-size, default: a page (L4_PAGESHIFT). This is only meaningful if the L4Re::Rm::F::Search_addr flag is used.
	task	Optional destination task of mapping if `F::Eager_map` flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	name	Optional name of the region.
	backing_offset	Optional value describing an offset into the backing store of this region.

Return values

0	Success
-L4_ENOENT	No area could be found (see L4Re::Rm::F::In_area)
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see L4Re::Rm::find).

15.300.3.3 attach() [2/2]

```
template<typename T>
l4_ret_t L4Re::Rm::attach (
             T ** start,
             unsigned long size,
             Flags flags,
             L4::Ipc::Cap< Dataspace > mem,
             Offset offs = 0,
             unsigned char align = L4_PAGESHIFT,
             L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
             char const * name = nullptr,
             Offset backing_offset = 0) const  [inline], [noexcept]
```

Attach a data space to a region.

Parameters

in,out	*start*	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If L4Re::Rm::F::Search_addr is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If L4Re::Rm::F::In_area is given the value is used as a selector for the area (see L4Re::Rm::reserve_area) to attach the data space to.
	size	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	flags	The flags control how and with which rights the dataspace is attached to the region. See L4Re::Rm::F::Attach_flags and L4Re::Rm::F::Region_flags. The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty.
	mem	Data space.
	offs	Offset into the data space to use.
	align	Alignment of the virtual region, log2-size, default: a page (L4_PAGESHIFT). This is only meaningful if the L4Re::Rm::F::Search_addr flag is used.
	task	Optional destination task of mapping if `F::Eager_map` flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	name	Optional name of the region.
	backing_offset	Optional value describing an offset into the backing store of this region.

Return values

0	Success
-L4_ENOENT	No area could be found (see L4Re::Rm::F::In_area)
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see L4Re::Rm::find).

15.300.3.4 detach() [1/3]

```
l4_ret_t L4Re::Rm::detach (
            l4_addr_t addr,
            L4::Cap< Dataspace > * mem,
            L4::Cap< L4::Task > const & task = This_task) const  [inline], [noexcept]
```

Detach and unmap a region from the address space.

Parameters

	addr	Virtual address of region, any address within the region is valid.
out	*mem*	Dataspace that is affected. Give 0 if not interested.
	task	This argument specifies the task where the pages are unmapped. Provide L4::Cap<L4::Task>::Invalid for none. The default is the current task.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees a region in the virtual address space given by addr (address type). The corresponding part of the address space is now available again.
Definition at line 895 of file rm.
References detach(), and Detach_overlap.
Referenced by detach(), detach(), detach(), free_area(), and remove_rescue_jump().

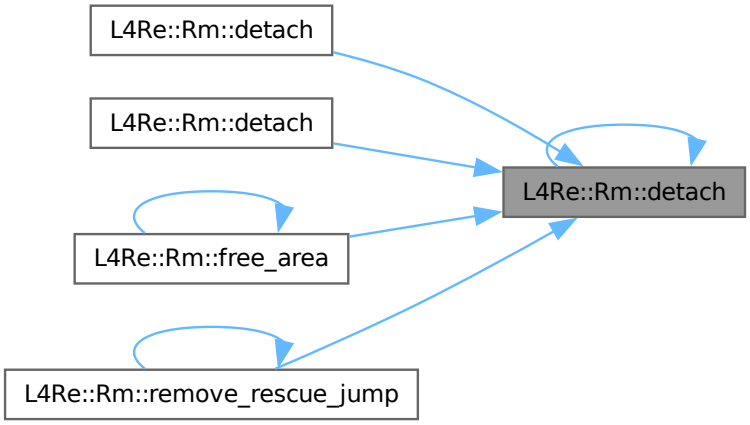
Here is the caller graph for this function:



15.300.3.5 detach() [2/3]

```
l4_ret_t L4Re::Rm::detach (
            l4_addr_t start,
            unsigned long size,
            L4::Cap< Dataspace > * mem,
            L4::Cap< L4::Task > const & task = This_task) const  [inline], [noexcept]
```

Detach and unmap all parts of the regions within the specified interval.

Parameters

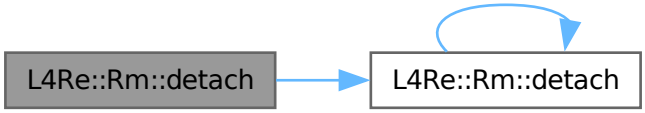
	start	Start of area to detach, must be within region.
	size	Size of of area to detach (in bytes).
out	*mem*	Dataspace that is affected. Give 0 if not interested.
	task	This argument specifies the task where the pages are unmapped. Provide L4::Cap<L4::Task>::Invalid for none. The default is the current task.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees all regions within the interval given by start and size. If a region overlaps the start or the end of the interval this region is only detached partly. If the interval is within one region the original region is split up into two separate regions.
Definition at line 908 of file rm.
References detach(), and Detach_exact.

Here is the call graph for this function:



15.300.3.6 detach() [3/3]

```
l4_ret_t L4Re::Rm::detach (
            void * addr,
            L4::Cap< Dataspace > * mem,
            L4::Cap< L4::Task > const & task = This_task) const  [inline], [noexcept]
```

Detach and unmap a region from the address space.

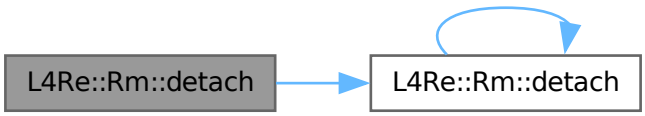
Parameters

	addr	Virtual address of region, any address within the region is valid.
out	*mem*	Dataspace that is affected. Give 0 if not interested.
	task	This argument specifies the task where the pages are unmapped. Provide L4::Cap<L4::Task>::Invalid for none. The default is the current task.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees a region in the virtual address space given by addr (address type). The corresponding part of the address space is now available again.
Definition at line 900 of file rm.
References detach(), and Detach_overlap.
Here is the call graph for this function:



15.300.3.7 find()

```
l4_ret_t L4Re::Rm::find (
            l4_addr_t * addr,
            unsigned long * size,
            Offset * offset,
            L4Re::Rm::Flags * flags,
            L4::Cap< Dataspace > * m)  [inline], [noexcept]
```

Find a region given an address and size.

Parameters

in,out	*addr*	Address to look for. Returns the start address of the found region.
in,out	*size*	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	*offset*	Offset at the beginning of the region within the associated dataspace.
out	*flags*	Region flags, see F::Region_flags (and F::In_area).
out	*m*	Associated dataspace or paging service. May be an invalid capability, see below.

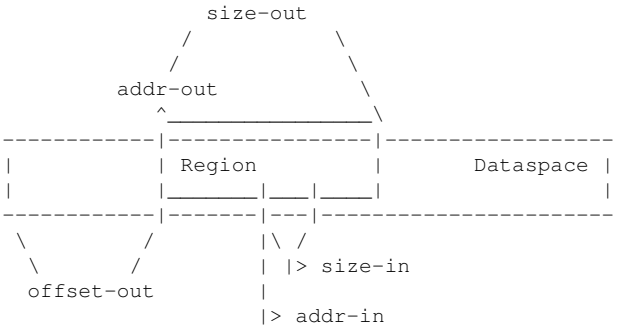
Return values

0	Success
-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the addr and size parameter. If no such region is found but a reserved area, the area is returned and F::In_area is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

Note

`m` is the dataspace that was passed when the region was attached. It is L4_INVALID_CAP whenever the region has no such dataspace, which is the case for regions attached with F::Anonymous because the memory is provided by the region manager itself. Additionally, the capability slot may have been reused by the application in the meantime. Thus, callers must be careful when using `m` of regions that have been created or manipulated by other code.



Note

The value of the size input parameter should be 1 to assure that a region can be determined unambiguously.

Definition at line 680 of file rm.

15.300.3.8 free_area()

```
l4_ret_t L4Re::Rm::free_area (
            l4_addr_t addr)
```

Free an area from the region map.

Parameters

addr	An address within the area to free.

Return values

0	Success
-L4_ENOENT	No area found.
<0	IPC errors

Note

The data spaces that are attached to that area are not detached by this operation.

See also

reserve_area() for more information about areas.

long L4Re::Rm::get_areas (
            l4_addr_t start,
            L4::Ipc::Array_ref< Area > & areas)
```

Return the list of areas whose starting addresses are higher or equal to `start` in the address space managed by this region map.

Parameters

	start	Virtual address from where to start searching.
out	*areas*	List of areas found in this region map.

Return values

>=0	Number of returned areas in the `areas` array.
<0	IPC errors

Note

The returned list of areas might not be complete and the caller shall use the function repeatedly with a start address one larger than the end address of the last area from the previous call.

15.300.3.12 page_in()

```
l4_ret_t L4Re::Rm::page_in (
            l4_addr_t start,
            unsigned long size,
            Rm::Region_flags rights,
            L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid) const  [noexcept]
```

Allocate and map pages for the given region.
Establish mappings of all pages in a region so that no page faults should happen after the call returned. Note that dataspace providers may unmap pages at their own discretion. This call is therefore no guarantee that page faults cannot happen.
The whole range must be backed by attached regions. It is not possible to request more rights than with what the region was attached in the first place.

Parameters

start	Start address.
size	Size of region.
rights	Requested mapping attributes (any combination of F::R, F::W and F::X).
dst	Optional destination task of mapping. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.

Return values

0	Success
-L4_EACCESS	More rights requested than attached region.
-L4_ENOENT	At least some part of the range was not covered by a region.
-L4_ENODEV	Region was not backed by a dataspace.
<0	IPC errors and other errors from dataspace provider (see L4Re::Dataspace::map).

15.300.3.14 reserve_area() [1/2]

```
l4_ret_t L4Re::Rm::reserve_area (
            l4_addr_t * start,
            unsigned long size,
            Flags flags = Flags(0),
            unsigned char align = L4_PAGESHIFT) const  [inline], [noexcept]
```

Reserve the given area in the region map.

Parameters

in,out	*start*	The virtual start address of the area to reserve. Returns the start address of the area.
	size	The size of the area to reserve (in bytes).
	flags	Flags for the reserved area (see F::Search_addr, F::Kernel and F::Reserved).
	align	Alignment of area if searched as bits (log2 value).

Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
-L4_EINVAL	Invalid parameters
<0	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (*flags* = L4Re::Rm::F::Reserved), where no data spaces can be attached

- Special purpose areas (*flags* = 0), where data spaces can be attached to the area via the L4Re::Rm::F::In_area flag and a start address within the area itself.

Note

When searching for a free place in the virtual address space (with *flags* = L4Re::Rm::F::Search_addr), the space between *start* and the end of the virtual address space is searched.

Definition at line 275 of file rm.

            Flags flags = Flags(0),
            unsigned char align = L4_PAGESHIFT) const  [inline], [noexcept]
```

Reserve the given area in the region map.

Parameters

in,out	*start*	The virtual start address of the area to reserve. Returns the start address of the area.
	size	The size of the area to reserve (in bytes).
	flags	Flags for the reserved area (see F::Search_addr, F::Kernel and F::Reserved).
	align	Alignment of area if searched as bits (log2 value).

Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
-L4_EINVAL	Invalid parameters
<0	IPC errors

15.302.2 Member Enumeration Documentation

15.302.2.1 Attach_flags

`enum L4Re::Rm::F::Attach_flags : l4_uint32_t`
Flags for attach operation.

Enumerator

Search_addr	Search for a suitable address range.
In_area	Search only in area, or map into area.
Eager_map	Eagerly map the attached data space in.
No_eager_map	Prevent eager mapping of the attached data space.
Attach_mask	Mask of all attach flags.

Definition at line 112 of file rm.

15.302.2.2 Region_flags

`enum L4Re::Rm::F::Region_flags : l4_uint16_t`
Region flags (permissions, cacheability, special).

Enumerator

Rights_mask	Region rights.
R	Readable region.
W	Writable region.
X	Executable region.
RW	Readable and writable region.
RX	Readable and executable region.
RWX	Readable, writable and executable region.
Kernel	Kernel-provided memory (KUMEM).
Pager	Region has a pager. Page faults in this region are not handled by ITAS but rather forwarded to the external region manager / pager.
Reserved	Region is reserved (blocked).
Private	Attach the dataspace privately with copy-on-write semantics. That is, updates to the mapping are not visible in the underlying dataspace.
Anonymous	Attach anonymous memory in the region. The caller must not pass a dataspace. Instead, the region manager provides anonymous memory for the region.
Caching_mask	Mask of all Rm cache bits.
Cache_normal	Cache bits for normal cacheable memory. This is the default if no other cache-related flag was specified.
Cache_buffered	Cache bits for buffered (write combining) memory.
Cache_uncached	Cache bits for uncached memory.
Ds_map_mask	Mask for all bits for cache options and rights.
Region_flags_mask	Mask of all region flags.

  Make the `Unique_region` invalid.
- bool is_valid () const noexcept

Check if the Unique_region is valid.

- T **operator∗** () const noexcept

  Dereference the address.

- T **operator->** () const noexcept

  Member access for the address.

15.304.1 Detailed Description

template<typename T>
class L4Re::Rm::Unique_region< T >

Unique region.
Capture a single region with automatic detach on destruction and unique ownership. Stores the start address and the region-mapper capability internally. A unique region is valid precisely if the internal region-mapper capability is valid. The features for unique ownership and automatic detach are only active for valid unique regions.
Definition at line 431 of file rm.

15.304.2 Constructor & Destructor Documentation

15.304.2.1 Unique_region() [1/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
            T addr)  [inline], [explicit], [noexcept]
```

Construct a Unique_region from an address.
No region manager is set.

Parameters

addr	The new address

Definition at line 452 of file rm.

15.304.2.2 Unique_region() [2/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
            T addr,
            L4::Cap< Rm > const & rm)  [inline], [noexcept]
```

Construct a valid Unique_region from an address and a region manager.

Parameters

addr	The address
rm	The region manager

Definition at line 461 of file rm.

15.304.2.3 Unique_region() [3/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
            Unique_region< T > && o)  [inline], [noexcept]
```

Move-Construct a Unique_region.

Parameters

o	L-value reference to other region.

Definition at line 469 of file rm.

15.304.2.4 ~Unique_region()

```
template<typename T>
L4Re::Rm::Unique_region< T >::~Unique_region ()  [inline], [noexcept]
```

Destructor.
If the region is valid, call `detach`.
Definition at line 494 of file rm.

15.304.3 Member Function Documentation

15.304.3.1 get()

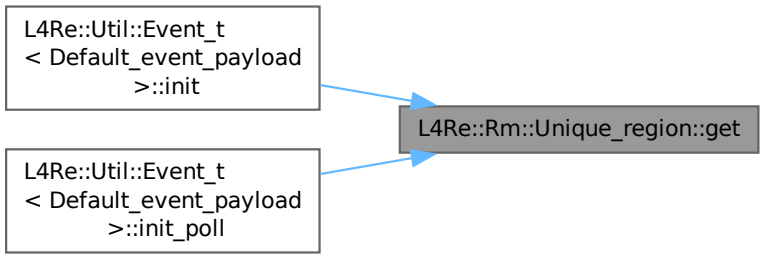
```
template<typename T>
T L4Re::Rm::Unique_region< T >::get () const  [inline], [noexcept]
```

Return the address.

Returns

the address

Definition at line 505 of file rm.
Referenced by L4Re::Util::Event_t< Default_event_payload >::init(), and L4Re::Util::Event_t< Default_event_payload >::init_poll().
Here is the caller graph for this function:



15.304.3.2 is_valid()

```
template<typename T>
bool L4Re::Rm::Unique_region< T >::is_valid () const  [inline], [noexcept]
```

Check if the `Unique_region` is valid.

Returns

true iff the `Unique_region` is valid

Definition at line 545 of file rm.

15.304.3.3 operator=()

```
template<typename T>
Unique_region & L4Re::Rm::Unique_region< T >::operator= (
            Unique_region< T > && o)  [inline], [noexcept]
```

Move-assign a Unique_region.

Parameters

o	L-value reference to region to assign from

Definition at line 477 of file rm.

15.304.3.4 release()

```
template<typename T>
T L4Re::Rm::Unique_region< T >::release ()  [inline], [noexcept]
```

Return the address and invalidate the Unique_region.

Returns

the address

Definition at line 513 of file rm.

15.304.3.5 reset()

```
template<typename T>
void L4Re::Rm::Unique_region< T >::reset (
            T addr,
            L4::Cap< Rm > const & rm)  [inline], [noexcept]
```

Set new address and region manager.

Parameters

addr	The new address
rm	The new region manager

Definition at line 525 of file rm.

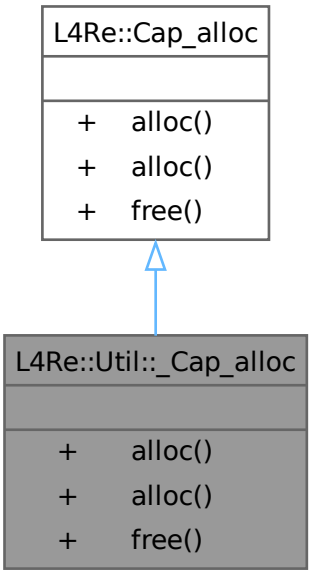
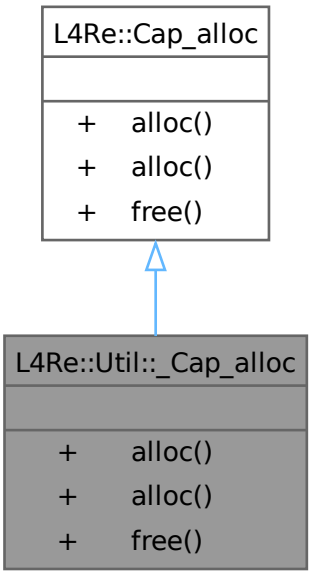
15.307 L4Re::Util::_Cap_alloc Class Reference

Adapter to expose the cap allocator implementation as L4Re::Cap_alloc compatible class.
`#include <cap_alloc_impl.h>`
Inheritance diagram for L4Re::Util::_Cap_alloc:



Collaboration diagram for L4Re::Util::_Cap_alloc:



Public Member Functions

- L4::Cap< void > alloc () noexcept override
  Allocate a capability.
- template<typename T>
  L4::Cap< T > alloc () noexcept
  Allocate a capability.
- void free (L4::Cap< void > cap, l4_cap_idx_t task=L4_BASE_TASK_CAP, unsigned unmap_↩ flags=L4_FP_ALL_SPACES) noexcept override
  Free a capability.

Public Member Functions inherited from L4Re::Cap_alloc

- template<typename T>
  L4::Cap< T > alloc () noexcept
  Allocate a capability.

15.307.1 Detailed Description

Adapter to expose the cap allocator implementation as L4Re::Cap_alloc compatible class.
Not intended to be used in application code.
Definition at line 66 of file cap_alloc_impl.h.

15.307.2 Member Function Documentation

15.307.2.1 alloc() [1/2]

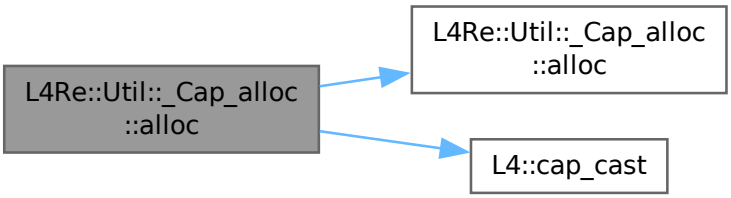
```
template<typename T>
L4::Cap< T > L4Re::Util::_Cap_alloc::alloc ()  [inline], [virtual], [noexcept]
```

Allocate a capability.

Returns

Capability of type void

Implements L4Re::Cap_alloc.
Definition at line 79 of file cap_alloc_impl.h.
References alloc(), and L4::cap_cast().
Here is the call graph for this function:



15.307.2.2 alloc() [2/2]

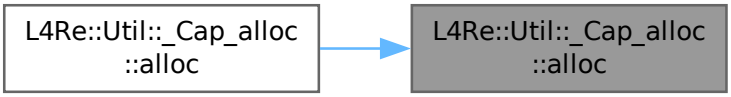
```
L4::Cap< void > L4Re::Util::_Cap_alloc::alloc ()  [inline], [override], [virtual], [noexcept]
```

Allocate a capability.

Returns

Capability of type void

Implements L4Re::Cap_alloc.
Definition at line 75 of file cap_alloc_impl.h.
Referenced by alloc().
Here is the caller graph for this function:



15.307.2.3 free()

```
void L4Re::Util::_Cap_alloc::free (
            L4::Cap< void > cap,

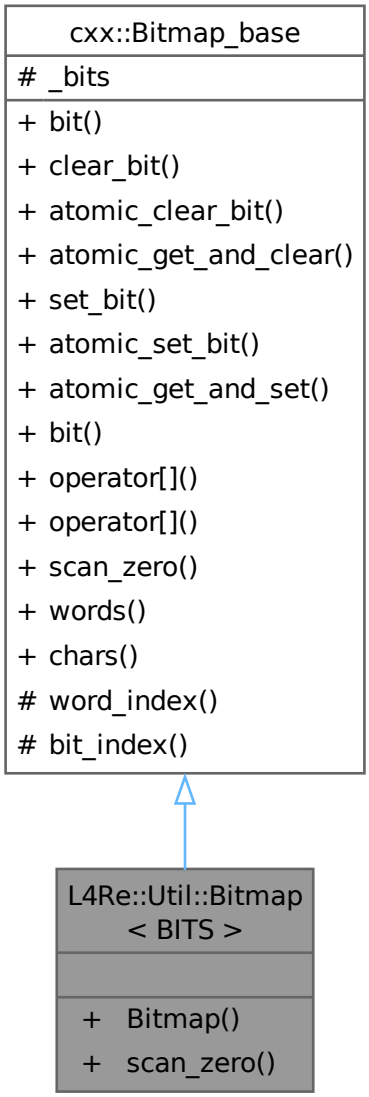
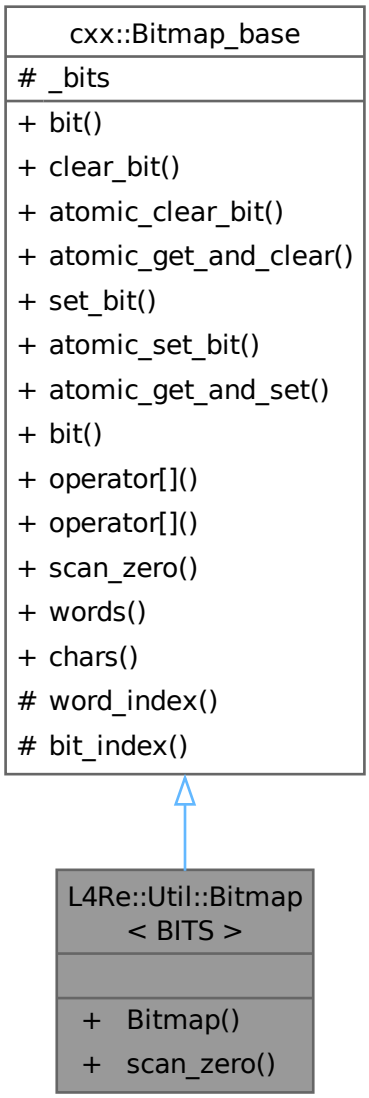
15.308 L4Re::Util::Bitmap< BITS > Class Template Reference

A static bitmap.
`#include <bitmap>`

Inheritance diagram for L4Re::Util::Bitmap< BITS >:



Collaboration diagram for L4Re::Util::Bitmap< BITS >:



Public Member Functions

- **Bitmap** () noexcept

  Create a bitmap with `BITS` *bits.*
- long scan_zero (long start_bit=0) const noexcept

  Scan for the first zero bit.

Public Member Functions inherited from cxx::Bitmap_base

- void bit (long bit, bool on) noexcept

  Set the value of bit `bit` *to* `on`*.*
- void clear_bit (long bit) noexcept

  Clear bit `bit`*.*

- void atomic_clear_bit (long bit) noexcept

  Clear bit `bit` atomically.
- word_type atomic_get_and_clear (long bit) noexcept

  Clear bit `bit` atomically and return old state.
- void set_bit (long bit) noexcept

  Set bit `bit`.
- void atomic_set_bit (long bit) noexcept

  Set bit `bit` atomically.
- word_type atomic_get_and_set (long bit) noexcept

  Set bit `bit` atomically and return old state.
- word_type bit (long bit) const noexcept

  Get the truth value of a bit.
- word_type operator[ ] (long bit) const noexcept

  Get the bit at index `bit`.
- Bit operator[ ] (long bit) noexcept

  Get the lvalue for the bit at index `bit`.
- long scan_zero (long max_bit, long start_bit=0) const noexcept

  Scan for the first zero bit.

Additional Inherited Members

Static Public Member Functions inherited from cxx::Bitmap_base

- static long **words** (long bits) noexcept

  Get the number of `Words` that are used for the bitmap.
- static long **chars** (long bits) noexcept

  Get the number of chars that are used for the bitmap.

Protected Types inherited from cxx::Bitmap_base

- enum { W_bits = sizeof(word_type) * 8 , C_bits = 8 }
- typedef unsigned long **word_type**

  Data type for each element of the bit buffer.

Static Protected Member Functions inherited from cxx::Bitmap_base

- static unsigned word_index (unsigned bit)

  Get the word index for the given bit.
- static unsigned bit_index (unsigned bit)

  Get the bit index within word_type for the given bit.

Protected Attributes inherited from cxx::Bitmap_base

- word_type * **_bits**

  Pointer to the buffer storing the bits.

15.308.1 Detailed Description

template<int BITS>
class L4Re::Util::Bitmap< BITS >

A static bitmap.

Template Parameters

BITS	The number of bits that shall be in the bitmap.

Definition at line 220 of file bitmap.

15.308.2 Member Function Documentation

15.308.2.1 scan_zero()

```
template<int BITS>
long cxx::Bitmap< BITS >::scan_zero (
             long start_bit = 0) const  [inline], [noexcept]
```

Scan for the first zero bit.

Parameters

start_bit	Hint at the number of the first bit to look at. Zero bits below `start_bit` may or may not be taken into account by the implementation.

Return values

>=	0 Number of first zero bit found.
-1	All bits at `start_bit` or higher are set.

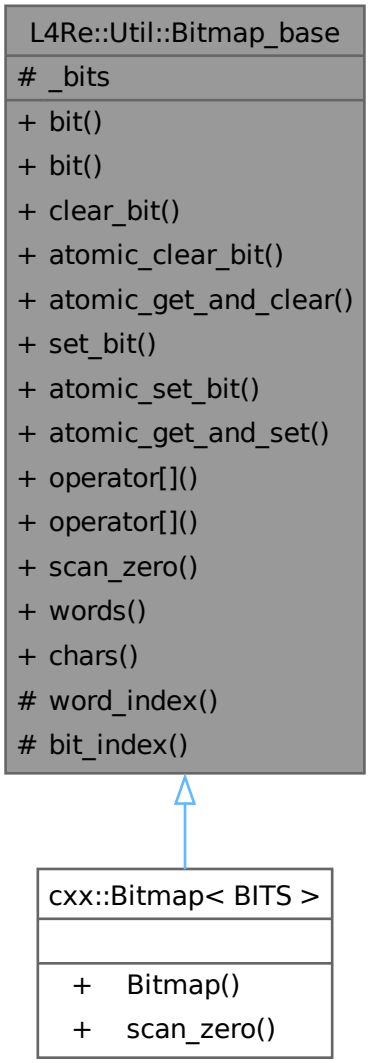
Compared to Bitmap_base::scan_zero(), the upper bound is set to BITS.
Definition at line 365 of file bitmap.
The documentation for this class was generated from the following file:

- l4/cxx/bitmap

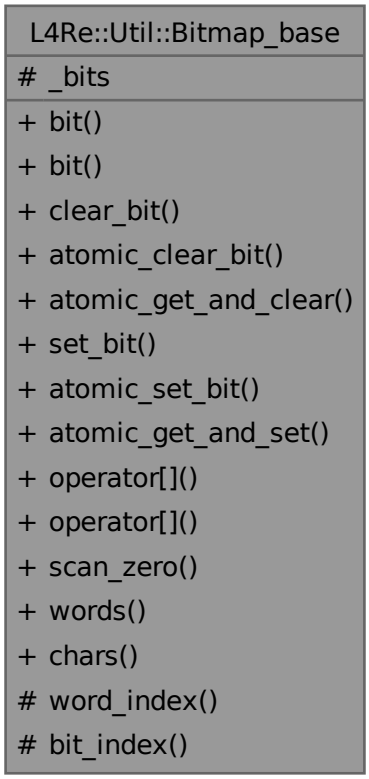
15.309 L4Re::Util::Bitmap_base Class Reference

Basic bitmap abstraction.
`#include <bitmap>`

Inheritance diagram for L4Re::Util::Bitmap_base:



Collaboration diagram for L4Re::Util::Bitmap_base:



Data Structures

- class Bit

  A writable bit in a bitmap.
- class Word

  Helper abstraction for a word contained in the bitmap.
- class Char

  Helper abstraction for a byte contained in the bitmap.

Public Member Functions

- void bit (long bit, bool on) noexcept

  Set the value of bit `bit` *to* `on`.
- word_type bit (long bit) const noexcept

  Get the truth value of a bit.
- void clear_bit (long bit) noexcept

  Clear bit `bit`.
- void atomic_clear_bit (long bit) noexcept

  Clear bit `bit` *atomically.*
- word_type atomic_get_and_clear (long bit) noexcept

  Clear bit `bit` *atomically and return old state.*

- void set_bit (long bit) noexcept
  Set bit `bit`.
- void atomic_set_bit (long bit) noexcept
  Set bit `bit` atomically.
- word_type atomic_get_and_set (long bit) noexcept
  Set bit `bit` atomically and return old state.
- word_type operator[ ] (long bit) const noexcept
  Get the bit at index `bit`.
- Bit operator[ ] (long bit) noexcept
  Get the lvalue for the bit at index `bit`.
- long scan_zero (long max_bit, long start_bit=0) const noexcept
  Scan for the first zero bit.

Static Public Member Functions

- static long **words** (long bits) noexcept
  Get the number of `Words` that are used for the bitmap.
- static long **chars** (long bits) noexcept
  Get the number of chars that are used for the bitmap.

Protected Types

- enum { W_bits = sizeof(word_type) * 8 , C_bits = 8 }
- typedef unsigned long **word_type**
  Data type for each element of the bit buffer.

Static Protected Member Functions

- static unsigned word_index (unsigned bit)
  Get the word index for the given bit.
- static unsigned bit_index (unsigned bit)
  Get the bit index within word_type for the given bit.

Protected Attributes

- word_type * **_bits**
  Pointer to the buffer storing the bits.

15.309.1 Detailed Description

Basic bitmap abstraction.
This abstraction keeps a pointer to a memory area that is used as bitmap.
Definition at line 18 of file bitmap.

15.309.2 Member Enumeration Documentation

15.309.2.1 anonymous enum

```
anonymous enum  [protected]
```

Enumerator

W_bits	number of bits in word_type
C_bits	number of bits in char

Definition at line 26 of file bitmap.

15.309.3 Member Function Documentation

15.309.3.1 atomic_clear_bit()

```
void cxx::Bitmap_base::atomic_clear_bit (
            long bit)  [inline], [noexcept]
```

Clear bit `bit` atomically.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to clear.

Definition at line 269 of file bitmap.

15.309.3.2 atomic_get_and_clear()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_clear (
            long bit)  [inline], [noexcept]
```

Clear bit `bit` atomically and return old state.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to clear.

Definition at line 279 of file bitmap.

15.309.3.3 atomic_get_and_set()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_set (
            long bit)  [inline], [noexcept]
```

Set bit `bit` atomically and return old state.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to set.

Definition at line 308 of file bitmap.

15.309.3.4 atomic_set_bit()

```
void cxx::Bitmap_base::atomic_set_bit (
            long bit)  [inline], [noexcept]
```

Set bit `bit` atomically.
Use this function for multi-threaded access to the bitmap.

Parameters

bit	The number of the bit to set.

Definition at line 298 of file bitmap.

15.309.3.5 bit() [1/2]

```
Bitmap_base::word_type cxx::Bitmap_base::bit (
```

```
            long bit) const  [inline], [noexcept]
```

Get the truth value of a bit.

Parameters

bit	The number of the bit to read.

Return values

0	Bit is not set.
!=	0 Bit is set.

Definition at line 318 of file bitmap.

15.309.3.6 bit() [2/2]

```
void cxx::Bitmap_base::bit (
            long bit,
            bool on)  [inline], [noexcept]
```

Set the value of bit `bit` to `on`.

Parameters

bit	The number of the bit.
on	The boolean value that shall be assigned to the bit.

Definition at line 251 of file bitmap.

15.309.3.7 bit_index()

```
unsigned cxx::Bitmap_base::bit_index (
            unsigned bit)  [inline], [static], [protected]
```

Get the bit index within word_type for the given bit.

Parameters

bit	The bit index in the bitmap.

Returns

the bit index within word_type (bit % W_bits).

Definition at line 53 of file bitmap.

15.309.3.8 clear_bit()

```
void cxx::Bitmap_base::clear_bit (
            long bit)  [inline], [noexcept]
```

Clear bit `bit`.

Parameters

bit	The number of the bit to clear.

Definition at line 260 of file bitmap.

15.309.3.9 operator[]() [1/2]

```
word_type cxx::Bitmap_base::operator[] (
            long bit) const  [inline], [noexcept]
```

Get the bit at index `bit`.

Parameters

bit	The number of the bit to read.

Return values

0	Bit is not set.
!=	0 Bit is set.

Definition at line 181 of file bitmap.

15.309.3.10 operator[]() [2/2]

```
Bit cxx::Bitmap_base::operator[] (
            long bit)  [inline], [noexcept]
```

Get the lvalue for the bit at index `bit`.

Parameters

bit	The number.

Returns

lvalue for `bit`

Definition at line 191 of file bitmap.

15.309.3.11 scan_zero()

```
long cxx::Bitmap_base::scan_zero (
            long max_bit,
            long start_bit = 0) const  [inline], [noexcept]
```

Scan for the first zero bit.

Parameters

max_bit	Upper bound (exclusive) for the scanning operation.
start_bit	Hint at the number of the first bit to look at. Zero bits below `start_bit` may or may not be taken into account by the implementation.

Return values

>=	0 Number of first zero bit found.

-1	All bits between `start_bit` and `max_bit` are set.

Definition at line 339 of file bitmap.

15.309.3.12 set_bit()

```
void cxx::Bitmap_base::set_bit (
            long bit)  [inline], [noexcept]
```

Set bit `bit`.

Parameters

bit	The number of the bit to set.

Definition at line 289 of file bitmap.

15.309.3.13 word_index()

```
unsigned cxx::Bitmap_base::word_index (
            unsigned bit)  [inline], [static], [protected]
```

Get the word index for the given bit.

Parameters

bit	The index of the bit in question.

Returns

the index in Bitmap_base::_bits for the given bit (bit / W_bits).

Definition at line 44 of file bitmap.

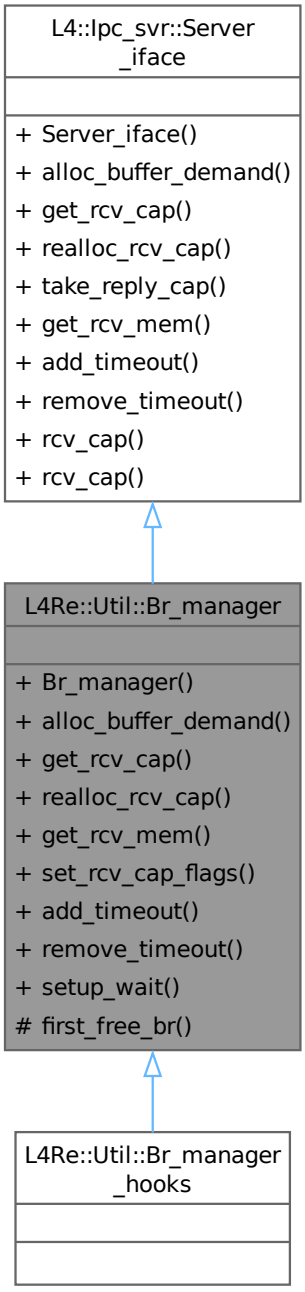
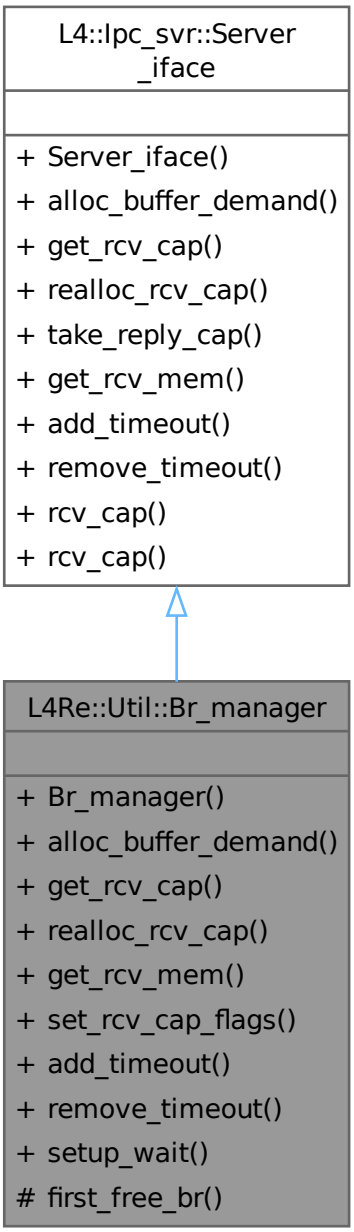
15.313 L4Re::Util::Br_manager Class Reference

Buffer-register (BR) manager for L4::Server.
`#include <br_manager>`

Inheritance diagram for L4Re::Util::Br_manager:



Collaboration diagram for L4Re::Util::Br_manager:



Public Member Functions

- **Br_manager** ()

  Make a buffer-register (BR) manager.
- int alloc_buffer_demand (Demand const &d) override

  Tells the server to allocate buffers for the given demand.
- L4::Cap< void > get_rcv_cap (int i) const override

  Get capability slot allocated to the given receive buffer.
- int realloc_rcv_cap (int i) override

Allocate a new capability for the given receive buffer.

- cxx::Result< L4::Ipc_svr::Server_iface::Mem_window > get_rcv_mem () noexcept override

  Take the current memory receive window.
- void set_rcv_cap_flags (unsigned long flags)

  Set the receive flags for the buffers.
- int **add_timeout** (L4::Ipc_svr::Timeout *, l4_kernel_clock_t) override

  No timeouts handled by us.
- int **remove_timeout** (L4::Ipc_svr::Timeout *) override

  No timeouts handled by us.
- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode)

  setup_wait() used the server loop (L4::Server)

Public Member Functions inherited from L4::Ipc_svr::Server_iface

- **Server_iface** ()

  Make a server interface.
- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.
- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Protected Member Functions

- unsigned **first_free_br** () const

  Used for assigning BRs for a timeout.

Additional Inherited Members

Public Types inherited from L4::Ipc_svr::Server_iface

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

15.313.1 Detailed Description

Buffer-register (BR) manager for L4::Server.
Implementation of the L4::Ipc_svr::Server_iface API for managing the server-side receive buffers needed for a set of server objects running within a server.
Definition at line 27 of file br_manager.

15.313.2 Member Function Documentation

15.313.2.1 alloc_buffer_demand()

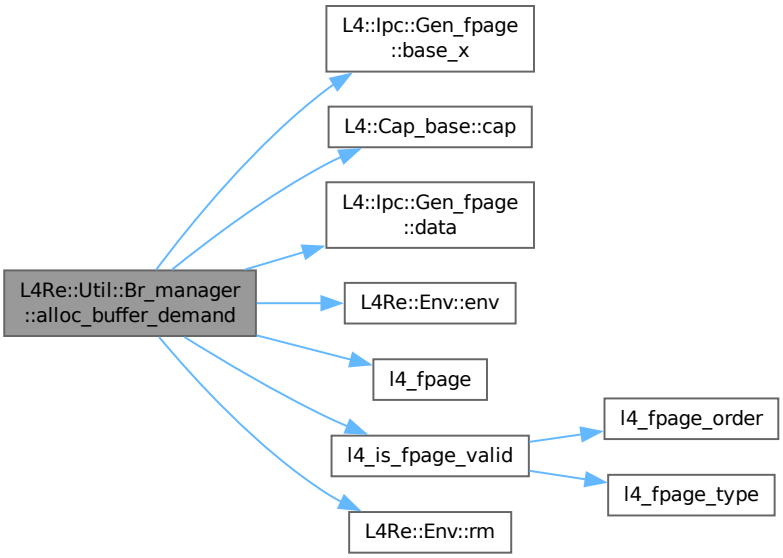
```
int L4Re::Util::Br_manager::alloc_buffer_demand (
            Demand const & demand)  [inline], [override], [virtual]
```

Tells the server to allocate buffers for the given demand.

Parameters

demand	The total server-side demand of receive buffers needed for a given interface, see Demand.

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.
Implements L4::Ipc_svr::Server_iface.
Definition at line 72 of file br_manager.
References L4::Ipc::Gen_fpage::base_x(), L4::Cap_base::cap(), L4Re::Util::cap_alloc, L4::Type_info::Demand::caps, L4::Ipc::Gen_fpage::data(), L4Re::Env::env(), L4_EINVAL, L4_ENOMEM, L4_EOK, L4_ERANGE, l4_fpage(), L4_FPAGE_RWX, l4_is_fpage_valid(), L4::Type_info::Demand::mem, L4::Type_info::Demand::ports, L4Re::Rm::F::Reserved, L4Re::Env::rm(), and L4Re::Rm::F::Search_addr.
Here is the call graph for this function:



15.313.2.2 get_rcv_cap()

```
L4::Cap< void > L4Re::Util::Br_manager::get_rcv_cap (
            int index) const  [inline], [override], [virtual]
```

Get capability slot allocated to the given receive buffer.

Parameters

index	The receive buffer index of the expected capability argument (0 <= `index` < `caps` registered with alloc_buffer_demand()).

Precondition

0 <= `index` < `caps` registered with alloc_buffer_demand()

Returns

Capability slot currently allocated to the given receive buffer.

Implements L4::Ipc_svr::Server_iface.
Definition at line 139 of file br_manager.
References L4::Cap_base::Invalid, and L4_CAP_MASK.

15.313.2.3 get_rcv_mem()

```
cxx::Result< L4::Ipc_svr::Server_iface::Mem_window > L4Re::Util::Br_manager::get_rcv_mem ()
[inline], [override], [virtual], [noexcept]
```

Take the current memory receive window.

The caller takes the ownership of the memory receive window. A new receive window will be allocated for the next call.

Attention

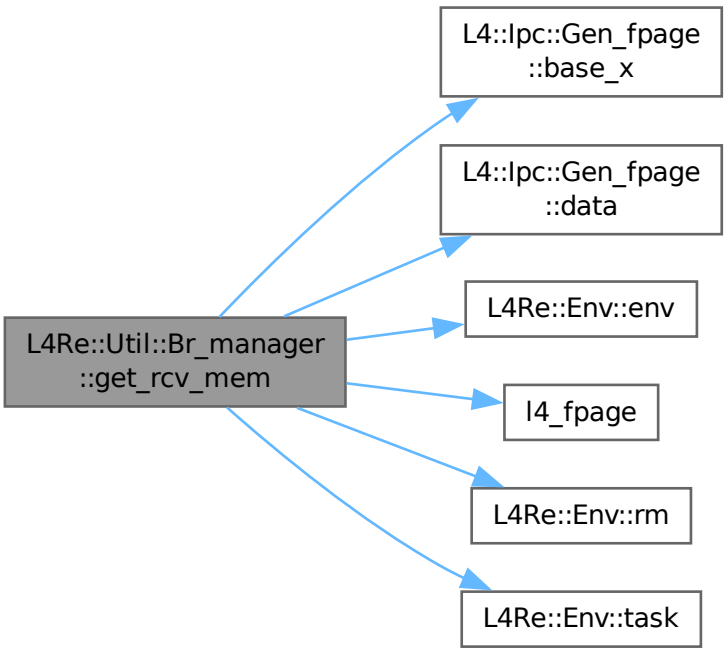
The caller has to ensure that the received IPC call actually mapped some memory flexpage. Still, the IPC client can revoke the pages at any time. Thus, any access into the memory window could create unresolved page faults.

Reimplemented from L4::Ipc_svr::Server_iface.

Definition at line 165 of file br_manager.

References L4::Ipc::Gen_fpage::base_x(), L4::Ipc::Gen_fpage::data(), L4Re::Env::env(), L4_EINVAL, L4_ENOMEM, L4Re::Util::L4_FP_ALL_SPACES, l4_fpage(), L4_FPAGE_RWX, L4Re::Rm::F::Reserved, L4Re::Env::rm(), L4Re::Rm::F::Search_addr, and L4Re::Env::task().

Here is the call graph for this function:



15.313.2.4 realloc_rcv_cap()

```
int L4Re::Util::Br_manager::realloc_rcv_cap (
            int index) [inline], [override], [virtual]
```

Allocate a new capability for the given receive buffer.

Parameters

index	The receive buffer index of the expected capability argument (0 <= `index` < `caps` registered with alloc_buffer_demand()).

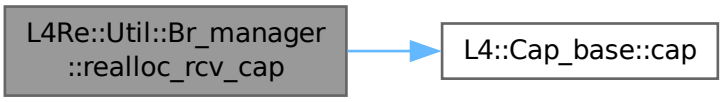
Precondition

0 <= `index` < `caps` registered with alloc_buffer_demand()

Returns

0 on success, < 0 on error.

On success, the caller implicitly takes ownership of the former rcv_cap(`index`) prior to the call. On error, rcv_cap(`index`) remains unchanged and will be reused for the next IPC receive of the server.
Implements L4::Ipc_svr::Server_iface.
Definition at line 147 of file br_manager.
References L4::Cap_base::cap(), L4Re::Util::cap_alloc, L4_EINVAL, L4_ENOMEM, and L4_EOK.
Here is the call graph for this function:



15.313.2.5 set_rcv_cap_flags()

```
void L4Re::Util::Br_manager::set_rcv_cap_flags (
            unsigned long flags)  [inline]
```

Set the receive flags for the buffers.

Precondition

Must be called before any handlers are registered.

Parameters

flags	New receive capability flags, see l4_msg_item_consts_t.

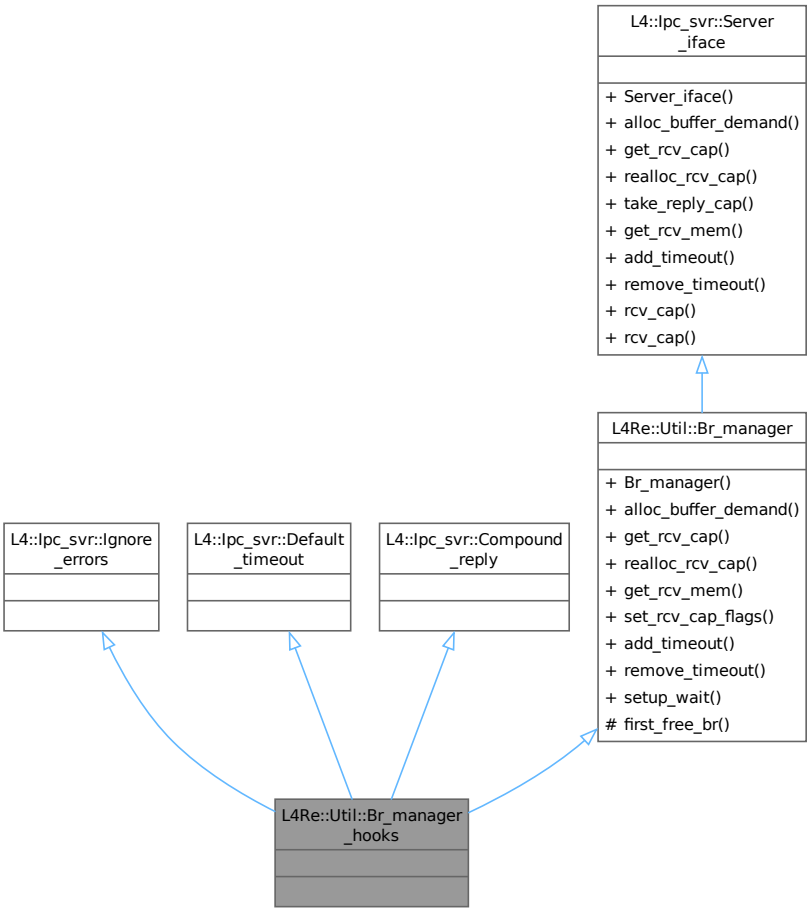
Definition at line 200 of file br_manager.
References l4_assert.
The documentation for this class was generated from the following file:

- l4/re/util/br_manager

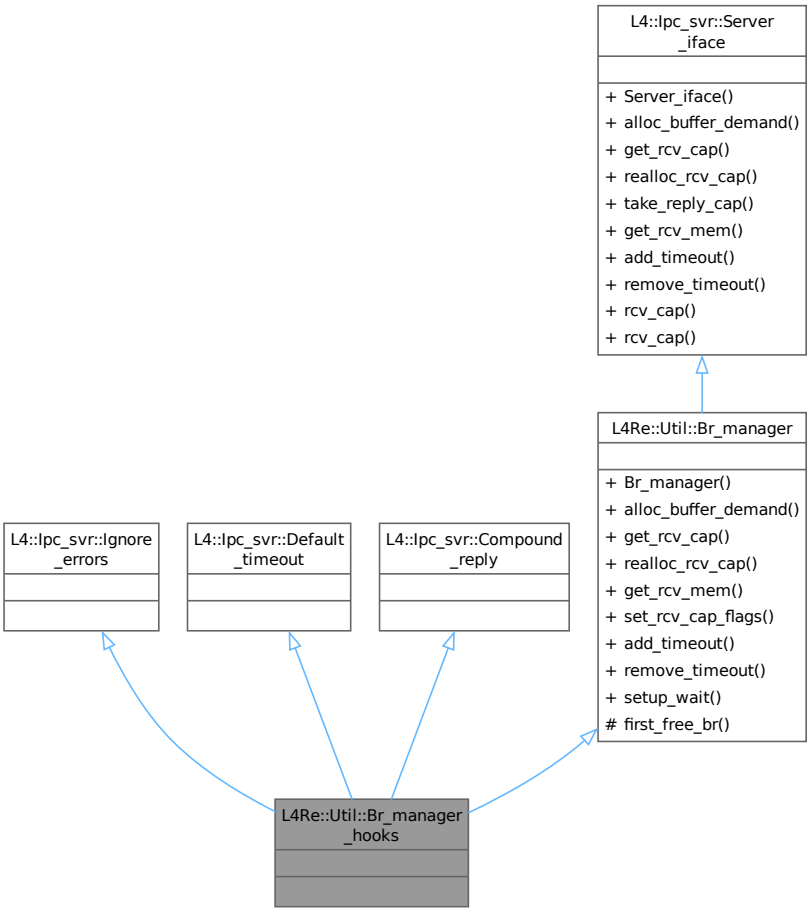
15.314 L4Re::Util::Br_manager_hooks Struct Reference

Predefined server-loop hooks for a server loop using the Br_manager.
`#include <br_manager>`

Inheritance diagram for L4Re::Util::Br_manager_hooks:



Collaboration diagram for L4Re::Util::Br_manager_hooks:



Additional Inherited Members

Public Types inherited from L4::Ipc_svr::Server_iface

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

Public Member Functions inherited from L4Re::Util::Br_manager

- **Br_manager** ()

  Make a buffer-register (BR) manager.
- int alloc_buffer_demand (Demand const &d) override

  Tells the server to allocate buffers for the given demand.
- L4::Cap< void > get_rcv_cap (int i) const override

  Get capability slot allocated to the given receive buffer.
- int realloc_rcv_cap (int i) override

  Allocate a new capability for the given receive buffer.
- cxx::Result< L4::Ipc_svr::Server_iface::Mem_window > get_rcv_mem () noexcept override

  Take the current memory receive window.
- void set_rcv_cap_flags (unsigned long flags)

Set the receive flags for the buffers.

- int **add_timeout** (L4::Ipc_svr::Timeout *, l4_kernel_clock_t) override

  No timeouts handled by us.

- int **remove_timeout** (L4::Ipc_svr::Timeout *) override

  No timeouts handled by us.

- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode)

  setup_wait() used the server loop (L4::Server)

Public Member Functions inherited from L4::Ipc_svr::Server_iface

- **Server_iface** ()

  Make a server interface.

- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.

- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.

- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Protected Member Functions inherited from L4Re::Util::Br_manager

- unsigned **first_free_br** () const

  Used for assigning BRs for a timeout.

15.314.1 Detailed Description

Predefined server-loop hooks for a server loop using the Br_manager.
This class can be used whenever a server loop including full management of receive buffer resources is needed.
Definition at line 250 of file br_manager.
The documentation for this struct was generated from the following file:

  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Data Fields inherited from L4::Ipc_svr::Timeout_queue_hooks< Br_manager_timeout_hooks, Br_manager >

- Timeout_queue **queue**

  Use this timeout queue.

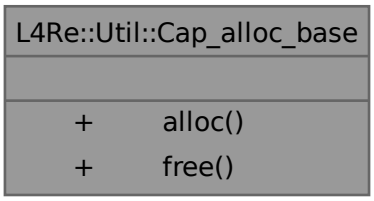
15.315.1 Detailed Description

Predefined server-loop hooks for a server with using the Br_manager and a timeout queue.
This class can be used for server loops that need the full package of buffer-register management and a timeout queue.
Definition at line 264 of file br_manager.
The documentation for this struct was generated from the following file:

- l4/re/util/br_manager

15.316 L4Re::Util::Cap_alloc_base Class Reference

Capability allocator.
`#include <bitmap_cap_alloc>`
Collaboration diagram for L4Re::Util::Cap_alloc_base:



Public Member Functions

- template<typename T>
  L4::Cap< T > **alloc** () noexcept

  Allocate a capability slot.
- template<typename T>
  void **free** (L4::Cap< T > const &cap, l4_cap_idx_t task=L4_INVALID_CAP, l4_umword_t unmap_↩ flags=L4_FP_ALL_SPACES) noexcept

  Free a capability slot.

15.316.1 Detailed Description

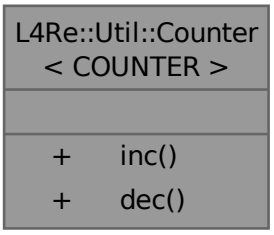
Capability allocator.
Definition at line 28 of file bitmap_cap_alloc.
The documentation for this class was generated from the following file:

- l4/re/util/bitmap_cap_alloc

15.317 L4Re::Util::Counter< COUNTER > Struct Template Reference

Counter for Counting_cap_alloc with variable data width.
`#include <counting_cap_alloc>`

Collaboration diagram for L4Re::Util::Counter< COUNTER >:



Public Member Functions

- bool inc ()

  Increment counter if not yet saturated.
- Type dec ()

  Decrement counter if not saturated.

15.317.1 Detailed Description

template<typename COUNTER = unsigned char>
struct L4Re::Util::Counter< COUNTER >

Counter for Counting_cap_alloc with variable data width.
This version is not thread safe.
Definition at line 27 of file counting_cap_alloc.

15.317.2 Member Function Documentation

15.317.2.1 dec()

```
template<typename COUNTER = unsigned char>
Type L4Re::Util::Counter< COUNTER >::dec ()  [inline]
```

Decrement counter if not saturated.
Once the counter reached the saturated state, the counter value isn't changed.
Definition at line 67 of file counting_cap_alloc.

15.317.2.2 inc()

```
template<typename COUNTER = unsigned char>
bool L4Re::Util::Counter< COUNTER >::inc ()  [inline]
```

Increment counter if not yet saturated.
Once the counter reached the saturated state, the counter value isn't changed.

Return values

false	The counter just went saturated after it was increased.
true	Either the counter was already saturated – in that case the counter value was not changed, or the counter was not saturated – in that case the counter was increased.

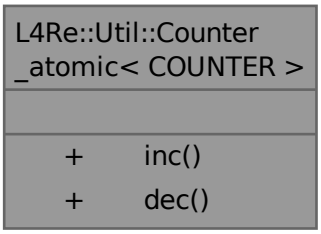
Definition at line 50 of file counting_cap_alloc.

The documentation for this struct was generated from the following file:

- l4/re/util/counting_cap_alloc

15.318 L4Re::Util::Counter_atomic< COUNTER > Struct Template Reference

Thread safe version of counter for Counting_cap_alloc.
`#include <counting_cap_alloc>`
Collaboration diagram for L4Re::Util::Counter_atomic< COUNTER >:



Public Member Functions

- bool inc ()

  Increment counter if not yet saturated.
- Type dec ()

  Decrement counter if not saturated.

15.318.1 Detailed Description

template<typename COUNTER = unsigned char>
struct L4Re::Util::Counter_atomic< COUNTER >

Thread safe version of counter for Counting_cap_alloc.
Despite using atomic instructions, this version has to make sure that capability slots are not reused too early. If the last reference is gone, the capability slot has to be unmapped. The slot must only be allocated again when the unmap has completed. This is accomplished by starting with an initial count of 2. The last reference will decrease the counter to 1. Only then, after the slot was unmapped, will the counter be set to 0. This will allow other threads to reallocate the slot.
Definition at line 98 of file counting_cap_alloc.

15.318.2 Member Function Documentation

15.318.2.1 dec()

```
template<typename COUNTER = unsigned char>
Type L4Re::Util::Counter_atomic< COUNTER >::dec ()  [inline]
```

Decrement counter if not saturated.
Once the counter reached the saturated state, the counter value isn't changed.
Definition at line 142 of file counting_cap_alloc.

15.318.2.2 inc()

```
template<typename COUNTER = unsigned char>
bool L4Re::Util::Counter_atomic< COUNTER >::inc ()  [inline]
```

Increment counter if not yet saturated.
Once the counter reached the saturated state, the counter value isn't changed.

Return values

false	The counter just went saturated after it was increased.
true	Either the counter was already saturated – in that case the counter value was not changed, or the counter was not saturated – in that case the counter was increased.

Definition at line 121 of file counting_cap_alloc.

15.319 L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg > Class Template Reference

Internal reference-counting cap allocator.
`#include <counting_cap_alloc>`
Collaboration diagram for L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >:

Public Member Functions

- L4::Cap< void > alloc () noexcept

  Allocate a new capability slot.
- template<typename T>
  L4::Cap< T > alloc () noexcept

Allocate a new capability slot.

- void take (L4::Cap< void > cap) noexcept

  Increase the reference counter for the capability.

- bool free (L4::Cap< void > cap, l4_cap_idx_t task=L4_BASE_TASK_CAP, unsigned unmap_↩ flags=L4_FP_ALL_SPACES) noexcept

  Free the capability.

- bool release (L4::Cap< void > cap, l4_cap_idx_t task=L4_BASE_TASK_CAP, unsigned unmap_↩ flags=L4_FP_ALL_SPACES) noexcept

  Decrease the reference counter for a capability.

- long **last** () noexcept

  Return highest capability id managed by this allocator.

Protected Member Functions

- Counting_cap_alloc () noexcept

  Create a new, empty allocator.

- void setup (void *m, long capacity, long bias, Dbg *dbg) noexcept

  Set up the backing memory for the allocator and the area of managed capability slots.

15.319.1 Detailed Description

template<typename COUNTERTYPE, typename Dbg>
class L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >

Internal reference-counting cap allocator.
This is intended for internal use only. L4Re applications should use L4Re::Util::cap_alloc().
Allocator for capability slots that automatically frees the slot and optionally unmaps the capability when the reference count goes down to zero. Reference counting must be done manually via take() and release(). The backing store for the reference counters must be provided in the setup() method. The allocator can recognize capability slots that are not managed by itself and does nothing on such slots.

Note

The user must ensure that the backing store is zero-initialized.

The user must ensure that the capability slots managed by this allocator are not used by a different allocator, see setup().

The operations in this class are not thread-safe.

Definition at line 191 of file counting_cap_alloc.

15.319.2 Constructor & Destructor Documentation

15.319.2.1 Counting_cap_alloc()

```
template<typename COUNTERTYPE, typename Dbg>
L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::Counting_cap_alloc ()  [inline], [protected],
[noexcept]
```

Create a new, empty allocator.
Needs to be initialized with setup() before it can be used.
Definition at line 224 of file counting_cap_alloc.

15.319.3 Member Function Documentation

15.319.3.1 alloc() [1/2]

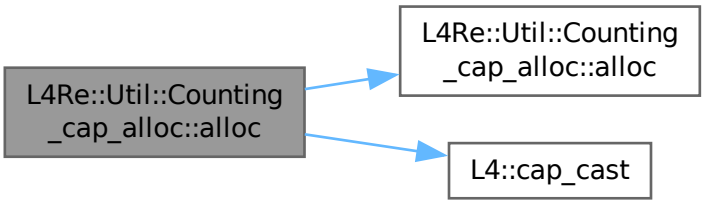
```
template<typename COUNTERTYPE, typename Dbg>
template<typename T>
L4::Cap< T > L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::alloc ()  [inline], [noexcept]
```

Allocate a new capability slot.

Returns

The newly allocated capability slot, invalid if the allocator was exhausted.

Definition at line 282 of file counting_cap_alloc.
References alloc(), and L4::cap_cast().
Here is the call graph for this function:



15.319.3.2 alloc() [2/2]

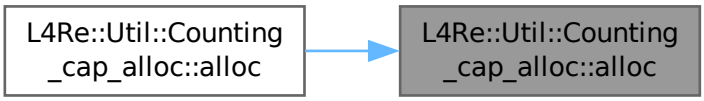
```
template<typename COUNTERTYPE, typename Dbg>
L4::Cap< void > L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::alloc ()  [inline], [noexcept]
```

Allocate a new capability slot.

Returns

The newly allocated capability slot, invalid if the allocator was exhausted.

Definition at line 257 of file counting_cap_alloc.
References L4::Cap_base::Invalid, and L4_CAP_SHIFT.
Referenced by alloc().
Here is the caller graph for this function:



15.319.3.3 free()

```
template<typename COUNTERTYPE, typename Dbg>
bool L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::free (
            L4::Cap< void > cap,
            l4_cap_idx_t task = L4_BASE_TASK_CAP,
            unsigned unmap_flags = L4_FP_ALL_SPACES)  [inline], [noexcept]
```

Free the capability.

Parameters

cap	Capability to free.
task	If set, task to unmap the capability from.
unmap_flags	Flags for unmap, see l4_unmap_flags_t.

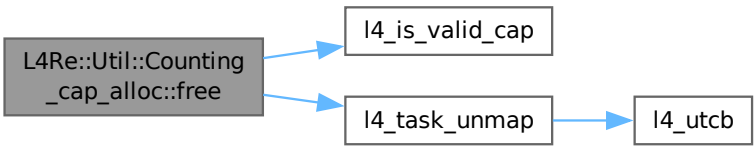
Precondition

The capability has been allocated. Calling free twice on a capability managed by this allocator results in undefined behaviour.

Returns

True, if the capability was managed by this allocator.

Definition at line 321 of file counting_cap_alloc.
References l4_assert, L4_BASE_TASK_CAP, L4Re::Util::L4_FP_ALL_SPACES, l4_is_valid_cap(), and l4_task_unmap().
Here is the call graph for this function:



15.319.3.4 release()

```
template<typename COUNTERTYPE, typename Dbg>
bool L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::release (
            L4::Cap< void > cap,
            l4_cap_idx_t task = L4_BASE_TASK_CAP,
            unsigned unmap_flags = L4_FP_ALL_SPACES)  [inline], [noexcept]
```

Decrease the reference counter for a capability.

Parameters

cap	Capability to release.
task	If set, task to unmap the capability from.
unmap_flags	Flags for unmap, see l4_unmap_flags_t.

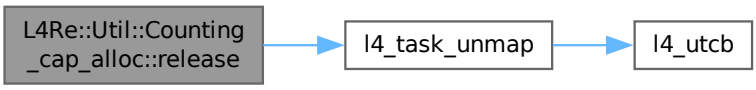
Precondition

The capability has been allocated. Calling release on a free capability results in undefined behaviour.

Returns

True, if the capability was freed as a result of this operation. If false is returned the capability is either still in use or is not managed by this allocator.

Does nothing apart from returning false if the capability is not managed by this allocator.
Definition at line 359 of file counting_cap_alloc.
References l4_assert, L4_BASE_TASK_CAP, L4Re::Util::L4_FP_ALL_SPACES, L4_INVALID_CAP, and l4_task_unmap().
Here is the call graph for this function:



15.319.3.5 setup()

```
template<typename COUNTERTYPE, typename Dbg>
void L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::setup (
             void * m,
             long capacity,
             long bias,
             Dbg * dbg)  [inline], [protected], [noexcept]
```

Set up the backing memory for the allocator and the area of managed capability slots.

Parameters

m	Pointer to backing memory.
capacity	Number of capabilities that can be stored.
bias	First capability id to use by this allocator.
dbg	Logger for warnings if counter got saturated.

The allocator will manage the capability slots between `bias` and `bias` + `capacity` - 1 (inclusive). It is the responsibility of the user to ensure that these slots are not used otherwise.
Definition at line 242 of file counting_cap_alloc.

15.319.3.6 take()

```
template<typename COUNTERTYPE, typename Dbg>
void L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::take (
             L4::Cap< void > cap)  [inline], [noexcept]
```

Increase the reference counter for the capability.

Parameters

cap	Capability, whose reference counter should be increased.

If the capability was still free, it will be automatically allocated. Silently does nothing if the capability is not managed by this allocator.
Definition at line 296 of file counting_cap_alloc.

References L4_CAP_SHIFT, and L4_UNLIKELY.
The documentation for this class was generated from the following file:

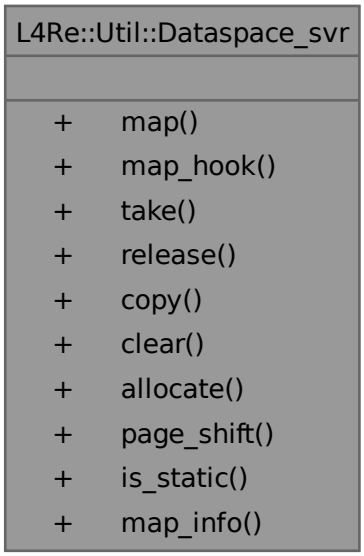
15.320 L4Re::Util::Dataspace_svr Class Reference

Dataspace server class.
`#include <dataspace_svr>`
Collaboration diagram for L4Re::Util::Dataspace_svr:



Public Member Functions

- l4_ret_t map (Dataspace::Offset offset, Dataspace::Map_addr local_addr, Dataspace::Flags flags, Dataspace::Map_addr min_addr, Dataspace::Map_addr max_addr, L4::Ipc::Snd_fpage &memory)

  Map a region of the dataspace.
- virtual l4_ret_t map_hook (Dataspace::Offset offs, unsigned order, Dataspace::Flags flags, Dataspace::↩ Map_addr *base, unsigned *send_order)

  A hook that is called for acquiring the data to be mapped.
- virtual void take () noexcept

  Take a reference to this dataspace.
- virtual unsigned long release () noexcept

  Release a reference to this dataspace.
- virtual l4_ret_t copy (l4_addr_t dst_offs, l4_umword_t src_id, l4_addr_t src_offs, unsigned long size) noexcept

  Copy from src dataspace to this destination dataspace.
- virtual l4_ret_t clear (unsigned long offs, unsigned long size) const noexcept

  Clear a region in the dataspace.
- virtual l4_ret_t allocate (l4_addr_t offset, l4_size_t size, unsigned access) noexcept

  Allocate a region within a dataspace.
- virtual unsigned long page_shift () const noexcept

Define the size of the flexpage to map.

- virtual bool is_static () const noexcept

  Return whether the dataspace is static.

- virtual l4_ret_t map_info (l4_addr_t &start_addr, l4_addr_t &end_addr) noexcept

  Return mapping information for no-MMU systems.

15.320.1 Detailed Description

Dataspace server class.
The default implementation of the interface provides a continuous dataspace with contiguous pages.
Definition at line 29 of file dataspace_svr.

15.320.2 Member Function Documentation

15.320.2.1 allocate()

```
virtual l4_ret_t L4Re::Util::Dataspace_svr::allocate (
             l4_addr_t offset,
             l4_size_t size,
             unsigned access)  [inline], [virtual], [noexcept]
```

Allocate a region within a dataspace.

Parameters

offset	Offset in the dataspace, in bytes.
size	Size of the range, in bytes.
access	Access mode with which the memory backing the dataspace region should be allocated.

Return values

0	Success
<0	Error

Definition at line 213 of file dataspace_svr.
References L4_ENODEV.

15.320.2.2 clear()

```
virtual l4_ret_t L4Re::Util::Dataspace_svr::clear (
             unsigned long offs,
             unsigned long size) const  [inline], [virtual], [noexcept]
```

Clear a region in the dataspace.

Parameters

offs	Start of the region
size	Size of the region

Return values

0	Success

<0	Error

Definition at line 192 of file dataspace_svr.
References L4_ERANGE.

15.320.2.3 copy()

```
virtual l4_ret_t L4Re::Util::Dataspace_svr::copy (
            l4_addr_t dst_offs,
            l4_umword_t src_id,
            l4_addr_t src_offs,
            unsigned long size)  [inline], [virtual], [noexcept]
```

Copy from src dataspace to this destination dataspace.

Parameters

dst_offs	Offset into the destination dataspace
src_id	Local id of the source dataspace
src_offs	Offset into the source dataspace
size	Number of bytes to copy

Return values

>=0	Number of bytes copied
<0	An error occurred. The error code may depend on the implementation.

Definition at line 175 of file dataspace_svr.
References L4_ENODEV.

15.320.2.4 is_static()

```
virtual bool L4Re::Util::Dataspace_svr::is_static () const  [inline], [virtual], [noexcept]
```

Return whether the dataspace is static.

Returns

True if dataspace is static

Definition at line 233 of file dataspace_svr.

15.320.2.5 map()

```
l4_ret_t L4Re::Util::Dataspace_svr::map (
            Dataspace::Offset offset,
            Dataspace::Map_addr local_addr,
            Dataspace::Flags flags,
            Dataspace::Map_addr min_addr,
            Dataspace::Map_addr max_addr,
            L4::Ipc::Snd_fpage & memory)  [inline]
```

Map a region of the dataspace.

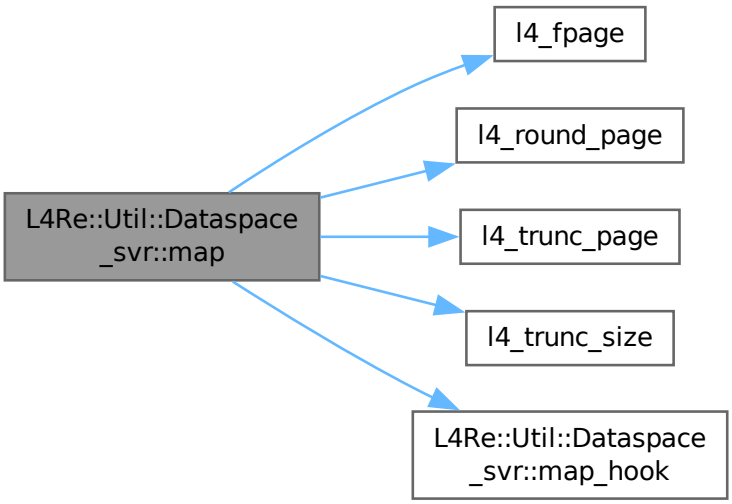
Parameters

	offset	Offset to start within data space
	local_addr	Local address to map to.
	flags	Dataspace flags, see L4Re::Dataspace::F::Flags.
	min_addr	Defines start of receive window.
	max_addr	Defines end of receive window.
out	*memory*	Send fpage to map

Return values

0	Success
<0	Error

Definition at line 57 of file dataspace_svr.
References L4_EOK, L4_ERANGE, l4_fpage(), L4_PAGESHIFT, l4_round_page(), l4_trunc_page(), l4_trunc_size(), and map_hook().
Here is the call graph for this function:



15.320.2.6 map_hook()

```
virtual l4_ret_t L4Re::Util::Dataspace_svr::map_hook (
            Dataspace::Offset offs,
            unsigned order,
            Dataspace::Flags flags,
            Dataspace::Map_addr * base,
            unsigned * send_order)  [inline], [virtual]
```

A hook that is called for acquiring the data to be mapped.

Parameters

offs	Offset in dataspace to supply
order	Log2-size of data to supply
flags	Flags for the mapping
base	Start address of the flexpage to be mapped
send_order	Order (log2 of size) of the flexpage to be mapped

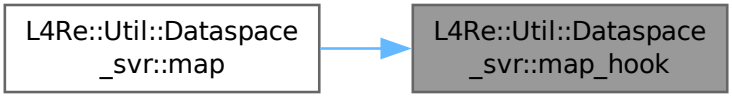
Return values

<0	Error and the map request will be aborted with that error.
>=0	Success

See also

map

Definition at line 136 of file dataspace_svr.
Referenced by map().
Here is the caller graph for this function:



15.320.2.7 map_info()

```
virtual l4_ret_t L4Re::Util::Dataspace_svr::map_info (
             l4_addr_t & start_addr,
             l4_addr_t & end_addr)  [inline], [virtual], [noexcept]
```

Return mapping information for no-MMU systems.
The method is only called on no-MMU systems. It should return the address of the underlying backing buffer so that the caller might map the dataspace.
The default implementation always returns an error because the derived class must provide the required information.

15.320.2.8 page_shift()

```
virtual unsigned long L4Re::Util::Dataspace_svr::page_shift () const  [inline], [virtual],
[noexcept]
```

Define the size of the flexpage to map.

Returns

flexpage size

Definition at line 225 of file dataspace_svr.
References L4_LOG2_PAGESIZE.

15.320.2.9 release()

`virtual unsigned long L4Re::Util::Dataspace_svr::release () [inline], [virtual], [noexcept]`
Release a reference to this dataspace.

Returns

Number of references to the dataspace

Default does nothing and returns always zero.
Definition at line 160 of file dataspace_svr.

15.320.2.10 take()

`virtual void L4Re::Util::Dataspace_svr::take () [inline], [virtual], [noexcept]`
Take a reference to this dataspace.
Default does nothing.
Definition at line 150 of file dataspace_svr.
The documentation for this class was generated from the following file:

- l4/re/util/dataspace_svr

15.321 L4Re::Util::Event_buffer_consumer_t< PAYLOAD > Class Template Reference

An event buffer consumer.
Definition at line 82 of file event_buffer.

15.321.2 Member Function Documentation

15.321.2.1 foreach_available_event()

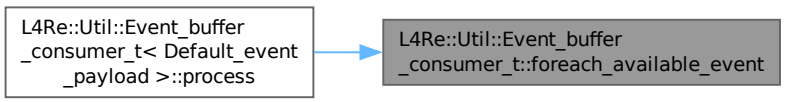
```
template<typename PAYLOAD>
template<typename CB, typename D>
void L4Re::Util::Event_buffer_consumer_t< PAYLOAD >::foreach_available_event (
            CB const & cb,
            D data = D())  [inline]
```

Call function on every available event.

Parameters

cb	Function callback.
data	Data to pass as an argument to the callback.

Definition at line 93 of file event_buffer.
Referenced by L4Re::Util::Event_buffer_consumer_t< Default_event_payload >::process().
Here is the caller graph for this function:



15.321.2.2 process()

```
template<typename PAYLOAD>
template<typename CB, typename D>
void L4Re::Util::Event_buffer_consumer_t< PAYLOAD >::process (
             L4::Cap< L4::Irq > irq,
             L4::Cap< L4::Thread > thread,
             CB const & cb,
             D data = D())  [inline]
```

Continuously wait for events and process them.

Parameters

irq	Event signal to wait for.
thread	Thread capability of the thread calling this function.
cb	Callback function that is called for each received event.
data	Data to pass as an argument to the processing callback.

Note

This function never returns.

Definition at line 114 of file event_buffer.

Public Member Functions

- void * buf () const noexcept

  Return the buffer.
- long attach (L4::Cap< L4Re::Dataspace > ds, L4::Cap< L4Re::Rm > rm) noexcept

  Attach event buffer from address space.
- long detach (L4::Cap< L4Re::Rm > rm) noexcept

  Detach event buffer from address space.

Public Member Functions inherited from L4Re::Event_buffer_t< PAYLOAD >

- Event * next () noexcept

  Next event in buffer.
- bool put (Event const &ev) noexcept

  Put event into buffer at current position.

15.322.1 Detailed Description

template<typename PAYLOAD>
class L4Re::Util::Event_buffer_t< PAYLOAD >

Event_buffer utility class.
Definition at line 24 of file event_buffer.

15.322.2 Member Function Documentation

15.322.2.1 attach()

```
template<typename PAYLOAD>
long L4Re::Util::Event_buffer_t< PAYLOAD >::attach (
             L4::Cap< L4Re::Dataspace > ds,
             L4::Cap< L4Re::Rm > rm)  [inline], [noexcept]
```

Attach event buffer from address space.

Parameters

ds	Dataspace of the event buffer.
rm	Region manager to attach buffer to.

Returns

0 on success, negative error code otherwise.

Definition at line 44 of file event_buffer.

15.322.2.2 buf()

```
template<typename PAYLOAD>
void * L4Re::Util::Event_buffer_t< PAYLOAD >::buf () const  [inline], [noexcept]
```

Return the buffer.

Returns

Pointer to the event buffer.

Definition at line 34 of file event_buffer.

15.322.2.3 detach()

```
template<typename PAYLOAD>
long L4Re::Util::Event_buffer_t< PAYLOAD >::detach (
             L4::Cap< L4Re::Rm > rm)  [inline], [noexcept]
```

Detach event buffer from address space.

Parameters

rm	Region manager to detach buffer from.

Returns

0 on success, negative error code otherwise.

Definition at line 67 of file event_buffer.

  int init (L4::Cap< L4Re::Event > event, L4Re::Env const *env=L4Re::Env::env(), L4Re::Cap_alloc *ca=&L4Re::Util::cap_alloc)

  Initialise an event object.
- int init_poll (L4::Cap< L4Re::Event > event, L4Re::Env const *env=L4Re::Env::env(), L4Re::Cap_alloc *ca=&L4Re::Util::cap_alloc)

  Initialise an event object in polling mode.
- L4Re::Event_buffer_t< PAYLOAD > & buffer ()

  Get event buffer.
- L4::Cap< L4::Triggerable > irq () const

  Get event IRQ.

15.324.1 Detailed Description

template<typename PAYLOAD>
class L4Re::Util::Event_t< PAYLOAD >

Convenience wrapper for getting access to an event object.
After calling init() the class supplies the event-buffer and the associated IRQ object.
Definition at line 32 of file event.

15.324.2 Member Enumeration Documentation

15.324.2.1 Mode

```
template<typename PAYLOAD>
enum L4Re::Util::Event_t::Mode
```

Modes of operation.

Enumerator

Mode_irq	Create an IRQ and attach, to get notifications.
Mode_polling	Do not use an IRQ.

Definition at line 38 of file event.

15.324.3 Member Function Documentation

15.324.3.1 buffer()

```
template<typename PAYLOAD>
L4Re::Event_buffer_t< PAYLOAD > & L4Re::Util::Event_t< PAYLOAD >::buffer ()  [inline]
```

Get event buffer.

Returns

Event buffer object.

Definition at line 148 of file event.

15.324.3.2 init()

```
template<typename PAYLOAD>
template<typename IRQ_TYPE>
int L4Re::Util::Event_t< PAYLOAD >::init (
            L4::Cap< L4Re::Event > event,
            L4Re::Env const * env = L4Re::Env::env(),
            L4Re::Cap_alloc * ca = &L4Re::Util::cap_alloc)  [inline]
```

Initialise an event object.

Template Parameters

IRQ_TYPE	Type used for handling notifications from the event provider. This must be derived from L4::Triggerable.

Parameters

event	Capability to event.
env	Pointer to L4Re-Environment
ca	Pointer to capability allocator.

Return values

0	Success
-L4_ENOMEM	No memory to allocate required capabilities.
<0	Other IPC errors.

Definition at line 59 of file event.

15.324.3.3 init_poll()

```
template<typename PAYLOAD>
int L4Re::Util::Event_t< PAYLOAD >::init_poll (
```

```
L4::Cap< L4Re::Event > event,
L4Re::Env const * env = L4Re::Env::env(),
L4Re::Cap_alloc * ca = &L4Re::Util::cap_alloc)  [inline]
```

Initialise an event object in polling mode.

Parameters

event	Capability to event.
env	Pointer to L4Re-Environment
ca	Pointer to capability allocator.

Return values

0	Success
-L4_ENOMEM	No memory to allocate required capabilities.
<0	Other IPC errors.

Definition at line 112 of file event.

15.324.3.4 irq()

```
template<typename PAYLOAD>
L4::Cap< L4::Triggerable > L4Re::Util::Event_t< PAYLOAD >::irq () const  [inline]
```

Get event IRQ.

Returns

Event IRQ.

Definition at line 155 of file event.

Additional Inherited Members

Public Types inherited from cxx::String

- typedef char const ∗ **Index**

  Character index type.

Public Member Functions inherited from cxx::String

- **String** (char const ∗s) noexcept

  Initialize from a zero-terminated string.
- **String** (char const ∗s, unsigned long len) noexcept

  Initialize from a pointer to first character and a length.
- String (char const ∗s, char const ∗e) noexcept

  Initialize with start and end pointer.
- **String** ()

  Zero-initialize. Create an invalid string.
- Index **start** () const

  Pointer to first character.
- Index **end** () const

Pointer to first byte behind the string.

- int **len** () const

  Length.
- void **start** (char const *s)

  Set start.
- void **len** (unsigned long len)

  Set length.
- bool **empty** () const

  Check if the string has length zero.
- String **head** (Index end) const

  Return prefix up to index.
- String **head** (unsigned long end) const

  Prefix of length `end`.
- String **substr** (unsigned long idx, unsigned long len=~0UL) const

  Substring of length `len` starting at `idx`.
- String **substr** (char const *start, unsigned long len=0) const

  Substring of length `len` starting at `start`.
- template<typename F>
  char const * **find_match** (F &&match) const

  Find matching character. `match` should be a function such as `isspace`.
- char const * **find** (char const *c) const

  Find character. Return end() if not found.
- char const * **find** (int c) const

  Find character. Return end() if not found.
- char const * **rfind** (char const *c) const

  Find right-most character. Return end() if not found.
- Index starts_with (cxx::String const &c) const

  Check if `c` is a prefix of string.
- char const * **find** (int c, char const *s) const

  Find character `c` starting at position `s`. Return end() if not found.
- char const * find (char const *c, char const *s) const

  Find character set at position.
- char const & **operator[ ]** (unsigned long idx) const

  Get character at `idx`.
- char const & **operator[ ]** (int idx) const

  Get character at `idx`.
- char const & **operator[ ]** (Index idx) const

  Get character at `idx`.
- bool **eof** (char const *s) const

  Check if pointer `s` points behind string.
- template<typename INT>
  int from_dec (INT *v) const

  Convert decimal string to integer.
- template<typename INT>
  int from_hex (INT *v) const

  Convert hex string to integer.
- template<typename INT>
  int from_number (INT *v, unsigned base=0) const

  Convert a number string to an integer.
- bool **operator==** (String const &o) const

  Equality.
- bool **operator!=** (String const &o) const

  Inequality.

15.326.1 Detailed Description

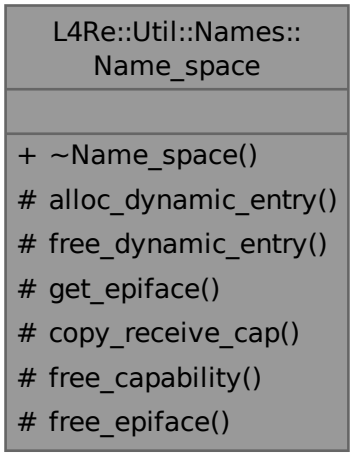
15.327 L4Re::Util::Names::Name_space Class Reference

Abstract server-side implementation of the L4::Namespace interface.
`#include <name_space_svr>`
Collaboration diagram for L4Re::Util::Names::Name_space:



Public Member Functions

- virtual ~**Name_space** ()

  The destructor of the derived class is responsible for freeing resources.

Protected Member Functions

- virtual Entry * alloc_dynamic_entry (Name const &n, unsigned flags)=0

  Allocate a new entry for the given name.
- virtual void free_dynamic_entry (Entry *e)=0

  Free an entry previously allocated with alloc_dynamic_entry().
- virtual l4_ret_t get_epiface (l4_umword_t data, bool is_local, L4::Epiface **lo)=0

  Return a pointer to the epiface assigned to a given label.
- virtual l4_ret_t copy_receive_cap (L4::Cap< void > *cap)=0

  Return the receive capability for permanent use.
- virtual void free_capability (L4::Cap< void > cap)=0

  Free a capability previously acquired with copy_receive_cap().
- virtual void free_epiface (L4::Epiface *epiface)=0

  Free epiface previously acquired with get_epiface().

15.327.1 Detailed Description

Abstract server-side implementation of the L4::Namespace interface.

Note

The derived class is responsible for resource management through the provided interfaces. This includes freeing all resources on destruction!

Definition at line 180 of file name_space_svr.

15.327.2 Member Function Documentation

15.327.2.1 alloc_dynamic_entry()

```
virtual Entry * L4Re::Util::Names::Name_space::alloc_dynamic_entry (
            Name const & n,
            unsigned flags)  [protected], [pure virtual]
```

Allocate a new entry for the given name.

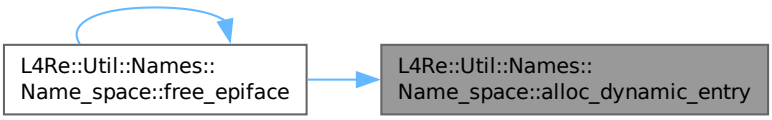
Parameters

n	Name of the entry, must be copied.
flags	Entry flags, see Obj::Flags.

Returns

A pointer to the newly allocated entry or NULL on error.

This method is called when a new entry was received. It must allocate memory, copy `n` out of the receive buffer and wrap everything in an Entry.
Referenced by free_epiface().
Here is the caller graph for this function:



15.327.2.2 copy_receive_cap()

```
virtual l4_ret_t L4Re::Util::Names::Name_space::copy_receive_cap (
            L4::Cap< void > * cap)  [protected], [pure virtual]
```

Return the receive capability for permanent use.

Parameters

`out`	*cap*	Capability slot with the received capability. Must be permanently available until free_capability() is called.

This method is called when a new entry is registered together with a capability mapping. It must decide whether and where to store the capability and return the final capability slot. Typical implementations return the capability slot in the receive window and allocate a new receive window.

15.327.2.3 free_capability()

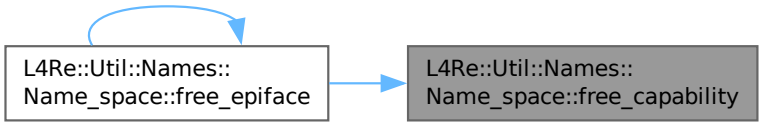
```
virtual void L4Re::Util::Names::Name_space::free_capability (
            L4::Cap< void > cap)  [protected], [pure virtual]
```

Free a capability previously acquired with copy_receive_cap().

Parameters

in	*cap*	Capability to free.

Counterpart of copy_receive_cap. Free the capability slot when the entry is deleted or changed.
Referenced by free_epiface().
Here is the caller graph for this function:



15.327.2.4 free_dynamic_entry()

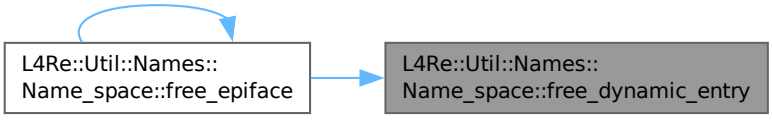
```
virtual void L4Re::Util::Names::Name_space::free_dynamic_entry (
            Entry * e)  [protected], [pure virtual]
```

Free an entry previously allocated with alloc_dynamic_entry().

Parameters

e	Entry to free.

Referenced by free_epiface().
Here is the caller graph for this function:



15.327.2.5 free_epiface()

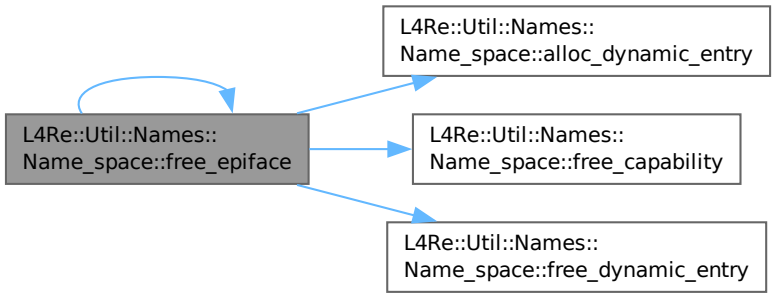
```
virtual void L4Re::Util::Names::Name_space::free_epiface (
            L4::Epiface * epiface)  [protected], [pure virtual]
```

Free epiface previously acquired with get_epiface().

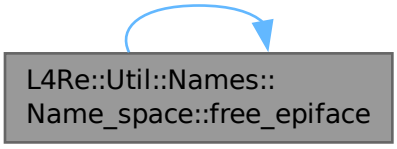
Parameters

in	*epiface*	Epiface to free.

Called when an entry that points to an epiface is deleted allowing implementations that hold resources to free them.
References alloc_dynamic_entry(), free_capability(), free_dynamic_entry(), free_epiface(), L4_BASE_TASK_CAP, L4_EEXIST, L4_ENOMEM, and L4Re::Namespace::Overwrite.
Referenced by free_epiface().
Here is the call graph for this function:



Here is the caller graph for this function:



15.327.2.6 get_epiface()

```
virtual l4_ret_t L4Re::Util::Names::Name_space::get_epiface (
            l4_umword_t data,
            bool is_local,
            L4::Epiface ** lo)  [protected], [pure virtual]
```

Return a pointer to the epiface assigned to a given label.

Parameters

in	*data*	Label or in the local case the capability slot of the receiving capability.
in	*is_local*	If true, a local capability slot was supplied, if false the label of a locally bound IPC gate.
out	*lo*	Pointer to epiface responsible for the capability.

Returns

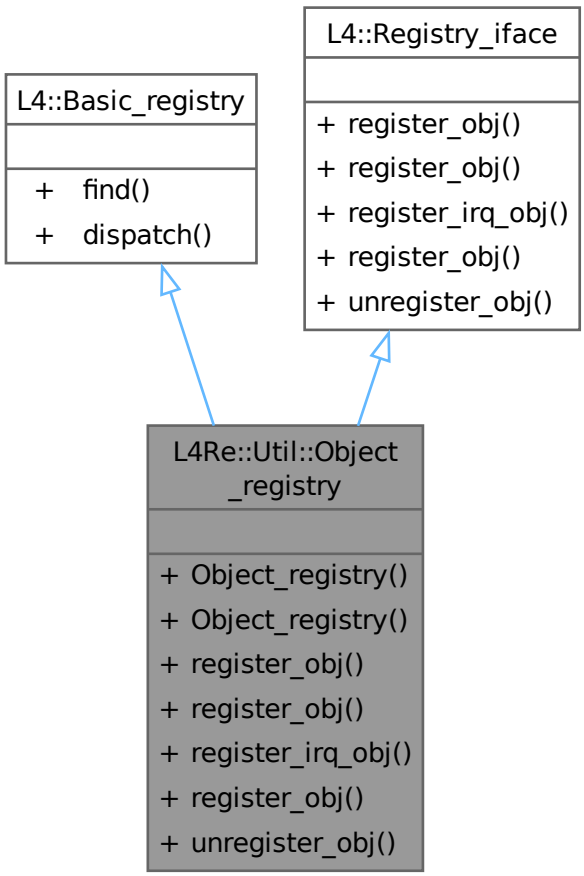
L4_EOK if a valid interface could be found or an error message otherwise.

This method is called when a new entry is registered and some local ID was received for the capability. In this case, the generic implementation needs to get the epiface in order to get the capability.
The callee must make sure that the epiface remains valid until free_epiface is called. In particular, the capability slot must not be reallocated as long as the namespace server holds a reference to the epiface.
The documentation for this class was generated from the following file:

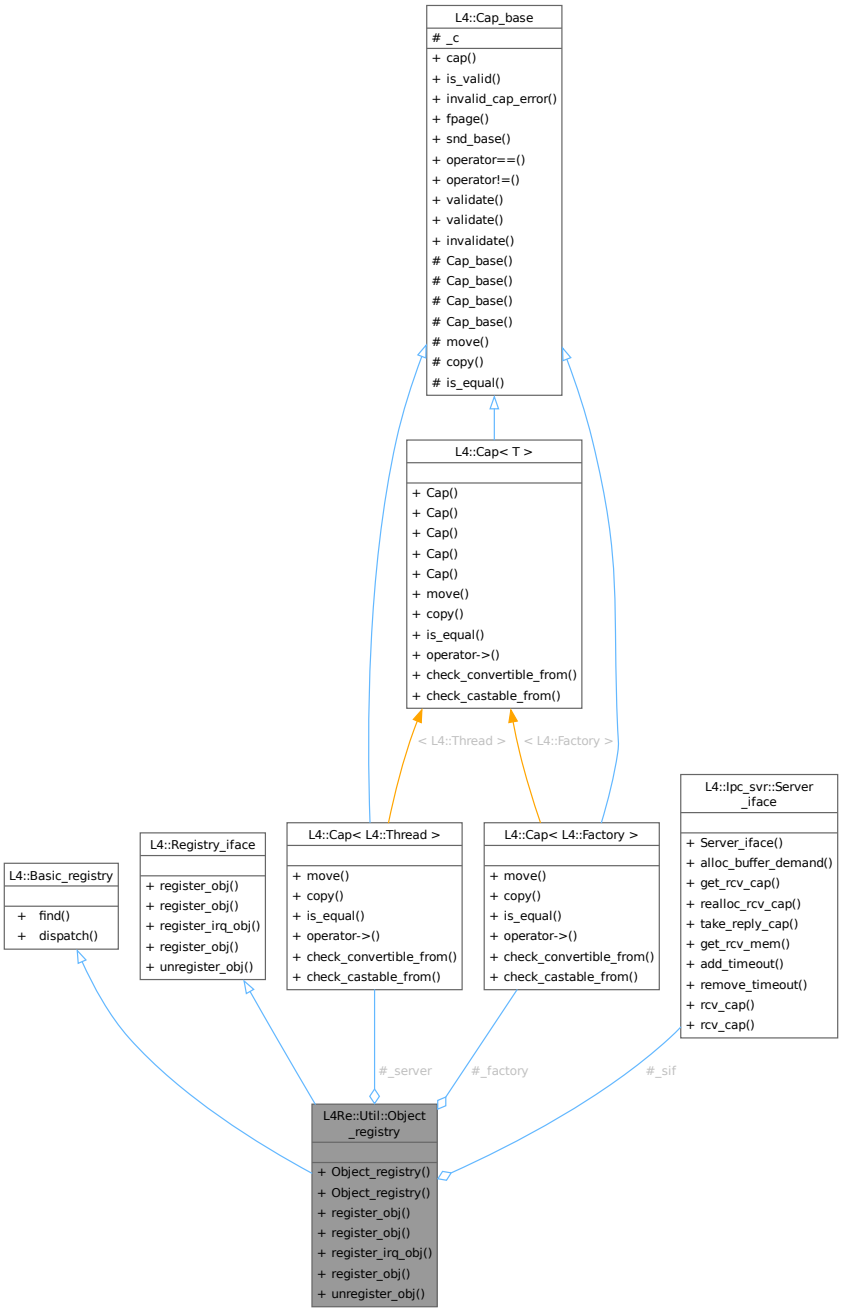
- l4/re/util/name_space_svr

15.328 L4Re::Util::Object_registry Class Reference

A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread.
`#include <object_registry>`
Inheritance diagram for L4Re::Util::Object_registry:



Collaboration diagram for L4Re::Util::Object_registry:



Public Member Functions

- Object_registry (L4::Ipc_svr::Server_iface ∗sif)

  Create a registry for the main thread of the task using the default factory.
- Object_registry (L4::Ipc_svr::Server_iface ∗sif, L4::Cap< L4::Thread > server, L4::Cap< L4::Factory > factory)

  Create a registry for arbitrary threads.
- L4::Cap< void > register_obj (L4::Epiface ∗o, char const ∗service) override

  Register a new server object to a pre-allocated receive endpoint.
- L4::Cap< void > register_obj (L4::Epiface ∗o) override

Register a new server object on a newly allocated capability.

- L4::Cap< L4::Irq > register_irq_obj (L4::Epiface *o) override

  Register a handler for an interrupt.

- L4::Cap< L4::Rcv_endpoint > register_obj (L4::Epiface *o, L4::Cap< L4::Rcv_endpoint > ep) override

  Register a handler for an already existing interrupt.

- void unregister_obj (L4::Epiface *o, bool unmap=true) override

  Remove a server object from the handler list.

Additional Inherited Members

Static Public Member Functions inherited from L4::Basic_registry

- static Value * find (l4_umword_t label)

  Get the server object for an Ipc_gate label.

- static l4_msgtag_t dispatch (l4_msgtag_t tag, l4_umword_t label, l4_utcb_t *utcb)

  The dispatch function called by the server loop.

15.328.1 Detailed Description

A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread.
This class manages most of the setup of a server object. If necessary, an IPC gate is created, the specified thread is bound to the IPC gate. Incoming IPC is dispatched to the server object based on the label of the IPC gate.
The object registry is also able to manage IRQ endpoints. They require a different method for the object creation. Otherwise they are handled in the same way as IPC gates: a server object is responsible to process the incoming interrupts.
Definition at line 41 of file object_registry.

15.328.2 Constructor & Destructor Documentation

15.328.2.1 Object_registry() [1/2]

```
L4Re::Util::Object_registry::Object_registry (
            L4::Ipc_svr::Server_iface * sif)  [inline], [explicit]
```

Create a registry for the main thread of the task using the default factory.

Parameters

sif	Server loop interface.

Definition at line 67 of file object_registry.

15.328.2.2 Object_registry() [2/2]

```
L4Re::Util::Object_registry::Object_registry (
            L4::Ipc_svr::Server_iface * sif,
            L4::Cap< L4::Thread > server,
            L4::Cap< L4::Factory > factory)  [inline]
```

Create a registry for arbitrary threads.

Parameters

sif	Server loop interface.
server	Capability to the thread that executes the server objects.
factory	Capability to a factory object capable of creating new IPC gates.

Definition at line 81 of file object_registry.

15.328.3 Member Function Documentation

15.328.3.1 register_irq_obj()

```
L4::Cap< L4::Irq > L4Re::Util::Object_registry::register_irq_obj (
            L4::Epiface * o)  [inline], [override], [virtual]
```

Register a handler for an interrupt.

Parameters

o	Server object that handles IRQs.

Return values

L4::Cap<L4::Irq>	Capability to a new IRQ object on success.
L4::Cap<L4::Irq>::Invalid	The allocation of the IRQ has failed.

The IRQ will be newly allocated using the registry's factory object. The caller must call unregister_obj() to free all resources.
Implements L4::Registry_iface.
Definition at line 227 of file object_registry.

15.328.3.2 register_obj() [1/3]

```
L4::Cap< void > L4Re::Util::Object_registry::register_obj (
            L4::Epiface * o)  [inline], [override], [virtual]
```

Register a new server object on a newly allocated capability.

Parameters

o	Server object that handles IPC requests.

Return values

L4::Cap<void>	A valid capability to a new IPC gate.
L4::Cap<void>::Invalid	The allocation of the IPC gate has failed.

The IPC gate will be allocated using the registry's factory. The caller must call unregister_obj() to free all resources.
Implements L4::Registry_iface.
Definition at line 211 of file object_registry.

15.328.3.3 register_obj() [2/3]

```
L4::Cap< void > L4Re::Util::Object_registry::register_obj (
            L4::Epiface * o,
            char const * service)  [inline], [override], [virtual]
```

Register a new server object to a pre-allocated receive endpoint.

Parameters

o	Server object that handles IPC requests.

service	Name of a pre-allocated receive endpoint.

Return values

L4::Cap<void>	The capability known as `service` on success.
L4::Cap<void>::Invalid	No capability with the given name found.

The interface must be freed with unregister_obj() by the caller to unbind the thread from the capability.
Implements L4::Registry_iface.
Definition at line 194 of file object_registry.

15.328.3.4 register_obj() [3/3]

```
L4::Cap< L4::Rcv_endpoint > L4Re::Util::Object_registry::register_obj (
            L4::Epiface * o,
            L4::Cap< L4::Rcv_endpoint > ep)  [inline], [override], [virtual]
```

Register a handler for an already existing interrupt.

Parameters

o	Server object that handles the IPC.
ep	Capability to a receive endpoint, may be a hardware or software interrupt or an IPC gate.

Return values

L4::Cap<L4::Rcv_endpoint>	Capability `ep` on success.
L4::Cap<L4::Rcv_endpoint>::Invalid	The IRQ attach operation has failed.

The interface must be freed with unregister_obj() by the caller to unbind the thread from the capability.
Implements L4::Registry_iface.
Definition at line 246 of file object_registry.

15.328.3.5 unregister_obj()

```
void L4Re::Util::Object_registry::unregister_obj (
            L4::Epiface * o,
            bool unmap = true)  [inline], [override], [virtual]
```

Remove a server object from the handler list.

Parameters

o	Server object to unbind.
unmap	Specifies if the object capability shall be unmapped (true) or not. The default (true) is to unmap the capability.

The capability used by the server object will be unmapped if `unmap` is true.
Implements L4::Registry_iface.
Definition at line 262 of file object_registry.
References L4::Thread::Modify_senders::add(), L4Re::Util::cap_alloc, L4::Cap_base::fpage(), L4::Cap_base::Invalid, L4::Cap_base::is_valid(), L4Re::Util::L4_FP_ALL_SPACES, L4_INVALID_CAP, L4::Epiface::obj_cap(), and L4::Epiface::set_server().

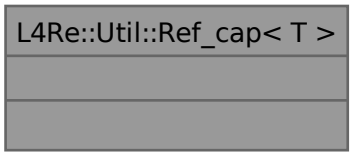
15.329 L4Re::Util::Ref_cap< T > Struct Template Reference

Automatic capability that implements automatic free and unmap of the capability slot.
`#include <cap_alloc>`
Collaboration diagram for L4Re::Util::Ref_cap< T >:



15.329.1 Detailed Description

template<typename T>
struct L4Re::Util::Ref_cap< T >

Automatic capability that implements automatic free and unmap of the capability slot.

Template Parameters

T	Type of the object that is referred by the capability.

This kind of automatic capability implements a counted reference to a capability slot. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.
Usage:

```
L4Re::Util::Ref_cap<L4Re::Dataspace>::Cap global_ds_cap;

{
  L4Re::Util::Ref_cap<L4Re::Dataspace>::Cap
    ds_cap(L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>());
  // reference count for the allocated capability slot is now 1

  // use the dataspace cap
  L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

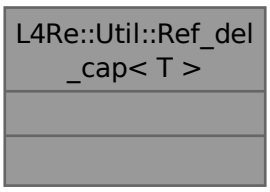
  global_ds_cap = ds_cap;
  // reference count is now 2
  ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
```

Definition at line 184 of file cap_alloc.
The documentation for this struct was generated from the following file:

- l4/re/util/cap_alloc

15.330 L4Re::Util::Ref_del_cap< T > Struct Template Reference

Automatic capability that implements automatic free and unmap+delete of the capability slot.
`#include <cap_alloc>`
Collaboration diagram for L4Re::Util::Ref_del_cap< T >:



15.330.1 Detailed Description

template<typename T>
struct L4Re::Util::Ref_del_cap< T >

Automatic capability that implements automatic free and unmap+delete of the capability slot.

Template Parameters

T	Type of the object that is referred by the capability.

This kind of automatic capability implements a counted reference to a capability slot. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to Ref_cap is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.
Usage:

```
L4Re::Util::Ref_del_cap<L4Re::Dataspace>::Cap global_ds_cap;

{
  L4Re::Util::Ref_del_cap<L4Re::Dataspace>::Cap
    ds_cap(L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>());
  // reference count for the allocated capability slot is now 1

  // use the dataspace cap
```

```
  L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

  global_ds_cap = ds_cap;
  // reference count is now 2
  ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
...
global_ds_cap = L4_INVALID_CAP;
// reference count dropped to 0 (data space shall be deleted).
```

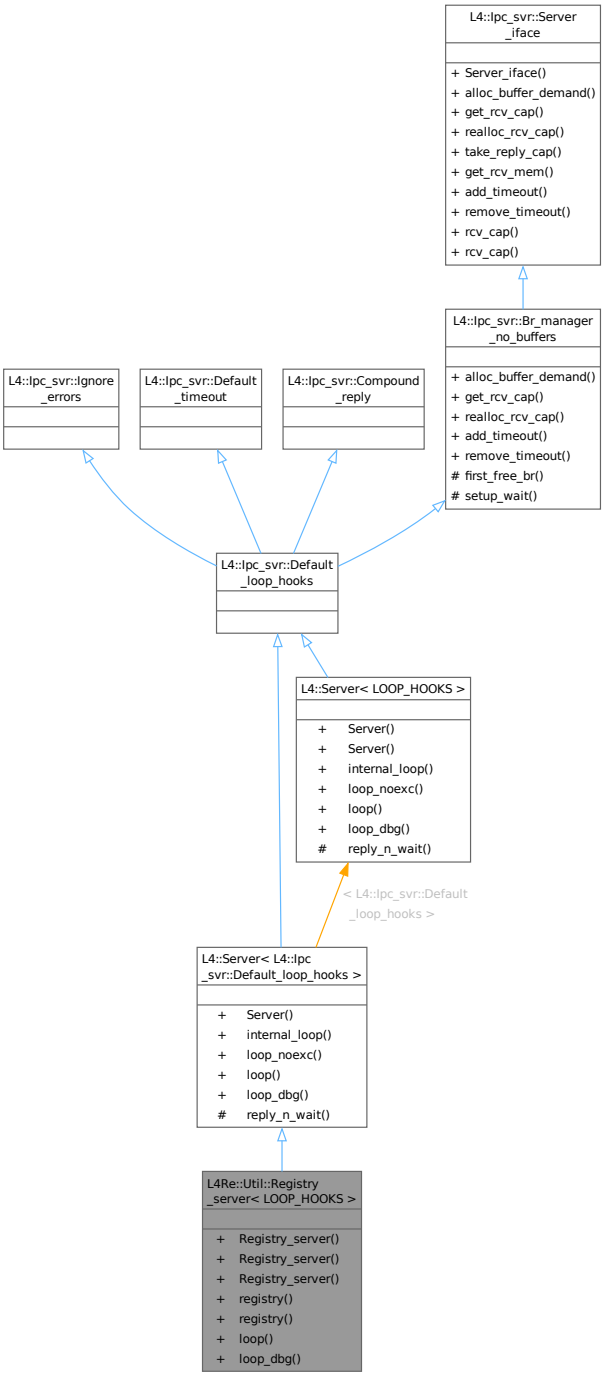
15.331 L4Re::Util::Registry_server< LOOP_HOOKS > Class Template Reference

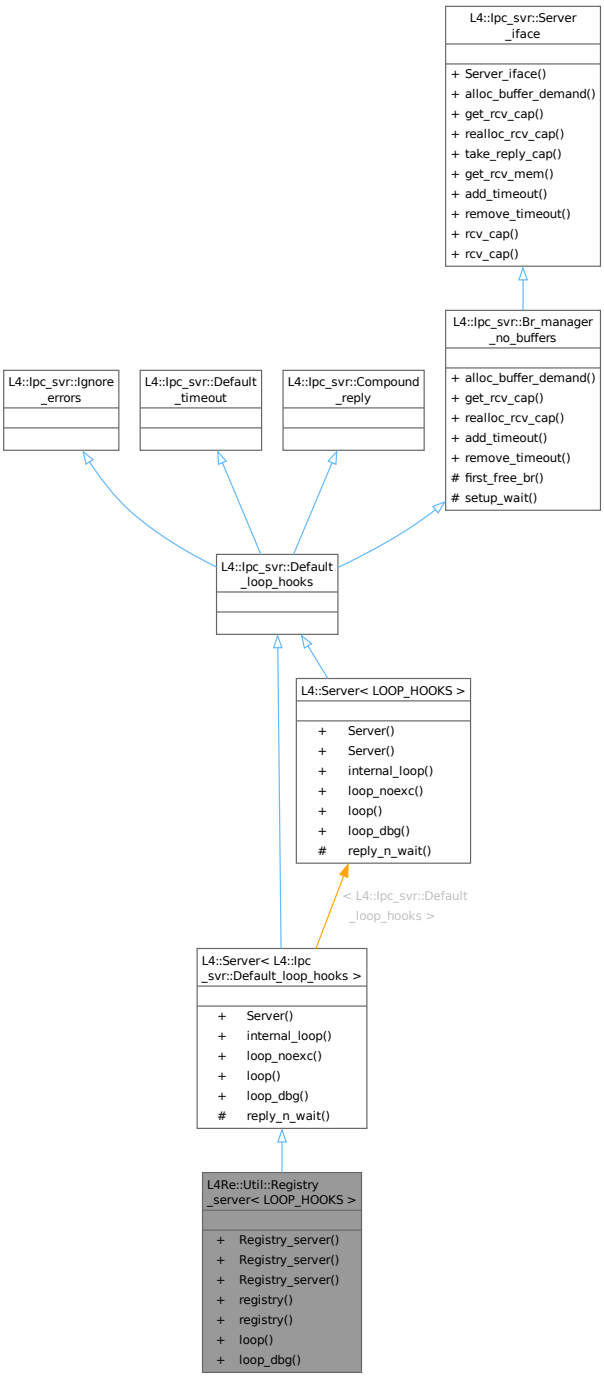
A server loop object which has a Object_registry included.

`#include <object_registry>`

Inheritance diagram for L4Re::Util::Registry_server< LOOP_HOOKS >:



Collaboration diagram for L4Re::Util::Registry_server< LOOP_HOOKS >:



Public Member Functions

- Registry_server ()

  Create a new server loop object for the main thread of the task.
- Registry_server (l4_utcb_t *, L4::Cap< L4::Thread > server, L4::Cap< L4::Factory > factory)

  Create a new server loop object for an arbitrary thread and factory.
- Registry_server (L4::Cap< L4::Thread > server, L4::Cap< L4::Factory > factory)

  Create a new server loop object for an arbitrary thread and factory.

- Object_registry const * **registry** () const

  Return registry of this server loop.
- Object_registry * **registry** ()

  Return registry of this server loop.
- void L4_NORETURN loop (l4_utcb_t *utcb=l4_utcb())

  Start the server loop.
- template<typename Printer>
  void L4_NORETURN loop_dbg (Printer printer, l4_utcb_t *utcb=l4_utcb())

  Start the server loop with error printing.

Public Member Functions inherited from L4::Server< L4::Ipc_svr::Default_loop_hooks >

- Server (l4_utcb_t *)

  Initializes the server loop.
- L4_NORETURN void internal_loop (DISPATCH dispatch, l4_utcb_t *)

  The server loop.
- L4_NORETURN void **loop_noexc** (R r, l4_utcb_t *u=l4_utcb())

  Server loop without exception handling.
- L4_NORETURN void loop (R r, l4_utcb_t *u=l4_utcb())

  Server loop with internal exception handling.
- L4_NORETURN void loop_dbg (R r, Printer p, l4_utcb_t *u=l4_utcb())

  Server loop with internal exception handling including message printing.

Public Member Functions inherited from L4::Ipc_svr::Br_manager_no_buffers

- int alloc_buffer_demand (Demand const &demand) override

  Tells the server to allocate buffers for the given demand.
- L4::Cap< void > **get_rcv_cap** (int) const override

  Returns L4::Cap<void>::Invalid, we have no buffer management.
- int **realloc_rcv_cap** (int) override

  Returns -L4_ENOMEM, we have no buffer management.
- int **add_timeout** (Timeout *, l4_kernel_clock_t) override

  Returns -L4_ENOSYS, we have no timeout queue.
- int **remove_timeout** (Timeout *) override

  Returns -L4_ENOSYS, we have no timeout queue.

Public Member Functions inherited from L4::Ipc_svr::Server_iface

- **Server_iface** ()

  Make a server interface.
- virtual cxx::Result< L4::Reply_cap > take_reply_cap () noexcept

  Take the currently used reply capability.
- virtual cxx::Result< Mem_window > get_rcv_mem () noexcept

  Take the current memory receive window.
- template<typename T>
  L4::Cap< T > rcv_cap (int index) const

  Get given receive buffer as typed capability.
- L4::Cap< void > rcv_cap (int index) const

  Get receive cap with the given index as generic (void) type.

Additional Inherited Members

Public Types inherited from L4::Ipc_svr::Server_iface

- using **Demand** = L4::Type_info::Demand

  Data type expressing server-side demand for receive buffers.

Protected Member Functions inherited from L4::Server< L4::Ipc_svr::Default_loop_hooks >

- l4_msgtag_t **reply_n_wait** (l4_msgtag_t reply, l4_umword_t *p, l4_utcb_t *)

  Internal implementation for reply and wait.

Protected Member Functions inherited from L4::Ipc_svr::Br_manager_no_buffers

- unsigned **first_free_br** () const

  Returns 1 as first free buffer.
- void **setup_wait** (l4_utcb_t *utcb, L4::Ipc_svr::Reply_mode)

  Setup wait function for the server loop (Server<>).

15.331.1 Detailed Description

template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
class L4Re::Util::Registry_server< LOOP_HOOKS >

A server loop object which has a Object_registry included.

Examples

examples/clntsrv/src/server.cc, examples/libs/l4re/c++/shared_ds/ds_srv.cc, and examples/libs/l4re/streammap/server.cc.

Definition at line 293 of file object_registry.

15.331.2 Constructor & Destructor Documentation

15.331.2.1 Registry_server() [1/3]

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server ()  [inline]
```

Create a new server loop object for the main thread of the task.

Precondition

Must be called from the main thread or behaviour is undefined.

Definition at line 305 of file object_registry.

15.331.2.2 Registry_server() [2/3]

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server (
            l4_utcb_t * ,
            L4::Cap< L4::Thread > server,
            L4::Cap< L4::Factory > factory)  [inline]
```

Create a new server loop object for an arbitrary thread and factory.

Parameters

server	Capability to thread running the server loop.
factory	Capability to factory object used to create new IPC gates.

Deprecated Note that this variant of the constructor is deprecated, please do not supply the UTCB pointer, it's not used.

Definition at line 317 of file object_registry.

15.331.2.3 Registry_server() [3/3]

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server (
            L4::Cap< L4::Thread > server,
            L4::Cap< L4::Factory > factory)  [inline]
```

Create a new server loop object for an arbitrary thread and factory.

Parameters

server	Capability to thread running the server loop.
factory	Capability to factory object used to create new IPC gates.

Definition at line 328 of file object_registry.

15.331.3 Member Function Documentation

15.331.3.1 loop()

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
void L4_NORETURN L4Re::Util::Registry_server< LOOP_HOOKS >::loop (
            l4_utcb_t * utcb = l4_utcb())  [inline]
```

Start the server loop.

Parameters

utcb	The UTCB of the thread running the server loop, defaults to l4_utcb().

Definition at line 344 of file object_registry.
References L4_NORETURN, and loop().
Referenced by loop().
Here is the call graph for this function:

Here is the caller graph for this function:

15.331.3.2 loop_dbg()

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
template<typename Printer>
void L4_NORETURN L4Re::Util::Registry_server< LOOP_HOOKS >::loop_dbg (
            Printer printer,
            l4_utcb_t * utcb = l4_utcb())  [inline]
```

Start the server loop with error printing.

Template Parameters

Printer	The printer type.

Parameters

printer	The printer object on which printf() is called.
utcb	The UTCB of the thread running the server loop, defaults to l4_utcb().

Definition at line 356 of file object_registry.
References L4_NORETURN, and loop_dbg().
Referenced by loop_dbg().
Here is the call graph for this function:

Here is the caller graph for this function:

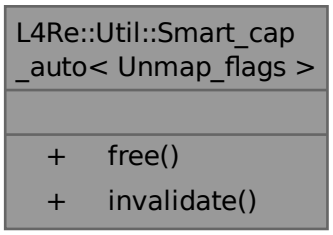
15.332 L4Re::Util::Smart_cap_auto< Unmap_flags > Class Template Reference

Helper for Unique_cap and Unique_del_cap.
`#include <cap_alloc>`
Collaboration diagram for L4Re::Util::Smart_cap_auto< Unmap_flags >:



Static Public Member Functions

- static void **free** (L4::Cap_base &c)

  Free the provided capability.
- static void **invalidate** (L4::Cap_base &c)

  Invalidate the provided capability.

15.332.1 Detailed Description

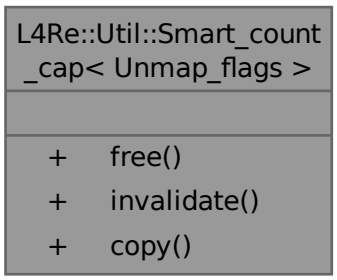
template<unsigned long Unmap_flags = L4_FP_ALL_SPACES>
class L4Re::Util::Smart_cap_auto< Unmap_flags >

Helper for Unique_cap and Unique_del_cap.
Definition at line 87 of file cap_alloc.
The documentation for this class was generated from the following file:

- l4/re/util/cap_alloc

15.333 L4Re::Util::Smart_count_cap< Unmap_flags > Class Template Reference

Helper for Ref_cap and Ref_del_cap.
`#include <cap_alloc>`
Collaboration diagram for L4Re::Util::Smart_count_cap< Unmap_flags >:



Static Public Member Functions

- static void **free** (L4::Cap_base &c) noexcept

  Free operation for L4::Smart_cap (decrement ref count and delete if 0).
- static void **invalidate** (L4::Cap_base &c) noexcept

  Invalidate operation for L4::Smart_cap.
- static L4::Cap_base **copy** (L4::Cap_base const &src)

  Copy operation for L4::Smart_cap (increment ref count).

15.333.1 Detailed Description

template<unsigned long Unmap_flags = L4_FP_ALL_SPACES>
class L4Re::Util::Smart_count_cap< Unmap_flags >

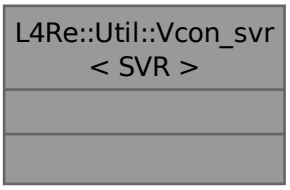
Helper for Ref_cap and Ref_del_cap.
Definition at line 118 of file cap_alloc.
The documentation for this class was generated from the following file:

- l4/re/util/cap_alloc

15.334 L4Re::Util::Vcon_svr< SVR > Class Template Reference

Console server template class.
`#include <vcon_svr>`

Collaboration diagram for L4Re::Util::Vcon_svr< SVR >:



15.334.1 Detailed Description

template<typename SVR>
class L4Re::Util::Vcon_svr< SVR >

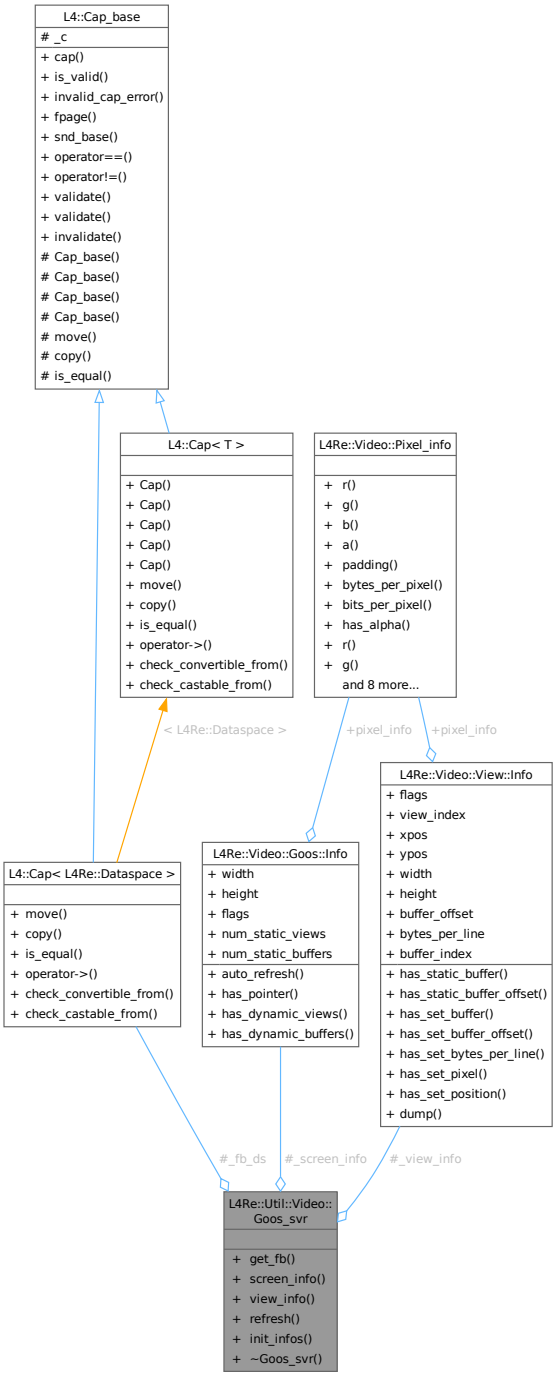
Console server template class.
This template uses vcon_write() and vcon_read() to get and deliver data from the implementor.
vcon_read() needs to update the status argument with the L4_vcon_read_stat flags, especially the L4_VCON_↩READ_STAT_DONE flag to indicate that there's nothing more to read for the other end.
vcon_write() gets the live data from the UTCB. Make sure to copy out the data before using the UTCB again.
The size parameter of both functions is given in bytes.
Definition at line 36 of file vcon_svr.
The documentation for this class was generated from the following file:

- l4/re/util/vcon_svr

15.335 L4Re::Util::Video::Goos_svr Class Reference

Goos server class.
`#include <goos_svr>`

Collaboration diagram for L4Re::Util::Video::Goos_svr:



Public Member Functions

- L4::Cap< L4Re::Dataspace > get_fb () const

  Return framebuffer memory dataspace.
- L4Re::Video::Goos::Info const * screen_info () const

  Goos information structure.
- L4Re::Video::View::Info const * view_info () const

  View information structure.

- virtual int refresh (int x, int y, int w, int h)

  Refresh area of the framebuffer.
- void init_infos ()

  Initialize the view information structure of this object.
- virtual ~**Goos_svr** ()

  Destructor.

Protected Attributes

- L4::Cap< L4Re::Dataspace > **_fb_ds**

  Goos memory dataspace.
- L4Re::Video::Goos::Info **_screen_info**

  Goos information.
- L4Re::Video::View::Info **_view_info**

  View information.

15.335.1 Detailed Description

Goos server class.
Definition at line 24 of file goos_svr.

15.335.2 Member Function Documentation

15.335.2.1 get_fb()

```
L4::Cap< L4Re::Dataspace > L4Re::Util::Video::Goos_svr::get_fb () const  [inline]
```

Return framebuffer memory dataspace.

Returns

Goos memory dataspace

Definition at line 41 of file goos_svr.
References _fb_ds.

15.335.2.2 init_infos()

```
void L4Re::Util::Video::Goos_svr::init_infos ()  [inline]
```

Initialize the view information structure of this object.
This function initializes the view info structure of this goos object based on the information in the goos information, i.e. the width, height and pixel_info of the goos information has to contain valid values before calling init_info().
Definition at line 77 of file goos_svr.
References _screen_info, and _view_info.

15.335.2.3 refresh()

```
virtual int L4Re::Util::Video::Goos_svr::refresh (
            int x,
            int y,
            int w,
            int h)  [inline], [virtual]
```

Refresh area of the framebuffer.

Parameters

x	X coordinate (pixels)
y	Y coordinate (pixels)

w	Width of area in pixels
h	Height of area in pixels

Returns

0 on success, negative error code otherwise

Definition at line 65 of file goos_svr.
References L4_ENOSYS.

15.335.2.4 screen_info()

```
L4Re::Video::Goos::Info const * L4Re::Util::Video::Goos_svr::screen_info () const  [inline]
```

Goos information structure.

Returns

Return goos information structure.

Definition at line 47 of file goos_svr.
References _screen_info.

15.335.2.5 view_info()

```
L4Re::Video::View::Info const * L4Re::Util::Video::Goos_svr::view_info () const  [inline]
```

View information structure.

Returns

Return view information structure.

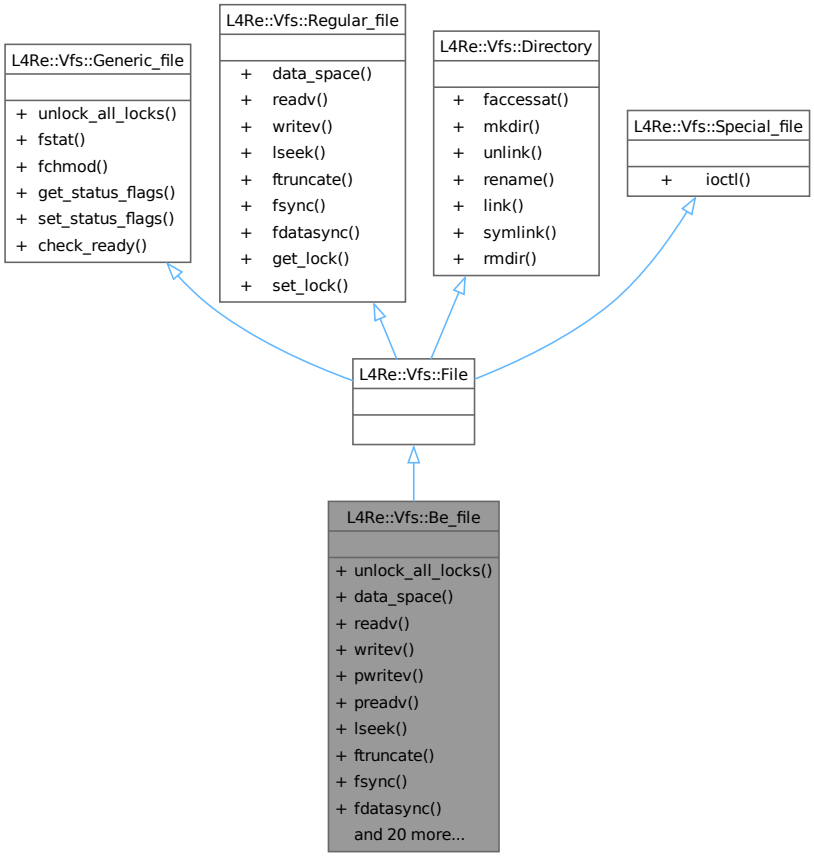
Definition at line 53 of file goos_svr.
References _view_info.
The documentation for this class was generated from the following file:

- l4/re/util/video/goos_svr

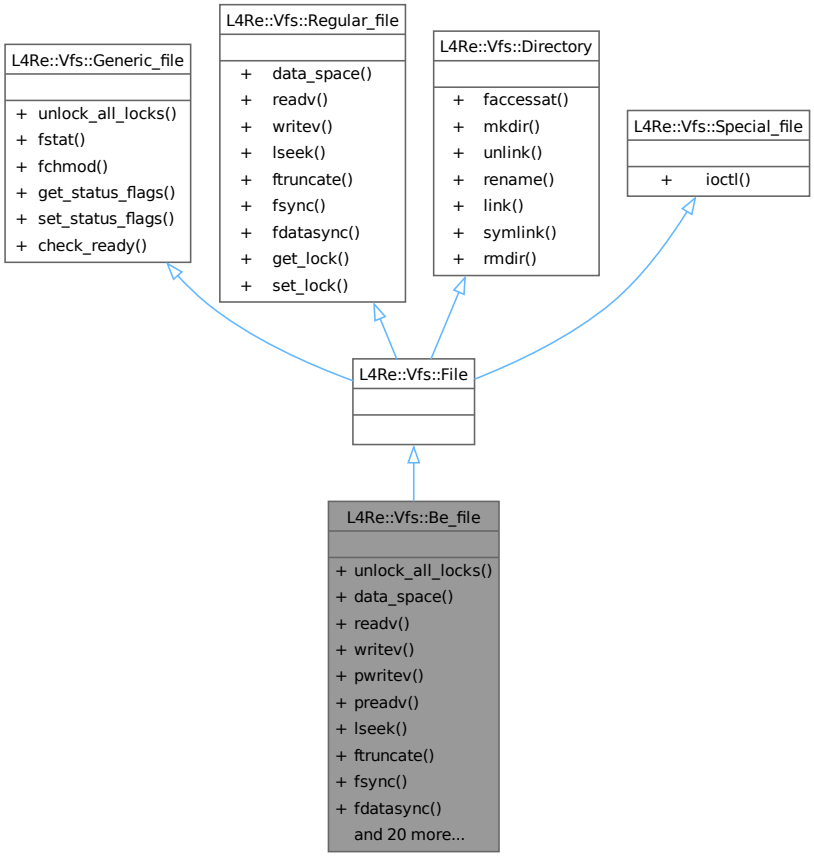
15.336 L4Re::Vfs::Be_file Class Reference

Boiler plate class for implementing an open file for L4Re::Vfs.
`#include <backend>`

Inheritance diagram for L4Re::Vfs::Be_file:



Collaboration diagram for L4Re::Vfs::Be_file:



Public Member Functions

- int unlock_all_locks () noexcept override

  Unlock all locks on the file.
- L4::Cap< L4Re::Dataspace > data_space () noexcept override

  Get an L4Re::Dataspace object for the file.
- ssize_t **readv** (const struct iovec *, int) noexcept override

  Default backend for POSIX read and readv functions.
- ssize_t **writev** (const struct iovec *, int) noexcept override

  Default backend for POSIX write and writev functions.
- ssize_t **pwritev** (const struct iovec *, int, off64_t) noexcept override

  Default backend for POSIX pwrite and pwritev functions.
- ssize_t **preadv** (const struct iovec *, int, off64_t) noexcept override

  Default backend for POSIX pread and preadv functions.
- off64_t **lseek** (off64_t, int) noexcept override

  Default backend for POSIX seek and lseek functions.
- int **ftruncate** (off64_t) noexcept override

  Default backend for the POSIX truncate, ftruncate and similar functions.
- int **fsync** () const noexcept override

  Default backend for POSIX fsync.
- int **fdatasync** () const noexcept override

Default backend for POSIX fdatasync.

- int **ioctl** (unsigned long, va_list) noexcept override

  Default backend for POSIX ioctl.

- int fstat (struct stat64 ∗) const noexcept override

  Get status information for the file.

- int **fchmod** (mode_t) noexcept override

  Default backend for POSIX chmod and fchmod.

- int **get_status_flags** () const noexcept override

  Default backend for POSIX fcntl subfunctions.

- int **set_status_flags** (long) noexcept override

  Default backend for POSIX fcntl subfunctions.

- int **get_lock** (struct flock64 ∗) noexcept override

  Default backend for POSIX fcntl subfunctions.

- int **set_lock** (struct flock64 ∗, bool) noexcept override

  Default backend for POSIX fcntl subfunctions.

- int **faccessat** (const char ∗, int, int) noexcept override

  Default backend for POSIX access and faccessat functions.

- int **fchmodat** (const char ∗, mode_t, int) noexcept override

  Default backend for POSIX fchmodat function.

- int **utime** (const struct utimbuf ∗) noexcept override

  Default backend for POSIX utime.

- int **utimes** (const struct timeval[2]) noexcept override

  Default backend for POSIX utimes.

- int **utimensat** (const char ∗, const struct timespec[2], int) noexcept override

  Default backend for POSIX utimensat.

- int **mkdir** (const char ∗, mode_t) noexcept override

  Default backend for POSIX mkdir and mkdirat.

- int **unlink** (const char ∗) noexcept override

  Default backend for POSIX unlink, unlinkat.

- int **rename** (const char ∗, const char ∗) noexcept override

  Default backend for POSIX rename, renameat.

- int **link** (const char ∗, const char ∗) noexcept override

  Default backend for POSIX link, linkat.

- int **symlink** (const char ∗, const char ∗) noexcept override

  Default backend for POSIX symlink, symlinkat.

- int **rmdir** (const char ∗) noexcept override

  Default backend for POSIX rmdir, rmdirat.

- ssize_t **readlink** (char ∗, size_t) override

  Default backend for POSIX readlink, readlinkat.

- bool check_ready (Ready_type) noexcept override

  Default implementation of a readiness check.

Additional Inherited Members

Public Types inherited from L4Re::Vfs::Generic_file

- enum Ready_type : unsigned

  Type of I/O operation/condition a file can indicate readiness.

15.336.1 Detailed Description

Boiler plate class for implementing an open file for L4Re::Vfs.
This class may be used as a base class for everything that a POSIX file descriptor may point to. This are things such as regular files, directories, special device files, streams, pipes, and so on.

Examples

tmpfs/lib/src/fs.cc.

Definition at line 30 of file backend.

15.336.2 Member Function Documentation

15.336.2.1 check_ready()

```
bool L4Re::Vfs::Be_file::check_ready (
            Ready_type )  [inline], [override], [virtual], [noexcept]
```

Default implementation of a readiness check.
By default, we assume a file is not ready for an I/O operation/condition since the proper semantics of that relies on the backend.

Returns

Always false.

Implements L4Re::Vfs::Generic_file.
Definition at line 217 of file backend.

15.336.2.2 data_space()

```
L4::Cap< L4Re::Dataspace > L4Re::Vfs::Be_file::data_space ()  [inline], [override], [virtual],
[noexcept]
```

Get an L4Re::Dataspace object for the file.
This is used as a backend for POSIX mmap and mmap2 functions.

Note

mmap is not possible if the function returns an invalid capability.

Returns

A capability to an L4Re::Dataspace that represents the file contents in an L4Re way.

Implements L4Re::Vfs::Regular_file.
Definition at line 47 of file backend.
References L4::Cap_base::Invalid.

15.336.2.3 fstat()

```
int L4Re::Vfs::Be_file::fstat (
            struct stat64 * buf) const  [inline], [override], [virtual], [noexcept]
```

Get status information for the file.
This is the backend for POSIX fstat, stat, fstat64 and friends.

Parameters

out	*buf*	This buffer is filled with the status information.

Returns

0 on success, or <0 on error.

Implements L4Re::Vfs::Generic_file.
Definition at line 86 of file backend.

15.336.2.4 unlock_all_locks()

`int L4Re::Vfs::Be_file::unlock_all_locks () [inline], [override], [virtual], [noexcept]`
Unlock all locks on the file.

Note

All locks means all locks independent of which file the locks were taken by.

This method is called by the POSIX close implementation to get the POSIX semantics of releasing all locks taken by this application on a close for any fd referencing the real file.

Returns

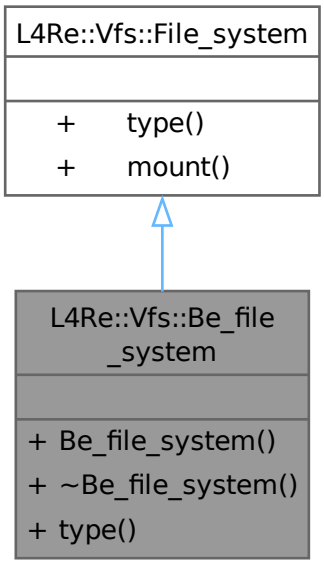
0 on success, or <0 on error.

Implements L4Re::Vfs::Generic_file.
Definition at line 43 of file backend.
The documentation for this class was generated from the following file:

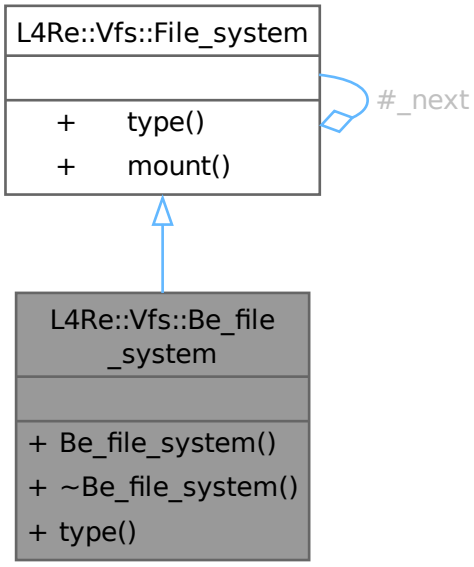
- l4/l4re_vfs/backend

15.337 L4Re::Vfs::Be_file_system Class Reference

Boilerplate class for implementing a L4Re::Vfs::File_system.
`#include <backend>`
Inheritance diagram for L4Re::Vfs::Be_file_system:



Collaboration diagram for L4Re::Vfs::Be_file_system:



Public Member Functions

- Be_file_system (char const ∗fstype) noexcept

  Create a file-system object for the given fstype.
- ∼Be_file_system () noexcept

  Destroy a file-system object.
- char const ∗ type () const noexcept override

  Return the file-system type.

Public Member Functions inherited from L4Re::Vfs::File_system

- virtual int mount (char const ∗source, unsigned long mountflags, void const ∗data, cxx::Ref_ptr< File > ∗dir) noexcept=0

  Create a directory object dir representing source mounted with this file system.

15.337.1 Detailed Description

Boilerplate class for implementing a L4Re::Vfs::File_system.
This class already takes care of registering and unregistering the file system in the global registry and implements the type() method.

Examples

tmpfs/lib/src/fs.cc.

Definition at line 310 of file backend.

15.337.2 Constructor & Destructor Documentation

15.337.2.1 Be_file_system()

```
L4Re::Vfs::Be_file_system::Be_file_system (
            char const * fstype)  [inline], [explicit], [noexcept]
```

Create a file-system object for the given *fstype*.

Parameters

fstype	The type that type() shall return.

This constructor takes care of registering the file system in the registry of L4Re::Vfs::vfs_ops.
Definition at line 324 of file backend.

15.337.2.2 ~Be_file_system()

```
L4Re::Vfs::Be_file_system::~Be_file_system ()  [inline], [noexcept]
```

Destroy a file-system object.
This destructor takes care of removing this file system from the registry of L4Re::Vfs::vfs_ops.
Definition at line 336 of file backend.

15.337.3 Member Function Documentation

15.337.3.1 type()

```
char const * L4Re::Vfs::Be_file_system::type () const  [inline], [override], [virtual], [noexcept]
```

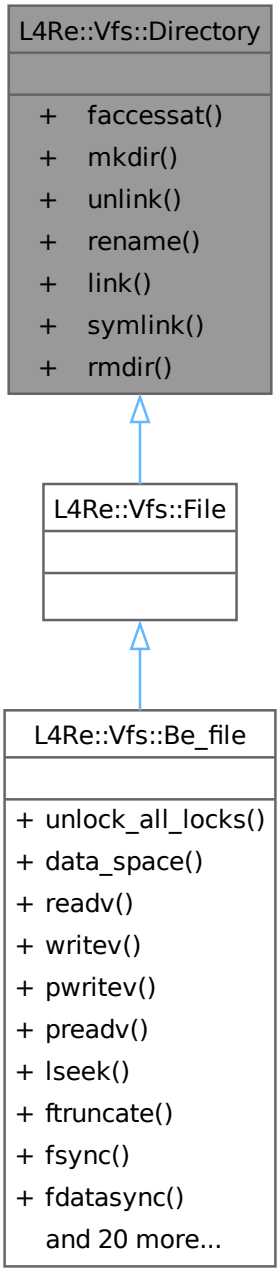
Return the file-system type.
Returns the file-system type given as *fstype* in the constructor.
Implements L4Re::Vfs::File_system.
Definition at line 346 of file backend.
The documentation for this class was generated from the following file:

- l4/l4re_vfs/backend

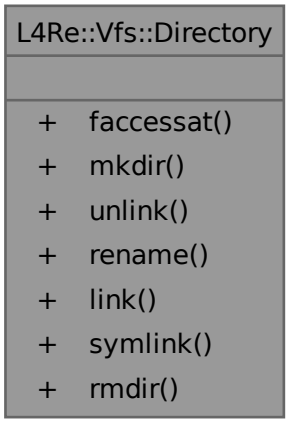
15.338 L4Re::Vfs::Directory Class Reference

Interface for a POSIX file that is a directory.
`#include <vfs.h>`

Inheritance diagram for L4Re::Vfs::Directory:



Collaboration diagram for L4Re::Vfs::Directory:



Public Member Functions

- virtual int faccessat (const char ∗path, int mode, int flags) noexcept=0

  Check access permissions on the given file.
- virtual int mkdir (const char ∗path, mode_t mode) noexcept=0

  Create a new subdirectory.
- virtual int unlink (const char ∗path) noexcept=0

  Unlink the given file from that directory.
- virtual int rename (const char ∗src_path, const char ∗dst_path) noexcept=0

  Rename the given file.
- virtual int link (const char ∗src_path, const char ∗dst_path) noexcept=0

  Create a hard link (second name) for the given file.
- virtual int symlink (const char ∗src_path, const char ∗dst_path) noexcept=0

  Create a symbolic link for the given file.
- virtual int rmdir (const char ∗path) noexcept=0

  Delete an empty directory.

15.338.1 Detailed Description

Interface for a POSIX file that is a directory.
This interface provides functionality for directory files in the L4Re::Vfs. However, real objects always use the combined L4Re::Vfs::File interface.
Definition at line 160 of file vfs.h.

15.338.2 Member Function Documentation

15.338.2.1 faccessat()

```
virtual int L4Re::Vfs::Directory::faccessat (
            const char * path,
            int mode,
            int flags)  [pure virtual], [noexcept]
```

Check access permissions on the given file.

Backend function for POSIX access and faccessat functions.

Parameters

path	The path relative to this directory. Note: *path* is relative to this directory and may contain subdirectories.
mode	The access mode to check.
flags	The flags as in POSIX faccessat (AT_EACCESS, AT_SYMLINK_NOFOLLOW).

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.

15.338.2.2 link()

```
virtual int L4Re::Vfs::Directory::link (
            const char * src_path,
            const char * dst_path)  [pure virtual], [noexcept]
```

Create a hard link (second name) for the given file.
Backend for the POSIX link and linkat functions.

Parameters

src_path	The old name of the file. Note: *src_path* is relative to this directory and may contain subdirectories.
dst_path	The new (second) name for the file. Note: *dst_path* is relative to this directory and may contain subdirectories.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.

15.338.2.3 mkdir()

```
virtual int L4Re::Vfs::Directory::mkdir (
            const char * path,
            mode_t mode)  [pure virtual], [noexcept]
```

Create a new subdirectory.
Backend for POSIX mkdir and mkdirat function calls.

Parameters

path	The name of the subdirectory to create. Note: *path* is relative to this directory and may contain subdirectories.
mode	The file mode to use for the new directory.

Returns

0 on success, or <0 on error. -ENOTDIR if this or some component in path is not a directory.

Implemented in L4Re::Vfs::Be_file.

15.338.2.4 rename()

```
virtual int L4Re::Vfs::Directory::rename (
            const char * src_path,
            const char * dst_path)  [pure virtual], [noexcept]
```

Rename the given file.
Backend for the POSIX rename, renameat functions.

Parameters

src_path	The old name of the file to rename. Note: *src_path* is relative to this directory and may contain subdirectories.
dst_path	The new name for the file. Note: *dst_path* is relative to this directory and may contain subdirectories.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.

15.338.2.5 rmdir()

```
virtual int L4Re::Vfs::Directory::rmdir (
            const char * path)  [pure virtual], [noexcept]
```

Delete an empty directory.
Backend for POSIX rmdir, rmdirat functions.

Parameters

path	The name of the directory to remove. Note: *path* is relative to this directory and may contain subdirectories.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.

15.338.2.6 symlink()

```
virtual int L4Re::Vfs::Directory::symlink (
            const char * src_path,
            const char * dst_path)  [pure virtual], [noexcept]
```

Create a symbolic link for the given file.
Backend for the POSIX symlink and symlinkat functions.

Parameters

src_path	The old name of the file. Note: *src_path* shall be an absolute path.
dst_path	The name for symlink. Note: *dst_path* is relative to this directory and may contain subdirectories.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.

15.338.2.7 unlink()

```
virtual int L4Re::Vfs::Directory::unlink (
            const char * path)  [pure virtual], [noexcept]
```

Unlink the given file from that directory.
Backend for the POSIX unlink and unlinkat functions.

Parameters

path	The name of the file to unlink. Note: *path* is relative to this directory and may contain subdirectories.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.
The documentation for this class was generated from the following file:

- l4/l4re_vfs/vfs.h

15.339 L4Re::Vfs::File Class Reference

The basic interface for an open POSIX file.

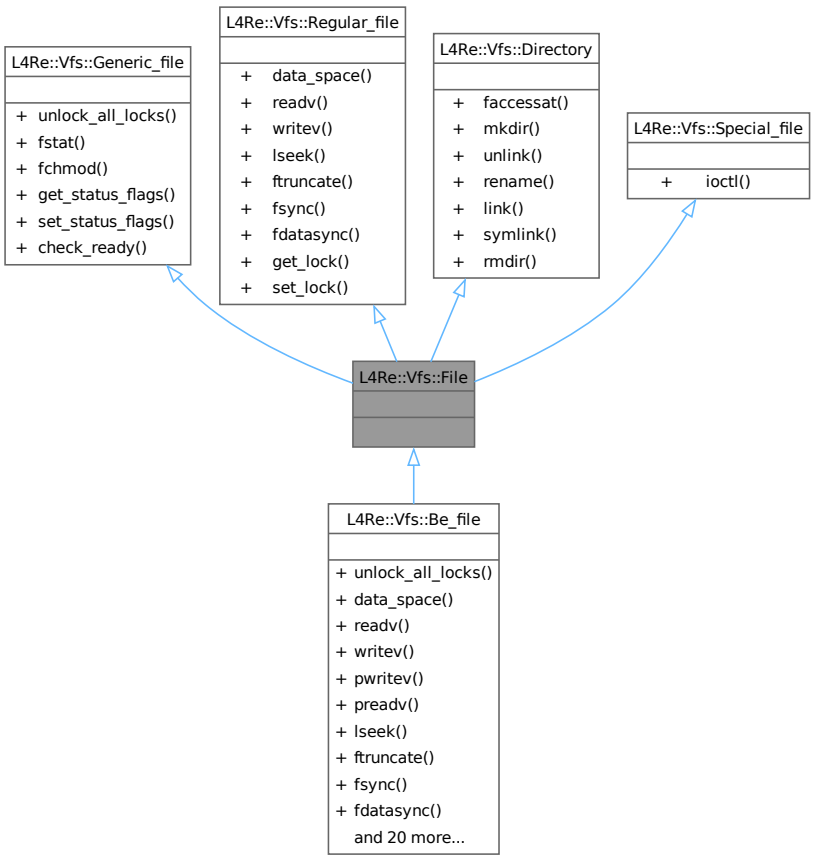
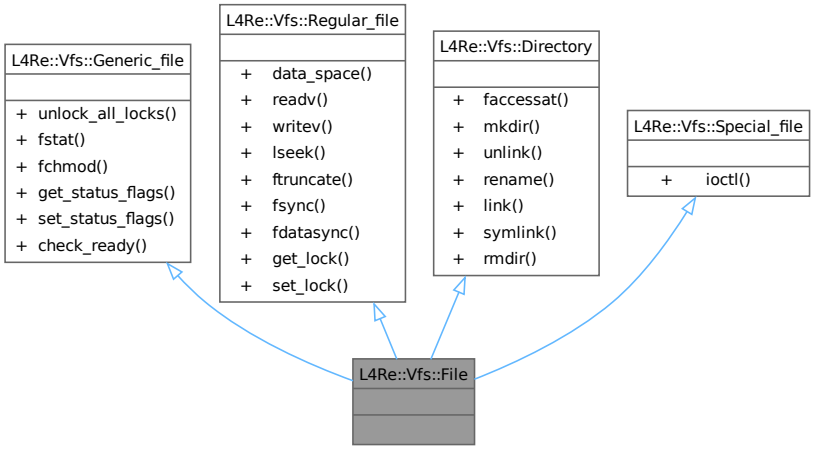
Inheritance diagram for L4Re::Vfs::File:



Collaboration diagram for L4Re::Vfs::File:



Additional Inherited Members

Public Types inherited from L4Re::Vfs::Generic_file

- enum Ready_type : unsigned

  Type of I/O operation/condition a file can indicate readiness.

Public Member Functions inherited from L4Re::Vfs::Generic_file

- virtual int unlock_all_locks () noexcept=0

  Unlock all locks on the file.
- virtual int fstat (struct stat64 ∗buf) const noexcept=0

  Get status information for the file.
- virtual int fchmod (mode_t) noexcept=0

  Change POSIX access rights on the file.
- virtual int get_status_flags () const noexcept=0

  Get file status flags (fcntl F_GETFL).
- virtual int set_status_flags (long flags) noexcept=0

  Set file status flags (fcntl F_SETFL).
- virtual bool check_ready (Ready_type rt) noexcept=0

  Check whether the file is ready for an I/O operation/condition.

Public Member Functions inherited from L4Re::Vfs::Regular_file

- virtual L4::Cap< L4Re::Dataspace > data_space () noexcept=0

  Get an L4Re::Dataspace object for the file.
- virtual ssize_t readv (const struct iovec ∗, int iovcnt) noexcept=0

  Read one or more blocks of data from the file.
- virtual ssize_t writev (const struct iovec ∗, int iovcnt) noexcept=0

  Write one or more blocks of data to the file.
- virtual off64_t lseek (off64_t, int) noexcept=0

  Change the file pointer.
- virtual int ftruncate (off64_t pos) noexcept=0

Truncate the file at the given position.

- virtual int fsync () const noexcept=0

  Sync the data and meta data to persistent storage.

- virtual int fdatasync () const noexcept=0

  Sync the data to persistent storage.

- virtual int get_lock (struct flock64 *lock) noexcept=0

  Test if the given lock can be placed in the file.

- virtual int set_lock (struct flock64 *lock, bool wait) noexcept=0

  Acquire or release the given lock on the file.

Public Member Functions inherited from L4Re::Vfs::Directory

- virtual int faccessat (const char *path, int mode, int flags) noexcept=0

  Check access permissions on the given file.

- virtual int mkdir (const char *path, mode_t mode) noexcept=0

  Create a new subdirectory.

- virtual int unlink (const char *path) noexcept=0

  Unlink the given file from that directory.

- virtual int rename (const char *src_path, const char *dst_path) noexcept=0

  Rename the given file.

- virtual int link (const char *src_path, const char *dst_path) noexcept=0

  Create a hard link (second name) for the given file.

- virtual int symlink (const char *src_path, const char *dst_path) noexcept=0

  Create a symbolic link for the given file.

- virtual int rmdir (const char *path) noexcept=0

  Delete an empty directory.

Public Member Functions inherited from L4Re::Vfs::Special_file

- virtual int ioctl (unsigned long cmd, va_list args) noexcept=0

  The famous IO control.

15.339.1 Detailed Description

The basic interface for an open POSIX file.
An open POSIX file can be anything that hides behind a POSIX file descriptor. This means that even directories are files. An open file can be anything from a directory to a special device file so see Generic_file, Regular_file, Directory, and Special_file for more information.

Note

For implementing a backend for the L4Re::Vfs L4Re::Vfs::Be_file may be used as a base class.

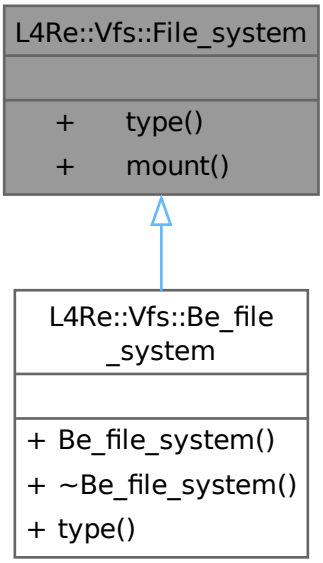
Definition at line 455 of file vfs.h.
The documentation for this class was generated from the following file:

- l4/l4re_vfs/vfs.h

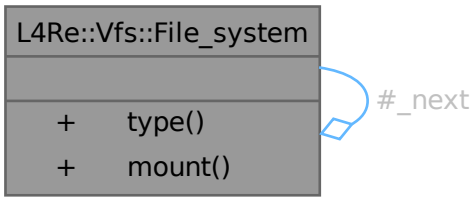
15.340 L4Re::Vfs::File_system Class Reference

Basic interface for an L4Re::Vfs file system.
`#include <vfs.h>`

Inheritance diagram for L4Re::Vfs::File_system:



Collaboration diagram for L4Re::Vfs::File_system:



Public Member Functions

- virtual char const ∗ type () const noexcept=0

  Returns the type of the file system used in mount as fstype argument.
- virtual int mount (char const ∗source, unsigned long mountflags, void const ∗data, cxx::Ref_ptr< File > ∗dir) noexcept=0

  Create a directory object dir representing source mounted with this file system.

15.340.1 Detailed Description

Basic interface for an L4Re::Vfs file system.

Note

For implementing a special file system L4Re::Vfs::Be_file_system may be used as a base class.

The main purpose of this interface is to have a single object for each supported file-system type (e.g., ext2, vfat) that exists in the application and is registered at the L4Re::Vfs::Fs singleton available via L4Re::Vfs::vfs_ops. Ultimately, the POSIX mount function calls the File_system::mount method matching the file-system type given in mount.
Definition at line 854 of file vfs.h.

15.340.2 Member Function Documentation

15.340.2.1 mount()

```
virtual int L4Re::Vfs::File_system::mount (
             char const * source,
             unsigned long mountflags,
             void const * data,
             cxx::Ref_ptr< File > * dir)  [pure virtual], [noexcept]
```

Create a directory object *dir* representing *source* mounted with this file system.

Parameters

	source	The path to the source device to mount. This may also be some URL or anything file-system specific.
	mountflags	The mount flags as specified in the POSIX mount call.
	data	The data as specified in the POSIX mount call. The contents are file-system specific.
out	*dir*	A new directory object representing the file-system root directory.

Returns

0 on success, and <0 on error (e.g. -EINVAL).

References mount().
Referenced by mount().
Here is the call graph for this function:

Here is the caller graph for this function:

15.340.2.2 type()

```
virtual char const * L4Re::Vfs::File_system::type () const  [pure virtual], [noexcept]
```

Returns the type of the file system used in mount as fstype argument.

Note

This method is already provided by Be_file_system.

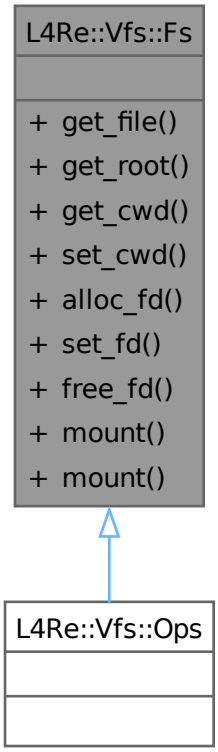
Implemented in L4Re::Vfs::Be_file_system.
The documentation for this class was generated from the following file:

- l4/l4re_vfs/vfs.h

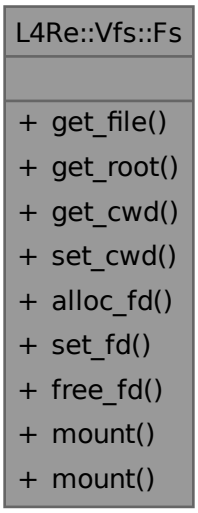
15.341 L4Re::Vfs::Fs Class Reference

POSIX File-system related functionality.
`#include <vfs.h>`

Inheritance diagram for L4Re::Vfs::Fs:



Collaboration diagram for L4Re::Vfs::Fs:



Public Member Functions

- virtual cxx::Ref_ptr< File > get_file (int fd) noexcept=0

  Get the L4Re::Vfs::File for the file descriptor fd.
- virtual cxx::Ref_ptr< File > **get_root** () noexcept=0

  Get the directory object for the application's root directory.
- virtual cxx::Ref_ptr< File > **get_cwd** () noexcept

  Get the directory object for the application's current working directory.
- virtual void **set_cwd** (cxx::Ref_ptr< File > const &) noexcept

  Set the current working directory for the application.
- virtual int alloc_fd (cxx::Ref_ptr< File > const &f=cxx::Ref_ptr<>::Nil) noexcept=0

  Allocate the next free file descriptor.
- virtual cxx::Pair< cxx::Ref_ptr< File >, int > set_fd (int fd, cxx::Ref_ptr< File > const &f=cxx::Ref_ptr<>↩ ::Nil) noexcept=0

  Set the file object referenced by the file descriptor fd.
- virtual cxx::Ref_ptr< File > free_fd (int fd) noexcept=0

  Free the file descriptor fd.
- virtual int mount (char const *path, cxx::Ref_ptr< File > const &dir) noexcept=0

  Mount a given file object at the given global path in the VFS.
- int **mount** (char const *source, char const *target, char const *fstype, unsigned long mountflags, void const *data) noexcept

  Backend for the POSIX mount call.

15.341.1 Detailed Description

POSIX File-system related functionality.

Note

This class usually exists as a singleton and as a superclass of L4Re::Vfs::Ops (

See also

L4Re::Vfs::vfs_ops).

Definition at line 943 of file vfs.h.

15.341.2 Member Function Documentation

15.341.2.1 alloc_fd()

```
virtual int L4Re::Vfs::Fs::alloc_fd (
            cxx::Ref_ptr< File > const & f = cxx::Ref_ptr<>::Nil)  [pure virtual], [noexcept]
```

Allocate the next free file descriptor.

Parameters

f	The file to assign to that file descriptor.

Returns

The allocated file descriptor, or -EMFILE on error.

15.341.2.2 free_fd()

```
virtual cxx::Ref_ptr< File > L4Re::Vfs::Fs::free_fd (
            int fd)  [pure virtual], [noexcept]
```

Free the file descriptor *fd*.

Parameters

fd	The file descriptor to free.

Returns

A pointer to the file object that was assigned to the fd.

15.341.2.3 get_file()

```
virtual cxx::Ref_ptr< File > L4Re::Vfs::Fs::get_file (
            int fd)  [pure virtual], [noexcept]
```

Get the L4Re::Vfs::File for the file descriptor *fd*.

Parameters

fd	The POSIX file descriptor number.

Returns

A pointer to the File object, or 0 if *fd* is not open.

15.341.2.4 mount()

```
virtual int L4Re::Vfs::Fs::mount (
            char const * path,
            cxx::Ref_ptr< File > const & dir)  [pure virtual], [noexcept]
```

Mount a given file object at the given global path in the VFS.

Parameters

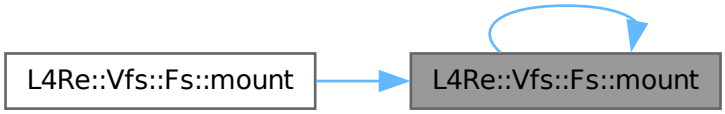
path	The global path to mount *dir* at.
dir	A pointer to the file/directory object that shall be mounted at *path*.

Returns

0 on success, or <0 on error.

References mount().
Referenced by mount(), and mount().
Here is the call graph for this function:

Here is the caller graph for this function:



15.341.2.5 set_fd()

```
virtual cxx::Pair< cxx::Ref_ptr< File >, int > L4Re::Vfs::Fs::set_fd (
            int fd,
            cxx::Ref_ptr< File > const & f = cxx::Ref_ptr<>::Nil)  [pure virtual], [noexcept]
```

Set the file object referenced by the file descriptor *fd*.

Parameters

fd	The file descriptor to set to *f*.
f	The file object to assign.

Returns

A pair of a pointer to the file object that was previously assigned to fd (`first`) and a return value (`second`). `second` contains `-#EBADF` if the passed file descriptor is outside the valid range. `first` contains a Nil pointer in that case. On success, `second` contains 0.

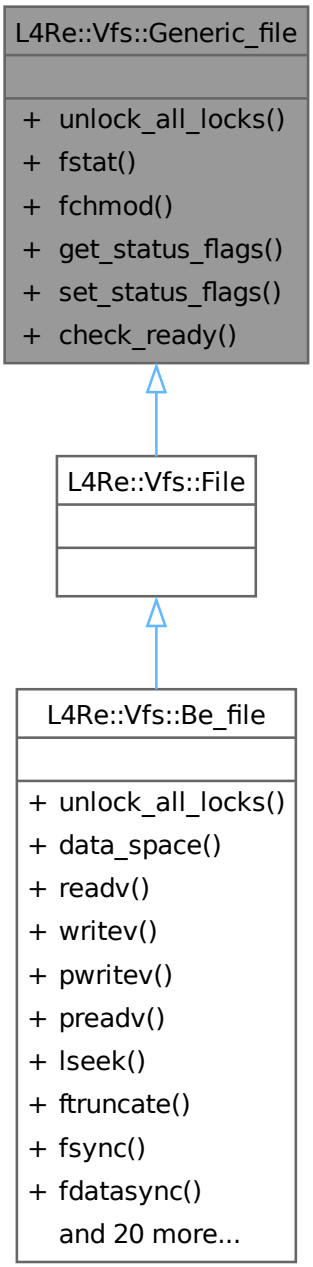
The documentation for this class was generated from the following files:

- l4/l4re_vfs/vfs.h
- l4/l4re_vfs/impl/vfs_impl.h

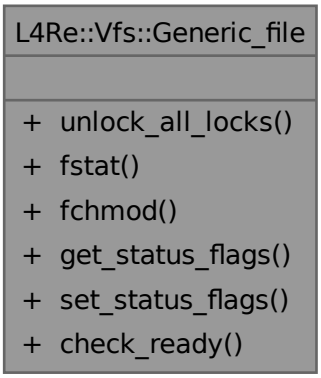
15.342 L4Re::Vfs::Generic_file Class Reference

The common interface for an open POSIX file.
`#include <vfs.h>`

Inheritance diagram for L4Re::Vfs::Generic_file:



Collaboration diagram for L4Re::Vfs::Generic_file:



Public Types

- enum Ready_type : unsigned

  Type of I/O operation/condition a file can indicate readiness.

Public Member Functions

- virtual int unlock_all_locks () noexcept=0

  Unlock all locks on the file.
- virtual int fstat (struct stat64 *buf) const noexcept=0

  Get status information for the file.
- virtual int fchmod (mode_t) noexcept=0

  Change POSIX access rights on the file.
- virtual int get_status_flags () const noexcept=0

  Get file status flags (fcntl F_GETFL).
- virtual int set_status_flags (long flags) noexcept=0

  Set file status flags (fcntl F_SETFL).
- virtual bool check_ready (Ready_type rt) noexcept=0

  Check whether the file is ready for an I/O operation/condition.

15.342.1 Detailed Description

The common interface for an open POSIX file.
This interface is common to all kinds of open files, independent of the file type (e.g., directory, regular file etc.). However, in the L4Re::Vfs the interface File is used for every real object.

See also

L4Re::Vfs::File for more information.

Definition at line 52 of file vfs.h.

15.342.2 Member Enumeration Documentation

15.342.2.1 Ready_type

```
enum L4Re::Vfs::Generic_file::Ready_type :  unsigned
```

Type of I/O operation/condition a file can indicate readiness.
As defined by select() and similar functions.
Definition at line 60 of file vfs.h.

15.342.3 Member Function Documentation

15.342.3.1 check_ready()

```
virtual bool L4Re::Vfs::Generic_file::check_ready (
            Ready_type rt)  [pure virtual], [noexcept]
```

Check whether the file is ready for an I/O operation/condition.
This method is used by the implementation of select() and similar functions.

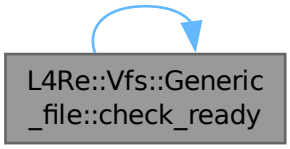
Parameters

rt	Type of the I/O operation/condition to be ready, as defined by the select() and similar functions (Read, Write, Exception).

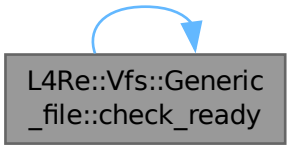
Return values

true	The file is ready for the given type of I/O operation/condition.
false	The file is not ready for the given type of I/O operation/condition.

Implemented in L4Re::Core::Ds_file, and L4Re::Vfs::Be_file.
References check_ready().
Referenced by check_ready().
Here is the call graph for this function:



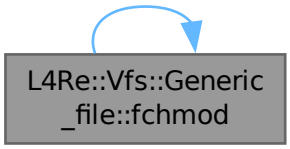
Here is the caller graph for this function:



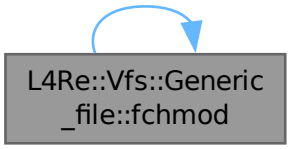
15.342.3.2 fchmod()

```
virtual int L4Re::Vfs::Generic_file::fchmod (
            mode_t )  [pure virtual], [noexcept]
```

Change POSIX access rights on the file.
Backend for POSIX chmod and fchmod.
Implemented in L4Re::Vfs::Be_file.
References fchmod().
Referenced by fchmod().
Here is the call graph for this function:



Here is the caller graph for this function:



15.342.3.3 fstat()

```
virtual int L4Re::Vfs::Generic_file::fstat (
```

```
struct stat64 * buf) const  [pure virtual], [noexcept]
```

Get status information for the file.
This is the backend for POSIX fstat, stat, fstat64 and friends.

Parameters

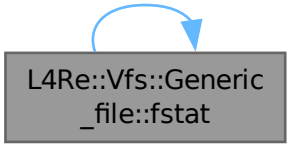
out	*buf*	This buffer is filled with the status information.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Core::Ds_file, and L4Re::Vfs::Be_file.
References fstat().
Referenced by fstat().
Here is the call graph for this function:

Here is the caller graph for this function:



15.342.3.4 get_status_flags()

```
virtual int L4Re::Vfs::Generic_file::get_status_flags () const  [pure virtual], [noexcept]
```

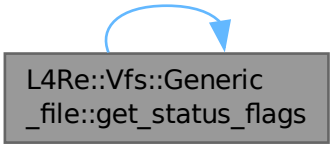
Get file status flags (fcntl F_GETFL).
This function is used by the fcntl implementation for the F_GETFL command.

Returns

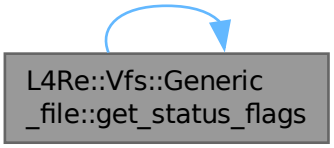
flags such as O_RDONLY, O_WRONLY, O_RDWR, O_DIRECT, O_ASYNC, O_NOATIME, O_NONBLOCK, or <0 on error.

Implemented in L4Re::Core::Ds_file, and L4Re::Vfs::Be_file.
References get_status_flags().

Referenced by get_status_flags().
Here is the call graph for this function:



Here is the caller graph for this function:



15.342.3.5 set_status_flags()

```
virtual int L4Re::Vfs::Generic_file::set_status_flags (
            long flags)  [pure virtual], [noexcept]
```

Set file status flags (fcntl F_SETFL).
This function is used by the fcntl implementation for the F_SETFL command.

Parameters

flags	The file status flags to set. This must be a combination of O_RDONLY, O_WRONLY, O_RDWR, O_↩ APPEND, O_ASYNC, O_DIRECT, O_NOATIME, O_NONBLOCK.

Note

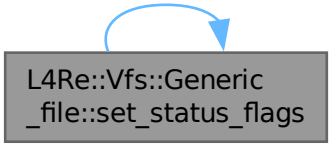
Creation flags such as O_CREAT, O_EXCL, O_NOCTTY, O_TRUNC are ignored.

Returns

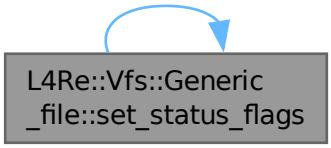
0 on success, or $<$0 on error.

Implemented in L4Re::Core::Ds_file, and L4Re::Vfs::Be_file.
References set_status_flags().
Referenced by set_status_flags().

Here is the call graph for this function:



Here is the caller graph for this function:



15.342.3.6 unlock_all_locks()

`virtual int L4Re::Vfs::Generic_file::unlock_all_locks () [pure virtual], [noexcept]`
Unlock all locks on the file.

Note

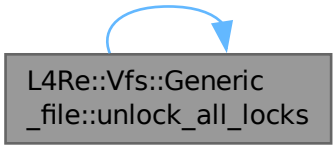
All locks means all locks independent of which file the locks were taken by.

This method is called by the POSIX close implementation to get the POSIX semantics of releasing all locks taken by this application on a close for any fd referencing the real file.

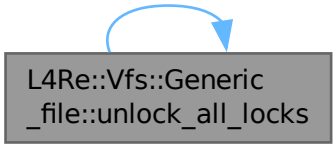
Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.
References unlock_all_locks().
Referenced by unlock_all_locks().
Here is the call graph for this function:



Here is the caller graph for this function:



The documentation for this class was generated from the following file:

  Read one or more blocks of data from the file.
- virtual ssize_t writev (const struct iovec *, int iovcnt) noexcept=0

  Write one or more blocks of data to the file.
- virtual off64_t lseek (off64_t, int) noexcept=0

  Change the file pointer.
- virtual int ftruncate (off64_t pos) noexcept=0

  Truncate the file at the given position.
- virtual int fsync () const noexcept=0

  Sync the data and meta data to persistent storage.
- virtual int fdatasync () const noexcept=0

  Sync the data to persistent storage.
- virtual int get_lock (struct flock64 *lock) noexcept=0

  Test if the given lock can be placed in the file.
- virtual int set_lock (struct flock64 *lock, bool wait) noexcept=0

  Acquire or release the given lock on the file.

15.345.1 Detailed Description

Interface for a POSIX file that provides regular file semantics.
Real objects always use the combined L4Re::Vfs::File interface.
Definition at line 287 of file vfs.h.

15.345.2 Member Function Documentation

15.345.2.1 data_space()

```
virtual L4::Cap< L4Re::Dataspace > L4Re::Vfs::Regular_file::data_space ()  [pure virtual],
[noexcept]
```

Get an L4Re::Dataspace object for the file.
This is used as a backend for POSIX mmap and mmap2 functions.

Note

mmap is not possible if the function returns an invalid capability.

Returns

A capability to an L4Re::Dataspace that represents the file contents in an L4Re way.

Implemented in L4Re::Core::Ds_file, and L4Re::Vfs::Be_file.

15.345.2.2 fdatasync()

```
virtual int L4Re::Vfs::Regular_file::fdatasync () const  [pure virtual], [noexcept]
```

Sync the data to persistent storage.
This is the backend for POSIX fdatasync.
Implemented in L4Re::Vfs::Be_file.
References fdatasync().
Referenced by fdatasync().
Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.3 fsync()

```
virtual int L4Re::Vfs::Regular_file::fsync () const  [pure virtual], [noexcept]
```

Sync the data and meta data to persistent storage.
This is the backend for POSIX fsync.
Implemented in L4Re::Vfs::Be_file.
References fsync().
Referenced by fsync().
Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.4 ftruncate()

```
virtual int L4Re::Vfs::Regular_file::ftruncate (
            off64_t pos)  [pure virtual], [noexcept]
```

Truncate the file at the given position.
This function is the backend for truncate and friends.

Parameters

pos	The offset at which the file shall be truncated.

Returns

0 on success, or <0 on error.

Implemented in L4Re::Vfs::Be_file.
References ftruncate().
Referenced by ftruncate().
Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.5 get_lock()

```
virtual int L4Re::Vfs::Regular_file::get_lock (
             struct flock64 * lock)  [pure virtual], [noexcept]
```

Test if the given lock can be placed in the file.
This function is used as backend for fcntl F_GETLK commands.

Parameters

lock	The lock that shall be placed on the file. The *l_type* member will contain `F_UNLCK` if the lock could be placed.

Returns

0 on success, <0 on error.

Implemented in L4Re::Vfs::Be_file.
References get_lock().
Referenced by get_lock().

Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.6 lseek()

```
virtual off64_t L4Re::Vfs::Regular_file::lseek (
            off64_t ,
            int )  [pure virtual], [noexcept]
```

Change the file pointer.
This is the backend for POSIX seek, lseek and friends.

Returns

The new file position, or <0 on error.

Implemented in L4Re::Vfs::Be_file.
References lseek().
Referenced by lseek().
Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.7 readv()

```
virtual ssize_t L4Re::Vfs::Regular_file::readv (
            const struct iovec * ,
            int iovcnt)  [pure virtual], [noexcept]
```

Read one or more blocks of data from the file.
This function acts as backend for POSIX read and readv calls and reads data starting from the f_pos pointer of that open file. The file pointer is advanced according to the number of bytes read.

Returns

The number of bytes read from the file, or <0 on error.

Implemented in L4Re::Vfs::Be_file.
References readv().
Referenced by readv().
Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.8 set_lock()

```
virtual int L4Re::Vfs::Regular_file::set_lock (
            struct flock64 * lock,
            bool wait)  [pure virtual], [noexcept]
```

Acquire or release the given lock on the file.
This function is used as backend for fcntl F_SETLK and F_SETLKW commands.

Parameters

lock	The lock that shall be placed on the file.
wait	If true, then block if there is a conflicting lock on the file.

Returns

0 on success, <0 on error.

Implemented in L4Re::Vfs::Be_file.
References set_lock().
Referenced by set_lock().
Here is the call graph for this function:

Here is the caller graph for this function:

15.345.2.9 writev()

```
virtual ssize_t L4Re::Vfs::Regular_file::writev (
            const struct iovec * ,
            int iovcnt)  [pure virtual], [noexcept]
```

Write one or more blocks of data to the file.
This function acts as backend for POSIX write and writev calls. The data is written starting at the current file pointer and the file pointer must be advanced according to the number of written bytes.

Returns

The number of bytes written to the file, or <0 on error.

Implemented in L4Re::Vfs::Be_file.
References writev().
Referenced by writev().
Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

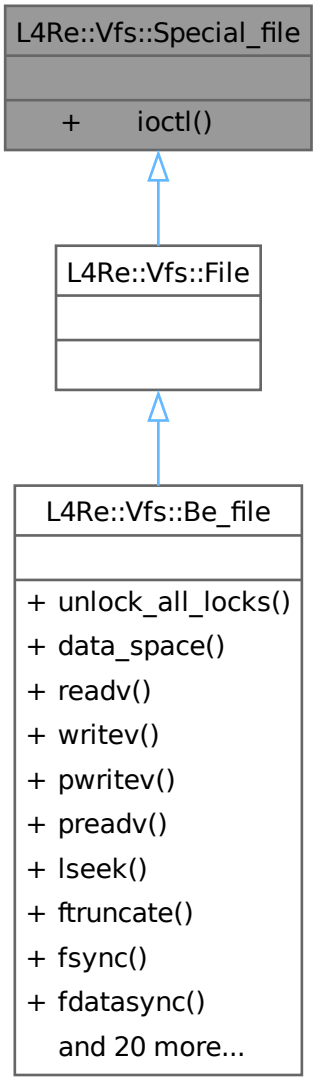
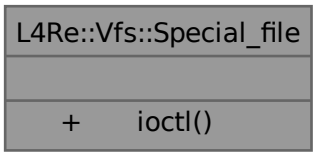
15.346 L4Re::Vfs::Special_file Class Reference

Interface for a POSIX file that provides special file semantics.
`#include <vfs.h>`

Inheritance diagram for L4Re::Vfs::Special_file:



Collaboration diagram for L4Re::Vfs::Special_file:



Public Member Functions

- virtual int ioctl (unsigned long cmd, va_list args) noexcept=0

  The famous IO control.

15.346.1 Detailed Description

Interface for a POSIX file that provides special file semantics.
Real objects always use the combined L4Re::Vfs::File interface.
Definition at line 420 of file vfs.h.

15.346.2 Member Function Documentation

15.346.2.1 ioctl()

```
virtual int L4Re::Vfs::Special_file::ioctl (
            unsigned long cmd,
            va_list args)  [pure virtual], [noexcept]
```

The famous IO control.
Backend for POSIX generic object invocation ioctl.

Parameters

cmd	The ioctl command.
args	The arguments for the ioctl, usually some kind of pointer.

Returns

>=0 on success, or <0 on error.

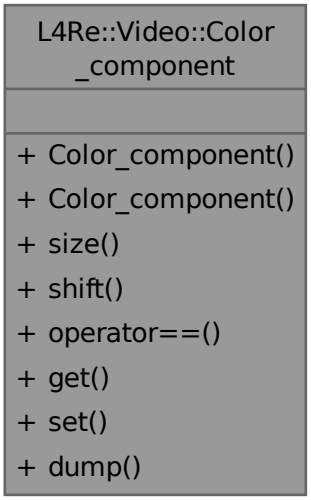
Implemented in L4Re::Core::Ds_file, and L4Re::Vfs::Be_file.
The documentation for this class was generated from the following file:

- l4/l4re_vfs/vfs.h

15.347 L4Re::Video::Color_component Class Reference

A color component.
`#include <colors>`

Collaboration diagram for L4Re::Video::Color_component:



Public Member Functions

- **Color_component** ()
  Constructor.
- Color_component (unsigned char bits, unsigned char shift)
  Constructor.
- unsigned char size () const
  Return the number of bits used by the component.
- unsigned char shift () const
  Return the position of the component in the pixel.
- bool operator== (Color_component const &o) const
  Compare for equality.
- int get (unsigned long v) const
  Get component from value (normalized to 16bits).
- long unsigned set (int v) const
  Transform 16bit normalized value to the component in the color space.
- template<typename OUT>
  void dump (OUT &s) const
  Dump information on the view information to a stream.

15.347.1 Detailed Description

A color component.
Definition at line 21 of file colors.

15.347.2 Constructor & Destructor Documentation

15.347.2.1 Color_component()

```
L4Re::Video::Color_component::Color_component (
            unsigned char bits,
            unsigned char shift)  [inline]
```

Constructor.

Parameters

bits	Number of bits used by the component
shift	Position in bits of the component in the pixel

Definition at line 36 of file colors.
References shift().
Here is the call graph for this function:

15.347.3 Member Function Documentation

15.347.3.1 dump()

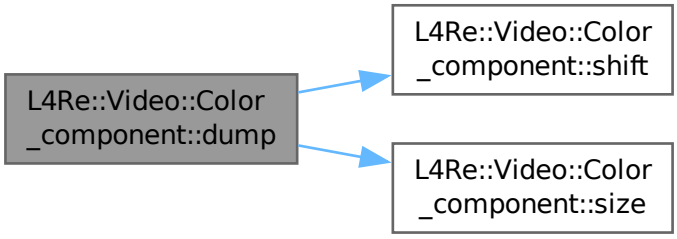
```
template<typename OUT>
void L4Re::Video::Color_component::dump (
             OUT & s) const  [inline]
```

Dump information on the view information to a stream.

Parameters

s	Stream

Definition at line 81 of file colors.
References shift(), and size().
Here is the call graph for this function:



15.347.3.2 get()

```
int L4Re::Video::Color_component::get (
            unsigned long v) const  [inline]
```

Get component from value (normalized to 16bits).

Parameters

v	Value

Returns

Converted value

Definition at line 63 of file colors.

15.347.3.3 operator==()

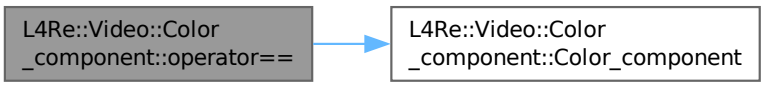
```
bool L4Re::Video::Color_component::operator== (
            Color_component const & o) const  [inline]
```

Compare for equality.

Returns

True if the same components are described, false if not.

Definition at line 55 of file colors.
References Color_component().
Here is the call graph for this function:



15.347.3.4 set()

```
long unsigned L4Re::Video::Color_component::set (
            int v) const  [inline]
```

Transform 16bit normalized value to the component in the color space.

Parameters

v	Value return Converted value.

Definition at line 73 of file colors.

15.347.3.5 shift()

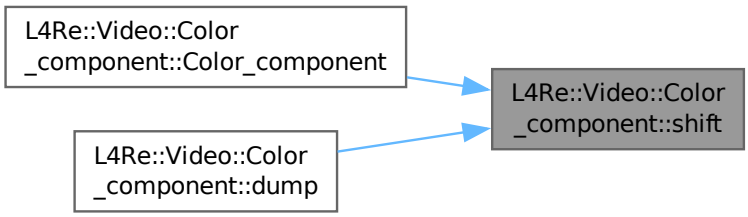
```
unsigned char L4Re::Video::Color_component::shift () const  [inline]
```

Return the position of the component in the pixel.

Returns

Position in bits of the component in the pixel

Definition at line 49 of file colors.
Referenced by Color_component(), and dump().
Here is the caller graph for this function:



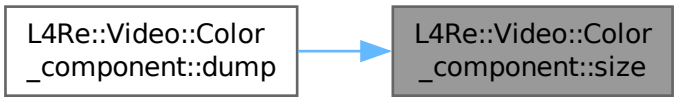
15.347.3.6 size()

`unsigned char L4Re::Video::Color_component::size () const [inline]`
Return the number of bits used by the component.

Returns

Number of bits used by the component

Definition at line 43 of file colors.
Referenced by dump().
Here is the caller graph for this function:



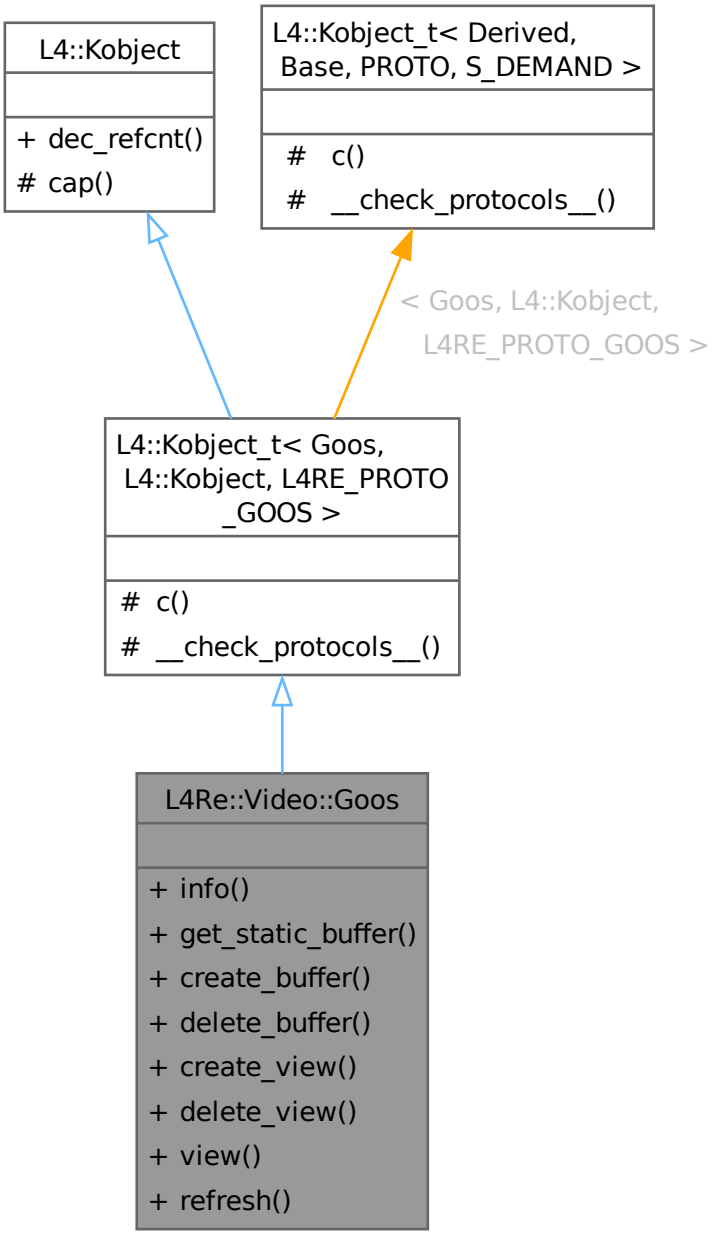
The documentation for this class was generated from the following file:

- l4/re/video/colors

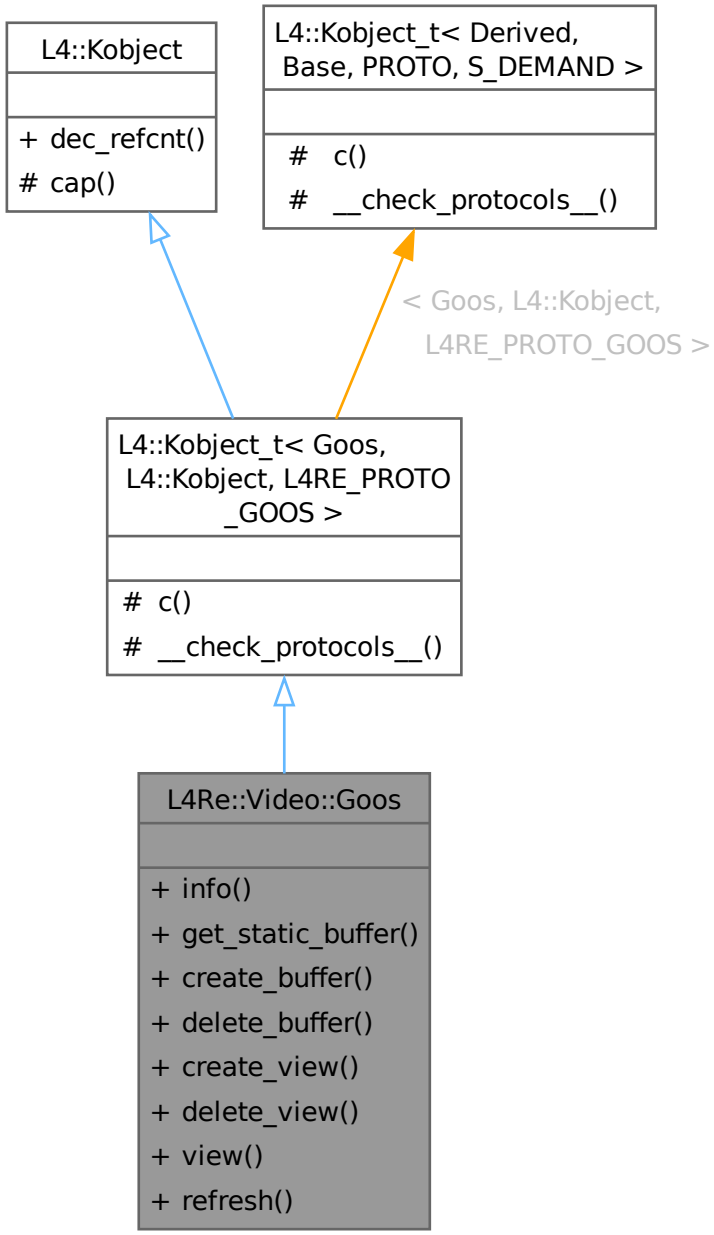
15.348 L4Re::Video::Goos Class Reference

Class that abstracts framebuffers.
`#include <goos>`

Inheritance diagram for L4Re::Video::Goos:



Collaboration diagram for L4Re::Video::Goos:



Data Structures

- struct Info

  Information structure of a Goos.

Public Types

- enum Flags { F_auto_refresh = 0x01 , F_pointer = 0x02 , F_dynamic_views = 0x04 , F_dynamic_buffers = 0x08 }

Flags for a Goos.

Public Member Functions

- l4_ret_t info (Info *info)

  Return the Goos information of the Goos.
- l4_ret_t get_static_buffer (unsigned idx, L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > rbuf)

  Return a static buffer of a Goos.
- l4_ret_t create_buffer (unsigned long size, L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > rbuf)

  Create a buffer.
- l4_ret_t delete_buffer (unsigned idx)

  Delete a buffer.
- l4_ret_t create_view (View *view, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Create a view.
- l4_ret_t delete_view (View const &v, l4_utcb_t *utcb=l4_utcb()) const noexcept

  Delete a view.
- View view (unsigned index) const noexcept

  Return a view.
- l4_ret_t **refresh** (int x, int y, int w, int h)

  Trigger refreshing of the given area on the virtual screen.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Goos, L4::Kobject, L4RE_PROTO_GOOS >

- typedef Goos **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Goos > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Goos, L4::Kobject, L4RE_PROTO_GOOS >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Goos, L4::Kobject, L4RE_PROTO_GOOS >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.348.1 Detailed Description

Class that abstracts framebuffers.
A framebuffer is the pixel data that is displayed on a screen and a Goos object lets the user manipulate that data. A Goos makes use of two kinds of objects:

- Buffers in the form of L4Re::Dataspace objects. These hold the bytes for the pixel data.
- L4Re::Video::View objects.

Both can either be static, that is their number and configuration is fixed and determined by the framebuffer, or they can be dynamic, with the user allocating them.
Definition at line 223 of file goos.

15.348.2 Member Enumeration Documentation

15.348.2.1 Flags

```
enum L4Re::Video::Goos::Flags
```
Flags for a Goos.

Enumerator

F_auto_refresh	The graphics display is automatically refreshed.
F_pointer	We have a mouse pointer.
F_dynamic_views	Supports dynamically allocated views.
F_dynamic_buffers	Supports dynamically allocated buffers.

Definition at line 228 of file goos.

15.348.3 Member Function Documentation

15.348.3.1 create_buffer()

```
l4_ret_t L4Re::Video::Goos::create_buffer (
             unsigned long size,
             L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > rbuf)
```
Create a buffer.

Parameters

size	Size of buffer in bytes.
rbuf	Capability slot to point the buffer dataspace to.

Return values

>=0	Success, the value returned is the buffer index.
<0	Error

Referenced by get_static_buffer().

Here is the caller graph for this function:

15.348.3.2 create_view()

```
l4_ret_t L4Re::Video::Goos::create_view (
            View * view,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Create a view.

Parameters

out	*view*	A view object.
	utcb	UTCB of the caller. This is a default parameter.

Return values

>=0	Success, the value returned is the view index.
<0	Error

Definition at line 312 of file goos.
References L4::Kobject_t< Goos, L4::Kobject, L4RE_PROTO_GOOS >::c(), L4::Kobject::cap(), and view().

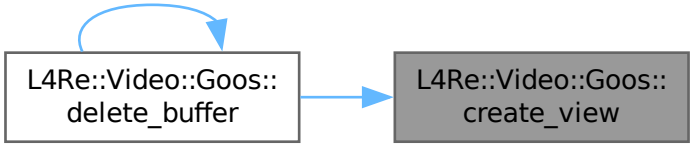
Here is the caller graph for this function:



15.348.3.3 delete_buffer()

```
l4_ret_t L4Re::Video::Goos::delete_buffer (
            unsigned idx)
```

Delete a buffer.

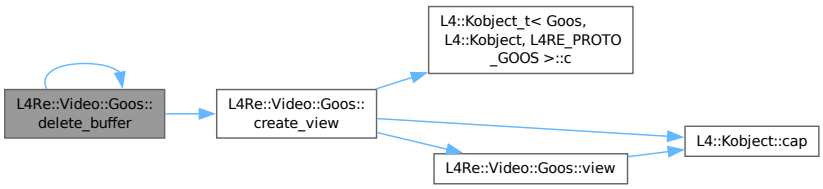
Parameters

idx	Buffer to delete.

Return values

0	Success
<0	Error

References create_view(), and delete_buffer().
Referenced by delete_buffer().
Here is the call graph for this function:



Here is the caller graph for this function:

15.348.3.4 delete_view()

```
l4_ret_t L4Re::Video::Goos::delete_view (
            View const & v,
            l4_utcb_t * utcb = l4_utcb()) const  [inline], [noexcept]
```

Delete a view.

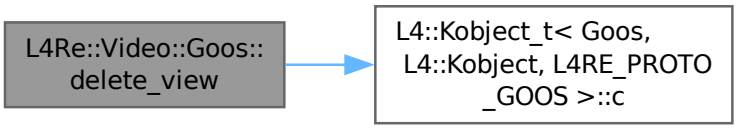
Parameters

v	The view object to delete.
utcb	UTCB of the caller. This is a default parameter.

Return values

0	Success
<0	Error

Definition at line 332 of file goos.
References L4::Kobject_t< Goos, L4::Kobject, L4RE_PROTO_GOOS >::c().
Here is the call graph for this function:



15.348.3.5 get_static_buffer()

```
l4_ret_t L4Re::Video::Goos::get_static_buffer (
            unsigned idx,
            L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > rbuf)
```

Return a static buffer of a Goos.

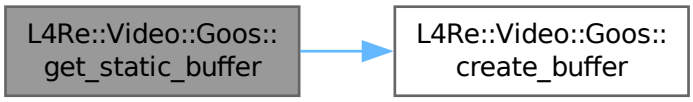
Parameters

idx	Index of the static buffer.
rbuf	Capability slot to point the buffer dataspace to.

Return values

0	Success
<0	Error

References create_buffer().
Referenced by info().
Here is the call graph for this function:



Here is the caller graph for this function:

15.348.3.6 info()

```
l4_ret_t L4Re::Video::Goos::info (
            Info * info)
```

Return the Goos information of the Goos.

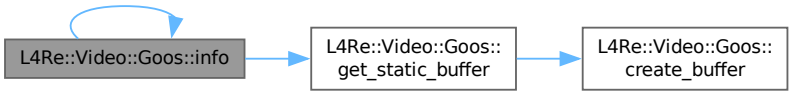
Parameters

out	*info*	Goos information structure pointer.

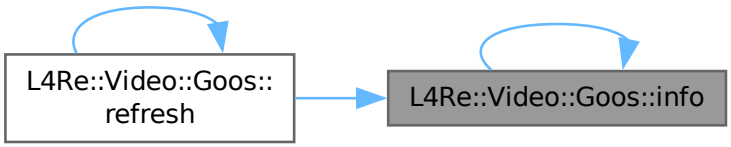
Return values

0	Success
<0	Error

References get_static_buffer(), and info().
Referenced by info(), and refresh().
Here is the call graph for this function:



Here is the caller graph for this function:



15.348.3.7 view()

```
View L4Re::Video::Goos::view (
            unsigned index) const  [inline], [noexcept]
```

Return a view.

Parameters

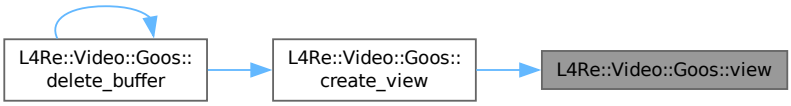
index	Index of the view to return.

Returns

The view.

Definition at line 363 of file goos.
References L4::Kobject::cap().
Referenced by create_view().
Here is the call graph for this function:

Here is the caller graph for this function:



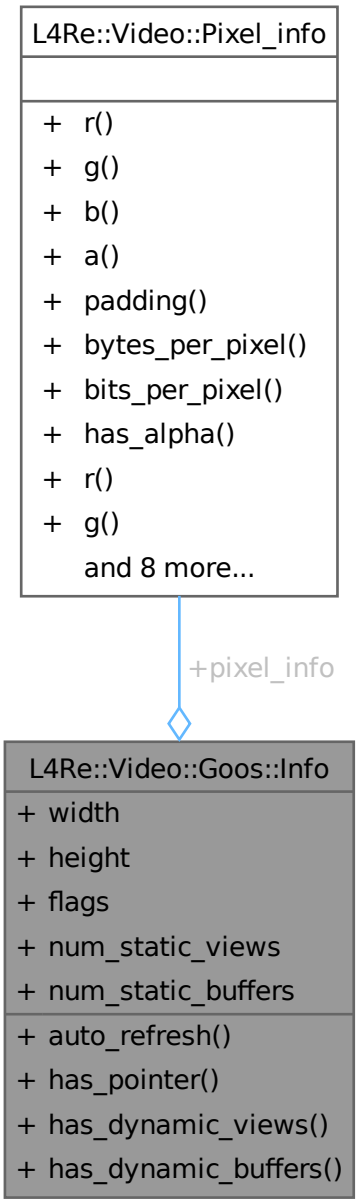
The documentation for this class was generated from the following file:

- l4/re/video/goos

15.349 L4Re::Video::Goos::Info Struct Reference

Information structure of a Goos.
`#include <goos>`

Collaboration diagram for L4Re::Video::Goos::Info:



Public Member Functions

- bool **auto_refresh** () const

  Return whether this Goos does auto refreshing or the view refresh functions must be used to make changes visible.
- bool **has_pointer** () const

  Return whether a pointer is used by the provider of the Goos.
- bool **has_dynamic_views** () const

  Return whether dynamic view are supported.
- bool **has_dynamic_buffers** () const

  Return whether dynamic buffers are supported.

Data Fields

- unsigned long **width**

  Width.
- unsigned long **height**

  Height.
- unsigned **flags**

  Flags, see Flags.
- unsigned **num_static_views**

  Number of static view.
- unsigned **num_static_buffers**

  Number of static buffers.
- Pixel_info **pixel_info**

  Pixel information.

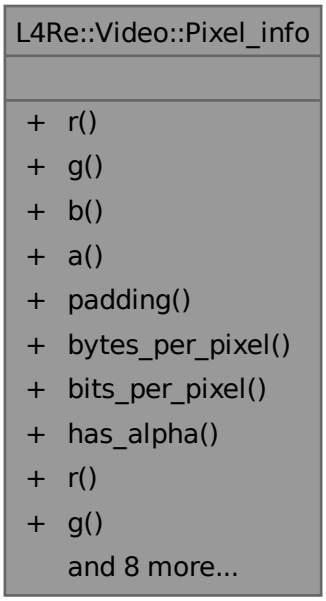
15.349.1 Detailed Description

Information structure of a Goos.
Definition at line 237 of file goos.
The documentation for this struct was generated from the following file:

- l4/re/video/goos

15.350 L4Re::Video::Pixel_info Class Reference

Pixel information.
`#include <colors>`
Collaboration diagram for L4Re::Video::Pixel_info:



Public Member Functions

- Color_component const & r () const

  Return the red color component of the pixel.
- Color_component const & g () const

  Return the green color component of the pixel.
- Color_component const & b () const

  Return the blue color component of the pixel.
- Color_component const & a () const

  Return the alpha color component of the pixel.
- Color_component const padding () const

  Compute the padding pseudo component.
- unsigned char bytes_per_pixel () const

  Query size of pixel in bytes.
- unsigned char bits_per_pixel () const

  Number of bits of the pixel.
- bool has_alpha () const

  Return whether the pixel has an alpha channel.
- void r (Color_component const &c)

  Set the red color component of the pixel.
- void g (Color_component const &c)

  Set the green color component of the pixel.
- void b (Color_component const &c)

  Set the blue color component of the pixel.
- void a (Color_component const &c)

  Set the alpha color component of the pixel.
- void bytes_per_pixel (unsigned char bpp)

  Set the size of the pixel in bytes.
- **Pixel_info** ()

  Constructor.
- Pixel_info (unsigned char bpp, char r, char rs, char g, char gs, char b, char bs, char a=0, char as=0)

  Constructor.
- template<typename VBI>
  Pixel_info (VBI const *vbi)

  Convenience constructor.
- bool operator== (Pixel_info const &o) const

  Compare for complete equality of the color space.
- template<typename OUT>
  void dump (OUT &s) const

  Dump information on the pixel to a stream.

15.350.1 Detailed Description

Pixel information.
This class wraps the information on a pixel, such as the size and position of each color component in the pixel.
Definition at line 94 of file colors.

15.350.2 Constructor & Destructor Documentation

15.350.2.1 Pixel_info() [1/2]

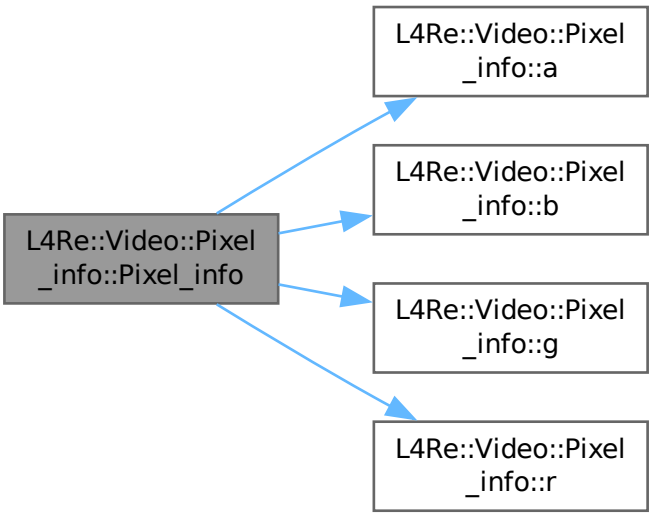
```
L4Re::Video::Pixel_info::Pixel_info (
            unsigned char bpp,
            char r,
            char rs,
            char g,
            char gs,
            char b,
            char bs,
            char a = 0,
            char as = 0)  [inline]
```

Constructor.

Parameters

bpp	Size of pixel in bytes.
r	Red component size.
rs	Red component shift.
g	Green component size.
gs	Green component shift.
b	Blue component size.
bs	Blue component shift.
a	Alpha component size, defaults to 0.
as	Alpha component shift, defaults to 0.

Definition at line 212 of file colors.
References a(), b(), g(), and r().
Here is the call graph for this function:



15.350.2.2 Pixel_info() [2/2]

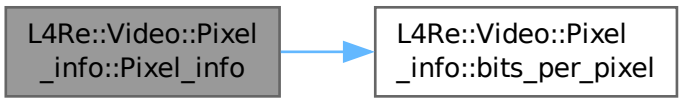
```
template<typename VBI>
L4Re::Video::Pixel_info::Pixel_info (
            VBI const * vbi)  [inline], [explicit]
```

Convenience constructor.

Parameters

vbi	Suitable information structure. Convenience constructor to create the pixel info from a VESA Framebuffer Info.

Definition at line 224 of file colors.
References bits_per_pixel().
Here is the call graph for this function:



15.350.3 Member Function Documentation

15.350.3.1 a() [1/2]

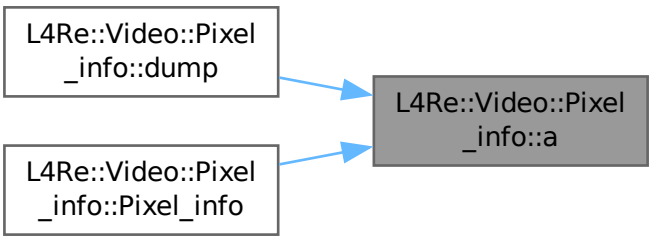
```
Color_component const & L4Re::Video::Pixel_info::a () const  [inline]
```

Return the alpha color component of the pixel.

Returns

Alpha color component.

Definition at line 123 of file colors.
Referenced by dump(), and Pixel_info().
Here is the caller graph for this function:



15.350.3.2 a() [2/2]

```
void L4Re::Video::Pixel_info::a (
            Color_component const & c)  [inline]
```

Set the alpha color component of the pixel.

Parameters

c	Alpha color component.

Definition at line 187 of file colors.

15.350.3.3 b() [1/2]

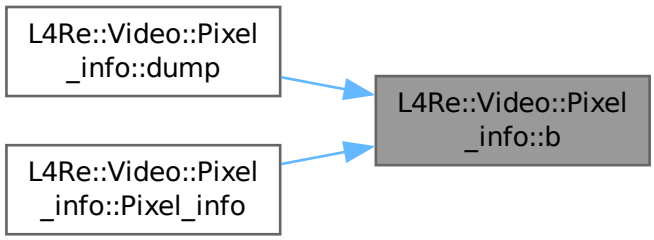
```
Color_component const & L4Re::Video::Pixel_info::b () const  [inline]
```

Return the blue color component of the pixel.

Returns

Blue color component.

Definition at line 117 of file colors.
Referenced by dump(), and Pixel_info().
Here is the caller graph for this function:



15.350.3.4 b() [2/2]

```
void L4Re::Video::Pixel_info::b (
            Color_component const & c)  [inline]
```

Set the blue color component of the pixel.

Parameters

c	Blue color component.

Definition at line 181 of file colors.

15.350.3.5 bits_per_pixel()

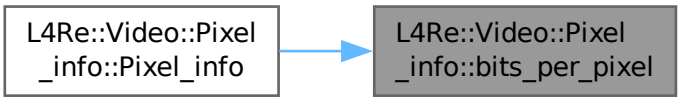
```
unsigned char L4Re::Video::Pixel_info::bits_per_pixel () const  [inline]
```

Number of bits of the pixel.

Returns

Number of bits used by the pixel.

Definition at line 156 of file colors.
Referenced by Pixel_info().
Here is the caller graph for this function:



15.350.3.6 bytes_per_pixel() [1/2]

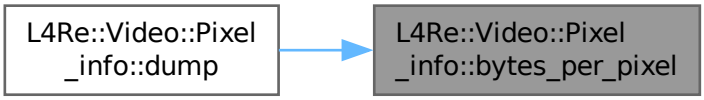
```
unsigned char L4Re::Video::Pixel_info::bytes_per_pixel () const  [inline]
```

Query size of pixel in bytes.

Returns

Size of pixel in bytes.

Definition at line 150 of file colors.
Referenced by dump().
Here is the caller graph for this function:



15.350.3.7 bytes_per_pixel() [2/2]

```
void L4Re::Video::Pixel_info::bytes_per_pixel (
            unsigned char bpp)  [inline]
```

Set the size of the pixel in bytes.

Parameters

bpp	Size of pixel in bytes.

Definition at line 193 of file colors.

15.350.3.8 dump()

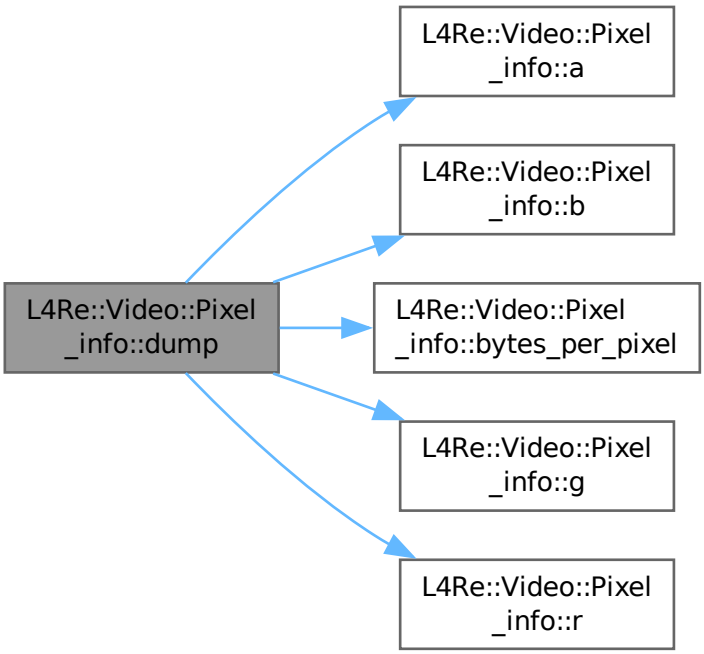
```
template<typename OUT>
void L4Re::Video::Pixel_info::dump (
             OUT & s) const  [inline]
```

Dump information on the pixel to a stream.

Parameters

s	Stream

Definition at line 246 of file colors.
References a(), b(), bytes_per_pixel(), g(), and r().
Here is the call graph for this function:



15.350.3.9 g() [1/2]

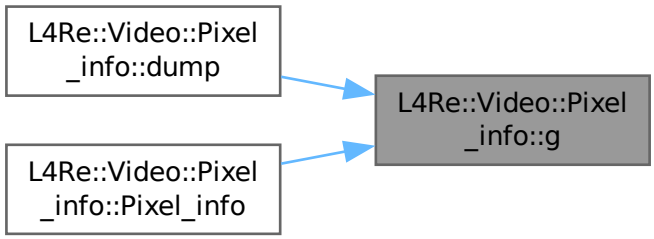
```
Color_component const & L4Re::Video::Pixel_info::g () const  [inline]
```

Return the green color component of the pixel.

Returns

Green color component.

Definition at line 111 of file colors.
Referenced by dump(), and Pixel_info().
Here is the caller graph for this function:



15.350.3.10 g() [2/2]

```
void L4Re::Video::Pixel_info::g (
            Color_component const & c)  [inline]
```

Set the green color component of the pixel.

Parameters

c	Green color component.

Definition at line 175 of file colors.

15.350.3.11 has_alpha()

```
bool L4Re::Video::Pixel_info::has_alpha () const  [inline]
```

Return whether the pixel has an alpha channel.

Returns

True if the pixel has an alpha channel, false if not.

Definition at line 163 of file colors.

15.350.3.12 operator==()

```
bool L4Re::Video::Pixel_info::operator== (
            Pixel_info const & o) const  [inline]
```

Compare for complete equality of the color space.

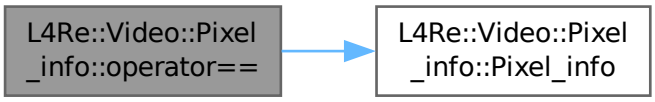
Parameters

o	A Pixel_info to compare to.

Returns

true if the both Pixel_info's are equal, false if not.

Definition at line 236 of file colors.
References Pixel_info().
Here is the call graph for this function:



15.350.3.13 padding()

```
Color_component const L4Re::Video::Pixel_info::padding () const  [inline]
```

Compute the padding pseudo component.
The padding pseudo component represents the trailing bits that are reserved in RGB32 and similar pixel formats.

Returns

Padding pseudo component.

Definition at line 131 of file colors.

15.350.3.14 r() [1/2]

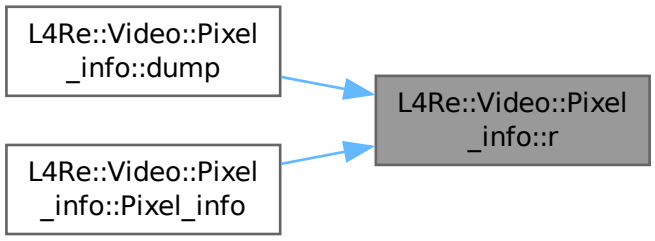
```
Color_component const & L4Re::Video::Pixel_info::r () const  [inline]
```

Return the red color component of the pixel.

Returns

Red color component.

Definition at line 105 of file colors.
Referenced by dump(), and Pixel_info().
Here is the caller graph for this function:



15.350.3.15 r() [2/2]

```
void L4Re::Video::Pixel_info::r (
            Color_component const & c)  [inline]
```

Set the red color component of the pixel.

Parameters

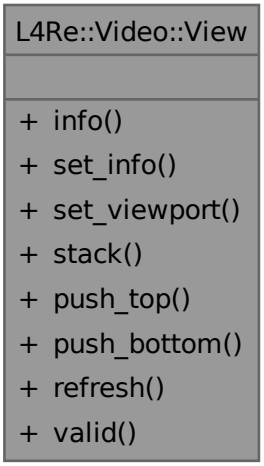
c	Red color component.

Definition at line 169 of file colors.
The documentation for this class was generated from the following file:

- l4/re/video/colors

15.351 L4Re::Video::View Class Reference

View of a framebuffer.
`#include <goos>`
Collaboration diagram for L4Re::Video::View:



Data Structures

- struct Info

  Information structure of a view.

Public Types

- enum Flags {
  F_none = 0x00 , F_set_buffer = 0x01 , F_set_buffer_offset = 0x02 , F_set_bytes_per_line = 0x04 ,
  F_set_pixel = 0x08 , F_set_position = 0x10 , F_dyn_allocated = 0x20 , F_set_background = 0x40 ,
  F_set_flags = 0x80 , F_fully_dynamic }

  Flags on a view.
- enum V_flags { F_above = 0x1000 , F_flags_mask = 0xff000 }

  Property flags of a view.

Public Member Functions

- int info (Info *info) const noexcept

  Return the view information of the view.
- int set_info (Info const &info) const noexcept

  Set the information structure for this view.
- int set_viewport (int scr_x, int scr_y, int w, int h, unsigned long buf_offset) const noexcept

  Set the position of the view in the Goos.
- int stack (View const &pivot, bool behind=true) const noexcept

  Move this view in the view stack.
- int **push_top** () const noexcept

  Make this view the top-most view.
- int **push_bottom** () const noexcept

  Push this view the back.
- int refresh (int x, int y, int w, int h) const noexcept

  Refresh/Redraw the view.
- bool **valid** () const

  Return whether this view is valid.

15.351.1 Detailed Description

View of a framebuffer.
A view is a rectangular subset of a framebuffer managed by a Goos object. The Goos orders multiple views in a stack which determines which view is on top in case they overlap. The view's pixel data is provided by a backing buffer, which must belong to the Goos. It can be static or dynamically allocated, depending on the framebuffer.

L4Re::Video::Goos

Definition at line 39 of file goos.

15.351.2 Member Enumeration Documentation

15.351.2.1 Flags

`enum L4Re::Video::View::Flags`
Flags on a view.

Enumerator

F_none	everything for this view is static (the BOOT-FB case)
F_set_buffer	buffer object for this view can be changed
F_set_buffer_offset	buffer offset can be set
F_set_bytes_per_line	bytes per line can be set
F_set_pixel	pixel type can be set
F_set_position	position on screen can be set
F_dyn_allocated	View is dynamically allocated.
F_set_background	Set view as background for session.
F_set_flags	Set view flags (. **See also** V_flags)

F_fully_dynamic	Flags for a fully dynamic view.

Definition at line 59 of file goos.

15.351.2.2 V_flags

```
enum L4Re::Video::View::V_flags
```

Property flags of a view.
Such flags can be set or deleted with the F_set_flags operation using the `set_info()` method.

Enumerator

F_above	Flag the view as stay on top.
F_flags_mask	Mask containing all possible property flags.

Definition at line 82 of file goos.

15.351.3 Member Function Documentation

15.351.3.1 info()

```
int L4Re::Video::View::info (
            Info * info) const  [inline], [noexcept]
```

Return the view information of the view.

Parameters

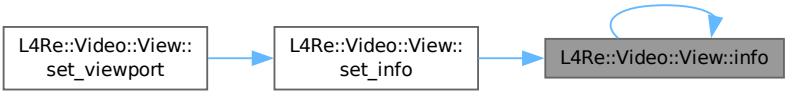
out	*info*	Information structure pointer.

Return values

0	Success
<0	Error

Definition at line 367 of file goos.
References info().
Referenced by info(), and set_info().
Here is the call graph for this function:

Here is the caller graph for this function:



15.351.3.2 refresh()

```
int L4Re::Video::View::refresh (
             int x,
             int y,
             int w,
             int h) const  [inline], [noexcept]
```

Refresh/Redraw the view.

Parameters

x	X position.
y	Y position.
w	Width.
h	Height.

Return values

0	Success
<0	Error

Definition at line 379 of file goos.

15.351.3.3 set_info()

```
int L4Re::Video::View::set_info (
             Info const & info) const  [inline], [noexcept]
```

Set the information structure for this view.

Parameters

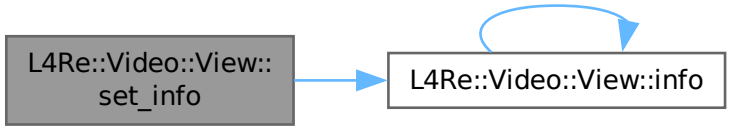
info	Information structure.

Return values

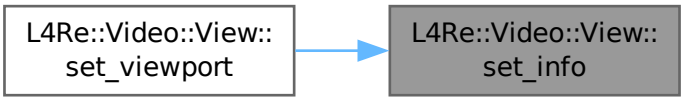
0	Success
<0	Error

The function will also set the view port according to the values given in the information structure.

Definition at line 371 of file goos.
References info().
Referenced by set_viewport().
Here is the call graph for this function:



Here is the caller graph for this function:



15.351.3.4 set_viewport()

```
int L4Re::Video::View::set_viewport (
            int scr_x,
            int scr_y,
            int w,
            int h,
            unsigned long buf_offset) const  [inline], [noexcept]
```

Set the position of the view in the Goos.

Parameters

scr_x	X position
scr_y	Y position
w	Width
h	Height
buf_offset	Offset in the buffer in bytes

Return values

0	Success
<0	Error

Definition at line 383 of file goos.

15.351.3.5 stack()

```
int L4Re::Video::View::stack (
            View const & pivot,
            bool behind = true) const  [inline], [noexcept]
```

Move this view in the view stack.

Parameters

pivot	View to move relative to
behind	When true move the view behind the pivot view, if false move the view before the pivot view.

Return values

0	Success
<0	Error

Definition at line 375 of file goos.
Referenced by push_bottom(), and push_top().

The documentation for this class was generated from the following file:

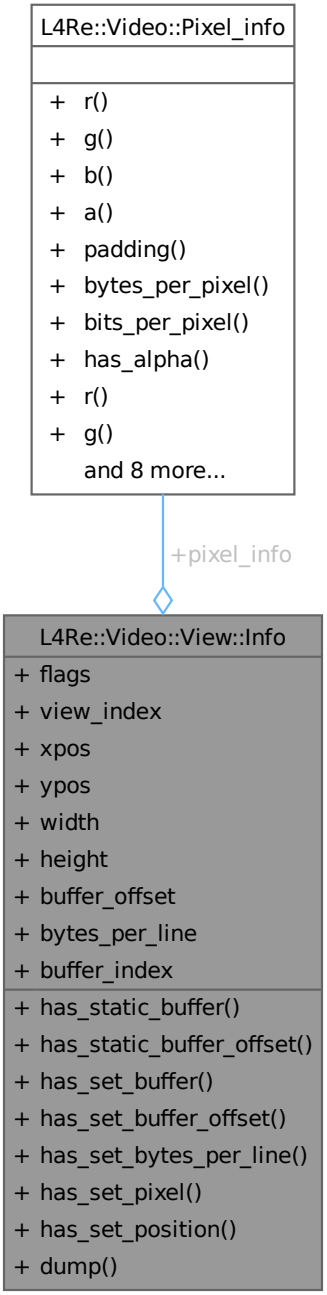
- l4/re/video/goos

15.352 L4Re::Video::View::Info Struct Reference

Information structure of a view.

`#include <goos>`

Collaboration diagram for L4Re::Video::View::Info:



Public Member Functions

- bool **has_static_buffer** () const

  Return whether the view has a static buffer.
- bool **has_static_buffer_offset** () const

  Return whether the static buffer offset is available.
- bool **has_set_buffer** () const

  Return whether a buffer is set.

- bool **has_set_buffer_offset** () const

  Return whether the given buffer offset is valid.
- bool **has_set_bytes_per_line** () const

  Return whether the given bytes-per-line value is valid.
- bool **has_set_pixel** () const

  Return whether the given pixel information is valid.
- bool **has_set_position** () const

  Return whether the position information given is valid.
- template<typename OUT>
  void **dump** (OUT &s) const

  Dump information on the view information to a stream.

Data Fields

- unsigned **flags** = 0

  Flags, see Flags and V_flags.
- unsigned **view_index** = 0

  Index of the view.
- unsigned long **xpos** = 0

  X position in pixels of the view in the Goos.
- unsigned long **ypos** = 0

  Y position in pixels of the view in the Goos.
- unsigned long **width** = 0

  Width of the view in pixels.
- unsigned long **height** = 0

  Height of the view in pixels.
- unsigned long **buffer_offset** = 0

  Offset in the memory buffer in bytes.
- unsigned long **bytes_per_line** = 0

  Bytes per line.
- Pixel_info **pixel_info**

  Pixel information.
- unsigned **buffer_index** = 0

  Number of the buffer used for this view.

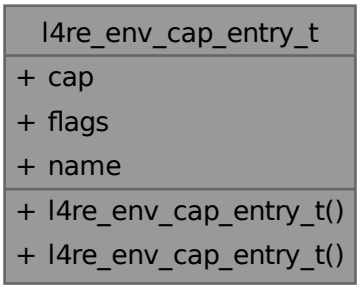
15.358 l4re_env_cap_entry_t Struct Reference

Entry in the L4Re environment array for the named initial objects.

`#include <env.h>`
Collaboration diagram for l4re_env_cap_entry_t:



Public Member Functions

- **l4re_env_cap_entry_t** () L4_NOTHROW

  Create an invalid entry.
- l4re_env_cap_entry_t (char const ∗n, l4_cap_idx_t c, l4_umword_t f=0) L4_NOTHROW

  Create an entry with the name n, capability c, and flags f.

Data Fields

- l4_cap_idx_t **cap**

  The capability index for the object or L4_INVALID_CAP.
- l4_umword_t flags

  Flags for the object.
- char **name** [16]

  The name of the object.

15.358.1 Detailed Description

Entry in the L4Re environment array for the named initial objects.
Definition at line 43 of file env.h.

15.358.2 Constructor & Destructor Documentation

15.358.2.1 l4re_env_cap_entry_t()

```
l4re_env_cap_entry_t::l4re_env_cap_entry_t (
            char const * n,
            l4_cap_idx_t c,
            l4_umword_t f = 0)  [inline]
```

Create an entry with the name *n*, capability *c*, and flags *f*.

Parameters

n	is the name of the initial object.
c	is the capability index that refers the initial object.

f	are the additional flags for the object.

Definition at line 74 of file env.h.
References cap, flags, L4_NOTHROW, and name.

15.358.3 Field Documentation

15.358.3.1 flags

```
l4_umword_t l4re_env_cap_entry_t::flags
```

Flags for the object.

Note

Currently unused, except as an end marker for the entry list.

Definition at line 54 of file env.h.
Referenced by l4re_env_cap_entry_t(), l4re_env_cap_entry_t(), and l4re_env_get_cap_l().
The documentation for this struct was generated from the following file:

- l4/re/env.h

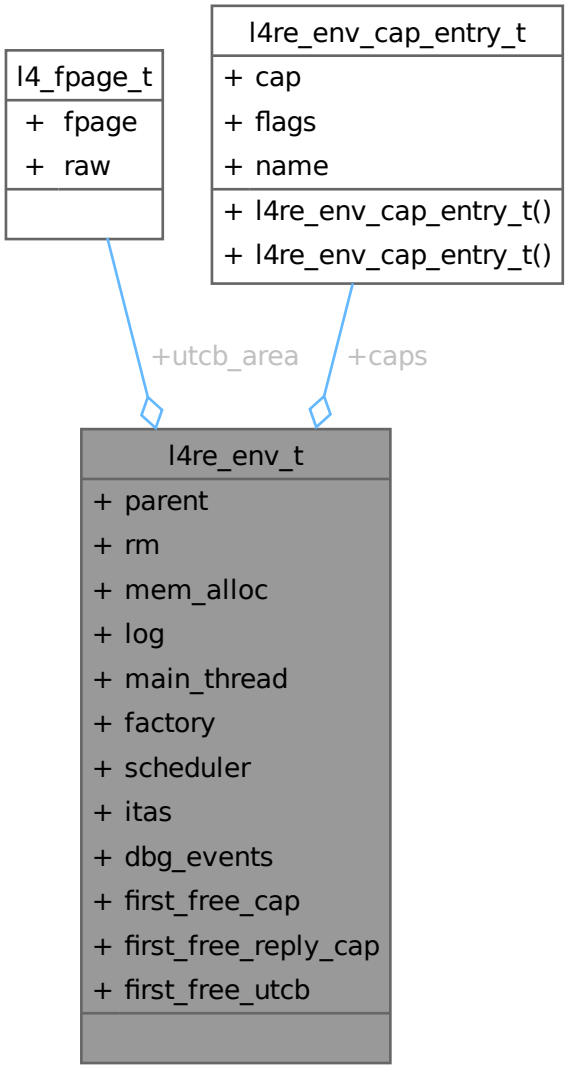
Initial environment data structure.
`#include <env.h>`

Collaboration diagram for l4re_env_t:



Data Fields

- l4_cap_idx_t **parent**

  Parent object-capability.
- l4_cap_idx_t **rm**

  Region map object-capability.
- l4_cap_idx_t **mem_alloc**

  Memory allocator object-capability.
- l4_cap_idx_t **log**

  Logging object-capability.
- l4_cap_idx_t **main_thread**

  Object-capability of the first user thread.
- l4_cap_idx_t **factory**

Object-capability of the factory available to the task.

- l4_cap_idx_t **scheduler**

  Object capability for the scheduler set to use.

- l4_cap_idx_t **itas**

  ITAS services object-capability.

- l4_cap_idx_t **dbg_events**

  Object-capability of the debug events service.

- l4_cap_idx_t **first_free_cap**

  *First object capability index available to the application (**not** shifted by L4_CAP_SHIFT).*

- l4_umword_t **first_free_reply_cap**

  *First reply capability index available to the application (**not** shifted by L4_CAP_SHIFT).*

- l4_fpage_t **utcb_area**

  UTCB area of the task.

- l4_addr_t **first_free_utcb**

  First UTCB within the UTCB area available to the application.

- l4re_env_cap_entry_t * caps

  Pointer to the first entry in the initial objects array which contains l4re_env_cap_entry_t elements.

15.359.1 Detailed Description

Initial environment data structure.

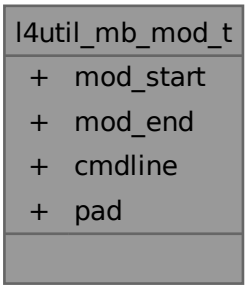
15.374 l4util_mb_mod_t Struct Reference

The structure type "mod_list" is used by the multiboot_info structure.
`#include <mb_info.h>`

Collaboration diagram for l4util_mb_mod_t:



Data Fields

- l4_uint32_t **mod_start**

  Starting address of module in memory.
- l4_uint32_t **mod_end**

  End address of module in memory.
- l4_uint32_t **cmdline**

  Module command line.
- l4_uint32_t **pad**

  padding to take it to 16 bytes

15.374.1 Detailed Description

The structure type "mod_list" is used by the multiboot_info structure.
Definition at line 33 of file mb_info.h.
The documentation for this struct was generated from the following file:

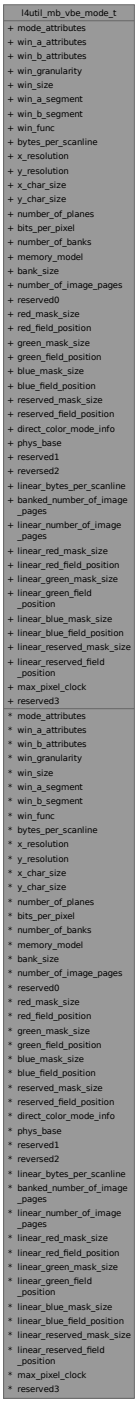
15.376 l4util_mb_vbe_mode_t Struct Reference

VBE mode information.
`#include <mb_info.h>`

Collaboration diagram for l4util_mb_vbe_mode_t:



Data Fields

all VESA versions

- l4_uint16_t **mode_attributes**
  Mode attributes.
- l4_uint8_t **win_a_attributes**
  Window A attributes.
- l4_uint8_t **win_b_attributes**

Window B attributes.

- l4_uint16_t **win_granularity**
  Window granularity.
- l4_uint16_t **win_size**
  Window size.
- l4_uint16_t **win_a_segment**
  Window A start segment.
- l4_uint16_t **win_b_segment**
  Window B start segment.
- l4_uint32_t **win_func**
  Real mode pointer to window function.
- l4_uint16_t **bytes_per_scanline**
  Bytes per scan line.

>= VESA version 1.2

- l4_uint16_t **x_resolution**
  Horizontal resolution in pixels or characters.
- l4_uint16_t **y_resolution**
  Vertical resolution in pixels or characters.
- l4_uint8_t **x_char_size**
  Character cell width in pixels.
- l4_uint8_t **y_char_size**
  Character cell height in pixels.
- l4_uint8_t **number_of_planes**
  Number of memory planes.
- l4_uint8_t **bits_per_pixel**
  Bits per pixel.
- l4_uint8_t **number_of_banks**
  Number of banks.
- l4_uint8_t **memory_model**
  Memory model type.
- l4_uint8_t **bank_size**
  Bank size in KiB.
- l4_uint8_t **number_of_image_pages**
  Number of images.
- l4_uint8_t **reserved0**
  Reserved for page function.

direct color

- l4_uint8_t **red_mask_size**
  Size of direct color red mask in bits.
- l4_uint8_t **red_field_position**
  Bit position of LSB of red mask.
- l4_uint8_t **green_mask_size**
  Size of direct color green mask in bits.
- l4_uint8_t **green_field_position**
  Bit position of LSB of green mask.
- l4_uint8_t **blue_mask_size**
  Size of direct color blue mask in bits.
- l4_uint8_t **blue_field_position**
  Bit position of LSB of blue mask.
- l4_uint8_t **reserved_mask_size**
  Size of direct color reserved mask in bits.
- l4_uint8_t **reserved_field_position**
  Bit position of LSB of reserved mask.
- l4_uint8_t **direct_color_mode_info**
  Direct color mode attributes.

>= VESA version 2.0

- l4_uint32_t **phys_base**
  Physical address for flat memory memory frame buffer.
- l4_uint32_t **reserved1**
  Reserved – always set to 0.
- l4_uint16_t **reversed2**
  Reserved – always set to 0.

>= VESA version 3.0

- l4_uint16_t **linear_bytes_per_scanline**
  Bytes per scan line for linear modes.
- l4_uint8_t **banked_number_of_image_pages**
  Number of images for banked modes.
- l4_uint8_t **linear_number_of_image_pages**
  Number of images for linear modes.
- l4_uint8_t **linear_red_mask_size**
  Size of direct color red mask (linear modes).
- l4_uint8_t **linear_red_field_position**
  Bit position of LSB of red mask (linear modes).
- l4_uint8_t **linear_green_mask_size**
  Size of direct color green mask (linear modes).
- l4_uint8_t **linear_green_field_position**
  Bit position of LSB of green mask (linear modes).
- l4_uint8_t **linear_blue_mask_size**
  Size of direct color blue mask (linear modes).
- l4_uint8_t **linear_blue_field_position**
  Bit position of LSB of blue mask (linear modes).
- l4_uint8_t **linear_reserved_mask_size**
  Size of direct color reserved mask (linear modes).
- l4_uint8_t **linear_reserved_field_position**
  Bit position of LSB of reserved mask (linear modes).
- l4_uint32_t **max_pixel_clock**
  Maximum pixel clock (in Hz) for graphics mode.
- l4_uint8_t **reserved3** [190]
  Reserved (padding).

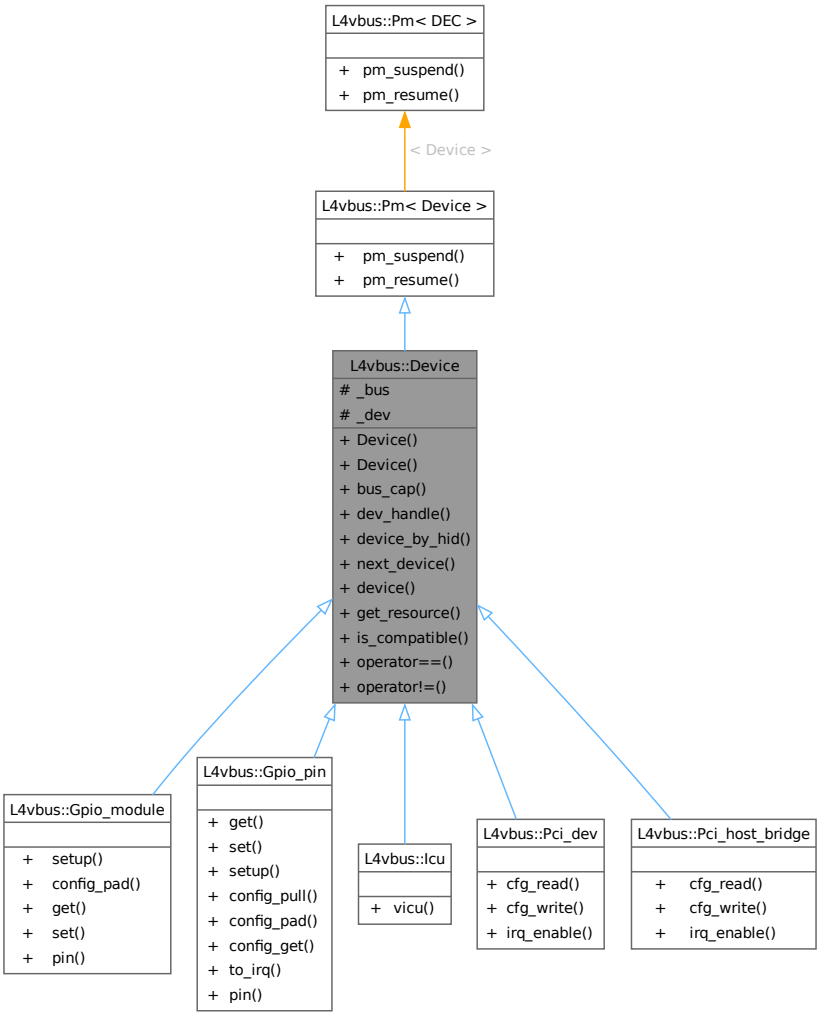
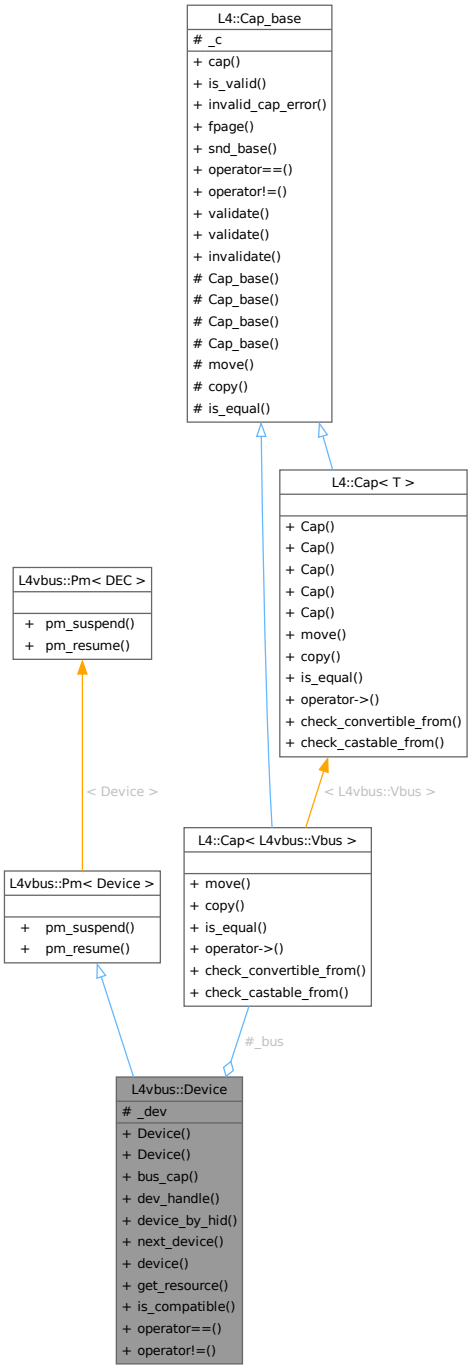
15.377 L4vbus::Device Class Reference

Device on a L4vbus::Vbus.
`#include <vbus>`

Inheritance diagram for L4vbus::Device:



Collaboration diagram for L4vbus::Device:



Public Member Functions

- **Device** ()

  Construct a new vbus device using the NULL device L4VBUS_NULL.

- Device (L4::Cap< Vbus > bus, l4vbus_device_handle_t dev)

  Construct a new vbus device using a device handle.

- L4::Cap< Vbus > bus_cap () const

  Access the Vbus capability of the underlying virtual bus.

- l4vbus_device_handle_t dev_handle () const

  Access the device handle of this device.
- int device_by_hid (Device *child, char const *hid, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find a device by the hardware interface identifier (HID).
- int next_device (Device *child, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find next child following `child`.
- int device (l4vbus_device_t *devinfo) const

  Obtain detailed information about a Vbus device.
- int get_resource (unsigned res_idx, l4vbus_resource_t *res) const

  Obtain the resource description of an individual device resource.
- int is_compatible (char const *cid) const

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- bool operator== (Device const &o) const

  Test if two devices are the same Vbus device.
- bool operator!= (Device const &o) const

  Test if two Vbus devices are not the same.

Public Member Functions inherited from L4vbus::Pm< Device >

- int pm_suspend () const

  Suspend the device.
- int pm_resume () const

  Resume the device.

Protected Attributes

- L4::Cap< Vbus > **_bus**

  The Vbus capability where this device is located on.
- l4vbus_device_handle_t **_dev**

  The device handle for this device.

15.377.1 Detailed Description

Device on a L4vbus::Vbus.
Definition at line 83 of file vbus.

15.377.2 Constructor & Destructor Documentation

15.377.2.1 Device()

```
L4vbus::Device::Device (
            L4::Cap< Vbus > bus,
            l4vbus_device_handle_t dev)  [inline]
```

Construct a new vbus device using a device handle.
Specifying the special root bus device handle L4VBUS_ROOT_BUS forms the root device of the corresponding vbus, see Vbus::root.

Parameters

bus	The vbus capability where this device is assigned.
dev	The device handle of the device.

Definition at line 100 of file vbus.
References _bus, and _dev.

15.377.3 Member Function Documentation

15.377.3.1 bus_cap()

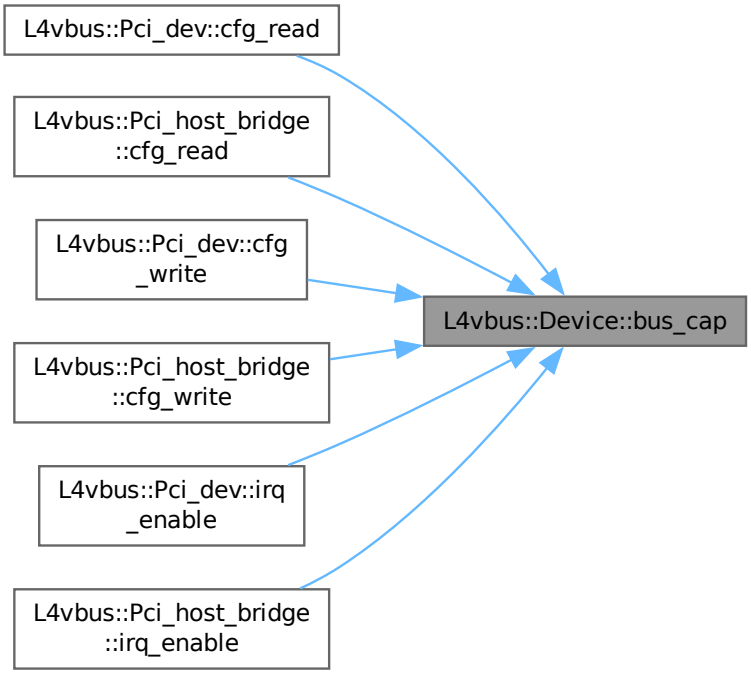
```
L4::Cap< Vbus > L4vbus::Device::bus_cap () const  [inline]
```

Access the Vbus capability of the underlying virtual bus.

Returns

the capability to the underlying Vbus.

Definition at line 107 of file vbus.
References _bus.
Referenced by L4vbus::Pci_dev::cfg_read(), L4vbus::Pci_host_bridge::cfg_read(), L4vbus::Pci_dev::cfg_write(), L4vbus::Pci_host_bridge::cfg_write(), L4vbus::Pci_dev::irq_enable(), and L4vbus::Pci_host_bridge::irq_enable().
Here is the caller graph for this function:



15.377.3.2 dev_handle()

```
l4vbus_device_handle_t L4vbus::Device::dev_handle () const  [inline]
```

Access the device handle of this device.

Returns

the device handle for this device.

The device handle is used to directly address the device on its virtual bus.
Definition at line 116 of file vbus.
References _dev.

15.377.3.3 device()

```
int L4vbus::Device::device (
            l4vbus_device_t * devinfo) const  [inline]
```

Obtain detailed information about a Vbus device.

Parameters

out	*devinfo*	Information structure which contains details about the device. The pointer might be NULL.

Return values

0	Success.
-L4_ENODEV	No device with the given device handle dev could be found.

Definition at line 189 of file vbus.
References _bus, _dev, and l4vbus_get_device().
Here is the call graph for this function:

15.377.3.4 device_by_hid()

```
int L4vbus::Device::device_by_hid (
            Device * child,
            char const * hid,
            int depth = L4VBUS_MAX_DEPTH,
            l4vbus_device_t * devinfo = 0) const  [inline]
```

Find a device by the hardware interface identifier (HID).
This function searches the vbus for a device with the given HID and returns a handle to the first matching device. The HID usually conforms to an ACPI HID or a Linux device tree compatible identifier.
It is possible to have multiple devices with the same HID on a vbus. In order to find all matching devices this function has to be called repeatedly with child pointing to the device found in the previous iteration. The iteration starts at child that might be any device node in the tree.

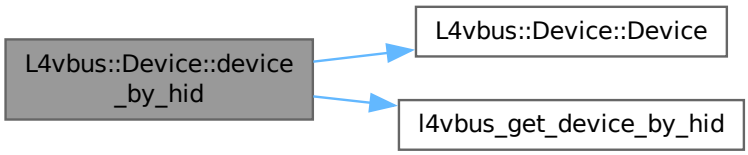
Parameters

in, out	*child*	Handle of the device from where in the device tree the search should start. To start searching from the beginning child must be initialized using the default (L4VBUS_NULL). If a matching device is found, its handle is returned through this parameter.
	hid	HID of the device
	depth	Maximum depth for the recursive lookup
out	*devinfo*	Device information structure (might be NULL)

Return values

>=0	A device with the given HID was found.
-L4_ENOENT	No device with the given HID could be found on the vbus.
-L4_EINVAL	Invalid or no HID provided.
-L4_ENODEV	Function called on a non-existing device.

Definition at line 148 of file vbus.
References _bus, _dev, Device(), and l4vbus_get_device_by_hid().
Here is the call graph for this function:



15.377.3.5 get_resource()

```
int L4vbus::Device::get_resource (
            unsigned res_idx,
            l4vbus_resource_t * res) const  [inline]
```

Obtain the resource description of an individual device resource.

Parameters

	res_idx	Index of the resource for which the resource description should be returned. The total number of resources for a device is available in the l4vbus_device_t structure that is returned by L4vbus::Device::device_by_hid() and L4vbus::Device::next_device().
out	*res*	Descriptor of the resource.

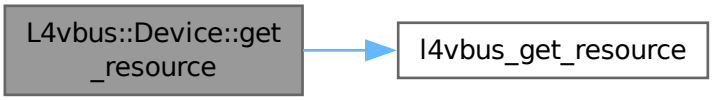
This function returns the resource descriptor of an individual device resource selected by the `res_idx` parameter.

Return values

0	Success.
-L4_ENOENT	Invalid resource index `res_idx`.

Definition at line 209 of file vbus.
References _bus, _dev, and l4vbus_get_resource().

Here is the call graph for this function:



15.377.3.6 is_compatible()

```
int L4vbus::Device::is_compatible (
            char const * cid) const  [inline]
```

Check if the given device has a compatibility ID (CID) or HID that matches *cid*.

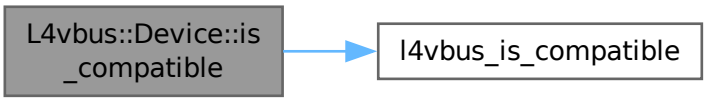
Parameters

cid	the compatibility ID to test

Returns

1 when the given ID (*cid*) matches this device, 0 when the given ID does not match, <0 on error.

Definition at line 223 of file vbus.
References _bus, _dev, and l4vbus_is_compatible().
Here is the call graph for this function:



15.377.3.7 next_device()

```
int L4vbus::Device::next_device (
            Device * child,
            int depth = L4VBUS_MAX_DEPTH,
            l4vbus_device_t * devinfo = 0) const  [inline]
```

Find next child following `child`.

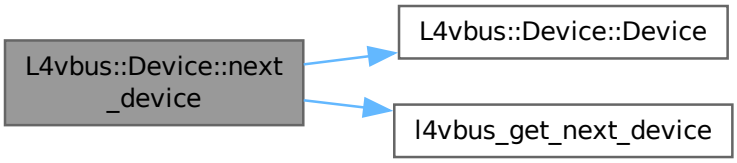
Parameters

in,out	*child*	Handle of the device that precedes the device that shall be returned. To start from the beginning, child must be initialized with L4VBUS_NULL (Device::Device). If a device is found, its handle is returned through this parameter.
	depth	Depth to look for
out	*devinfo*	Device information (might be NULL)

Returns

0 on success, else failure

Definition at line 171 of file vbus.
References _bus, _dev, Device(), and l4vbus_get_next_device().
Here is the call graph for this function:



15.377.3.8 operator"!=()

```
bool L4vbus::Device::operator!= (
            Device const & o) const  [inline]
```

Test if two Vbus devices are not the same.

Returns

true if the two devices are different, false else.

Definition at line 239 of file vbus.
References _bus, _dev, and Device().
Here is the call graph for this function:

15.377.3.9 operator==()

```
bool L4vbus::Device::operator== (
            Device const & o) const  [inline]
```

Test if two devices are the same Vbus device.

Returns

true if the two devices are the same, false else.

Definition at line 230 of file vbus.
References _bus, _dev, and Device().
Here is the call graph for this function:

The documentation for this class was generated from the following file:

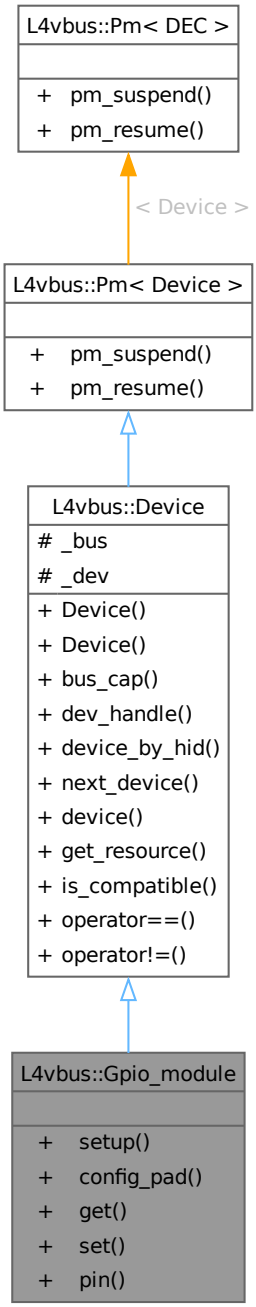
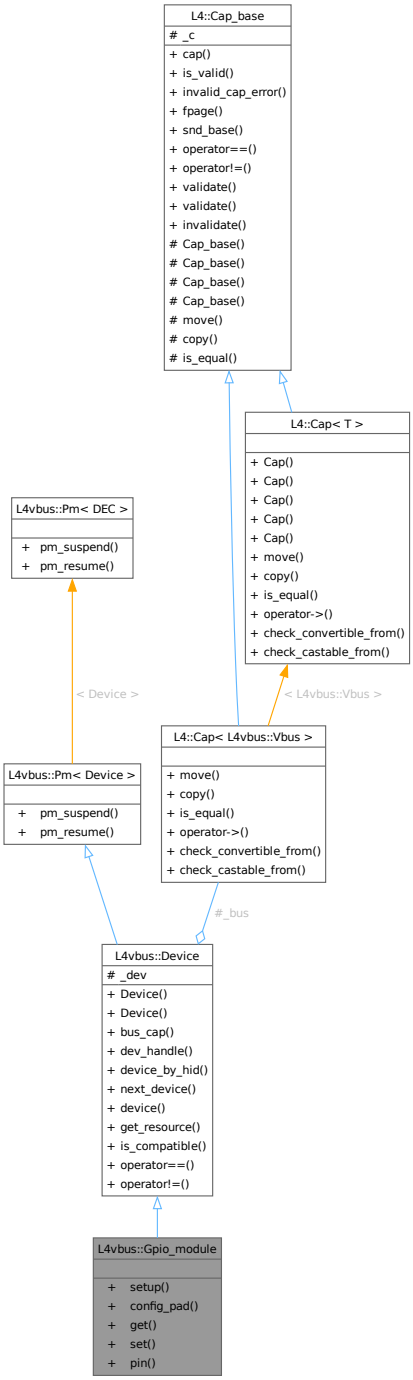
15.378 L4vbus::Gpio_module Class Reference

A Gpio_module groups multiple GPIO pins together.
`#include <vbus_gpio>`

Inheritance diagram for L4vbus::Gpio_module:



Collaboration diagram for L4vbus::Gpio_module:



Data Structures

- struct Pin_slice

  A slice of the pins provided by this module.

Public Member Functions

- int setup (Pin_slice const &mask, unsigned mode, unsigned value) const

Configure function of multiple GPIO pins at once.

- int config_pad (Pin_slice const &mask, unsigned func, unsigned value) const

  Hardware specific configuration function for multiple GPIO pins.
- int get (unsigned offset, unsigned *data) const

  Read values of multiple GPIO pins at once.
- int set (Pin_slice const &mask, unsigned data)

  Set multiple GPIO output pins at once.
- Gpio_pin pin (unsigned pin) const

  Get Gpio_pin for a specific pin of this Gpio_module.

Public Member Functions inherited from L4vbus::Device

- **Device** ()

  Construct a new vbus device using the NULL device L4VBUS_NULL.
- Device (L4::Cap< Vbus > bus, l4vbus_device_handle_t dev)

  Construct a new vbus device using a device handle.
- L4::Cap< Vbus > bus_cap () const

  Access the Vbus capability of the underlying virtual bus.
- l4vbus_device_handle_t dev_handle () const

  Access the device handle of this device.
- int device_by_hid (Device *child, char const *hid, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find a device by the hardware interface identifier (HID).
- int next_device (Device *child, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find next child following `child`.
- int device (l4vbus_device_t *devinfo) const

  Obtain detailed information about a Vbus device.
- int get_resource (unsigned res_idx, l4vbus_resource_t *res) const

  Obtain the resource description of an individual device resource.
- int is_compatible (char const *cid) const

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- bool operator== (Device const &o) const

  Test if two devices are the same Vbus device.
- bool operator!= (Device const &o) const

  Test if two Vbus devices are not the same.

Public Member Functions inherited from L4vbus::Pm< Device >

- int pm_suspend () const

  Suspend the device.
- int pm_resume () const

  Resume the device.

Additional Inherited Members

Protected Attributes inherited from L4vbus::Device

- L4::Cap< Vbus > **_bus**

  The Vbus capability where this device is located on.
- l4vbus_device_handle_t **_dev**

  The device handle for this device.

15.378.1 Detailed Description

A Gpio_module groups multiple GPIO pins together.
Definition at line 133 of file vbus_gpio.

15.378.2 Member Function Documentation

15.378.2.1 config_pad()

```
int L4vbus::Gpio_module::config_pad (
            Pin_slice const & mask,
            unsigned func,
            unsigned value) const  [inline]
```

Hardware specific configuration function for multiple GPIO pins.

Parameters

mask	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
func	Hardware specific configuration register, usually offset to the GPIO chip's base address.
value	Value which is written into the hardware specific configuration register for the specified pins

Returns

0 if OK, error code otherwise

Definition at line 185 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_multi_config_pad().
Here is the call graph for this function:

15.378.2.2 get()

```
int L4vbus::Gpio_module::get (
            unsigned offset,
            unsigned * data) const  [inline]
```

Read values of multiple GPIO pins at once.

Parameters

	offset	Pin corresponding to the LSB in *data*. Note: allowed may be hardware specific.
out	*data*	Each bit returns the value (0 or 1) for the corresponding GPIO pin. The value of pins that are not accessible is undefined.

Returns

0 if OK, error code otherwise

Definition at line 201 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_multi_get().
Here is the call graph for this function:

15.378.2.3 pin()

```
Gpio_pin L4vbus::Gpio_module::pin (
            unsigned pin) const  [inline]
```

Get Gpio_pin for a specific pin of this Gpio_module.

Parameters

pin	GPIO pin number to get Gpio_pin for.

Returns

Gpio_pin

Definition at line 229 of file vbus_gpio.
References pin().
Referenced by pin().
Here is the call graph for this function:

Here is the caller graph for this function:

15.378.2.4 set()

```
int L4vbus::Gpio_module::set (
            Pin_slice const & mask,
            unsigned data)  [inline]
```

Set multiple GPIO output pins at once.

Parameters

mask	Mask of GPIO pins to set. A bit set to 1 selects this pin. A maximum of 32 pins can be set at once. The real number depends on the hardware and the driver implementation.
data	Each bit corresponds to the GPIO pin in *mask*. The value of each bit is written to the GPIO pin if its bit in *mask* is set.

Returns

0 if OK, error code otherwise

Definition at line 217 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_multi_set().
Here is the call graph for this function:

15.378.2.5 setup()

```
int L4vbus::Gpio_module::setup (
            Pin_slice const & mask,
            unsigned mode,
            unsigned value) const  [inline]
```

Configure function of multiple GPIO pins at once.

Parameters

mask	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
mode	GPIO function, see L4vbus_gpio_generic_func for generic functions. Hardware specific functions must be provided in the lower 8 bits.
value	Optional value to set the GPIO pins to if they are configured as output pins

Returns

0 if OK, error code otherwise

Definition at line 166 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_multi_setup().
Here is the call graph for this function:

15.380.1 Detailed Description

A GPIO pin.
Definition at line 26 of file vbus_gpio.

15.380.2 Member Function Documentation

15.380.2.1 config_get()

```
int L4vbus::Gpio_pin::config_get (
            unsigned func,
            unsigned * value) const  [inline]
```

Read hardware specific configuration.

Parameters

	func	Hardware specific configuration register to read from. Usually this is an offset to the GPIO chip's base address.
out	*value*	The configuration value.

Returns

0 if OK, error code otherwise

Definition at line 102 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_config_get().
Here is the call graph for this function:

15.380.2.2 config_pad()

```
int L4vbus::Gpio_pin::config_pad (
            unsigned func,
            unsigned value) const  [inline]
```

Hardware specific configuration function.

Parameters

func	Hardware specific configuration register, usually offset to the GPIO chip's base address
value	Value which is written into the hardware specific configuration register for the specified pin

Returns

0 if OK, error code otherwise

Definition at line 89 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_config_pad().

```
int L4vbus::Gpio_pin::config_pull (
            unsigned mode) const  [inline]
```

Generic function to set pull up/down mode.

Parameters

mode	mode for pull up/down resistors, see L4vbus_gpio_pull_modes

Returns

0 if OK, error code otherwise

Definition at line 75 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_config_pull().
Here is the call graph for this function:

15.380.2.4 get()

```
int L4vbus::Gpio_pin::get () const  [inline]
```

Read value of GPIO input pin.

Returns

Value of GPIO pin (usually 0 or 1), negative error code otherwise.

Definition at line 38 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_get().
Here is the call graph for this function:

15.380.2.5 pin()

```
unsigned L4vbus::Gpio_pin::pin () const  [inline]
```

Get pin number.

Returns

GPIO pin number

Definition at line 122 of file vbus_gpio.

15.380.2.6 set()

```
int L4vbus::Gpio_pin::set (
            int value) const  [inline]
```

Set GPIO output pin.

Parameters

value	Value to write to the GPIO pin (usually 0 or 1)

Returns

0 if OK, error code otherwise

Definition at line 49 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_set().
Here is the call graph for this function:

15.380.2.7 setup()

```
int L4vbus::Gpio_pin::setup (
            unsigned mode,
            unsigned value) const  [inline]
```

Configure the function of a GPIO pin.

Parameters

mode	GPIO function, see L4vbus_gpio_generic_func for generic functions. Hardware specific functions must be provided in the lower 8 bits.
value	Optional value to set the GPIO pin to if it is configured as an output pin

Returns

0 if OK, error code otherwise

Definition at line 64 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_setup().
Here is the call graph for this function:

15.380.2.8 to_irq()

```
int L4vbus::Gpio_pin::to_irq () const  [inline]
```

Create IRQ for GPIO pin.

Returns

IRQ number if OK, negative error code otherwise

Definition at line 112 of file vbus_gpio.
References L4vbus::Device::_bus, L4vbus::Device::_dev, and l4vbus_gpio_to_irq().
Here is the call graph for this function:

The documentation for this class was generated from the following file:

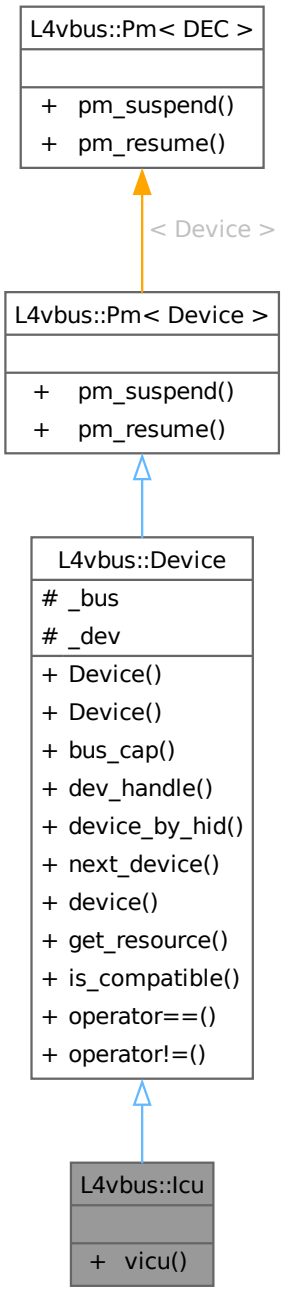
15.381 L4vbus::Icu Class Reference

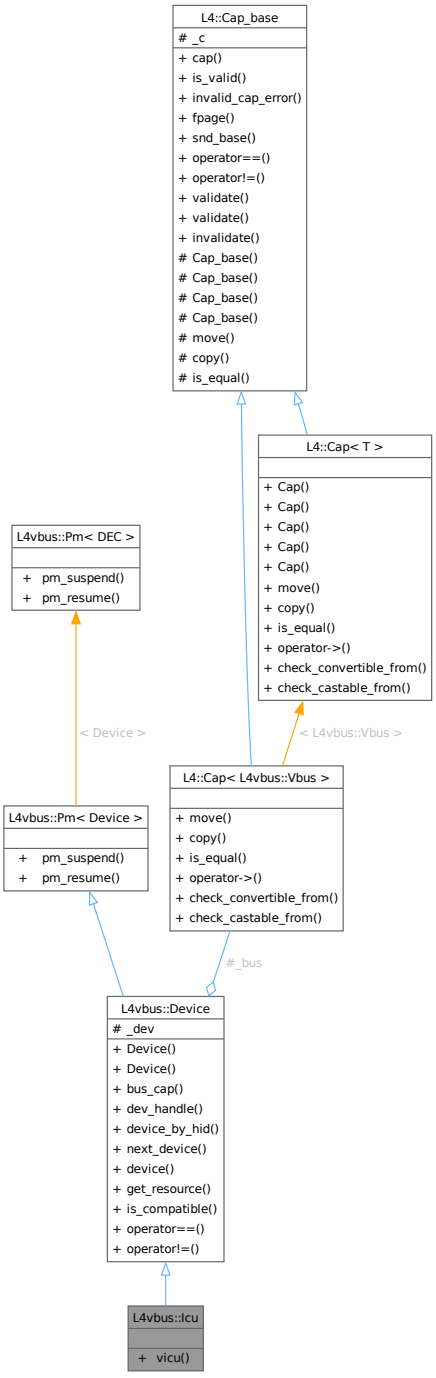
Vbus Interrupt controller API.

`#include <vbus>`

Inheritance diagram for L4vbus::Icu:



Collaboration diagram for L4vbus::Icu:



Public Types

- enum Src_types { Src_dev_handle = L4VBUS_ICU_SRC_DEV_HANDLE }

  Flags that can be used with the ICU on a vbus device.

Public Member Functions

- int vicu (L4::Cap< L4::Icu > icu) const

Request an L4::Icu capability for this Vbus's virtual ICU.

Public Member Functions inherited from L4vbus::Device

- **Device** ()

  Construct a new vbus device using the NULL device L4VBUS_NULL.
- Device (L4::Cap< Vbus > bus, l4vbus_device_handle_t dev)

  Construct a new vbus device using a device handle.
- L4::Cap< Vbus > bus_cap () const

  Access the Vbus capability of the underlying virtual bus.
- l4vbus_device_handle_t dev_handle () const

  Access the device handle of this device.
- int device_by_hid (Device *child, char const *hid, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find a device by the hardware interface identifier (HID).
- int next_device (Device *child, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find next child following `child`.
- int device (l4vbus_device_t *devinfo) const

  Obtain detailed information about a Vbus device.
- int get_resource (unsigned res_idx, l4vbus_resource_t *res) const

  Obtain the resource description of an individual device resource.
- int is_compatible (char const *cid) const

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- bool operator== (Device const &o) const

  Test if two devices are the same Vbus device.
- bool operator!= (Device const &o) const

  Test if two Vbus devices are not the same.

Public Member Functions inherited from L4vbus::Pm< Device >

- int pm_suspend () const

  Suspend the device.
- int pm_resume () const

  Resume the device.

Additional Inherited Members

Protected Attributes inherited from L4vbus::Device

- L4::Cap< Vbus > **_bus**

  The Vbus capability where this device is located on.
- l4vbus_device_handle_t **_dev**

  The device handle for this device.

15.381.1 Detailed Description

Vbus Interrupt controller API.
Every Vbus contains a virtual interrupt control unit that manages the IRQs of the devices on the bus. This class provides access to a capability to an L4::Icu object which can then be used to interface with the IRQs.

See also

L4::Icu

Definition at line 260 of file vbus.

15.381.2 Member Enumeration Documentation

15.381.2.1 Src_types

`enum L4vbus::Icu::Src_types`

Flags that can be used with the ICU on a vbus device.

Enumerator

Src_dev_handle	Flag to denote that the value should be interpreted as a device handle. This flag may be used in the `source` parameter in L4::Icu::msi_info() to denote that the ICU should interpret the source ID as a device handle.

Definition at line 264 of file vbus.

15.381.3 Member Function Documentation

15.381.3.1 vicu()

```
int L4vbus::Icu::vicu (
            L4::Cap< L4::Icu > icu) const  [inline]
```

Request an L4::Icu capability for this Vbus's virtual ICU.

Parameters

`out`	*icu*	Capability slot where the L4::Icu capability shall be stored.

Return values

0	Success.
otherwise	IPC error.

Definition at line 285 of file vbus.
References L4vbus::Device::_bus, L4vbus::Device::_dev, L4::Cap_base::cap(), and l4vbus_vicu_get_cap().
Here is the call graph for this function:

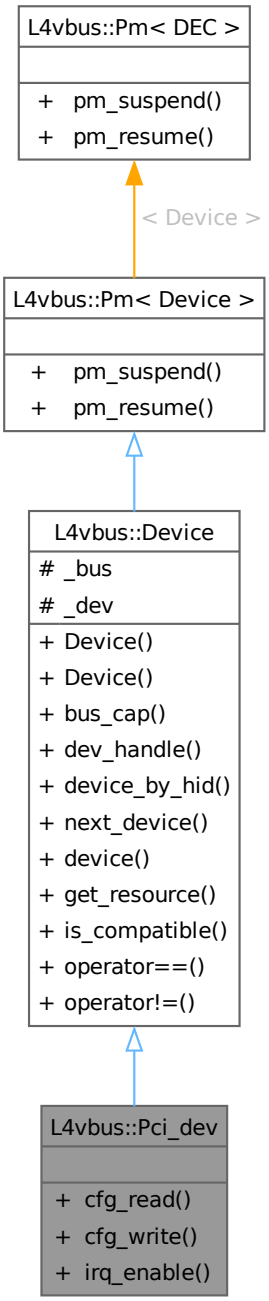
15.382 L4vbus::Pci_dev Class Reference

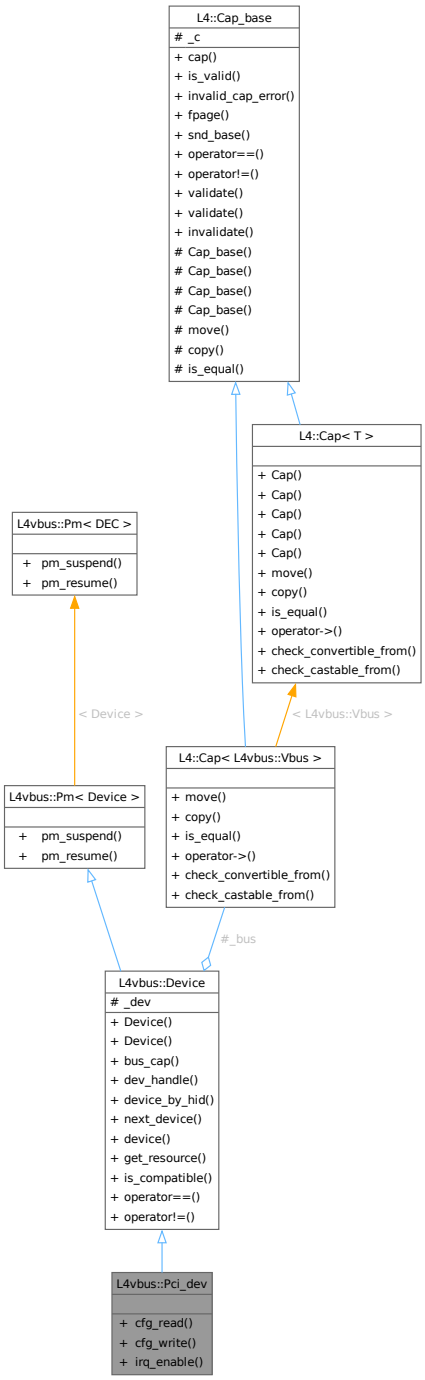
A PCI device.

`#include <vbus_pci>`

Inheritance diagram for L4vbus::Pci_dev:



Collaboration diagram for L4vbus::Pci_dev:



Public Member Functions

- int cfg_read (l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width) const

  Read from the device's vPCI configuration space.
- int cfg_write (l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width) const

  Write to the device's vPCI configuration space.
- int irq_enable (unsigned char *trigger, unsigned char *polarity) const

  Enable the device's PCI interrupt.

Public Member Functions inherited from L4vbus::Device

- **Device** ()

  Construct a new vbus device using the NULL device L4VBUS_NULL.
- Device (L4::Cap< Vbus > bus, l4vbus_device_handle_t dev)

  Construct a new vbus device using a device handle.
- L4::Cap< Vbus > bus_cap () const

  Access the Vbus capability of the underlying virtual bus.
- l4vbus_device_handle_t dev_handle () const

  Access the device handle of this device.
- int device_by_hid (Device *child, char const *hid, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find a device by the hardware interface identifier (HID).
- int next_device (Device *child, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find next child following `child`.
- int device (l4vbus_device_t *devinfo) const

  Obtain detailed information about a Vbus device.
- int get_resource (unsigned res_idx, l4vbus_resource_t *res) const

  Obtain the resource description of an individual device resource.
- int is_compatible (char const *cid) const

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- bool operator== (Device const &o) const

  Test if two devices are the same Vbus device.
- bool operator!= (Device const &o) const

  Test if two Vbus devices are not the same.

- int pm_suspend () const

  Suspend the device.
- int pm_resume () const

  Resume the device.

Additional Inherited Members

Protected Attributes inherited from L4vbus::Device

- L4::Cap< Vbus > **_bus**

  The Vbus capability where this device is located on.
- l4vbus_device_handle_t **_dev**

  The device handle for this device.

15.382.1 Detailed Description

A PCI device.
Definition at line 93 of file vbus_pci.

15.382.2 Member Function Documentation

15.382.2.1 cfg_read()

```
int L4vbus::Pci_dev::cfg_read (
            l4_uint32_t reg,
            l4_uint32_t * value,
            l4_uint32_t width) const  [inline]
```

Read from the device's vPCI configuration space.

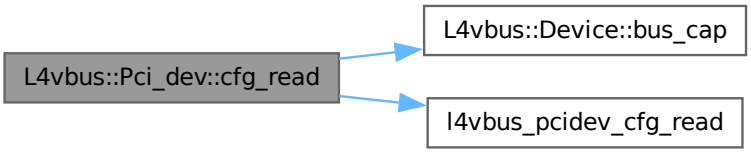
Parameters

	reg	Register in configuration space to read
out	*value*	Value that has been read
	width	Width to read in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

Definition at line 105 of file vbus_pci.
References L4vbus::Device::_dev, L4vbus::Device::bus_cap(), and l4vbus_pcidev_cfg_read().
Here is the call graph for this function:



15.382.2.2 cfg_write()

```
int L4vbus::Pci_dev::cfg_write (
            l4_uint32_t reg,
            l4_uint32_t value,
            l4_uint32_t width) const  [inline]
```

Write to the device's vPCI configuration space.

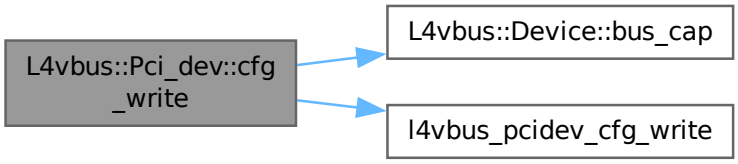
Parameters

reg	Register in configuration space to write
value	Value to write
width	Width to write in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

Definition at line 121 of file vbus_pci.
References L4vbus::Device::_dev, L4vbus::Device::bus_cap(), and l4vbus_pcidev_cfg_write().
Here is the call graph for this function:



15.382.2.3 irq_enable()

```
int L4vbus::Pci_dev::irq_enable (
            unsigned char * trigger,
            unsigned char * polarity) const  [inline]
```

Enable the device's PCI interrupt.

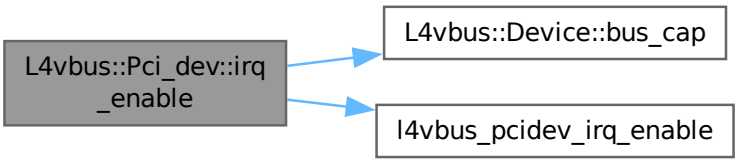
Parameters

out	*trigger*	False if interrupt is level-triggered
out	*polarity*	True if interrupt is of low polarity

Returns

On success: Interrupt line to be used, else failure

Definition at line 137 of file vbus_pci.
References L4vbus::Device::_dev, L4vbus::Device::bus_cap(), and l4vbus_pcidev_irq_enable().
Here is the call graph for this function:



The documentation for this class was generated from the following file:

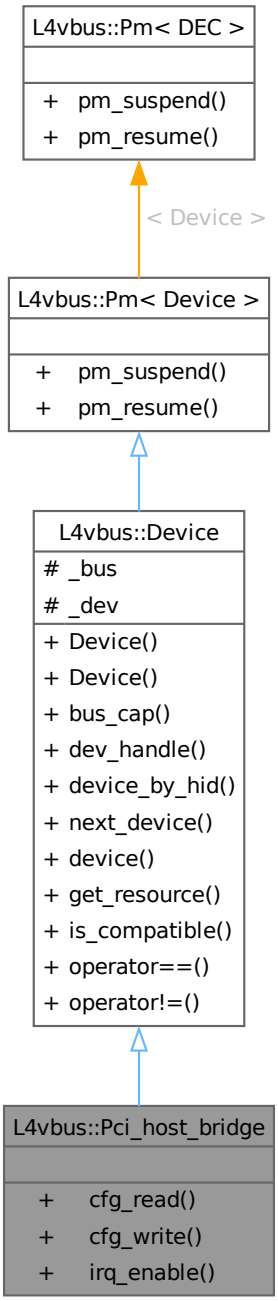
- l4/vbus/vbus_pci

15.383 L4vbus::Pci_host_bridge Class Reference

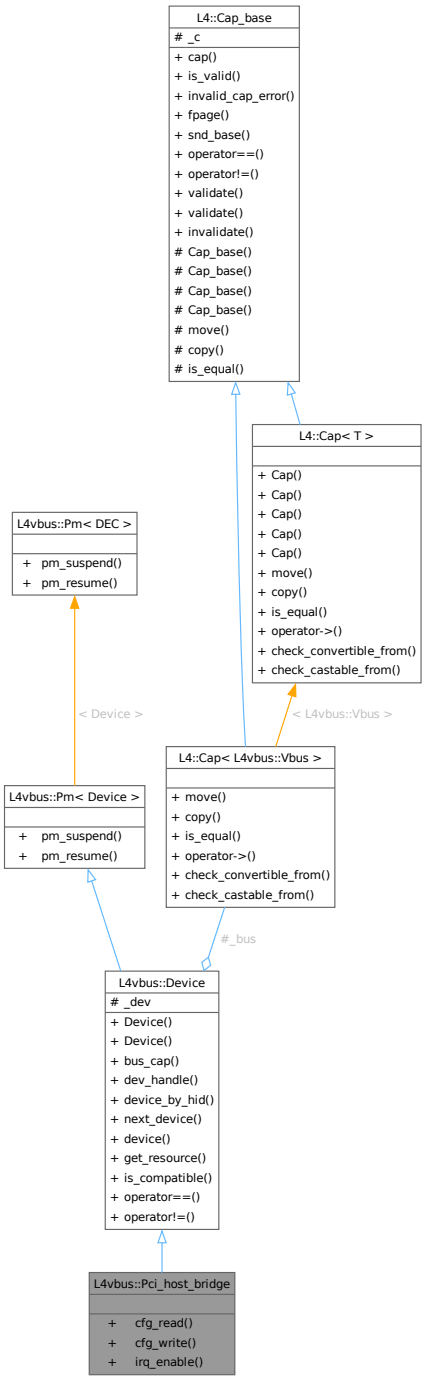
A Pci host bridge.

`#include <vbus_pci>`

Inheritance diagram for L4vbus::Pci_host_bridge:



Collaboration diagram for L4vbus::Pci_host_bridge:



Public Member Functions

- int cfg_read (l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width) const

  Read from the vPCI configuration space using the PCI root bridge.
- int cfg_write (l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width) const

  Write to the vPCI configuration space using the PCI root bridge.
- int irq_enable (l4_uint32_t bus, l4_uint32_t devfn, int pin, unsigned char *trigger, unsigned char *polarity) const

Enable PCI interrupt for a specific device using the PCI root bridge.

Public Member Functions inherited from L4vbus::Device

- **Device** ()

  Construct a new vbus device using the NULL device L4VBUS_NULL.
- Device (L4::Cap< Vbus > bus, l4vbus_device_handle_t dev)

  Construct a new vbus device using a device handle.
- L4::Cap< Vbus > bus_cap () const

  Access the Vbus capability of the underlying virtual bus.
- l4vbus_device_handle_t dev_handle () const

  Access the device handle of this device.
- int device_by_hid (Device *child, char const *hid, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find a device by the hardware interface identifier (HID).
- int next_device (Device *child, int depth=L4VBUS_MAX_DEPTH, l4vbus_device_t *devinfo=0) const

  Find next child following `child`.
- int device (l4vbus_device_t *devinfo) const

  Obtain detailed information about a Vbus device.
- int get_resource (unsigned res_idx, l4vbus_resource_t *res) const

  Obtain the resource description of an individual device resource.
- int is_compatible (char const *cid) const

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- bool operator== (Device const &o) const

  Test if two devices are the same Vbus device.
- bool operator!= (Device const &o) const

  Test if two Vbus devices are not the same.

Public Member Functions inherited from L4vbus::Pm< Device >

- int pm_suspend () const

  Suspend the device.
- int pm_resume () const

  Resume the device.

Additional Inherited Members

Protected Attributes inherited from L4vbus::Device

- L4::Cap< Vbus > **_bus**

  The Vbus capability where this device is located on.
- l4vbus_device_handle_t **_dev**

  The device handle for this device.

15.383.1 Detailed Description

A Pci host bridge.
Definition at line 25 of file vbus_pci.

15.383.2 Member Function Documentation

15.383.2.1 cfg_read()

```
int L4vbus::Pci_host_bridge::cfg_read (
            l4_uint32_t bus,
            l4_uint32_t devfn,
            l4_uint32_t reg,
            l4_uint32_t * value,
            l4_uint32_t width) const  [inline]
```

Read from the vPCI configuration space using the PCI root bridge.

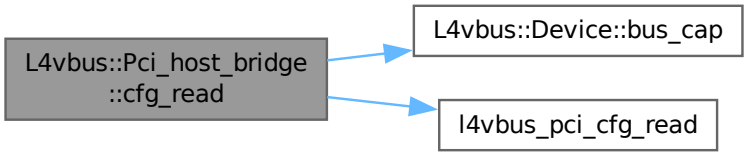
Parameters

	bus	Bus number
	devfn	Device id (upper 16bit) and function (lower 16bit)
	reg	Register in configuration space to read
out	*value*	Value that has been read
	width	Width to read in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

Definition at line 39 of file vbus_pci.
References L4vbus::Device::_dev, L4vbus::Device::bus_cap(), and l4vbus_pci_cfg_read().
Here is the call graph for this function:



15.383.2.2 cfg_write()

```
int L4vbus::Pci_host_bridge::cfg_write (
            l4_uint32_t bus,
            l4_uint32_t devfn,
            l4_uint32_t reg,
            l4_uint32_t value,
            l4_uint32_t width) const  [inline]
```

Write to the vPCI configuration space using the PCI root bridge.

Parameters

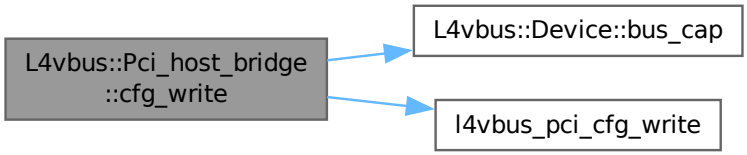
bus	Bus number
devfn	Device id (upper 16bit) and function (lower 16bit)

reg	Register in configuration space to write
value	Value to write
width	Width to write in bits (e.g. 8, 16, 32)

Returns

0 on success, else failure

Definition at line 58 of file vbus_pci.
References L4vbus::Device::_dev, L4vbus::Device::bus_cap(), and l4vbus_pci_cfg_write().
Here is the call graph for this function:



15.383.2.3 irq_enable()

```
int L4vbus::Pci_host_bridge::irq_enable (
              l4_uint32_t bus,
              l4_uint32_t devfn,
              int pin,
              unsigned char * trigger,
              unsigned char * polarity) const  [inline]
```

Enable PCI interrupt for a specific device using the PCI root bridge.

Parameters

	bus	Bus number
	devfn	Device id (upper 16bit) and function (lower 16bit)
	pin	Interrupt pin (normally as reported in configuration register INTR)
out	*trigger*	False if interrupt is level-triggered
out	*polarity*	True if interrupt is of low polarity

Returns

On success: Interrupt line to be used, else failure

Definition at line 79 of file vbus_pci.
References L4vbus::Device::_dev, L4vbus::Device::bus_cap(), and l4vbus_pci_irq_enable().
Here is the call graph for this function:

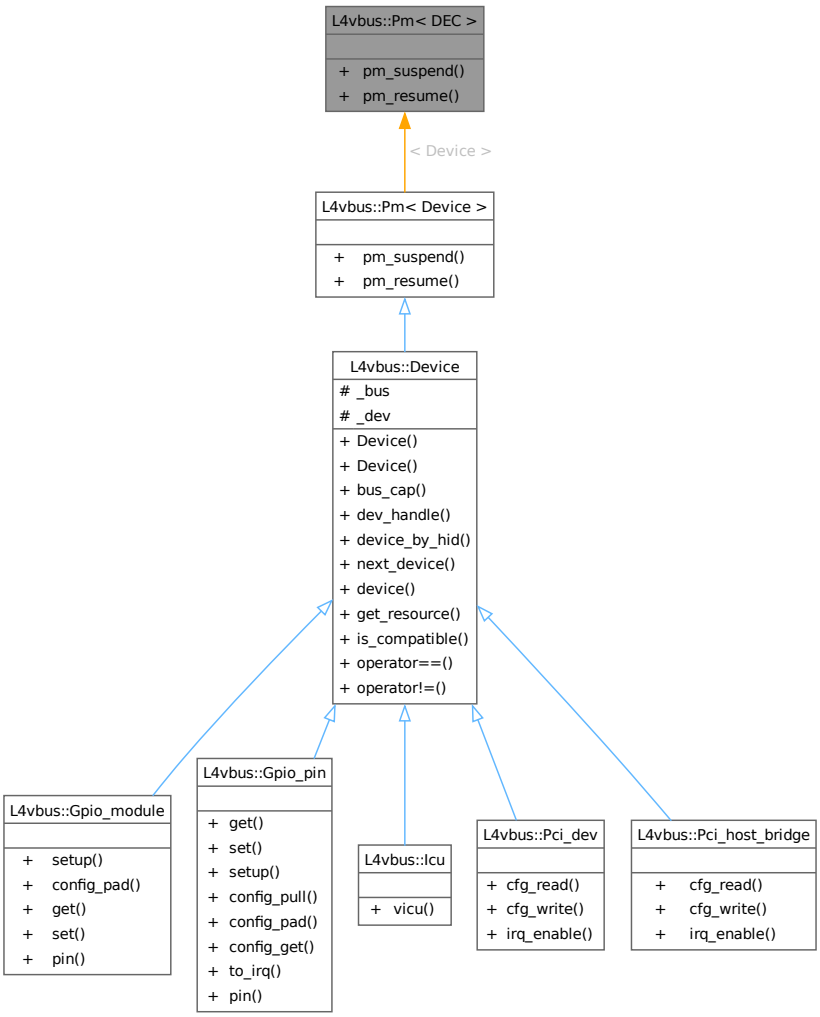
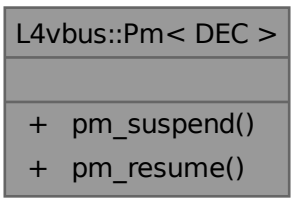
15.384 L4vbus::Pm< DEC > Class Template Reference

Power-management API mixin.
`#include <vbus>`

Inheritance diagram for L4vbus::Pm< DEC >:



Collaboration diagram for L4vbus::Pm< DEC >:



Public Member Functions

- int pm_suspend () const

Suspend the device.

- int pm_resume () const

  Resume the device.

15.384.1 Detailed Description

template<typename DEC>
class L4vbus::Pm< DEC >

Power-management API mixin.
Devices that inherit from this mixin provide an API to be suspended and resumed.
Definition at line 50 of file vbus.

15.384.2 Member Function Documentation

15.384.2.1 pm_resume()

```
template<typename DEC>
int L4vbus::Pm< DEC >::pm_resume () const  [inline]
```

Resume the device.
Switches the device from low-power mode to normal operation and restores the saved state.

Return values

0	Success.

Definition at line 74 of file vbus.
References l4vbus_pm_resume().
Here is the call graph for this function:

15.384.2.2 pm_suspend()

```
template<typename DEC>
int L4vbus::Pm< DEC >::pm_suspend () const  [inline]
```

Suspend the device.
Saves the state of the device and puts it into a low-power mode.

Return values

0	Success.

Definition at line 63 of file vbus.
References l4vbus_pm_suspend().

Here is the call graph for this function:

The documentation for this class was generated from the following file:

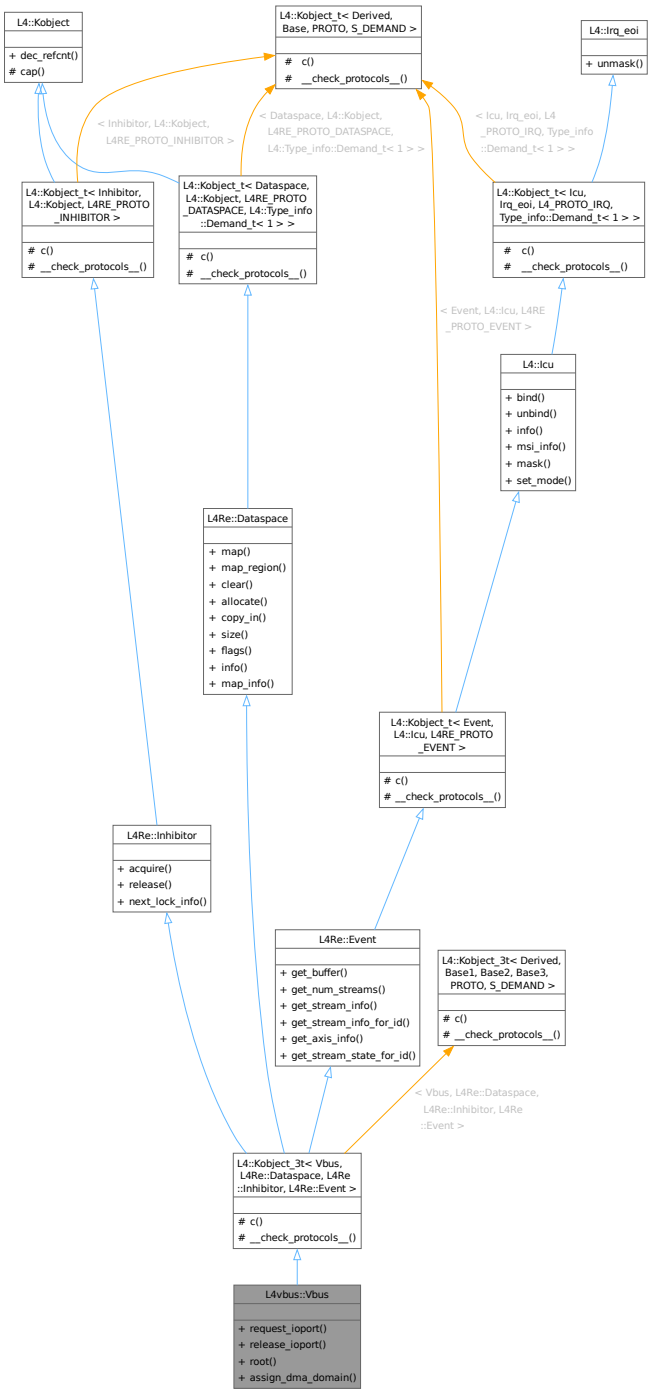
- l4/vbus/vbus

15.385 L4vbus::Vbus Class Reference

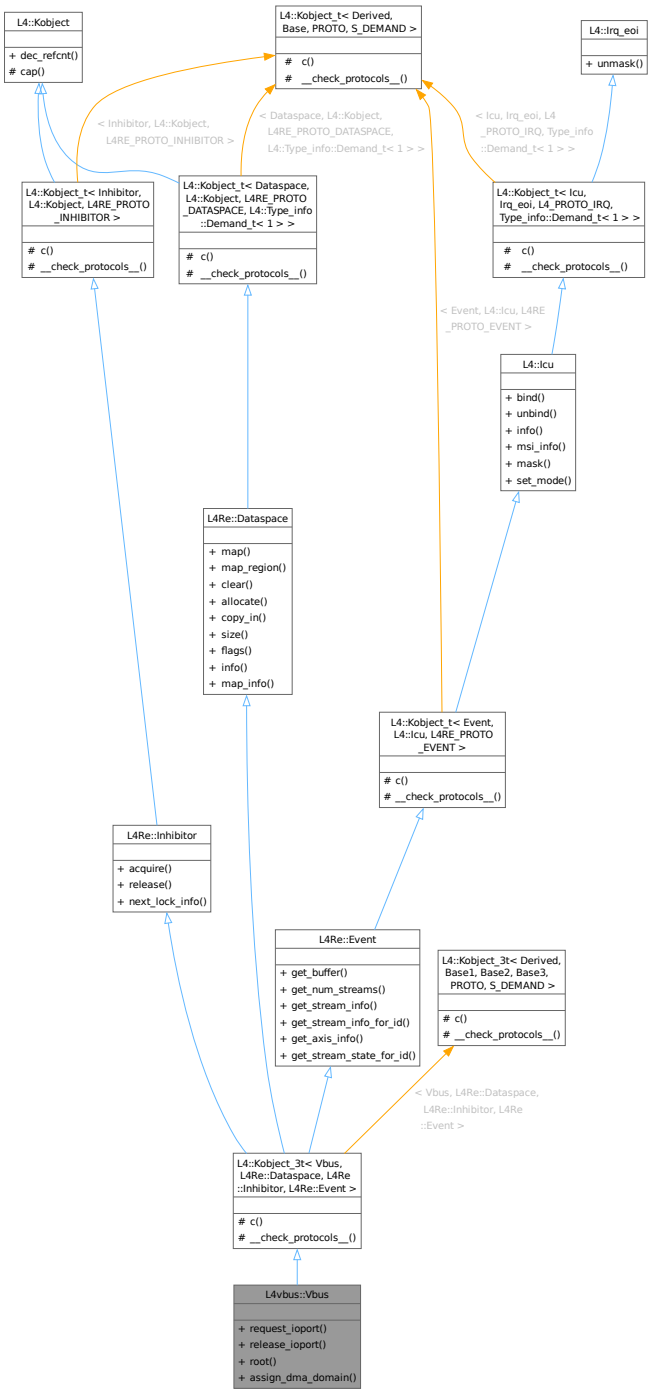
The virtual bus (Vbus) interface.

`#include <vbus>`

Inheritance diagram for L4vbus::Vbus:



Collaboration diagram for L4vbus::Vbus:



Public Member Functions

- int request_ioport (l4vbus_resource_t *res) const

  Request the given IO port resource from the bus.
- int release_ioport (l4vbus_resource_t *res) const

  Release the given IO port resource from the bus.
- Device root () const

  Get the root device of the device tree of this bus.

- int assign_dma_domain (unsigned domain_id, unsigned flags, L4::Cap< L4Re::Dma_space > dma_space) const

  Bind or unbind an L4Re::Dma_space to a DMA domain.

Public Member Functions inherited from L4Re::Dataspace

- l4_ret_t map (Offset offset, Flags flags, Map_addr local_addr, Map_addr min_addr, Map_addr max_addr, L4::Cap< L4::Task > dst=L4::Cap< L4::Task >::Invalid) const noexcept

  Request a flexpage mapping from the dataspace.
- l4_ret_t map_region (Offset offset, Flags flags, Map_addr min_addr, Map_addr max_addr, L4::Cap< L4::Task > dst=L4::Cap< L4::Task >::Invalid) const noexcept

  Map a part of a dataspace into a local memory area.
- l4_ret_t clear (Offset offset, Size size)

  Clear parts of a dataspace.
- l4_ret_t allocate (Offset offset, Size size)

  Allocate a range in the dataspace.
- l4_ret_t copy_in (Offset dst_offs, L4::Ipc::Cap< Dataspace > src, Offset src_offs, Size size)

  Copy contents from another dataspace.
- Size size () const noexcept

  Get size of a dataspace.
- Flags flags () const noexcept

  Get flags of the dataspace.
- l4_ret_t info (Stats *stats)

  Get information on the dataspace.
- long map_info (l4_addr_t *start_addr, l4_addr_t *end_addr)

  Get mapping range of dataspace.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Public Member Functions inherited from L4Re::Inhibitor

- l4_ret_t acquire (l4_umword_t id, L4::Ipc::String<> reason)

  Acquire a specific inhibitor lock.
- l4_ret_t release (l4_umword_t id)

  Release a specific inhibitor lock.
- l4_ret_t next_lock_info (char *name, unsigned len, l4_mword_t current_id=-1, l4_utcb_t *utcb=l4_utcb())

  Get information for the next available inhibitor lock.

Public Member Functions inherited from L4Re::Event

- l4_ret_t get_buffer (L4::Ipc::Out< L4::Cap< Dataspace > > ds)

  Get event signal buffer.
- l4_ret_t get_num_streams ()

  Get number of event streams.
- l4_ret_t get_stream_info (int idx, Event_stream_info *info)

  Get event stream infos.
- l4_ret_t get_stream_info_for_id (l4_umword_t stream_id, Event_stream_info *info)

  Get event stream infos.
- l4_ret_t get_axis_info (l4_umword_t stream_id, unsigned naxes, unsigned const *axis, Event_absinfo *info) const noexcept

Get event stream axis infos.

- l4_ret_t get_stream_state_for_id (l4_umword_t stream_id, Event_stream_state *state)

  Get event stream state.

Public Member Functions inherited from L4::Icu

- l4_msgtag_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t info (l4_icu_info_t *info, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get information about the ICU features.
- l4_msgtag_t msi_info (l4_umword_t irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info)

  Get MSI info about IRQ.
- l4_msgtag_t mask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Mask an IRQ line.
- l4_msgtag_t set_mode (unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb=l4_utcb()) noexcept

  Set interrupt mode.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

Additional Inherited Members

15.385.1 Detailed Description

The virtual bus (Vbus) interface.

See also

L4Re Vbus API

Definition at line 298 of file vbus.

15.385.2 Member Function Documentation

15.385.2.1 assign_dma_domain()

```
int L4vbus::Vbus::assign_dma_domain (
            unsigned domain_id,
            unsigned flags,
            L4::Cap< L4Re::Dma_space > dma_space) const  [inline]
```

Bind or unbind an L4Re::Dma_space to a DMA domain.

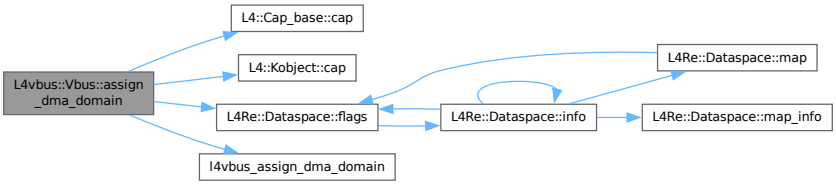
Parameters

domain_id	DMA domain ID (resource address of DMA domain found on the vBUS). If the value is ~0U the DMA space of the whole vBUS is used.
flags	A combination of L4vbus_dma_domain_assign_flags.
dma_space	The DMA space capability to bind. For unbind, the `dma_space` is ignored and should be passed an invalid capability.

Return values

0	Operation completed successfully.
-L4_ENOENT	The vbus does not support a global DMA domain or no DMA domain could be found.
-L4_EINVAL	Invalid argument used.
-L4_EBUSY	DMA domain is already active, this means another DMA space is already assigned.

Definition at line 358 of file vbus.
References L4::Cap_base::cap(), L4::Kobject::cap(), L4Re::Dataspace::flags(), and l4vbus_assign_dma_domain().
Here is the call graph for this function:



15.385.2.2 release_ioport()

```
int L4vbus::Vbus::release_ioport (
            l4vbus_resource_t * res) const  [inline]
```

Release the given IO port resource from the bus.

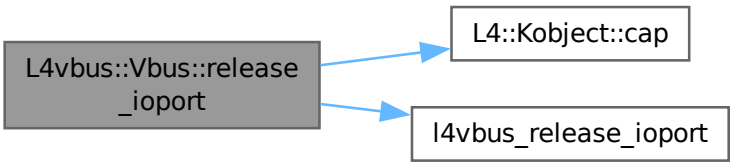
Parameters

in	*res*	The IO port resource to be released from the bus.

Returns

>=0 on success, <0 on error.

Definition at line 323 of file vbus.
References L4::Kobject::cap(), and l4vbus_release_ioport().
Here is the call graph for this function:



15.385.2.3 request_ioport()

```
int L4vbus::Vbus::request_ioport (
            l4vbus_resource_t * res) const  [inline]
```

Request the given IO port resource from the bus.

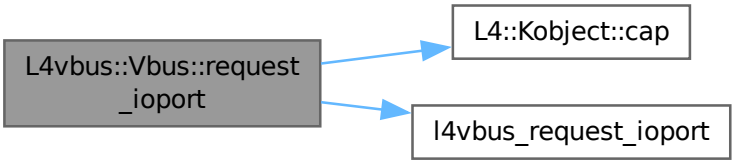
Parameters

in	*res*	The IO port resource to be requested from the bus.

Return values

0	Success.
-L4_EINVAL	Resource is not an IO port resource.
-L4_ENOENT	No matching IO port resource found.

Definition at line 311 of file vbus.
References L4::Kobject::cap(), and l4vbus_request_ioport().
Here is the call graph for this function:



15.385.2.4 root()

```
Device L4vbus::Vbus::root () const  [inline]
```

Get the root device of the device tree of this bus.
The root device is usually the starting point for iterating the bus, see Device::next_device.

Returns

A Vbus device representing the root of the device tree.

Definition at line 336 of file vbus.
References L4::Kobject::cap(), and L4VBUS_ROOT_BUS.
Here is the call graph for this function:

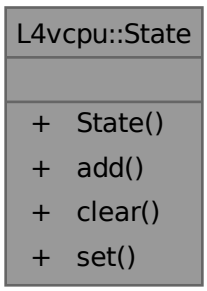
15.388 L4vcpu::State Class Reference

C++ implementation of state word in the vCPU area.
`#include <vcpu>`
Collaboration diagram for L4vcpu::State:



Public Member Functions

- State (unsigned v)
  Initialize state.
- void add (unsigned bits) throw ()
  Add flags.
- void clear (unsigned bits) throw ()
  Clear flags.
- void set (unsigned v) throw ()
  Set flags.

15.388.1 Detailed Description

C++ implementation of state word in the vCPU area.
Definition at line 24 of file vcpu.

15.388.2 Constructor & Destructor Documentation

15.388.2.1 State()

```
L4vcpu::State::State (
            unsigned v)  [inline], [explicit]
```

Initialize state.

Parameters

v	Initial state.

Definition at line 34 of file vcpu.

15.388.3 Member Function Documentation

15.388.3.1 add()

```
void L4vcpu::State::add (
            unsigned bits) throw ( )   [inline]
```

Add flags.

Parameters

bits	Bits to add to the word.

Definition at line 41 of file vcpu.

15.388.3.2 clear()

```
void L4vcpu::State::clear (
            unsigned bits) throw ( )   [inline]
```

Clear flags.

Parameters

bits	Bits to clear in the word.

Definition at line 48 of file vcpu.

15.388.3.3 set()

```
void L4vcpu::State::set (
            unsigned v) throw ( )   [inline]
```

Set flags.

Parameters

v	Set the word to the value of v.

Definition at line 55 of file vcpu.
The documentation for this class was generated from the following file:

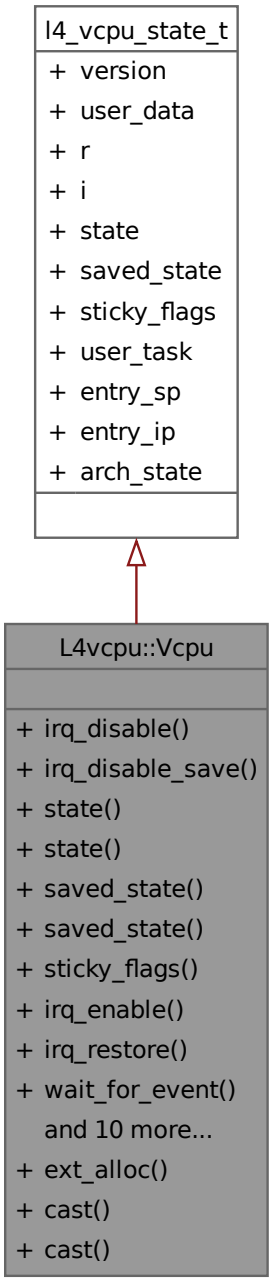
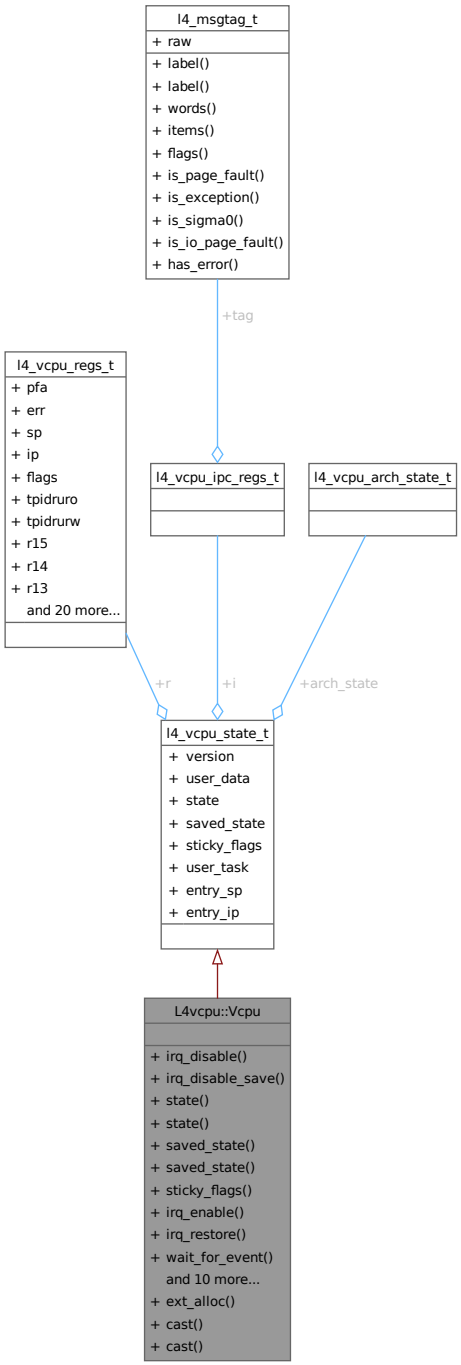
15.389 L4vcpu::Vcpu Class Reference

C++ implementation of the vCPU save state area.
`#include <vcpu>`

Inheritance diagram for L4vcpu::Vcpu:



Collaboration diagram for L4vcpu::Vcpu:



Public Member Functions

- void **irq_disable** () throw ()

  Disable the vCPU for event delivery.
- unsigned irq_disable_save () throw ()

  Disable the vCPU for event delivery and return previous state.
- State * state () throw ()

  Get state word.

- State state () const throw ()

  Get state word.
- State * saved_state () throw ()

  Get saved_state word.
- State saved_state () const throw ()

  Get saved_state word.
- l4_uint16_t **sticky_flags** () const throw ()

  Get sticky flags.
- void irq_enable (l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) throw ()

  Enable the vCPU for event delivery.
- void irq_restore (unsigned s, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) throw ()

  Restore a previously saved IRQ/event state.
- void wait_for_event (l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) throw ()

  Wait for event.
- void task (L4::Cap< L4::Task > const task=L4::Cap< L4::Task >::Invalid) throw ()

  Set the task of the vCPU.
- int is_page_fault_entry () const

  Return whether the entry reason was a page fault.
- int is_irq_entry () const

  Return whether the entry reason was an IRQ/IPC message.
- l4_vcpu_regs_t * r () throw ()

  Return pointer to register state.
- l4_vcpu_regs_t const * r () const throw ()

  Return pointer to register state.
- l4_vcpu_ipc_regs_t * i () throw ()

  Return pointer to IPC state.
- l4_vcpu_ipc_regs_t const * i () const throw ()

  Return pointer to IPC state.
- void entry_sp (l4_umword_t sp)

  Set vCPU entry stack pointer.
- void entry_ip (l4_umword_t ip)

  Set vCPU entry instruction pointer.
- void **print_state** (const char *prefix="") const throw ()

  Print the state of the vCPU.

Static Public Member Functions

- static int ext_alloc (Vcpu **vcpu, l4_addr_t *ext_state, L4::Cap< L4::Task > task=L4Re::Env::env() ->task(), L4::Cap< L4Re::Rm > rm=L4Re::Env::env() ->rm()) throw ()

  Allocate state area for an extended vCPU.
- static Vcpu * cast (void *x) throw ()

  Cast a void pointer to a class pointer.
- static Vcpu * cast (l4_addr_t x) throw ()

  Cast an address to a class pointer.

15.389.1 Detailed Description

C++ implementation of the vCPU save state area.
Definition at line 65 of file vcpu.

15.389.2 Member Function Documentation

15.389.2.1 cast() [1/2]

```
Vcpu * L4vcpu::Vcpu::cast (
            l4_addr_t x) throw ( )   [inline], [static]
```

Cast an address to a class pointer.

Parameters

x	Pointer.

Returns

Pointer to Vcpu class.

Definition at line 269 of file vcpu.

15.389.2.2 cast() [2/2]

```
Vcpu * L4vcpu::Vcpu::cast (
            void * x) throw ( )   [inline], [static]
```

Cast a void pointer to a class pointer.

Parameters

x	Pointer.

Returns

Pointer to Vcpu class.

Definition at line 259 of file vcpu.
References cast().
Referenced by cast().

Here is the caller graph for this function:

15.389.2.3 entry_ip()

```
void L4vcpu::Vcpu::entry_ip (
            l4_umword_t ip)  [inline]
```

Set vCPU entry instruction pointer.

Parameters

ip	Instruction pointer address to set.

Definition at line 232 of file vcpu.
References l4_vcpu_state_t::entry_ip.

15.389.2.4 entry_sp()

```
void L4vcpu::Vcpu::entry_sp (
            l4_umword_t sp)  [inline]
```

Set vCPU entry stack pointer.

Parameters

sp	Stack pointer address to set.

Note

The value is only used when entering from a user-task.

Definition at line 225 of file vcpu.
References l4_vcpu_state_t::entry_sp.

15.389.2.5 ext_alloc()

```
int L4vcpu::Vcpu::ext_alloc (
            Vcpu ** vcpu,
            l4_addr_t * ext_state,
            L4::Cap< L4::Task > task = L4Re::Env::env() ->task(),
            L4::Cap< L4Re::Rm > rm = L4Re::Env::env() ->rm()) throw ( )   [static]
```

Allocate state area for an extended vCPU.

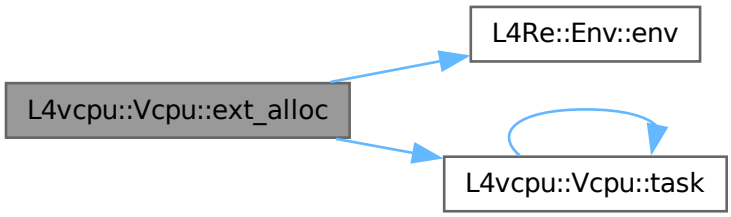
Parameters

out	*vcpu*	Allocated vcpu-state area.
out	*ext_state*	Allocated extended vcpu-state area.
	task	Task to use for allocation, defaults to own task.
	rm	Region manager to use for allocation defaults to standard region manager.

Returns

0 for success, error code otherwise

References L4Re::Env::env(), and task().
Here is the call graph for this function:



15.389.2.6 i() [1/2]

```
l4_vcpu_ipc_regs_t * L4vcpu::Vcpu::i () throw ( )   [inline]
```

Return pointer to IPC state.

Returns

Pointer to IPC state.

Definition at line 209 of file vcpu.
References l4_vcpu_state_t::i.

15.389.2.7 i() [2/2]

```
l4_vcpu_ipc_regs_t const * L4vcpu::Vcpu::i () const throw ( )   [inline]

            l4vcpu_event_hndl_t do_event_work_cb,
            l4vcpu_setup_ipc_t setup_ipc) throw ( )   [inline]
```

Enable the vCPU for event delivery.

Parameters

utcb	The UTCB to use.
do_event_work_cb	Call-back function that is called in case an event (such as an interrupt) is pending.
setup_ipc	Call-back function that is called before an IPC operation is called, and before event delivery is enabled.

Definition at line 135 of file vcpu.
References l4vcpu_irq_enable().
Here is the call graph for this function:

15.389.2.10 irq_restore()

```
void L4vcpu::Vcpu::irq_restore (
            unsigned s,
            l4_utcb_t * utcb,
            l4vcpu_event_hndl_t do_event_work_cb,
            l4vcpu_setup_ipc_t setup_ipc) throw ( )   [inline]
```

Restore a previously saved IRQ/event state.

Parameters

s	IRQ state to be restored.
utcb	The UTCB to use.

do_event_work_cb	Call-back function that is called in case an event (such as an interrupt) is pending.
setup_ipc	Call-back function that is called before an IPC operation is called, and before event delivery is enabled.

Definition at line 150 of file vcpu.

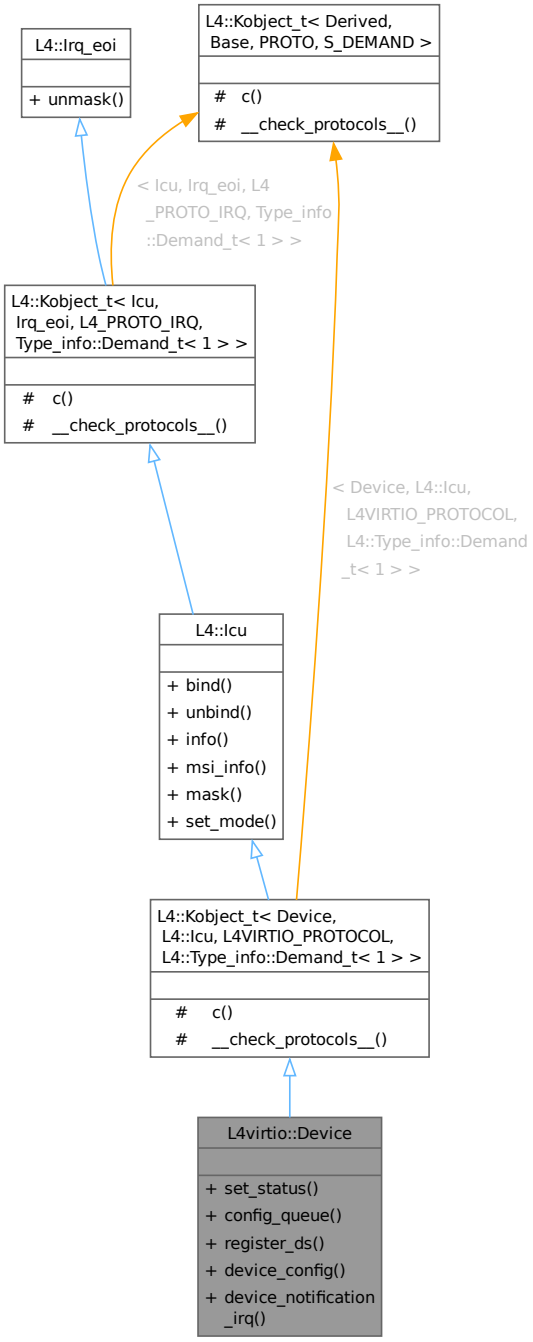
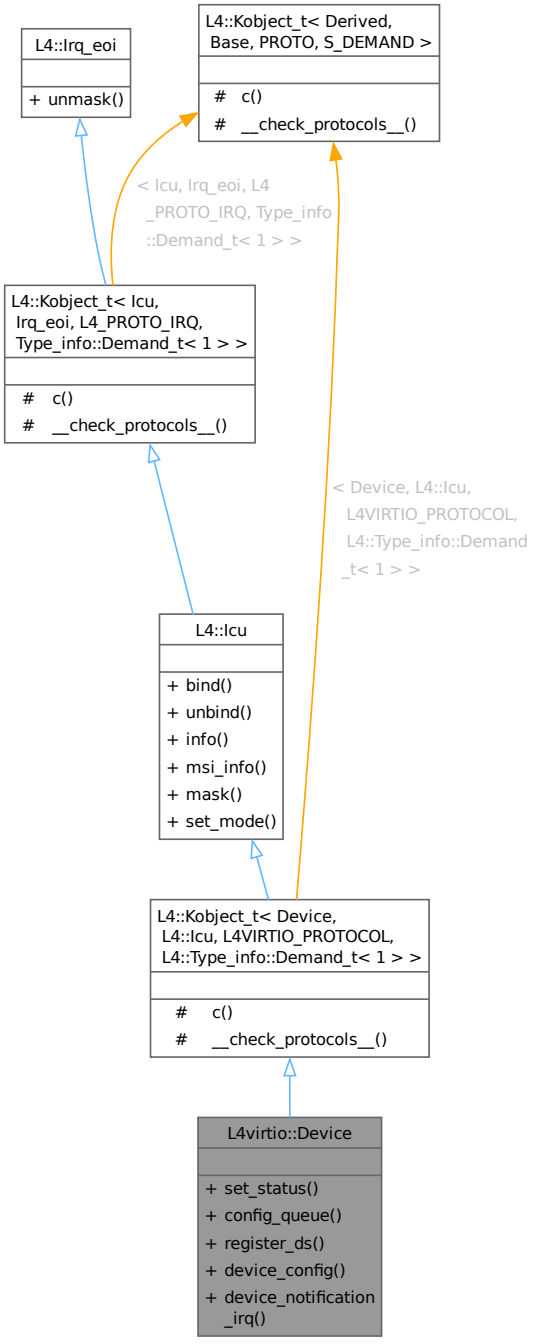
15.390 L4virtio::Device Class Reference

IPC interface for virtio over L4 IPC.
`#include <l4virtio>`

Inheritance diagram for L4virtio::Device:



Collaboration diagram for L4virtio::Device:



Public Member Functions

- long set_status (unsigned status)

  Write the VIRTIO status register.
- long config_queue (unsigned queue)

  Trigger queue configuration of the given queue.
- long register_ds (L4::Ipc::Cap< L4Re::Dataspace > ds_cap, l4_uint64_t base, l4_umword_t offset, l4_umword_t size)

Register a shared data space with VIRTIO host.

- long device_config (L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > config_ds, l4_addr_t *ds_offset)

  Get the dataspace with the L4virtio configuration page.
- long device_notification_irq (unsigned index, L4::Ipc::Out< L4::Cap< L4::Triggerable > > irq)

  Get the notification interrupt corresponding to the given index.

Public Member Functions inherited from L4::Icu

- l4_msgtag_t bind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Bind an interrupt line of an interrupt controller to an interrupt object.
- l4_msgtag_t unbind (unsigned irqnum, L4::Cap< Triggerable > irq, l4_utcb_t *utcb=l4_utcb()) noexcept

  Remove binding of an interrupt line from the interrupt controller object.
- l4_msgtag_t info (l4_icu_info_t *info, l4_utcb_t *utcb=l4_utcb()) noexcept

  Get information about the ICU features.
- l4_msgtag_t msi_info (l4_umword_t irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info)

  Get MSI info about IRQ.
- l4_msgtag_t mask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Mask an IRQ line.
- l4_msgtag_t set_mode (unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb=l4_utcb()) noexcept

  Set interrupt mode.

Public Member Functions inherited from L4::Irq_eoi

- l4_msgtag_t unmask (unsigned irqnum, l4_umword_t *label=0, l4_timeout_t to=L4_IPC_NEVER, l4_utcb_t *utcb=l4_utcb()) noexcept

  Unmask the given interrupt line.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Device, L4::Icu, L4VIRTIO_PROTOCOL, L4::Type_info::Demand_t< 1 > >

- typedef Device **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Device > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Icu::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- typedef Icu **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Icu > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Irq_eoi::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Device, L4::Icu, L4VIRTIO_PROTOCOL, L4::Type_info::Demand_t< 1 > >

- L4::Cap< Class > **c** () const noexcept

  Helper to check for protocol conflicts.

Static Protected Member Functions inherited from L4::Kobject_t< Icu, Irq_eoi, L4_PROTO_IRQ, Type_info::Demand_t< 1 > >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.390.1 Detailed Description

IPC interface for virtio over L4 IPC.
The L4virtio protocol is an adaption of the mmio virtio transport 1.0(4). This interface allows to exchange the necessary resources: device configuration page, notification interrupts and dataspaces for payload.
Notification interrupts can be configured independently for changes to the configuration space and each queue through special L4virtio-specific notify_index fields in the config page and queue configuration. The interface distinguishes between device-to-driver and driver-to-device notification interrupts.
Device-to-driver interrupts are configured via the ICU interface. The device announces the maximum number of supported interrupts via Icu::info(). The driver can then bind interrupts using Icu::bind().
Driver-to-device interrupts must be requested from the device through device_notification_irq().
Definition at line 39 of file l4virtio.

15.390.2 Member Function Documentation

15.390.2.1 config_queue()

```
long L4virtio::Device::config_queue (
            unsigned queue)
```

Trigger queue configuration of the given queue.
Usually all queues are configured when the status is written to running. However, in some cases queues shall be disabled or enabled dynamically, in this case this function triggers a reconfiguration from the shared memory register of the queue config.

Parameters

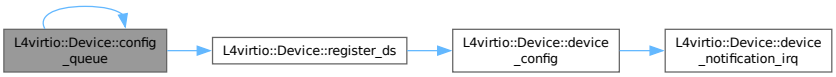
queue	Queue index for the queue to be configured.

Return values

0	on success.
-L4_EIO	The queue's status is invalid.
-L4_ERANGE	The queue index exceeds the number of queues.
-L4_EINVAL	Otherwise.

References config_queue(), L4VIRTIO_OP_REGISTER_DS, and register_ds().

Referenced by config_queue().
Here is the call graph for this function:



Here is the caller graph for this function:

15.390.2.2 device_config()

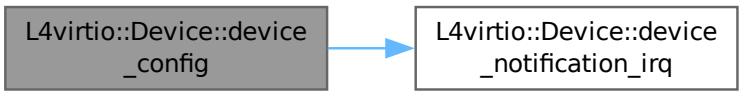
```
long L4virtio::Device::device_config (
            L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > config_ds,
            l4_addr_t * ds_offset)
```

Get the dataspace with the L4virtio configuration page.

Parameters

config_ds	Capability for receiving the dataspace capability for the shared L4-VIRTIO config data space.
ds_offset	Offset into the dataspace where the device configuration structure starts.

References device_notification_irq(), and L4VIRTIO_OP_GET_DEVICE_IRQ.
Referenced by register_ds().
Here is the call graph for this function:



Here is the caller graph for this function:

15.390.2.3 device_notification_irq()

```
long L4virtio::Device::device_notification_irq (
            unsigned index,
            L4::Ipc::Out< L4::Cap< L4::Triggerable > > irq)
```

Get the notification interrupt corresponding to the given index.

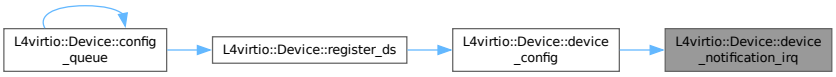
Parameters

	index	Index of the interrupt.
out	*irq*	Triggerable for the given index.

Return values

L4_EOK	Success.
L4_ENOSYS	IRQ notification not supported by device.
<0	Other error.

An index is only guaranteed to return an IRQ object when the index is set in one of the device notify index fields. The device must return the same interrupt for a given index as long as the index is in use. If an index disappears as a result of a configuration change and then is reused later, the interrupt is not guaranteed to be the same.
Interrupts must always be rerequested after a device reset.
Referenced by device_config().
Here is the caller graph for this function:



15.390.2.4 register_ds()

```
long L4virtio::Device::register_ds (
            L4::Ipc::Cap< L4Re::Dataspace > ds_cap,
            l4_uint64_t base,
            l4_umword_t offset,
            l4_umword_t size)
```

Register a shared data space with VIRTIO host.

Parameters

ds_cap	Dataspace capability to register. The lower 8 bits determine the rights mask with which the guest's rights are masked during the registration of the dataspace at the VIRTIO host.
base	VIRTIO guest physical start address of shared memory region
offset	Offset within the data space that is attached to the given `base` in the guest physical memory.
size	Size of the memory region in the guest

Return values

L4_EOK	Operation successful.
-L4_EINVAL	The `ds_cap` capability is invalid, does not refer to a valid dataspace, is not a trusted dataspace if trusted dataspace validation is enabled, or `size` and `offset` specify an invalid region.
-L4_ENOMEM	The limit of dataspaces that can be registered has been reached or no capability slot could be allocated.
-L4_ERANGE	`offset` is lager than the size of the dataspace.
<0	Any error returned by the dataspace when queried for information during setup or any error returned by the region manager from attaching the dataspace.

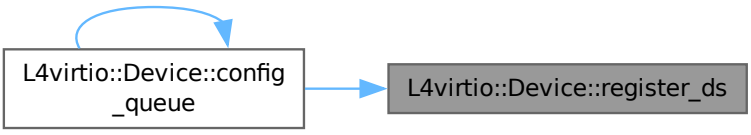
Here is the caller graph for this function:



15.390.2.5 set_status()

```
long L4virtio::Device::set_status (
            unsigned status)
```

Write the VIRTIO status register.

Parameters

status	Status word to write to the VIRTIO status.

Return values

0	on success.

Note

All other registers are accessed via shared memory.

References L4VIRTIO_OP_CONFIG_QUEUE, and set_status().
Referenced by set_status().

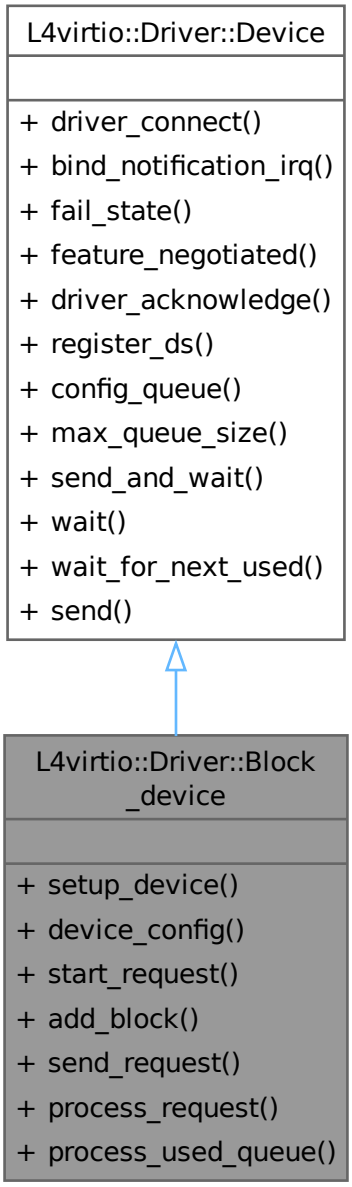
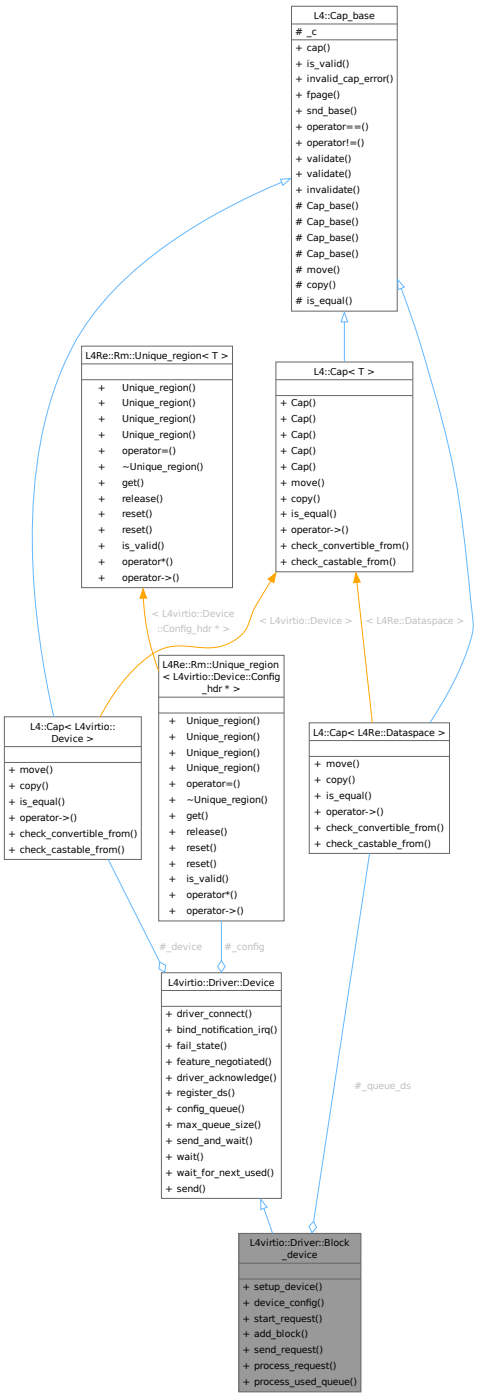
Simple class for accessing a virtio block device synchronously.
`#include <virtio-block>`

Inheritance diagram for L4virtio::Driver::Block_device:



Collaboration diagram for L4virtio::Driver::Block_device:



Data Structures

- class Handle

  Handle to an ongoing request.

Public Member Functions

- void setup_device (L4::Cap< L4virtio::Device > srvcap, l4_size_t usermem, void **userdata, Ptr< void > &user_devaddr, L4::Cap< L4Re::Dataspace > qds=L4::Cap< L4Re::Dataspace >(), l4_uint32_t fmask0=-

1U, l4_uint32_t fmask1=-1U, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

Establish a connection to the device and set up shared memory.

- l4virtio_block_config_t const & **device_config** () const

  Return a reference to the device configuration.
- Handle start_request (l4_uint64_t sector, l4_uint32_t type, Callback callback)

  Start the setup of a new request.
- int add_block (Handle handle, Ptr< void > addr, l4_uint32_t size)

  Add a data block to a request that has already been set up.
- int send_request (Handle handle)

  Process request asynchronously.
- int process_request (Handle handle)

  Process request synchronously.
- void process_used_queue ()

  Process and free all items in the used queue.

Public Member Functions inherited from L4virtio::Driver::Device

- void driver_connect (L4::Cap< L4virtio::Device > srvcap, bool manage_notify=true)

  Contacts the device and starts the initial handshake.
- int bind_notification_irq (unsigned index, L4::Cap< L4::Triggerable > irq) const

  Register a triggerable to receive notifications from the device.
- bool **fail_state** () const

  Return true if the device is in a fail state.
- bool feature_negotiated (unsigned int feat) const

  Check if a particular feature bit was negotiated with the device.
- int driver_acknowledge ()

  Finalize handshake with the device.
- int register_ds (L4::Cap< L4Re::Dataspace > ds, l4_umword_t offset, l4_umword_t size, l4_uint64_t *devaddr)

  Share a dataspace with the device.
- int config_queue (int num, unsigned size, l4_uint64_t desc_addr, l4_uint64_t avail_addr, l4_uint64_t used_addr)

  Send the virtqueue configuration to the device.
- int max_queue_size (int num) const

  Maximum queue size allowed by the device.
- int send_and_wait (Virtqueue &queue, l4_uint16_t descno)

  Send a request to the device and wait for it to be processed.
- int wait (int index) const

  Wait for a notification from the device.
- int wait_for_next_used (Virtqueue &queue, l4_uint32_t *len=nullptr) const

  Wait for the next item to arrive in the used queue and return it.
- void send (Virtqueue &queue, l4_uint16_t descno)

  Send a request to the device.

15.391.1 Detailed Description

Simple class for accessing a virtio block device synchronously.
Definition at line 36 of file virtio-block.

15.391.2 Member Function Documentation

15.391.2.1 add_block()

```
int L4virtio::Driver::Block_device::add_block (
            Handle handle,
            Ptr< void > addr,
            l4_uint32_t size)  [inline]
```

Add a data block to a request that has already been set up.

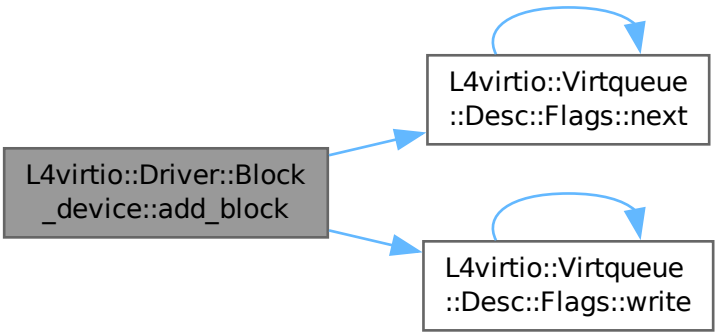
Parameters

handle	Handle to request previously set up with start_request().
addr	Address of data block in device address space.
size	Size of data block.

Return values

L4_OK	Block was successfully added.
-L4_EAGAIN	No descriptors available. Try again later.

Definition at line 232 of file virtio-block.
References L4virtio::Virtqueue::Desc::addr, L4virtio::Virtqueue::Desc::flags, L4_EAGAIN, L4_EOK, L4VIRTIO_BLOCK_T_GET_ID, L4VIRTIO_BLOCK_T_IN, L4virtio::Virtqueue::Desc::len, L4virtio::Virtqueue::Desc::Flags::next(), L4virtio::Virtqueue::Desc::next, L4virtio::Virtqueue::Desc::Flags::raw, and L4virtio::Virtqueue::Desc::Flags::write().
Here is the call graph for this function:



15.391.2.2 process_request()

```
int L4virtio::Driver::Block_device::process_request (
            Handle handle)  [inline]
```

Process request synchronously.

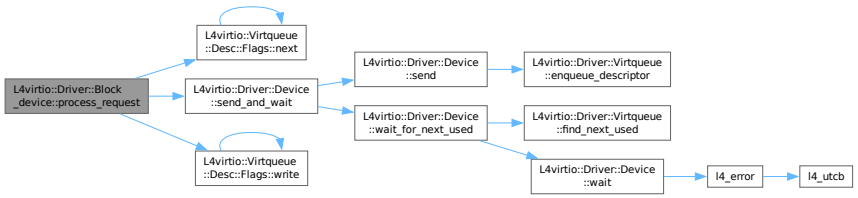
Parameters

handle	Handle to request to process.

Return values

L4_EOK	Request processed successfully.
-L4_EAGAIN	No descriptors available. Try again later.
-L4_EIO	IO error during request processing.
-L4_ENOSYS	Unsupported request.
<0	Another unspecified error occurred.

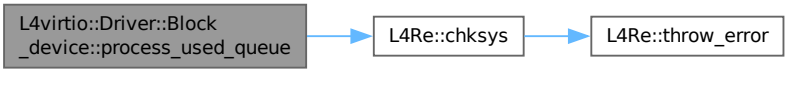
Sends a request to the driver that was previously set up with start_request() and add_block() and wait for it to be executed.
Definition at line 315 of file virtio-block.
References L4virtio::Virtqueue::Desc::addr, L4virtio::Virtqueue::Desc::flags, L4_EAGAIN, L4_EINVAL, L4_EIO, L4_ENOSYS, L4_EOK, L4VIRTIO_BLOCK_S_IOERR, L4VIRTIO_BLOCK_S_OK, L4VIRTIO_BLOCK_S_UNSUPP, L4virtio::Virtqueue::Desc::len, L4virtio::Virtqueue::Desc::Flags::next(), L4virtio::Virtqueue::Desc::next, L4virtio::Virtqueue::Desc::Flags L4virtio::Driver::Device::send_and_wait(), and L4virtio::Virtqueue::Desc::Flags::write().
Here is the call graph for this function:



15.391.2.3 process_used_queue()

```
void L4virtio::Driver::Block_device::process_used_queue ()  [inline]
```

Process and free all items in the used queue.
If the request has a callback registered it is called after the item has been removed from the queue.
Definition at line 366 of file virtio-block.
References L4Re::chksys(), and L4_ENOSYS.
Here is the call graph for this function:



15.391.2.4 send_request()

```
int L4virtio::Driver::Block_device::send_request (
            Handle handle)  [inline]
```

Process request asynchronously.

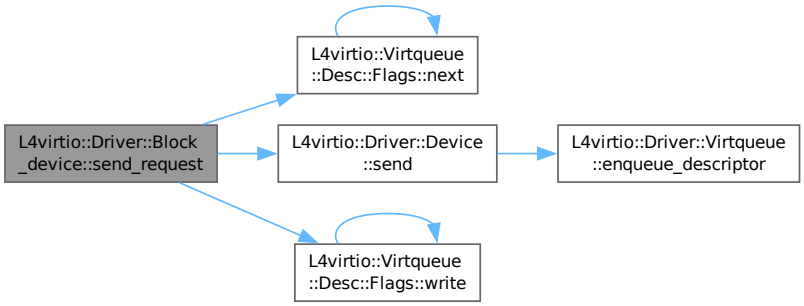
Parameters

handle	Handle to request to send to the device

Return values

L4_OK	Request was successfully scheduled.
-L4_EAGAIN	No descriptors available. Try again later.

Sends a request to the driver that was previously set up with start_request() and add_block() and wait for it to be executed.
Definition at line 274 of file virtio-block.
References L4virtio::Virtqueue::Desc::addr, L4virtio::Virtqueue::Desc::flags, L4_EAGAIN, L4_EOK, L4virtio::Virtqueue::Desc::len, L4virtio::Virtqueue::Desc::Flags::next(), L4virtio::Virtqueue::Desc::next, L4virtio::Virtqueue::Desc::Flags::raw, L4virtio::Driver::Device::send(), and L4virtio::Virtqueue::Desc::Flags::write().
Here is the call graph for this function:



15.391.2.5 setup_device()

```
void L4virtio::Driver::Block_device::setup_device (
            L4::Cap< L4virtio::Device > srvcap,
            l4_size_t usermem,
            void ** userdata,
            Ptr< void > & user_devaddr,
            L4::Cap< L4Re::Dataspace > qds = L4::Cap<L4Re::Dataspace>(),
            l4_uint32_t fmask0 = ~1U,
            l4_uint32_t fmask1 = ~1U,
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

Establish a connection to the device and set up shared memory.

Parameters

	srvcap	IPC capability of the channel to the server.
	usermem	Size of additional memory to share with device.
out	*userdata*	Pointer to the region of user-usable memory.
out	*user_devaddr*	Address of user-usable memory in device address space.

	qds	External queue dataspace. If this capability is invalid, the function will attempt to allocate a dataspace on its own. Note that the external queue dataspace must be large enough.
	fmask0	Feature bits 0..31 that the driver supports.
	fmask1	Feature bits 32..63 that the driver supports.
	msg_dev	Debug channel for developer-related information. Verbosity of L4Re::Util::Dbg(2) by default.

This function starts a handshake with the device and sets up the virtqueues for communication and the additional data structures for the block device. It will also allocate and share additional memory that the caller then can use freely, i.e. normally this memory would be used as a reception buffer. The caller may also decide to not make use of this convenience function and request 0 bytes in usermem. Then it has to allocate the block buffers for sending/receiving payload manually and share them using register_ds().
Definition at line 94 of file virtio-block.

15.391.2.6 start_request()

```
Handle L4virtio::Driver::Block_device::start_request (
            l4_uint64_t sector,
            l4_uint32_t type,
            Callback callback)  [inline]
```

Start the setup of a new request.

Parameters

sector	First sector to write to/read from.
type	Request type.
callback	Function to call, when the request is finished. May be 0 for synchronous requests.

Definition at line 194 of file virtio-block.
References L4virtio::Virtqueue::Desc::addr, L4virtio::Virtqueue::Desc::flags, l4virtio_block_header_t::ioprio, L4virtio::Virtqueue::Desc::len, L4virtio::Virtqueue::Desc::Flags::raw, l4virtio_block_header_t::sector, and l4virtio_block_header_t::type

- int wait_for_next_used (Virtqueue &queue, l4_uint32_t *len=nullptr) const

  Wait for the next item to arrive in the used queue and return it.
- void send (Virtqueue &queue, l4_uint16_t descno)

  Send a request to the device.

15.393.1 Detailed Description

Client-side implementation for a general virtio device.
Definition at line 31 of file l4virtio.

15.393.2 Member Function Documentation

15.393.2.1 bind_notification_irq()

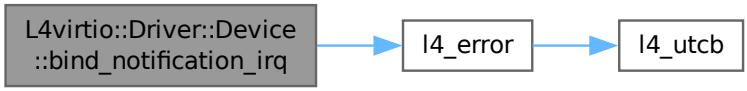
```
int L4virtio::Driver::Device::bind_notification_irq (
            unsigned index,
            L4::Cap< L4::Triggerable > irq) const  [inline]
```

Register a triggerable to receive notifications from the device.

Parameters

	index	Index of the interrupt.
out	*irq*	Triggerable to register for notifications.

Definition at line 129 of file l4virtio.
References l4_error().
Here is the call graph for this function:



15.393.2.2 config_queue()

```
int L4virtio::Driver::Device::config_queue (
            int num,
            unsigned size,
            l4_uint64_t desc_addr,
            l4_uint64_t avail_addr,
            l4_uint64_t used_addr)  [inline]
```

Send the virtqueue configuration to the device.

Parameters

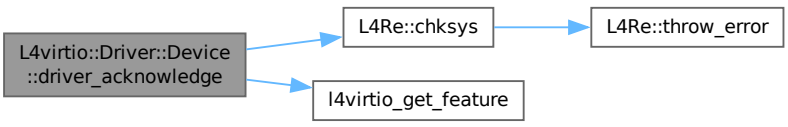
num	Number of queue to configure.
size	Size of rings in the queue, must be a power of 2)
desc_addr	Address of descriptor table (device address)
avail_addr	Address of available ring (device address)
used_addr	Address of used ring (device address)

Definition at line 212 of file l4virtio.

15.393.2.3 driver_acknowledge()

```
int L4virtio::Driver::Device::driver_acknowledge ()  [inline]
```

Finalize handshake with the device.
Must be called after all queues have been set up and before the first request is sent. It is still possible to add more shared dataspaces after the handshake has been finished.
Definition at line 156 of file l4virtio.
References L4Re::chksys(), L4_EINVAL, L4_EIO, L4_ENODEV, L4_EOK, L4VIRTIO_FEATURE_VERSION_1, l4virtio_get_feature(), L4VIRTIO_STATUS_DRIVER_OK, and L4VIRTIO_STATUS_FEATURES_OK.
Here is the call graph for this function:



15.393.2.4 driver_connect()

```
void L4virtio::Driver::Device::driver_connect (
            L4::Cap< L4virtio::Device > srvcap,
            bool manage_notify = true)  [inline]
```

Contacts the device and starts the initial handshake.

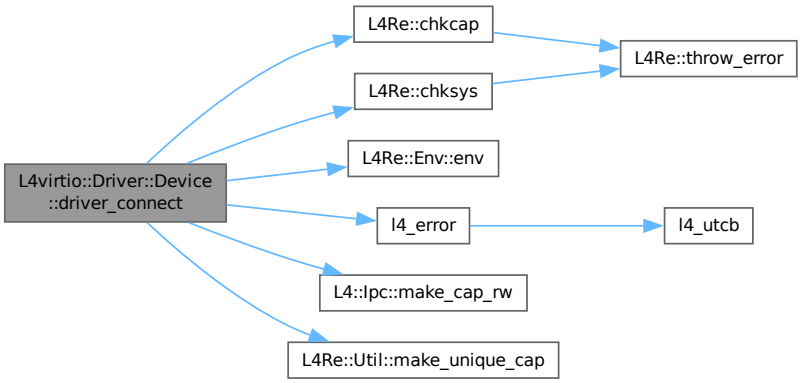
Parameters

srvcap	Capability for device communication.
manage_notify	Set up a semaphore for notifications from the device. See below.

Exceptions

L4::Runtime_error	if the initialisation fails

This function contacts the server, sets up the notification channels and the configuration dataspace. After this is done, the caller can set up any dataspaces it needs. The initialisation then needs to be finished by calling driver_acknowledge().
Per default this function creates and registers a semaphore for receiving notification from the device. This semaphore is used in the blocking functions send_and_wait(), wait() and next_used().
When `manage_notify` is false, then the caller may manually register and handle notification interrupts from the device. This is for example useful, when the client runs in an application with a server loop.
Definition at line 56 of file l4virtio.
References L4Re::chkcap(), L4Re::chksys(), L4Re::Env::env(), L4_EINVAL, L4_EIO, L4_ENODEV, l4_error(), L4_PAGEMASK, L4_PAGESHIFT, L4_PAGESIZE, L4_SUPERPAGESIZE, L4VIRTIO_STATUS_ACKNOWLEDGE, L4VIRTIO_STATUS_DRIVER, L4::Ipc::make_cap_rw(), L4Re::Util::make_unique_cap(), L4Re::Rm::F::RW, and L4Re::Rm::F::Search_addr.
Here is the call graph for this function:



15.393.2.5 feature_negotiated()

```
bool L4virtio::Driver::Device::feature_negotiated (
            unsigned int feat) const  [inline]
```

Check if a particular feature bit was negotiated with the device.
The result is only valid after driver_acknowledge() was called (when the handshake with the device was completed).

Parameters

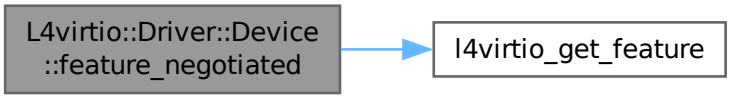
feat	The feature bit.

Return values

true	The feature is supported by both driver and device.
false	The feature is not supported by the driver and/or device.

Definition at line 145 of file l4virtio.
References l4virtio_get_feature().

Here is the call graph for this function:



15.393.2.6 max_queue_size()

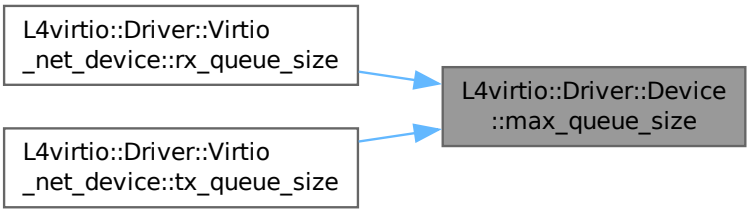
```
int L4virtio::Driver::Device::max_queue_size (
            int num) const  [inline]
```

Maximum queue size allowed by the device.

Parameters

num	Number of queue for which to determine the maximum size.

Definition at line 230 of file l4virtio.
Referenced by L4virtio::Driver::Virtio_net_device::rx_queue_size(), and L4virtio::Driver::Virtio_net_device::tx_queue_size().
Here is the caller graph for this function:



15.393.2.7 register_ds()

```
int L4virtio::Driver::Device::register_ds (
            L4::Cap< L4Re::Dataspace > ds,
            l4_umword_t offset,
            l4_umword_t size,
            l4_uint64_t * devaddr)  [inline]
```

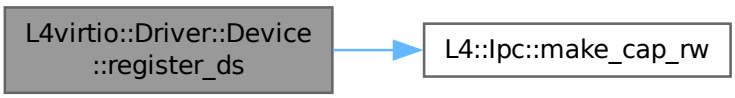
Share a dataspace with the device.

Parameters

ds	Dataspace to share with the device.
offset	Offset in dataspace where the shared part starts.

size	Total size in bytes of the shared space.
devaddr	Start of shared space in the device address space.

Although this function allows to share only a part of the given dataspace for convenience, the granularity of sharing is always the dataspace level. Thus, the remainder of the dataspace is not protected from the device.
When communicating with the device, addresses must be given with respect to the device address space. This is not the same as the virtual address space of the client in order to not leak information about the address space layout.
Definition at line 196 of file l4virtio.
References L4::Ipc::make_cap_rw().
Here is the call graph for this function:



15.393.2.8 send()

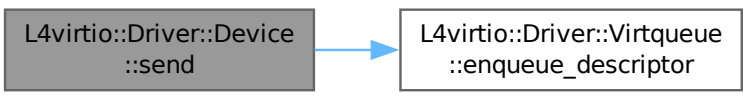
```
void L4virtio::Driver::Device::send (
            Virtqueue & queue,
            l4_uint16_t descno)  [inline]
```

Send a request to the device.

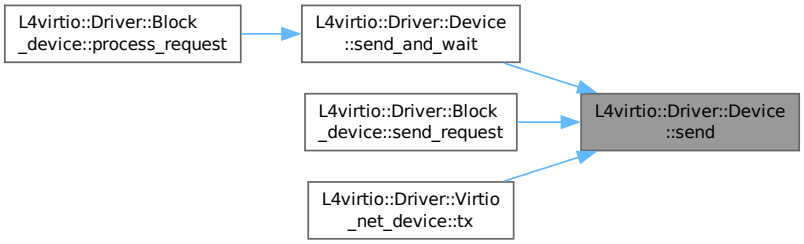
Parameters

queue	Queue that contains the request in its descriptor table
descno	Index of first entry in descriptor table where

Definition at line 312 of file l4virtio.
References L4virtio::Driver::Virtqueue::enqueue_descriptor().
Referenced by send_and_wait(), L4virtio::Driver::Block_device::send_request(), and L4virtio::Driver::Virtio_net_device::tx().
Here is the call graph for this function:



Here is the caller graph for this function:



15.393.2.9 send_and_wait()

```
int L4virtio::Driver::Device::send_and_wait (
            Virtqueue & queue,
            l4_uint16_t descno)  [inline]
```

Send a request to the device and wait for it to be processed.

Parameters

queue	Queue that contains the request in its descriptor table
descno	Index of first entry in descriptor table where

This function provides a simple mechanism to send requests synchronously. It must not be used with other requests at the same time as it directly waits for a notification on the device irq cap.

Precondition

driver_connect() was called with manage_notify.

Definition at line 247 of file l4virtio.
References L4_EINVAL, L4_EOK, send(), and wait_for_next_used().
Referenced by L4virtio::Driver::Block_device::process_request().

15.393.2.10 wait()

```
int L4virtio::Driver::Device::wait (
            int index) const  [inline]
```

Wait for a notification from the device.

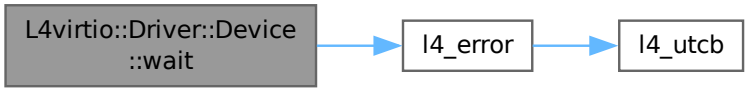
Parameters

index	Notification slot to wait for.

Precondition

driver_connect() was called with manage_notify.

Definition at line 268 of file l4virtio.
References L4_EEXIST, and l4_error().
Referenced by wait_for_next_used().
Here is the call graph for this function:



Here is the caller graph for this function:

15.393.2.11 wait_for_next_used()

```
int L4virtio::Driver::Device::wait_for_next_used (
            Virtqueue & queue,
            l4_uint32_t * len = nullptr) const  [inline]
```

Wait for the next item to arrive in the used queue and return it.

Parameters

	queue	A queue.
out	*len*	(optional) Size of valid data in finished block. Note that this is the value reported by the device, which may set it to a value that is larger than the original buffer size.

Return values

>=0	Descriptor number of item removed from used queue.
<0	IPC error while waiting for notification.

The call blocks until the next item is available in the used queue.

Precondition

driver_connect() was called with manage_notify.

Definition at line 291 of file l4virtio.
References L4virtio::Driver::Virtqueue::find_next_used(), and wait().
Referenced by send_and_wait().

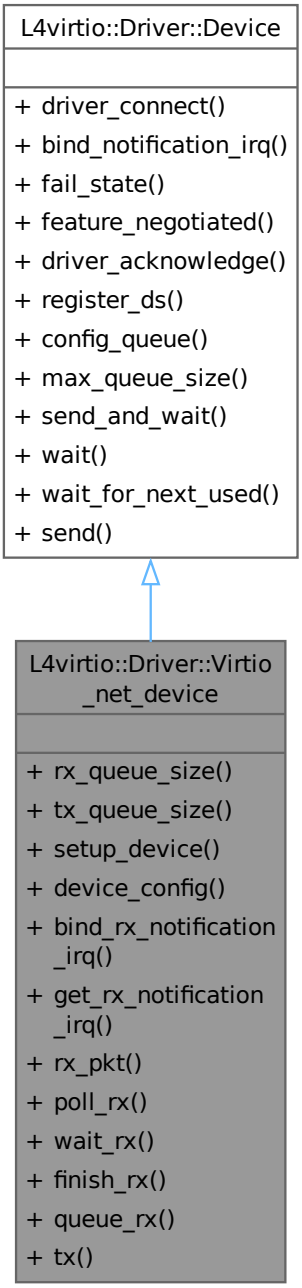
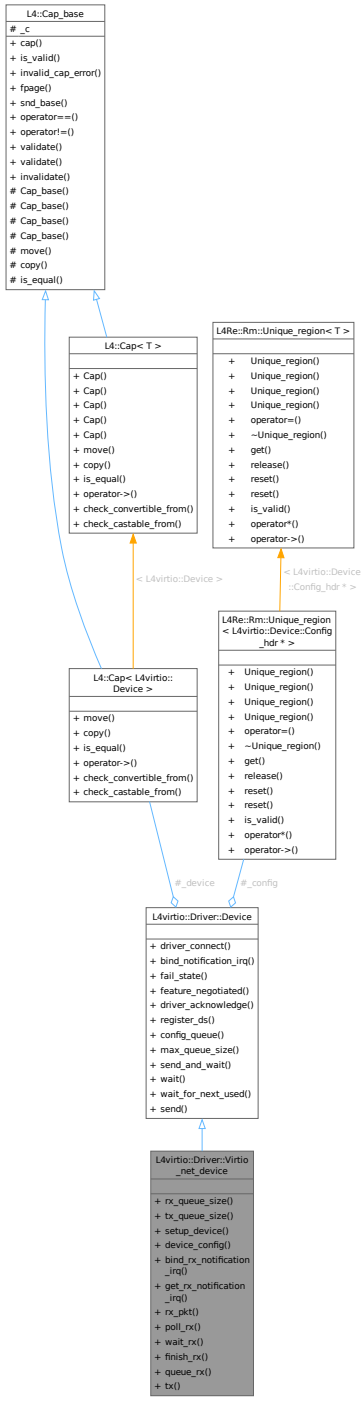
15.394 L4virtio::Driver::Virtio_net_device Class Reference

Simple class for accessing a virtio net device.
`#include <virtio-net>`

Inheritance diagram for L4virtio::Driver::Virtio_net_device:



Collaboration diagram for L4virtio::Driver::Virtio_net_device:



Data Structures

- struct Packet

  Structure for a network packet (header including data) with maximum size, assuming that no extra features have been negotiated.

Public Member Functions

- int rx_queue_size () const

Return the maximum receive queue size allowed by the device.

- int tx_queue_size () const

  Return the maximum transmit queue size allowed by the device.

- void setup_device (L4::Cap< L4virtio::Device > srvcap, L4::Cap< L4Re::Dataspace > queue_ds=L4::Cap< L4Re::Dataspace >::Invalid, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Establish a connection to the device and set up shared memory.

- l4virtio_net_config_t const & **device_config** () const

  Return a reference to the device configuration.

- int bind_rx_notification_irq (L4::Cap< L4::Thread > thread, l4_umword_t label)

  Bind the rx notification IRQ to the specified thread.

- L4::Cap< L4::Irq > **get_rx_notification_irq** () const

  Get notification IRQ.

- Packet & rx_pkt (l4_uint16_t descno)

  Return a reference to the RX packet buffer of the specified descriptor, e.g.

- l4_uint16_t poll_rx (l4_uint32_t *len=nullptr)

  Poll if a network packet has been received from the device and return the descriptor number, if any.

- l4_uint16_t wait_rx (l4_uint32_t *len=nullptr)

  Block until a network packet has been received from the device and return the descriptor number.

- void finish_rx (l4_uint16_t descno)

  Free an RX descriptor number to make it available for the RX queue again.

- void **queue_rx** ()

  Queue new available descriptors in the RX queue.

- bool tx (std::function< l4_uint32_t(Packet &)> prepare)

  Attempt to allocate a descriptor in the TX queue and transmit the packet, after calling the prepare callback.

Public Member Functions inherited from L4virtio::Driver::Device

- void driver_connect (L4::Cap< L4virtio::Device > srvcap, bool manage_notify=true)

  Contacts the device and starts the initial handshake.

- int bind_notification_irq (unsigned index, L4::Cap< L4::Triggerable > irq) const

  Register a triggerable to receive notifications from the device.

- bool **fail_state** () const

  Return true if the device is in a fail state.

- bool feature_negotiated (unsigned int feat) const

  Check if a particular feature bit was negotiated with the device.

- int driver_acknowledge ()

  Finalize handshake with the device.

- int register_ds (L4::Cap< L4Re::Dataspace > ds, l4_umword_t offset, l4_umword_t size, l4_uint64_t *devaddr)

  Share a dataspace with the device.

- int config_queue (int num, unsigned size, l4_uint64_t desc_addr, l4_uint64_t avail_addr, l4_uint64_t used_↩ addr)

  Send the virtqueue configuration to the device.

- int max_queue_size (int num) const

  Maximum queue size allowed by the device.

- int send_and_wait (Virtqueue &queue, l4_uint16_t descno)

  Send a request to the device and wait for it to be processed.

- int wait (int index) const

  Wait for a notification from the device.

- int wait_for_next_used (Virtqueue &queue, l4_uint32_t *len=nullptr) const

  Wait for the next item to arrive in the used queue and return it.

- void send (Virtqueue &queue, l4_uint16_t descno)

  Send a request to the device.

15.394.1 Detailed Description

Simple class for accessing a virtio net device.
Definition at line 30 of file virtio-net.

15.394.2 Member Function Documentation

15.394.2.1 bind_rx_notification_irq()

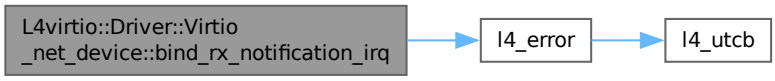
```
int L4virtio::Driver::Virtio_net_device::bind_rx_notification_irq (
            L4::Cap< L4::Thread > thread,
            l4_umword_t label)  [inline]
```

Bind the rx notification IRQ to the specified thread.

Parameters

thread	Thread to bind the notification IRQ to.
label	Label to assign to the IRQ.

Definition at line 185 of file virtio-net.
References l4_error().
Here is the call graph for this function:



15.394.2.2 finish_rx()

```
void L4virtio::Driver::Virtio_net_device::finish_rx (
            l4_uint16_t descno)  [inline]
```

Free an RX descriptor number to make it available for the RX queue again.

Parameters

descno	Descriptor number in the virtio queue.

Usually queue_rx() should be called afterwards to queue the freed descriptor(s).
Definition at line 271 of file virtio-net.

15.394.2.3 poll_rx()

```
l4_uint16_t L4virtio::Driver::Virtio_net_device::poll_rx (
            l4_uint32_t * len = nullptr)  [inline]
```

Poll if a network packet has been received from the device and return the descriptor number, if any.

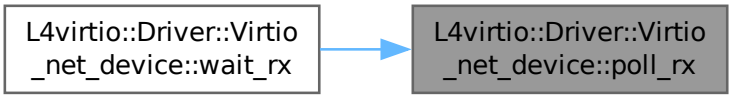
Parameters

out	*len*	(optional) Length of valid data in RX packet.

Return values

!=Virtqueue::Eoq	Descriptor number of received packet
==Virtqueue::Eoq	No descriptor is available.

The packet data can be obtained with rx_pkt(). finish_rx() should be called after the packet buffer can be returned to the RX queue.
Definition at line 221 of file virtio-net.
Referenced by wait_rx().
Here is the caller graph for this function:



15.394.2.4 rx_pkt()

```
Packet & L4virtio::Driver::Virtio_net_device::rx_pkt (
            l4_uint16_t descno)  [inline]
```

Return a reference to the RX packet buffer of the specified descriptor, e.g. from wait_rx().

Parameters

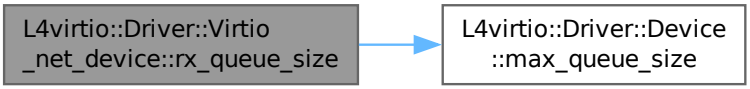
descno	Descriptor number in the virtio queue.

Definition at line 202 of file virtio-net.

15.394.2.5 rx_queue_size()

```
int L4virtio::Driver::Virtio_net_device::rx_queue_size () const  [inline]
```

Return the maximum receive queue size allowed by the device.
wait_rx() will return a descriptor number that is smaller than this size.
Definition at line 47 of file virtio-net.
References L4virtio::Driver::Device::max_queue_size().
Here is the call graph for this function:



15.394.2.6 setup_device()

```
void L4virtio::Driver::Virtio_net_device::setup_device (
            L4::Cap< L4virtio::Device > srvcap,
            L4::Cap< L4Re::Dataspace > queue_ds = L4::Cap<L4Re::Dataspace>::Invalid,
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

Establish a connection to the device and set up shared memory.

Parameters

srvcap	IPC capability of the channel to the server.
queue_ds	(optional) External queue dataspace. If this capability is invalid, the function will attempt to allocate a dataspace on its own. Note that the external queue dataspace must be large enough.
msg_dev	Debug channel for developer-related information. Verbosity of L4Re::Util::Dbg(2) by default.

This function starts a handshake with the device and sets up the virtqueues for communication and the additional data structures for the network device.
Definition at line 72 of file virtio-net.
References L4::Cap_base::Invalid.

15.394.2.7 tx()

```
bool L4virtio::Driver::Virtio_net_device::tx (
            std::function< l4_uint32_t(Packet &)> prepare)  [inline]
```

Attempt to allocate a descriptor in the TX queue and transmit the packet, after calling the prepare callback.

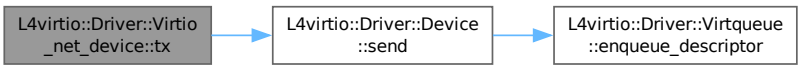
Parameters

prepare	Function that fills the packet with data, should return the length of the data copied to the packet.

Return values

true	The packet was queued.
false	TX queue is full.

The prepare callback should fill the packet with data and return the length of the packet data (without the size of the virtio-net packet header).
Definition at line 301 of file virtio-net.
References L4virtio::Driver::Device::send().
Here is the call graph for this function:

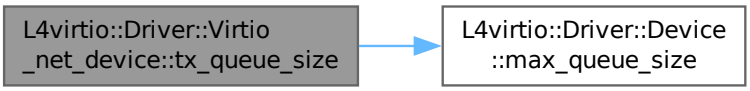


15.394.2.8 tx_queue_size()

```
int L4virtio::Driver::Virtio_net_device::tx_queue_size () const  [inline]
```

Return the maximum transmit queue size allowed by the device.

tx() will fail if the amount of queued packets exceeds this size.
Definition at line 54 of file virtio-net.
References L4virtio::Driver::Device::max_queue_size().
Here is the call graph for this function:



15.394.2.9 wait_rx()

```
l4_uint16_t L4virtio::Driver::Virtio_net_device::wait_rx (
            l4_uint32_t * len = nullptr)  [inline]
```

Block until a network packet has been received from the device and return the descriptor number.

Precondition

The calling thread must be bound to the rx notification IRQ via `bind_rx_notification_irq()`.

Parameters

out	*len*	(optional) Length of valid data in RX packet.

Returns

Descriptor number of received packet.

The packet data can be obtained with rx_pkt(). finish_rx() should be called after the packet buffer can be returned to the RX queue.
Definition at line 247 of file virtio-net.
References L4Re::chksys(), and poll_rx().
Here is the call graph for this function:

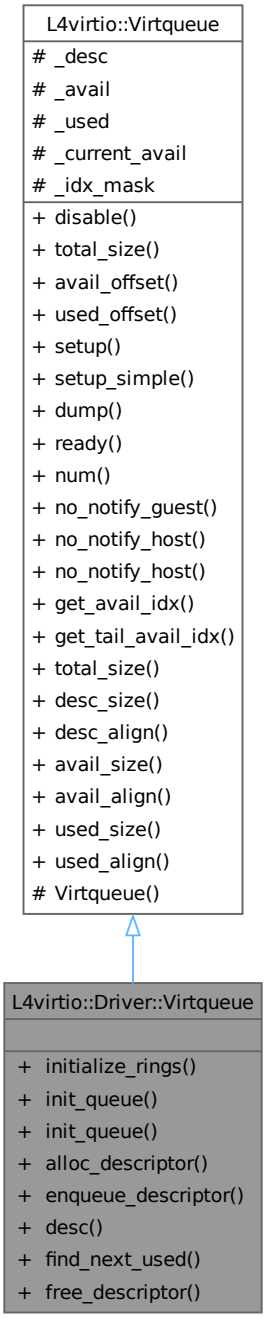
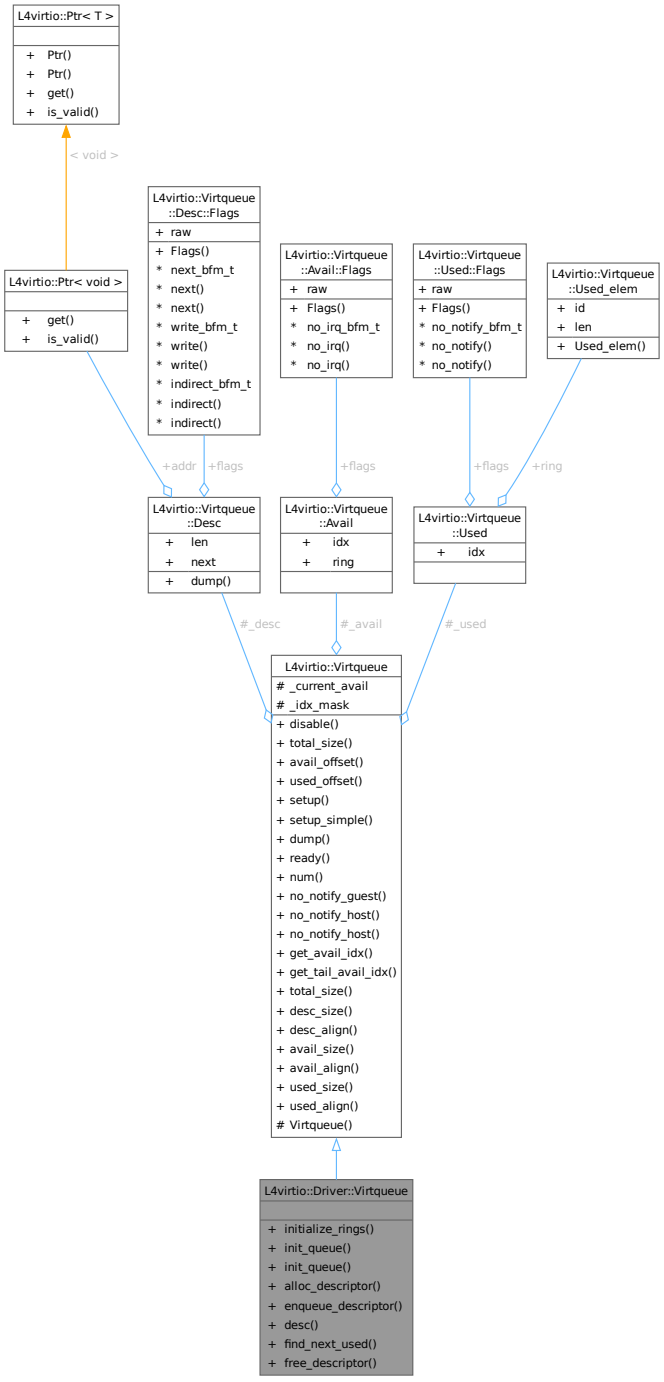
15.396 L4virtio::Driver::Virtqueue Class Reference

Driver-side implementation of a Virtqueue.
`#include <virtqueue>`

Inheritance diagram for L4virtio::Driver::Virtqueue:



Collaboration diagram for L4virtio::Driver::Virtqueue:



Public Member Functions

- void initialize_rings (unsigned num)

  Initialize the descriptor table and the index structures of this queue.

- void init_queue (unsigned num, void ∗desc, void ∗avail, void ∗used, L4Re::Util::Dbg msg_dev=L4Re::Util::↩ Dbg{2})

  Initialize this virtqueue.

- void init_queue (unsigned num, void ∗base, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

Initialize this virtqueue.

- l4_uint16_t alloc_descriptor ()

  Allocate and return an unused descriptor from the descriptor table.

- void enqueue_descriptor (l4_uint16_t descno)

  Enqueue a descriptor in the available ring.

- Desc & desc (l4_uint16_t descno)

  Return a reference to a descriptor in the descriptor table.

- l4_uint16_t find_next_used (l4_uint32_t *len=nullptr)

  Return the next finished block.

- void free_descriptor (l4_uint16_t head, l4_uint16_t tail)

  Free a chained list of descriptors in the descriptor queue.

Public Member Functions inherited from L4virtio::Virtqueue

- void disable ()

  Completely disable the queue.

- unsigned long total_size () const

  Calculate the total size of this virtqueue.

- unsigned long **avail_offset** () const

  Get the offset of the available ring from the descriptor table.

- unsigned long **used_offset** () const

  Get the offset of the used ring from the descriptor table.

- void setup (unsigned num, void *desc, void *avail, void *used, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Enable this queue.

- void setup_simple (unsigned num, void *ring, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Enable this queue.

- void dump (Desc const *d, L4Re::Util::Dbg dbg=L4Re::Util::Dbg{}) const

  Dump a descriptor for this queue.

- bool ready () const

  Test if this queue is in working state.

- unsigned num () const
- bool no_notify_guest () const

  Get the no IRQ flag of this queue.

- bool no_notify_host () const

  Get the no notify flag of this queue.

- void no_notify_host (bool value)

  Set the no-notify flag for this queue.

- l4_uint16_t get_avail_idx () const

  Get available index from available ring (for debugging).

- l4_uint16_t get_tail_avail_idx () const

  Get tail-available index stored in local state (for debugging).

Additional Inherited Members

Public Types inherited from L4virtio::Virtqueue

- enum

  Fixed alignment values for different parts of a virtqueue.

Static Public Member Functions inherited from L4virtio::Virtqueue

- static unsigned long total_size (unsigned num)

  Calculate the total size for a virtqueue of the given dimensions.
- static unsigned long desc_size (unsigned num)

  Calculate the size of the descriptor table for `num` entries.
- static unsigned long desc_align ()

  Get the alignment in zero LSBs needed for the descriptor table.
- static unsigned long avail_size (unsigned num)

  Calculate the size of the available ring for `num` entries.
- static unsigned long avail_align ()

  Get the alignment in zero LSBs needed for the available ring.
- static unsigned long used_size (unsigned num)

  Calculate the size of the used ring for `num` entries.
- static unsigned long used_align ()

  Get the alignment in zero LSBs needed for the used ring.

Protected Member Functions inherited from L4virtio::Virtqueue

- **Virtqueue** ()=default

  Create a disabled virtqueue.

Protected Attributes inherited from L4virtio::Virtqueue

- Desc * **_desc** = nullptr

  pointer to descriptor table, NULL if queue is off.
- Avail * **_avail** = nullptr

  pointer to available ring.
- Used * **_used** = nullptr

  pointer to used ring.
- l4_uint16_t **_current_avail** = 0

  The life counter for the queue.
- l4_uint16_t **_idx_mask** = 0

  mask used for indexing into the descriptor table and the rings.

15.396.1 Detailed Description

Driver-side implementation of a Virtqueue.
Adds function for managing the descriptor list, enqueueing new and dequeueing finished requests.

Note

The Virtqueue implementation is not thread-safe.

Definition at line 491 of file virtqueue.

15.396.2 Member Function Documentation

15.396.2.1 alloc_descriptor()

```
l4_uint16_t L4virtio::Driver::Virtqueue::alloc_descriptor ()  [inline]
```

Allocate and return an unused descriptor from the descriptor table.
The descriptor will be removed from the free list, the content should be considered undefined. After use, it needs to be freed using free_descriptor().

Returns

The index of the reserved descriptor or Virtqueue::Eoq if no free descriptor is available.

Note: the implementation uses (2^16 - 1) as the end of queue marker. That means that the final entry in the queue can not be allocated iff the queue size is 2^16.
Definition at line 585 of file virtqueue.
References L4virtio::Virtqueue::_desc.

15.396.2.2 desc()

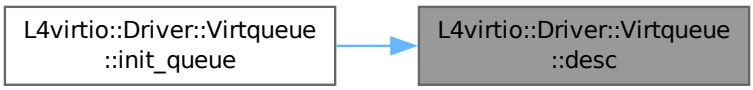
```
Desc & L4virtio::Driver::Virtqueue::desc (
            l4_uint16_t descno)  [inline]
```

Return a reference to a descriptor in the descriptor table.

Parameters

descno	Index of the descriptor, expected to be in correct range.

Definition at line 620 of file virtqueue.
References L4virtio::Virtqueue::_desc, and L4virtio::Virtqueue::_idx_mask.
Referenced by init_queue().
Here is the caller graph for this function:



15.396.2.3 enqueue_descriptor()

```
void L4virtio::Driver::Virtqueue::enqueue_descriptor (
            l4_uint16_t descno)  [inline]
```

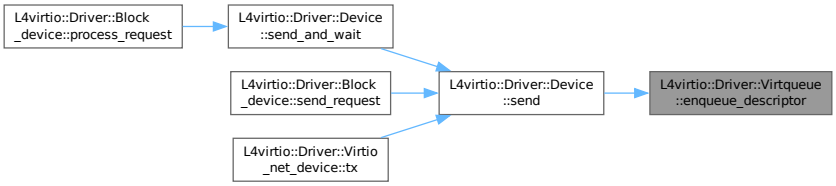
Enqueue a descriptor in the available ring.

Parameters

descno	Index of the head descriptor to enqueue.

Definition at line 601 of file virtqueue.
References L4virtio::Virtqueue::_avail, and L4virtio::Virtqueue::_idx_mask.
Referenced by L4virtio::Driver::Device::send().

Here is the caller graph for this function:



15.396.2.4 find_next_used()

```
l4_uint16_t L4virtio::Driver::Virtqueue::find_next_used (
            l4_uint32_t * len = nullptr)  [inline]
```

Return the next finished block.

Parameters

out	*len*	(optional) Size of valid data in finished block. Note that this is the value reported by the device, which may set it to a value that is larger than the original buffer size.

Returns

Index of the head or Virtqueue::Eoq if no used element is currently available.

Definition at line 639 of file virtqueue.
References L4virtio::Virtqueue::_current_avail, L4virtio::Virtqueue::_idx_mask, and L4virtio::Virtqueue::_used.
Referenced by L4virtio::Driver::Device::wait_for_next_used().
Here is the caller graph for this function:

15.396.2.5 free_descriptor()

```
void L4virtio::Driver::Virtqueue::free_descriptor (
            l4_uint16_t head,
            l4_uint16_t tail)  [inline]
```

Free a chained list of descriptors in the descriptor queue.

Parameters

head	Index of the first element in the descriptor chain.
tail	Index of the last element in the descriptor chain.

Simply takes the descriptor chain and prepends it to the beginning of the free list. Assumes that the list has been correctly chained.
Definition at line 667 of file virtqueue.
References L4virtio::Virtqueue::_desc, and L4virtio::Virtqueue::_idx_mask.

15.396.2.6 init_queue() [1/2]

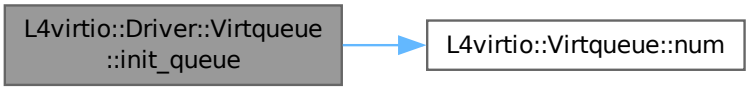
```
void L4virtio::Driver::Virtqueue::init_queue (
            unsigned num,
            void * base,
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

Initialize this virtqueue.

Parameters

num	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
base	The base address for the queue data structure.
msg_dev	Debug channel for developer-related information. Verbosity of L4Re::Util::Dbg(2) by default.

This function sets up the memory and initializes the freelist.
Definition at line 563 of file virtqueue.
References L4virtio::Virtqueue::num().
Here is the call graph for this function:



15.396.2.7 init_queue() [2/2]

```
void L4virtio::Driver::Virtqueue::init_queue (
            unsigned num,
            void * desc,
            void * avail,
            void * used,
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

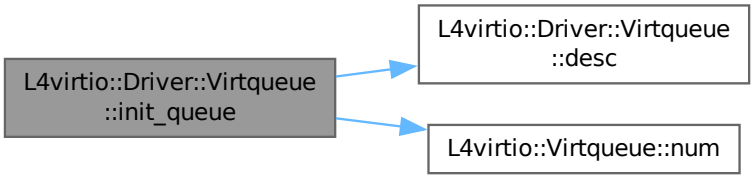
Initialize this virtqueue.

Parameters

num	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
desc	The address of the descriptor table. (Must be Desc_align aligned and at least `desc_size(num)` bytes in size.)
avail	The address of the available ring. (Must be Avail_align aligned and at least `avail_size(num)` bytes in size.)
used	The address of the used ring. (Must be Used_align aligned and at least `used_size(num)` bytes in size.)
msg_dev	Debug channel for developer-related information. Verbosity of L4Re::Util::Dbg(2) by default.

This function sets up the memory and initializes the freelist.
Definition at line 545 of file virtqueue.

References desc(), and L4virtio::Virtqueue::num().
Here is the call graph for this function:



15.396.2.8 initialize_rings()

```
void L4virtio::Driver::Virtqueue::initialize_rings (
            unsigned num)  [inline]
```

Initialize the descriptor table and the index structures of this queue.

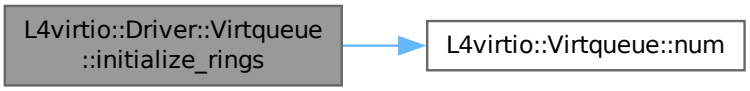
Parameters

num	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).

Precondition

The queue must be set up correctly with setup() or setup_simple().

Definition at line 515 of file virtqueue.
References L4virtio::Virtqueue::_avail, L4virtio::Virtqueue::_desc, L4virtio::Virtqueue::_used, and L4virtio::Virtqueue::num().
Here is the call graph for this function:



The documentation for this class was generated from the following file:

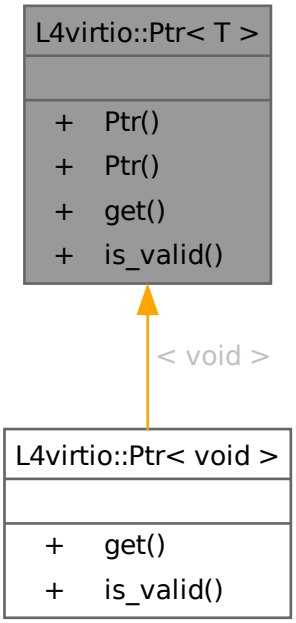
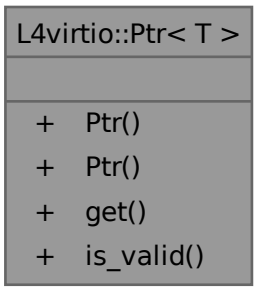
15.397 L4virtio::Ptr< T > Class Template Reference

Pointer used in virtio descriptors.
`#include <virtqueue>`

Inheritance diagram for L4virtio::Ptr< T >:



Collaboration diagram for L4virtio::Ptr< T >:



Public Types

- enum Invalid_type { Invalid }

  Type for making an invalid (NULL) Ptr.

Public Member Functions

- **Ptr** (Invalid_type)

  Make and invalid Ptr.

- **Ptr** (l4_uint64_t vm_addr)

  Make a Ptr from a raw 64bit address.
- l4_uint64_t get () const
- bool is_valid () const

15.397.1 Detailed Description

template<typename T>
class L4virtio::Ptr< T >

Pointer used in virtio descriptors.
As the descriptor contain guest addresses these pointers cannot be dereferenced directly.
Definition at line 53 of file virtqueue.

15.397.2 Member Enumeration Documentation

15.397.2.1 Invalid_type

```
template<typename T>
enum L4virtio::Ptr::Invalid_type
```

Type for making an invalid (NULL) Ptr.

Enumerator

Invalid	Use to set a Ptr to invalid (NULL).

Definition at line 57 of file virtqueue.

15.397.3 Member Function Documentation

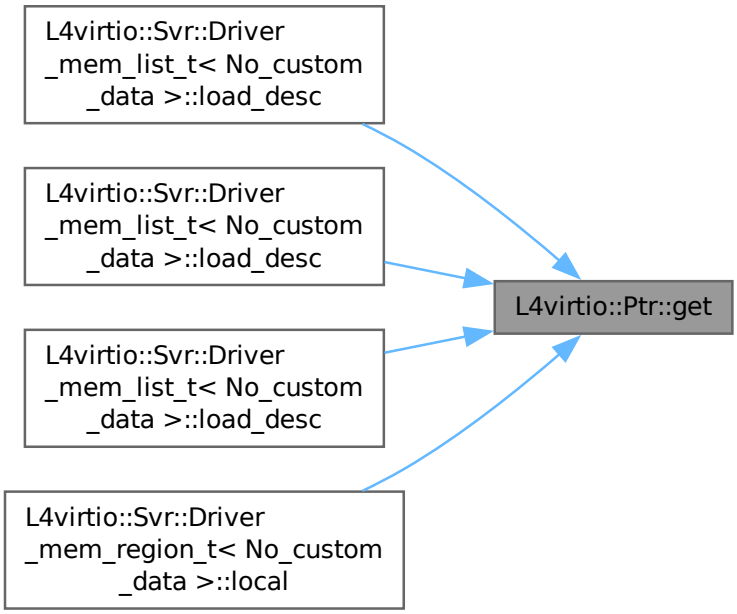
15.397.3.1 get()

```
template<typename T>
l4_uint64_t L4virtio::Ptr< T >::get () const  [inline]
```

Returns

The raw 64bit address of the stored pointer.

Definition at line 68 of file virtqueue.
Referenced by L4virtio::Svr::Driver_mem_list_t< No_custom_data >::load_desc(), L4virtio::Svr::Driver_mem_list_t< No_custom_da
L4virtio::Svr::Driver_mem_list_t< No_custom_data >::load_desc(), and L4virtio::Svr::Driver_mem_region_t< No_custom_data >::lo
Here is the caller graph for this function:



15.397.3.2 is_valid()

```
template<typename T>
bool L4virtio::Ptr< T >::is_valid () const  [inline]
```

Returns

true if the stored pointer is valid (not NULL).

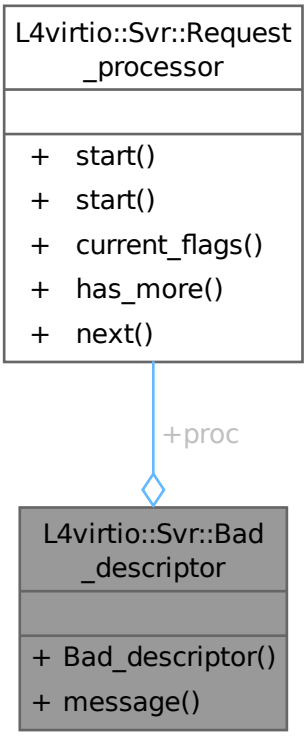
Definition at line 71 of file virtqueue.
The documentation for this class was generated from the following file:

- l4/l4virtio/virtqueue

15.398 L4virtio::Svr::Bad_descriptor Struct Reference

Exception used by Queue to indicate descriptor errors.
`#include <virtio>`

Collaboration diagram for L4virtio::Svr::Bad_descriptor:



Public Types

- enum Error {
  Bad_address , Bad_rights , Bad_flags , Bad_next ,
  Bad_size }

  The error code.

Public Member Functions

- Bad_descriptor (Request_processor const ∗proc, Error e)

  Make a bad descriptor exception.
- char const ∗ message () const

  Get a human readable description of the error code.

Data Fields

- Request_processor const ∗ **proc**

  The processor that triggered the exception.

15.398.1 Detailed Description

Exception used by Queue to indicate descriptor errors.
Definition at line 397 of file virtio.

15.398.2 Member Enumeration Documentation

15.398.2.1 Error

```
enum L4virtio::Svr::Bad_descriptor::Error
```
The error code.

Enumerator

Bad_address	Address cannot be translated.
Bad_rights	Missing access rights on memory.
Bad_flags	Invalid combination of descriptor flags.
Bad_next	Invalid next index.
Bad_size	Invalid size of memory block.

Definition at line 400 of file virtio.

15.398.3 Constructor & Destructor Documentation

15.398.3.1 Bad_descriptor()

```
L4virtio::Svr::Bad_descriptor::Bad_descriptor (
            Request_processor const * proc,
            Error e)  [inline]
```
Make a bad descriptor exception.

Parameters

proc	The request processor causing the exception
e	The error code.

Definition at line 421 of file virtio.
References proc.

15.398.4 Member Function Documentation

15.398.4.1 message()

```
char const * L4virtio::Svr::Bad_descriptor::message () const  [inline]
```
Get a human readable description of the error code.

Returns

Message describing the error.

Definition at line 430 of file virtio.
References Bad_address, Bad_flags, Bad_next, Bad_rights, and Bad_size.
Referenced by Virtio_switch::handle_l4virtio_port_tx().
Here is the caller graph for this function:

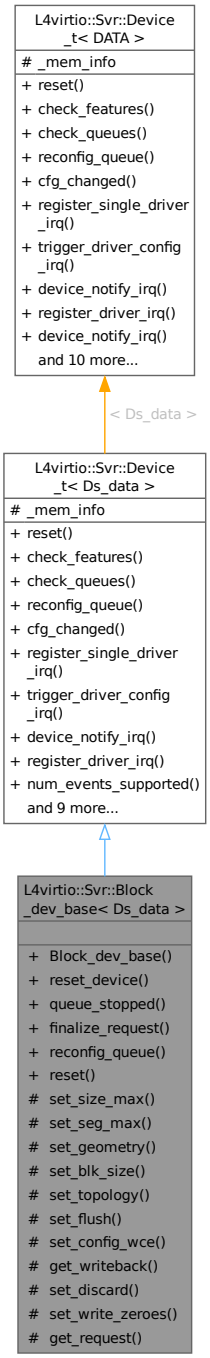
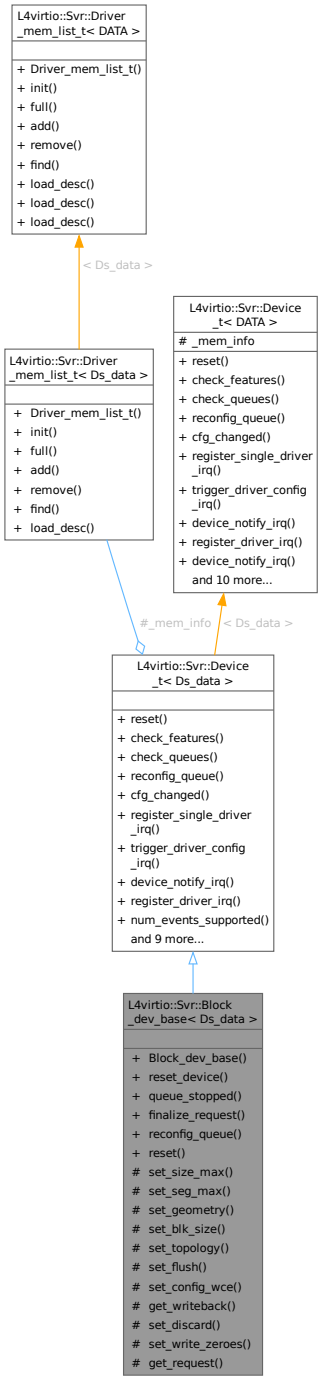
15.399 L4virtio::Svr::Block_dev_base< Ds_data > Class Template Reference

Base class for virtio block devices.
`#include <virtio-block>`

Inheritance diagram for L4virtio::Svr::Block_dev_base< Ds_data >:



Collaboration diagram for L4virtio::Svr::Block_dev_base< Ds_data >:



Public Member Functions

- Block_dev_base (l4_uint32_t vendor, unsigned queue_size, l4_uint64_t capacity, bool read_only, L4Re::↩ Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Create a new virtio block device.
- virtual void **reset_device** ()=0

  Reset the actual hardware device.
- virtual bool **queue_stopped** ()=0

Return true, if the queues should not be processed further.

- void finalize_request (cxx::unique_ptr< Request > req, unsigned sz, l4_uint8_t status=L4VIRTIO_BLOCK_S_OK)

  Releases resources related to a request and notifies the client.
- int **reconfig_queue** (unsigned idx) override

  callback for client queue-config request
- void **reset** () override

  reset callback, called for doing a device reset

Public Member Functions inherited from L4virtio::Svr::Device_t< Ds_data >

- virtual bool **check_features** ()

  callback for checking the subset of accepted features
- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual L4::Cap< L4::Irq > **device_notify_irq** () const

  callback to gather the device notification IRQ (old-style)
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Protected Member Functions

- void set_size_max (l4_uint32_t sz)

  Sets the maximum size of any single segment reported to client.
- void **set_seg_max** (l4_uint32_t sz)

  Sets the maximum number of segments in a request that is reported to client.
- void **set_geometry** (l4_uint16_t cylinders, l4_uint8_t heads, l4_uint8_t sectors)

  Set disk geometry that is reported to the client.
- void set_blk_size (l4_uint32_t sz)

  Sets block disk size to be reported to the client.

- void set_topology (l4_uint8_t physical_block_exp, l4_uint8_t alignment_offset, l4_uint16_t min_io_size, l4_uint32_t opt_io_size)

  Sets the I/O alignment information reported back to the client.
- void **set_flush** ()

  Enables the flush command.
- void set_config_wce (l4_uint8_t writeback)

  Sets cache mode and enables the writeback toggle.
- l4_uint8_t get_writeback ()

  Get the writeback field from the configuration space.
- void set_discard (l4_uint32_t max_discard_sectors, l4_uint32_t max_discard_seg, l4_uint32_t discard_↩ sector_alignment)

  Sets constraints for and enables the discard command.
- void set_write_zeroes (l4_uint32_t max_write_zeroes_sectors, l4_uint32_t max_write_zeroes_seg, l4_uint8_t write_zeroes_may_unmap)

  Sets constraints for and enables the write zeroes command.
- cxx::unique_ptr< Request > **get_request** ()

  Return one request if available.

Additional Inherited Members

Protected Attributes inherited from L4virtio::Svr::Device_t< Ds_data >

- Mem_list **_mem_info**

  Memory region list.

15.399.1 Detailed Description

template<typename Ds_data>
class L4virtio::Svr::Block_dev_base< Ds_data >

Base class for virtio block devices.
Use this class as a base to implement your own specific block device.
Definition at line 268 of file virtio-block.

15.399.2 Constructor & Destructor Documentation

15.399.2.1 Block_dev_base()

```
template<typename Ds_data>
L4virtio::Svr::Block_dev_base< Ds_data >::Block_dev_base (
            l4_uint32_t vendor,
            unsigned queue_size,
            l4_uint64_t capacity,
            bool read_only,
            L4Re::Util::Dbg msg_user = L4Re::Util::Dbg{},
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

Create a new virtio block device.

Parameters

vendor	Vendor ID
queue_size	Number of entries to provide in avail and used queue.
capacity	Size of the device in 512-byte sectors.
read_only	True, if the device should not be writable.

msg_user	Debug channel for informational messages relevant for the user. Verbosity of L4Re::Util::Dbg() by default.
msg_dev	Debug channel for debugging messages relevant for the developer. Verbosity of L4Re::Util::Dbg(2) by default.

Definition at line 457 of file virtio-block.

15.399.3 Member Function Documentation

15.399.3.1 finalize_request()

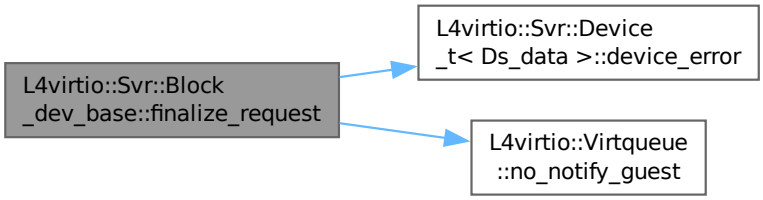
```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::finalize_request (
             cxx::unique_ptr< Request > req,
             unsigned sz,
             l4_uint8_t status = L4VIRTIO_BLOCK_S_OK)  [inline]
```

Releases resources related to a request and notifies the client.

Parameters

req	Pointer to request that has finished.
sz	Number of bytes consumed.
status	Status of request (see L4virtio_block_status).

This function must be called when an asynchronous request finishes, either successfully or with an error. The status byte in the request must have been set prior to calling it.
Definition at line 497 of file virtio-block.
References L4virtio::Svr::Device_t< Ds_data >::device_error(), L4VIRTIO_BLOCK_S_OK, L4VIRTIO_IRQ_STATUS_VRING, and L4virtio::Virtqueue::no_notify_guest().
Here is the call graph for this function:



15.399.3.2 get_writeback()

```
template<typename Ds_data>
l4_uint8_t L4virtio::Svr::Block_dev_base< Ds_data >::get_writeback ()  [inline], [protected]
```

Get the writeback field from the configuration space.

Returns

Value of the writeback field.

Definition at line 397 of file virtio-block.

15.399.3.3 set_blk_size()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_blk_size (
            l4_uint32_t sz)  [inline], [protected]
```

Sets block disk size to be reported to the client.
Setting this does not change the logical sector size used for addressing the device.
Definition at line 341 of file virtio-block.

15.399.3.4 set_config_wce()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_config_wce (
            l4_uint8_t writeback)  [inline], [protected]
```

Sets cache mode and enables the writeback toggle.

Parameters

writeback	Mode of the cache (0 for writethrough, 1 for writeback).

Definition at line 384 of file virtio-block.

15.399.3.5 set_discard()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_discard (
            l4_uint32_t max_discard_sectors,
            l4_uint32_t max_discard_seg,
            l4_uint32_t discard_sector_alignment)  [inline], [protected]
```

Sets constraints for and enables the discard command.

Parameters

max_discard_sectors	Maximum discard sectors size.
max_discard_seg	Maximum discard segment number.
discard_sector_alignment	Can be used by the driver when splitting a request based on alignment.

Definition at line 411 of file virtio-block.

15.399.3.6 set_size_max()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_size_max (
            l4_uint32_t sz)  [inline], [protected]
```

Sets the maximum size of any single segment reported to client.
The limit is also applied to any incoming requests. Requests with larger segments result in an IO error being reported to the client. That means that process_request() can safely make the assumption that all segments in the received request are smaller.
Definition at line 299 of file virtio-block.

15.399.3.7 set_topology()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_topology (
            l4_uint8_t physical_block_exp,
            l4_uint8_t alignment_offset,
```

```
            l4_uint16_t min_io_size,
            l4_uint32_t opt_io_size)  [inline], [protected]
```

Sets the I/O alignment information reported back to the client.

Parameters

physical_block_exp	Number of logical blocks per physical block(log2)
alignment_offset	Offset of the first aligned logical block
min_io_size	Suggested minimum I/O size in blocks
opt_io_size	Optimal I/O size in blocks

Definition at line 357 of file virtio-block.

15.399.3.8 set_write_zeroes()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_write_zeroes (
            l4_uint32_t max_write_zeroes_sectors,
            l4_uint32_t max_write_zeroes_seg,
            l4_uint8_t write_zeroes_may_unmap)  [inline], [protected]
```

Sets constraints for and enables the write zeroes command.

Parameters

max_write_zeroes_sectors	Maximum write zeroes sectors size.
max_write_zeroes_seg	maximum write zeroes segment number.
write_zeroes_may_unmap	Set if a write zeroes request can result in deallocating one or more sectors.

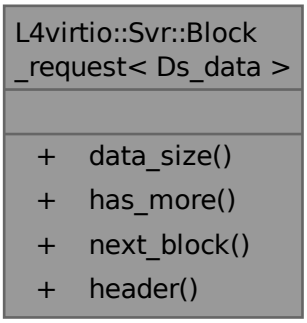
Definition at line 431 of file virtio-block.
The documentation for this class was generated from the following file:

- l4/l4virtio/server/virtio-block

15.400 L4virtio::Svr::Block_request< Ds_data > Class Template Reference

A request to read or write data.
`#include <virtio-block>`

Collaboration diagram for L4virtio::Svr::Block_request< Ds_data >:



Public Member Functions

- unsigned data_size () const

  Compute the total size of the data in the request.
- bool **has_more** ()

  Check if the request contains more data blocks.
- Data_block next_block ()

  Return next block in scatter-gather list.
- l4virtio_block_header_t const & **header** () const

  Return the block request header.

15.400.1 Detailed Description

template<typename Ds_data>
class L4virtio::Svr::Block_request< Ds_data >

A request to read or write data.
Definition at line 28 of file virtio-block.

15.400.2 Member Function Documentation

15.400.2.1 data_size()

```
template<typename Ds_data>
unsigned L4virtio::Svr::Block_request< Ds_data >::data_size () const  [inline]
```

Compute the total size of the data in the request.

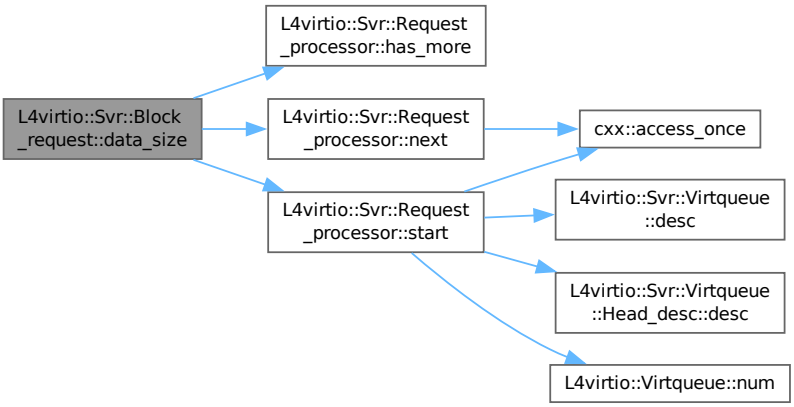
Return values

Size	in bytes or 0 if there was an error.

Exceptions

L4::Runtime_error(-L4_EIO)	Request has a bad format.

Note that this operation is relatively expensive as it has to iterate over the complete list of blocks.
Definition at line 63 of file virtio-block.
References L4virtio::Svr::Request_processor::has_more(), L4_EIO, L4virtio::Svr::Request_processor::next(), and L4virtio::Svr::Request_processor::start().
Here is the call graph for this function:



15.400.2.2 next_block()

```
template<typename Ds_data>
Data_block L4virtio::Svr::Block_request< Ds_data >::next_block ()  [inline]
```

Return next block in scatter-gather list.

Returns

Information about the next data block.

Exceptions

L4::Runtime_error	No more data block is available.
Bad_descriptor	Virtio request is corrupted.

Definition at line 114 of file virtio-block.
References L4virtio::Svr::Bad_descriptor::Bad_size, and L4_EEXIST.

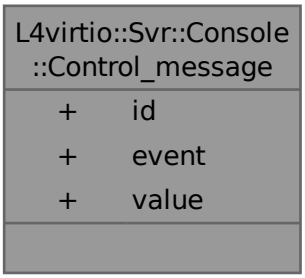
15.401 L4virtio::Svr::Console::Control_message Struct Reference

Virtio console control message.
`#include <virtio-console>`

Collaboration diagram for L4virtio::Svr::Console::Control_message:



Public Types

- enum Events {
  Device_ready = 0 , Device_add = 1 , Device_remove = 2 , Port_ready = 3 ,
  Console_port = 4 , Resize = 5 , Port_open = 6 , Port_name = 7 }

  Possible control events.

Data Fields

- l4_uint32_t **id**

  Port number.
- l4_uint16_t **event**

  Control event, see `Events`.
- l4_uint16_t **value**

  Extra information.

15.401.1 Detailed Description

Virtio console control message.
Definition at line 31 of file virtio-console.

15.401.2 Member Enumeration Documentation

15.401.2.1 Events

`enum L4virtio::Svr::Console::Control_message::Events`
Possible control events.

Enumerator

Device_ready	Sent by driver at initialization.
Device_add	Sent by device to create new ports.
Device_remove	Sent by device to remove added ports.
Port_ready	Sent by driver as response to `Device_add`.
Console_port	Sent by device to nominate port as console port.
Resize	Sent by device to indicate a console size change.

Port_open	Sent by device and driver to indicate whether a port is open.
Port_name	Sent by device to tag a port.

Definition at line 34 of file virtio-console.

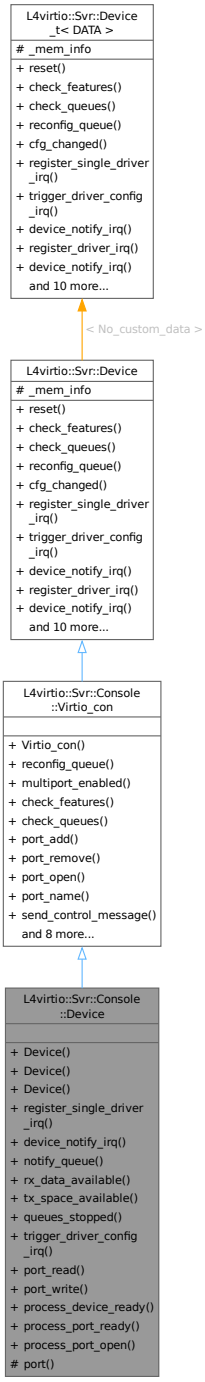
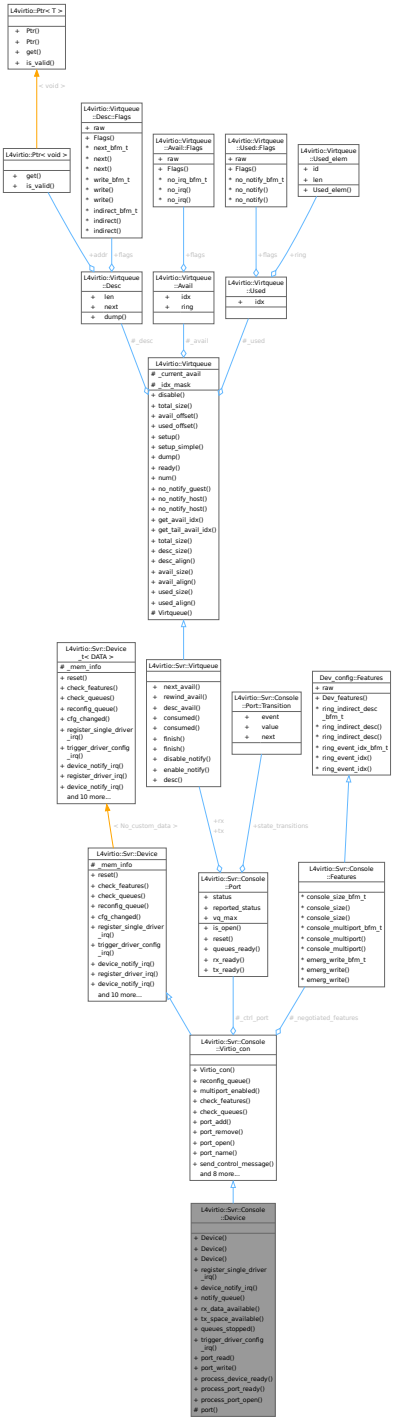
15.403 L4virtio::Svr::Console::Device Class Reference

Base class implementing a virtio console device with L4Re-based notification handling.
`#include <virtio-console-device>`

Inheritance diagram for L4virtio::Svr::Console::Device:



Collaboration diagram for L4virtio::Svr::Console::Device:



Public Member Functions

- Device (unsigned vq_max)

  Create a new console device.
- Device (unsigned vq_max, unsigned ports)

  Create a new console device.
- Device (cxx::static_vector< unsigned > const &vq_max_nums)

  Create a new console Device.

- void **register_single_driver_irq** () override

  callback for registering a single guest IRQ for all queues (old-style)
- L4::Cap< L4::Irq > **device_notify_irq** () const override

  callback to gather the device notification IRQ (old-style)
- void notify_queue (Virtqueue *queue) override

  Notify queue of available data.
- virtual void **rx_data_available** (unsigned port)=0

  Callback to notify that new data is available to be read from port.
- virtual void **tx_space_available** (unsigned port)=0

  Callback to notify that data can be written to port.
- virtual bool **queues_stopped** ()

  Return true, if the queues should not be processed further.
- void **trigger_driver_config_irq** () override

  callback for triggering configuration change notification IRQ
- unsigned port_read (char *buf, unsigned len, unsigned port=0)

  Read data from port.
- unsigned port_write (char const *buf, unsigned len, unsigned port=0)

  Write data to port.
- void process_device_ready (l4_uint16_t value) override

  Callback called on DEVICE_READY event.
- void process_port_ready (l4_uint32_t id, l4_uint16_t value) override

  Callback called on PORT_READY event.
- void process_port_open (l4_uint32_t id, l4_uint16_t value) override

  Callback called on PORT_OPEN event.

Public Member Functions inherited from L4virtio::Svr::Console::Virtio_con

- Virtio_con (unsigned max_ports, bool enable_multiport)

  Create a new multiport console device.
- int **reconfig_queue** (unsigned index) override

  callback for client queue-config request
- bool **multiport_enabled** () const

  Return true if the multiport feature is enabled and control queues are available.
- bool **check_features** (void) override

  callback for checking the subset of accepted features
- bool **check_queues** () override

  callback for checking if the queues at DRIVER_OK transition
- int port_add (unsigned idx)

  Send a DEVICE_ADD message and update the internal state.
- int port_remove (unsigned idx)

  Send a DEVICE_REMOVE message and update the internal state.
- int port_open (unsigned idx, bool open)

  Send a PORT_OPEN message and update the internal state.
- int port_name (unsigned idx, char const *name)

  Send a PORT_NAME message to announce the port name.
- int send_control_message (l4_uint32_t idx, l4_uint16_t event, l4_uint16_t value=0, const char *name=0)

  Send control message to driver.
- int handle_control_message ()

  Handle control message received from the driver.
- void **reset** () override

  reset callback, called for doing a device reset
- virtual void reset_device ()

  Reset the state of the actual console device.

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_↩ dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_↩ notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Protected Member Functions

- Port * port (unsigned idx) override

  Return the specified port.

Additional Inherited Members

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.403.1 Detailed Description

Base class implementing a virtio console device with L4Re-based notification handling.
This console device is derived from Virtio_con and already includes functionality to handle interrupts and notify drivers. If an interrupt is received, all the necessary interaction with the virtqueues is performed and only the actual data processing has to be done by the derived class. By default all available ports are added and an "open"-request of a port by the driver is automatically acknowledged. The derived class can optionally change this behaviour by overriding `process_device_ready()`, `process_port_ready()` and `process_port_open()`.
This class provides a stream-based interface to access the port data with edge-triggered notification callbacks. If a port receives data from the driver the derived class is notified with the `rx_data_available()` callback. The actual data can be retrieved by `port_read()`. If there was not enough data to be read, the call will return the available partial data. Only then will the `rx_data_available()` callback be triggered again.

Data on a port may be transmitted by `port_write()`. If there were not enough buffers available, only a part of the data will be transmitted. Once there are new buffers available, the `tx_space_available()` callback will be invoked. This callback will be called again only after a previous `port_write()` was not able to send all requested data.
Use this class as a base to provide your own high-level console device. You must derive from this class as well as L4::Epiface_t<..., L4virtio::Device>. For a working device the irq_iface() must be registered too. A typical implementation might look like the following:

```
class My_console
: public L4virtio::Svr::Console::Device,
  public L4::Epiface_t<My_console, L4virtio::Device>
{
public:
  My_console(L4Re::Util::Object_registry *r)
  : L4virtio::Svr::Console::Device(0x100)
  {
    init_mem_info(4);
    L4Re::chkcap(r->register_irq_obj(irq_iface()), "virtio notification IRQ");
  }

  void rx_data_available(unsigned port) override
  {
    // call port_read() to fetch available data
  }

  void tx_space_available(unsigned port) override
  {
    // can call port_write() to send (pending) data
  }
};

My_console console(registry);
registry->register_obj(&console, ...);
```

The maximum number of memory regions (init_mem_info()) should correlate with the number of supported ports.
Definition at line 118 of file virtio-console-device.

15.403.2 Constructor & Destructor Documentation

15.403.2.1 Device() [1/3]

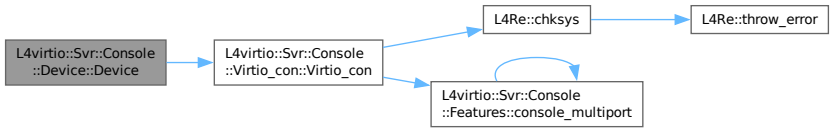
```
L4virtio::Svr::Console::Device::Device (
            unsigned vq_max)  [inline], [explicit]
```

Create a new console device.

Parameters

vq_max	Maximum number of buffers in data queues.

Create a console device with no multiport support, i.e. control queues are disabled.
Definition at line 145 of file virtio-console-device.
References L4virtio::Svr::Console::Virtio_con::Virtio_con().
Here is the call graph for this function:



15.403.2.2 Device() [2/3]

```
L4virtio::Svr::Console::Device::Device (
            unsigned vq_max,
```

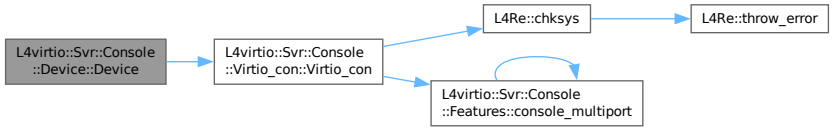
```
            unsigned ports)  [inline], [explicit]
```

Create a new console device.

Parameters

vq_max	Maximum number of buffers in data queues.
ports	Number of ports (maximum 32).

Create a console device with multiport support, i.e. control queues are enabled.
Definition at line 163 of file virtio-console-device.
References L4virtio::Svr::Console::Virtio_con::Virtio_con().
Here is the call graph for this function:



15.403.2.3 Device() [3/3]

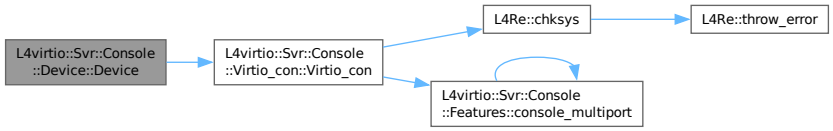
```
L4virtio::Svr::Console::Device::Device (
            cxx::static_vector< unsigned > const & vq_max_nums)  [inline], [explicit]
```

Create a new console Device.

Parameters

vq_max_nums	Maximum number of buffers in data queues, given as a cxx::static_vector with one entry per port.

Create a console device with multiport support, i.e. control queues are enabled.
Definition at line 182 of file virtio-console-device.
References L4virtio::Svr::Console::Virtio_con::Virtio_con().
Here is the call graph for this function:



15.403.3 Member Function Documentation

15.403.3.1 notify_queue()

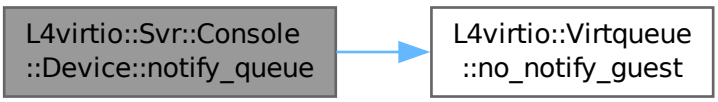
```
void L4virtio::Svr::Console::Device::notify_queue (
            Virtqueue * queue)  [inline], [override], [virtual]
```

Notify queue of available data.

Parameters

queue	Virtqueue to notify.

This callback is called whenever data is sent to `queue`. It is the responsibility of the derived class to perform all necessary notification actions, e.g. triggering guest interrupts.
Implements L4virtio::Svr::Console::Virtio_con.
Definition at line 202 of file virtio-console-device.
References L4VIRTIO_IRQ_STATUS_VRING, and L4virtio::Virtqueue::no_notify_guest().
Here is the call graph for this function:



15.403.3.2 port()

```
Port * L4virtio::Svr::Console::Device::port (
            unsigned port)  [inline], [override], [protected], [virtual]
```

Return the specified port.

Parameters

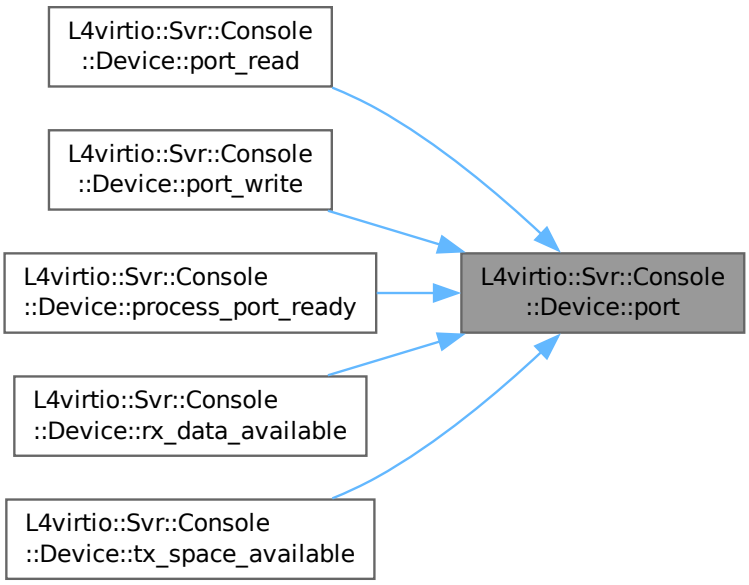
port	Port number.

Precondition

Port number must be lower than the configured maximum number of ports.

Implements L4virtio::Svr::Console::Virtio_con.
Definition at line 457 of file virtio-console-device.
Referenced by port_read(), port_write(), process_port_ready(), rx_data_available(), and tx_space_available().

Here is the caller graph for this function:



15.403.3.3 port_read()

```
unsigned L4virtio::Svr::Console::Device::port_read (
            char * buf,
            unsigned len,
            unsigned port = 0)  [inline]
```

Read data from port.

Will read up to *len* bytes from *port* into *buf*. Returns the number of bytes read, which may be less if not enough data was available. If all data was read, the rx_data_available() callback will be invoked the next time the driver queues new data for the port. The callback won't be called again until all data was consumed again.

Parameters

buf	The destination buffer
len	Size of the buffer
port	Port index to read data from

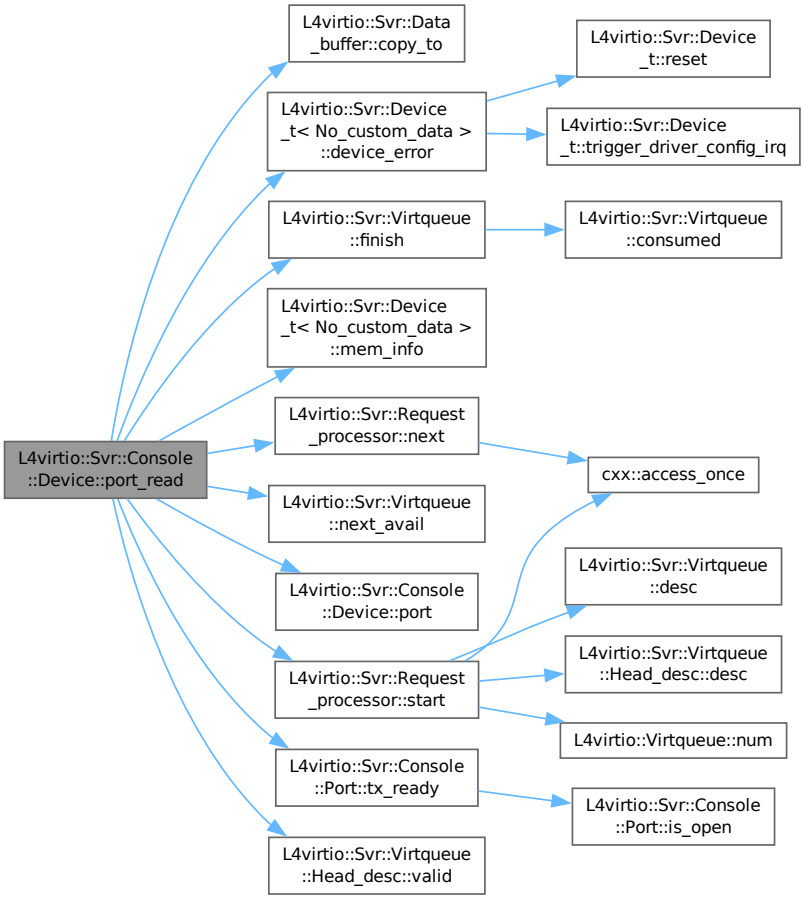
Returns

Number of bytes read

Definition at line 272 of file virtio-console-device.

References L4virtio::Svr::Data_buffer::copy_to(), L4virtio::Svr::Device_t< No_custom_data >::device_error(), L4virtio::Svr::Virtqueue::finish(), L4virtio::Svr::Data_buffer::left, L4virtio::Svr::Device_t< No_custom_data >::mem_info(), L4virtio::Svr::Request_processor::next(), L4virtio::Svr::Virtqueue::next_avail(), port(), L4virtio::Svr::Data_buffer::pos, L4virtio::Svr::Console::Device_port::request, L4virtio::Svr::Console::Device_port::rp, L4virtio::Svr::Console::Device_port::src, L4virtio::Svr::Request_processor::start(), L4virtio::Svr::Console::Port::tx, L4virtio::Svr::Console::Port::tx_ready(), and L4virtio::Svr::Virtqueue::Head_desc::valid().

Here is the call graph for this function:



15.403.3.4 port_write()

```
unsigned L4virtio::Svr::Console::Device::port_write (
            char const * buf,
            unsigned len,
            unsigned port = 0)  [inline]
```

Write data to port.

Will write up to *len* bytes to *port* from *buf*. Returns the number of bytes written, which may be less if not enough virtio buffers were available. If not all data could be written, the tx_space_available() callback will be invoked the next time the driver queues new receive buffers for the port. The callback won't be called again until all receive buffers were filled again.

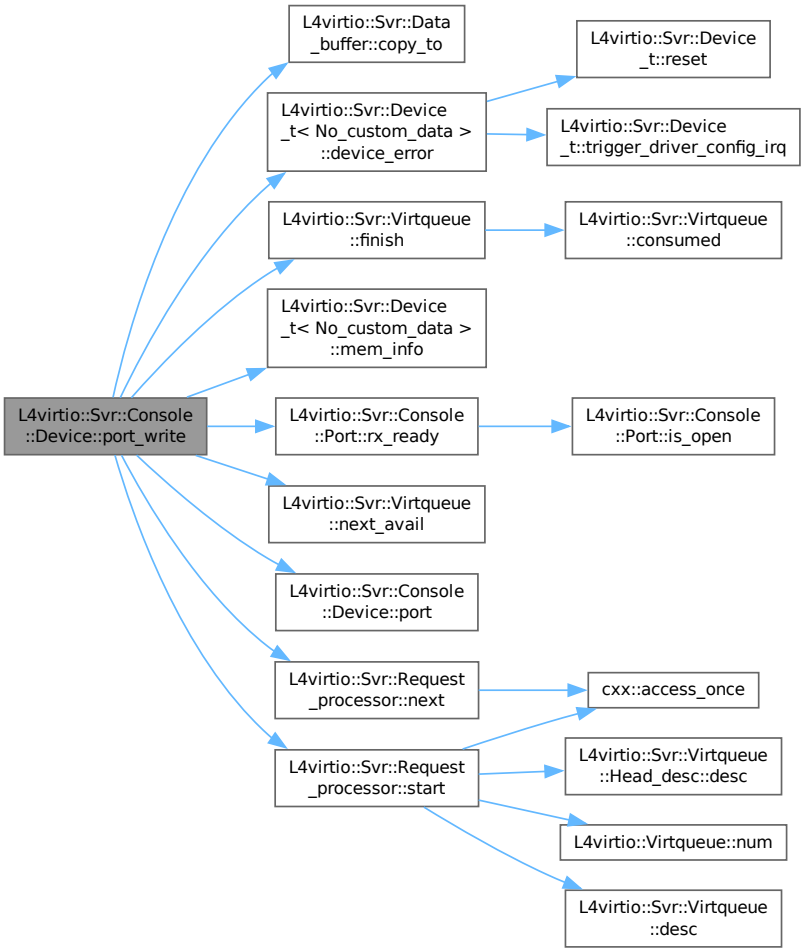
Parameters

buf	The souce buffer
len	Size of the buffer
port	Port index to write data to

Returns

Number of bytes written

Definition at line 341 of file virtio-console-device.
References L4virtio::Svr::Data_buffer::copy_to(), L4virtio::Svr::Device_t< No_custom_data >::device_error(), L4virtio::Svr::Virtqueue::finish(), L4virtio::Svr::Data_buffer::left, L4virtio::Svr::Device_t< No_custom_data >::mem_info(), L4virtio::Svr::Request_processor::next(), L4virtio::Svr::Virtqueue::next_avail(), port(), L4virtio::Svr::Data_buffer::pos, L4virtio::Svr::Console::Port::rx, L4virtio::Svr::Console::Port::rx_ready(), and L4virtio::Svr::Request_processor::start().
Here is the call graph for this function:



15.403.3.5 process_device_ready()

```
void L4virtio::Svr::Console::Device::process_device_ready (
            l4_uint16_t value)  [inline], [override], [virtual]
```

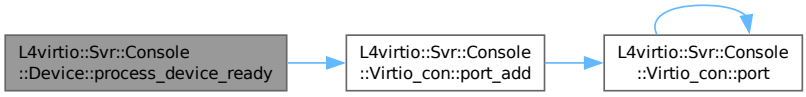
Callback called on DEVICE_READY event.

Parameters

value	The value field of the control message, indicating if the initialization was successful.

By default, this function adds all ports if the driver indicates successful initialization. Override this function to perform

custom actions for a DEVICE_READY event. It is then your responsibility to inform the driver about usable ports, see `port_add()`.
Implements L4virtio::Svr::Console::Virtio_con.
Definition at line 406 of file virtio-console-device.
References L4virtio::Svr::Console::Virtio_con::port_add().
Here is the call graph for this function:



15.403.3.6 process_port_open()

```
void L4virtio::Svr::Console::Device::process_port_open (
            l4_uint32_t id,
            l4_uint16_t value)  [inline], [override], [virtual]
```

Callback called on PORT_OPEN event.

Parameters

id	The id field of the control message, i.e. the port number.
value	The value field of the control message, indicating if the port was opened or closed.

The default implementation does nothing. Override it to implement some custom logic to respond to open/close events of the driver.
Implements L4virtio::Svr::Console::Virtio_con.
Definition at line 450 of file virtio-console-device.

15.403.3.7 process_port_ready()

```
void L4virtio::Svr::Console::Device::process_port_ready (
            l4_uint32_t id,
            l4_uint16_t value)  [inline], [override], [virtual]
```

Callback called on PORT_READY event.

Parameters

id	The id field of the control message, i.e. the port number.
value	The value field of the control message, indicating if the initialization was successful.

By default, this function opens the port if the driver is ready. Otherwise, the port is removed if the driver failed to set it up correctly. Override this function to perform custom actions for a PORT_READY event, *after* the generic management of the base class. It is then your responsibility to inform the driver about connected or unusable ports. See `port_open()` and `port_remove()`.
Reimplemented from L4virtio::Svr::Console::Virtio_con.
Definition at line 429 of file virtio-console-device.
References port(), L4virtio::Svr::Console::Port::Port_failed, L4virtio::Svr::Console::Virtio_con::port_open(), L4virtio::Svr::Console::Port::Port_ready, L4virtio::Svr::Console::Virtio_con::port_remove(), L4virtio::Svr::Console::Virtio_con::process_
and L4virtio::Svr::Console::Port::status.

  State transition table from last report state to current state.

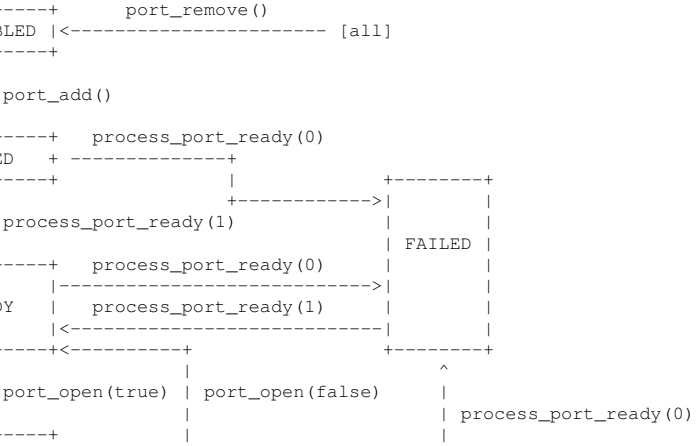
15.406.1 Detailed Description

Representation of a Virtio console port.
Each port consists of a pair of queues for sending and receiving.
A port may be added and removed at runtime when the multi-port feature is enabled. The states are as follows:



```
|   OPEN   |-----------+                      |
+----------+----------------------------------+
```

Definition at line 109 of file virtio-console.

15.406.2 Member Enumeration Documentation

15.406.2.1 Port_status

enum L4virtio::Svr::Console::Port::Port_status
Possible states of a virtio console port.

Enumerator

Port_disabled	Reset state, waiting for port to be added.
Port_added	Port has been added by device, waiting for ready message.
Port_ready	Port is ready but still closed.
Port_open	Port is in a working state.
Port_failed	Device failure, port unusable.
Port_num_states	Number of port states. Must be last.

Definition at line 114 of file virtio-console.

15.406.3 Field Documentation

15.406.3.1 state_transitions

Transition L4virtio::Svr::Console::Port::state_transitions[Port_num_states][Port_num_states] [static], [constexpr]
State transition table from last report state to current state.
Not all transitions can be made directly. For example, if the last reported state was Port_disabled and the current state is Port_open, the device has to send two messages: Control_message::Device_add and Control_message::Port_open. This is expressed by going through an intermediate state (Port_ready) on the reporting side.
For the purpose of the driver there are only three coarse states:

1. The port does not exist (Port_disabled).
2. The port exists but is closed on the device side (Port_added, Port_ready, Port_failed).
3. The port exists and is open on the device side (Port_open).

The state transition table with Port_added, Port_ready and Port_failed as current state are thus identical.
Definition at line 197 of file virtio-console.

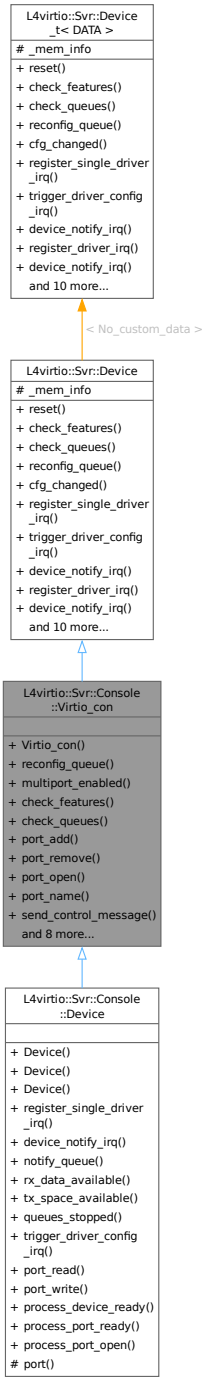
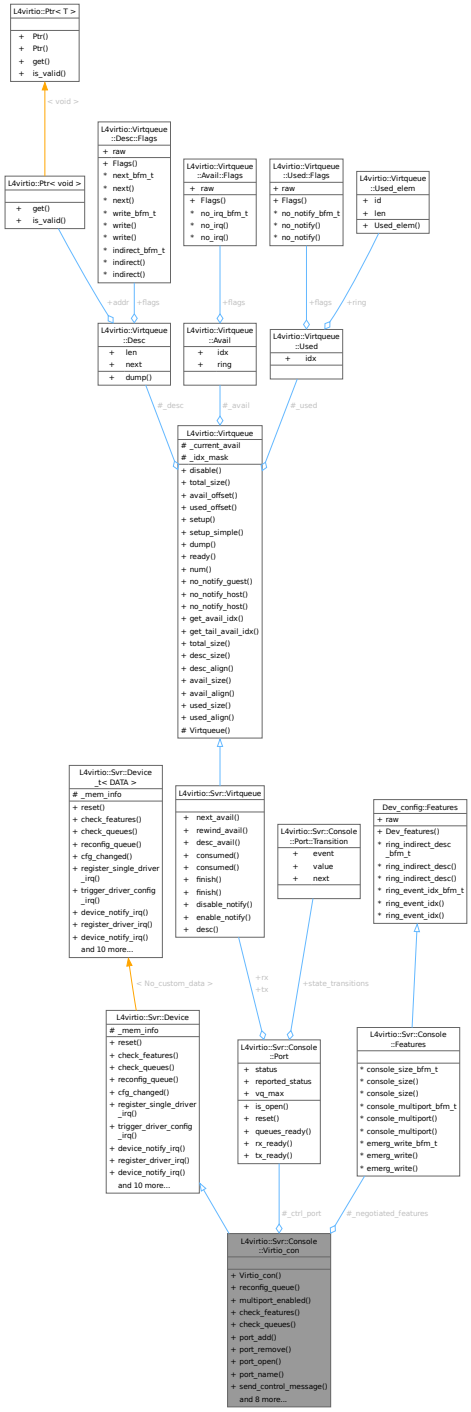
15.408 L4virtio::Svr::Console::Virtio_con Class Reference

Base class implementing a virtio console functionality.
`#include <virtio-console>`

Inheritance diagram for L4virtio::Svr::Console::Virtio_con:



Collaboration diagram for L4virtio::Svr::Console::Virtio_con:



Public Member Functions

- Virtio_con (unsigned max_ports, bool enable_multiport)

  Create a new multiport console device.
- int **reconfig_queue** (unsigned index) override

  callback for client queue-config request
- bool **multiport_enabled** () const

  Return true if the multiport feature is enabled and control queues are available.

- bool **check_features** (void) override

  callback for checking the subset of accepted features
- bool **check_queues** () override

  callback for checking if the queues at DRIVER_OK transition
- int port_add (unsigned idx)

  Send a DEVICE_ADD message and update the internal state.
- int port_remove (unsigned idx)

  Send a DEVICE_REMOVE message and update the internal state.
- int port_open (unsigned idx, bool open)

  Send a PORT_OPEN message and update the internal state.
- int port_name (unsigned idx, char const *name)

  Send a PORT_NAME message to announce the port name.
- int send_control_message (l4_uint32_t idx, l4_uint16_t event, l4_uint16_t value=0, const char *name=0)

  Send control message to driver.
- int handle_control_message ()

  Handle control message received from the driver.
- void **reset** () override

  reset callback, called for doing a device reset
- virtual void reset_device ()

  Reset the state of the actual console device.
- virtual void notify_queue (Virtqueue *queue)=0

  Notify queue of available data.
- virtual Port * port (unsigned port)=0

  Return the specified port.
- virtual void process_device_ready (l4_uint16_t value)=0

  Callback called on DEVICE_READY event.
- virtual void process_port_ready (l4_uint32_t id, l4_uint16_t value)

  Callback called on PORT_READY event.
- virtual void process_port_open (l4_uint32_t id, l4_uint16_t value)=0

  Callback called on PORT_OPEN event.

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual void **register_single_driver_irq** ()

  callback for registering a single guest IRQ for all queues (old-style)
- virtual void **trigger_driver_config_irq** ()=0

  callback for triggering configuration change notification IRQ
- virtual L4::Cap< L4::Irq > **device_notify_irq** () const

  callback to gather the device notification IRQ (old-style)
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_↩ dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

Get the memory region list used for this device.

- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_↩ notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Additional Inherited Members

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.408.1 Detailed Description

Base class implementing a virtio console functionality.
It is possible to activate the MULTIPORT feature, in which case incoming control messages need to be dispatched by calling `handle_control_message()`. The derived class must additionally override `process_device_ready()`, `process_port_ready()` and `process_port_open()` to implement the actual behaviour. The derived class has the following responsibilities:

- inform the driver about usable ports once the device is ready as signaled in process_device_ready(), see the wrapper `port_add()`.
- inform the driver about unusable ports, see the wrapper `port_remove()`.
- react to open/close events, see the wrapper `port_open()`.

This implementation provides no means to handle interrupts or notify guests, therefore derived classes have to provide this functionality, see `notify_queue()` and `handle_control_message()`. Similarly, all interaction with data queues has to be implemented. Memory for port structures must be managed by the implementor as well. Use this class as a base to implement your own specific console device.
Definition at line 269 of file virtio-console.

15.408.2 Constructor & Destructor Documentation

15.408.2.1 Virtio_con()

```
L4virtio::Svr::Console::Virtio_con::Virtio_con (
            unsigned max_ports,
            bool enable_multiport)  [inline], [explicit]
```

Create a new multiport console device.

Parameters

max_ports	Maximum number of ports the device should be able to handle (ignored when `enable_multiport` is false).
enable_multiport	Enable the control queue for dynamic handling of ports.

Definition at line 295 of file virtio-console.
References L4Re::chksys(), L4virtio::Svr::Console::Features::console_multiport(), L4_EINVAL, L4VIRTIO_ID_CONSOLE, and L4virtio::Svr::Dev_features::raw.

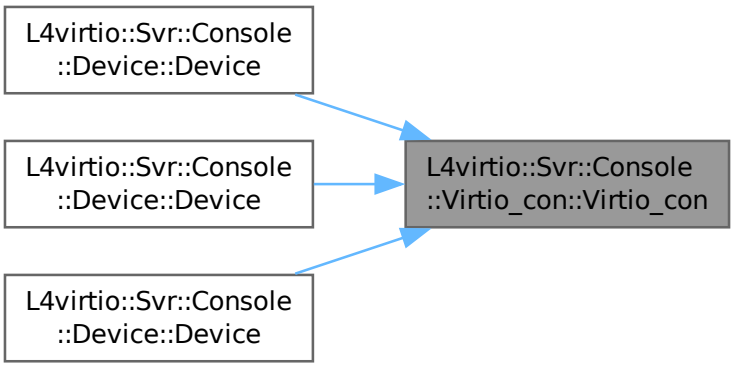
Here is the caller graph for this function:



15.408.3 Member Function Documentation

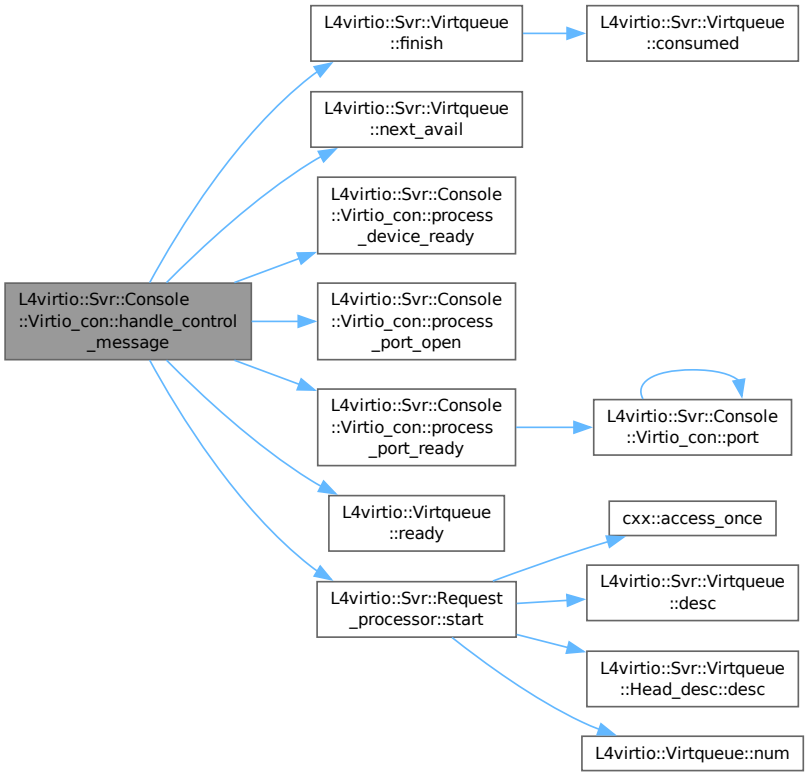
15.408.3.1 handle_control_message()

`int L4virtio::Svr::Console::Virtio_con::handle_control_message () [inline]`
Handle control message received from the driver.

Return values

L4_EOK	Message has been handled.
-L4_ENODEV	Control queue is not ready.
-L4_EINVAL	Received an unexpected control event.

This function performs the basic handling of control messages from the driver. It does all necessary work with the control queues and performs some sanity checks. All other work is deferred to the derived class, see `process_device_ready()`, `process_port_ready()` and `process_port_open()`.
Definition at line 538 of file virtio-console.
References L4virtio::Svr::Console::Control_message::Device_ready, L4virtio::Svr::Console::Control_message::event, L4virtio::Svr::Virtqueue::finish(), L4virtio::Svr::Console::Control_message::id, L4_EINVAL, L4_EIO, L4_ENODEV, L4_EOK, L4virtio::Svr::Console::Control_request::len, L4virtio::Svr::Console::Control_request::msg, L4virtio::Svr::Virtqueue::next_ava L4virtio::Svr::Console::Port::Port_disabled, L4virtio::Svr::Console::Control_message::Port_open, L4virtio::Svr::Console::Port::Port_op L4virtio::Svr::Console::Control_message::Port_ready, process_device_ready(), process_port_open(), process_port_ready(), L4virtio::Virtqueue::ready(), L4virtio::Svr::Request_processor::start(), and L4virtio::Svr::Console::Control_message::value.
Here is the call graph for this function:



15.408.3.2 notify_queue()

```
virtual void L4virtio::Svr::Console::Virtio_con::notify_queue (
            Virtqueue * queue)  [pure virtual]
```

Notify queue of available data.

Parameters

queue	Virtqueue to notify.

This callback is called whenever data is sent to `queue`. It is the responsibility of the derived class to perform all necessary notification actions, e.g. triggering guest interrupts.
Implemented in L4virtio::Svr::Console::Device.

15.408.3.3 port()

```
virtual Port * L4virtio::Svr::Console::Virtio_con::port (
            unsigned port)  [pure virtual]
```

Return the specified port.

Parameters

port	Port number.

Precondition

Port number must be lower than the configured maximum number of ports.

Implemented in L4virtio::Svr::Console::Device.
References port().
Referenced by check_queues(), port(), port_add(), port_name(), port_open(), port_remove(), process_port_ready(), and reset().

15.408.3.4 port_add()

```
int L4virtio::Svr::Console::Virtio_con::port_add (
            unsigned idx)  [inline]
```

Send a DEVICE_ADD message and update the internal state.

Parameters

idx	Port that should be added.

Return values

L4_EOK	Message has been sent.
-L4_EPERM	Invalid state transition.

Precondition

`idx` must be smaller than the configured number of ports.

Port must not already exist.

Definition at line 381 of file virtio-console.
References L4_EOK, L4_EPERM, port(), L4virtio::Svr::Console::Port::Port_added, L4virtio::Svr::Console::Port::Port_disabled, and L4virtio::Svr::Console::Port::status.

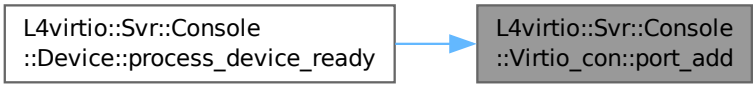
Here is the caller graph for this function:



15.408.3.5 port_name()

```
int L4virtio::Svr::Console::Virtio_con::port_name (
```

```
unsigned idx,
char const * name)  [inline]
```

Send a PORT_NAME message to announce the port name.

Parameters

idx	Port that should be opened or closed.
name	The port name

Return values

L4_EOK	Message has been sent.
-L4_EPERM	Control message is not allowed in the current state.

Returns

Errors from send_control_message()

Precondition

`idx` must be smaller than the configured number of ports.

Port must already exist.

Definition at line 457 of file virtio-console.
References L4_EPERM, port(), L4virtio::Svr::Console::Port::Port_disabled, L4virtio::Svr::Console::Control_message::Port_name, send_control_message(), and L4virtio::Svr::Console::Port::status.

15.408.3.6 port_open()

```
int L4virtio::Svr::Console::Virtio_con::port_open (
unsigned idx,
bool open)  [inline]
```

Send a PORT_OPEN message and update the internal state.

Parameters

idx	Port that should be opened or closed.
open	Open or close port.

Return values

L4_EOK	Message has been sent.
-L4_EPERM	Invalid state transition.

Precondition

`idx` must be smaller than the configured number of ports.

Port must be ready when opening or open when closing.

Definition at line 430 of file virtio-console.
References L4_EOK, L4_EPERM, port(), L4virtio::Svr::Console::Port::Port_open, L4virtio::Svr::Console::Port::Port_ready, and L4virtio::Svr::Console::Port::status.

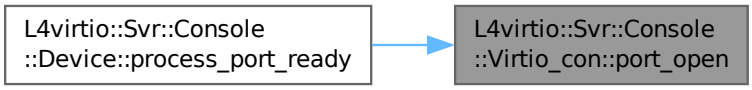
Here is the caller graph for this function:



15.408.3.7 port_remove()

```
int L4virtio::Svr::Console::Virtio_con::port_remove (
            unsigned idx)  [inline]
```

Send a DEVICE_REMOVE message and update the internal state.

Parameters

idx	Port that should be removed.

Return values

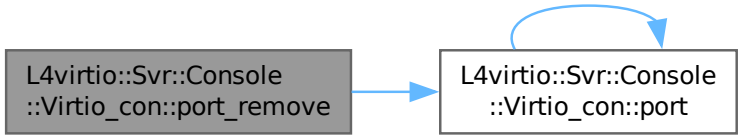
L4_EOK	Message has been sent.
-L4_EPERM	Invalid state transition.

Precondition

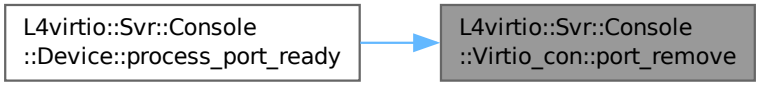
`idx` must be smaller than the configured number of ports.

Port must already exist.

Definition at line 405 of file virtio-console.
References L4_EOK, L4_EPERM, port(), L4virtio::Svr::Console::Port::Port_disabled, and L4virtio::Svr::Console::Port::status.
Referenced by L4virtio::Svr::Console::Device::process_port_ready().
Here is the call graph for this function:



Here is the caller graph for this function:



15.408.3.8 process_device_ready()

```
virtual void L4virtio::Svr::Console::Virtio_con::process_device_ready (
            l4_uint16_t value)  [pure virtual]
```

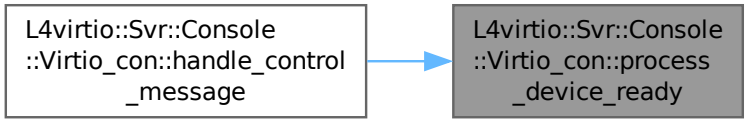
Callback called on DEVICE_READY event.

Parameters

value	The value field of the control message, indicating if the initialization was successful.

Needs to be overridden by the derived class if the MULTIPORT feature is enabled. Control messages may be sent only after the driver has successfully initialized the device.

Implemented in L4virtio::Svr::Console::Device.
Referenced by handle_control_message().
Here is the caller graph for this function:



15.408.3.9 process_port_open()

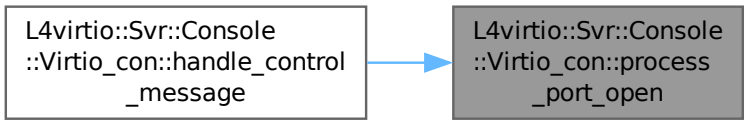
```
virtual void L4virtio::Svr::Console::Virtio_con::process_port_open (
            l4_uint32_t id,
            l4_uint16_t value)  [pure virtual]
```

Callback called on PORT_OPEN event.

Parameters

id	The id field of the control message, i.e. the port number.
value	The value field of the control message, indicating if the port was opened or closed.

Signal that an application has opened the port. Can to be overridden by the derived class if the MULTIPORT feature is enabled.
Implemented in L4virtio::Svr::Console::Device.
Referenced by handle_control_message().
Here is the caller graph for this function:



15.408.3.10 process_port_ready()

```
virtual void L4virtio::Svr::Console::Virtio_con::process_port_ready (
            l4_uint32_t id,
            l4_uint16_t value)  [inline], [virtual]
```

Callback called on PORT_READY event.

Parameters

id	The id field of the control message, i.e. the port number.
value	The value field of the control message, indicating if the initialization was successful.

May be overridden by the derived class if the MULTIPORT feature is enabled. This default implementation just sets the status of the port according to the driver message.
Reimplemented in L4virtio::Svr::Console::Device.
Definition at line 702 of file virtio-console.

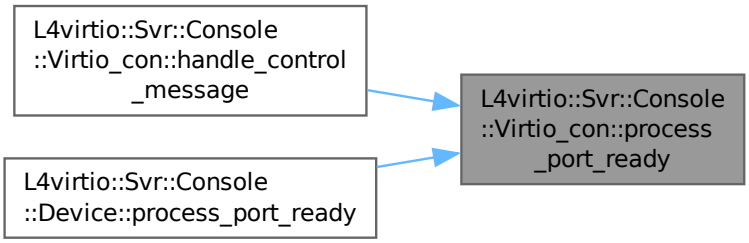
Here is the caller graph for this function:

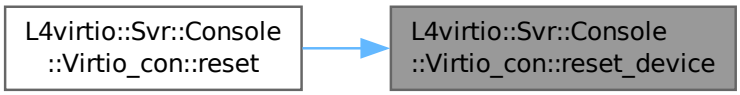


15.408.3.11 reset_device()

```
virtual void L4virtio::Svr::Console::Virtio_con::reset_device ()  [inline], [virtual]
```

Reset the state of the actual console device.
This callback is called at the end of `reset()`, allowing the derived class to reset internal state.
Definition at line 656 of file virtio-console.
Referenced by reset().

Here is the caller graph for this function:



15.408.3.12 send_control_message()

```
int L4virtio::Svr::Console::Virtio_con::send_control_message (
              l4_uint32_t idx,
              l4_uint16_t event,
              l4_uint16_t value = 0,
              const char * name = 0)  [inline]
```

Send control message to driver.

Parameters

idx	Port number.
event	Kind of control event.
value	Extra information for the event.
name	Name to be used for Port_name message

Return values

L4_EOK	Message has been sent.
-L4_ENODEV	Control queue is not ready.
-L4_EBUSY	Currently no descriptor available in the control queue.
-L4_ENOMEM	Client-issued descriptor too small. Device will be set to failed state.

Precondition

`port` must be smaller than the configured number of ports.

The convenience functions `port_add()`, `port_remove()` and `port_open()` should cover the most use cases and are the preferred way of communication with the driver. If you use this function directly, it is your responsibility to guarantee no invalid control messages are sent to the driver.
Definition at line 489 of file virtio-console.

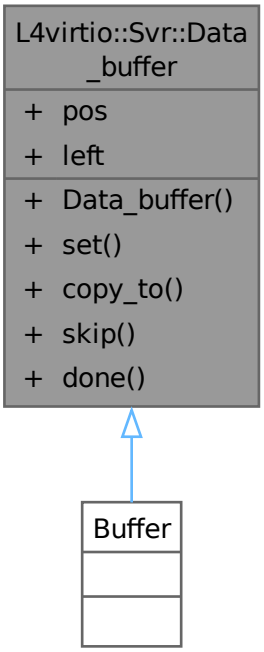
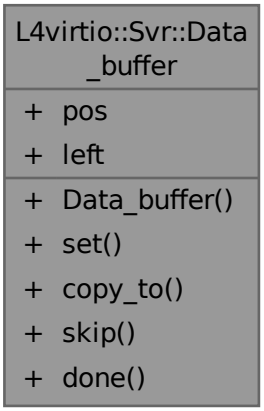
Abstract data buffer.
`#include <virtio>`

Inheritance diagram for L4virtio::Svr::Data_buffer:



Collaboration diagram for L4virtio::Svr::Data_buffer:



Public Member Functions

- template<typename T>
  Data_buffer (T *p)

Create buffer for object p.

- template<typename T>
  void set (T *p)

  Set buffer for object p.
- l4_uint32_t copy_to (Data_buffer *dst, l4_uint32_t max=UINT_MAX)

  Copy contents from this buffer to the destination buffer.
- l4_uint32_t skip (l4_uint32_t bytes)

  Skip given number of bytes in this buffer.
- bool done () const

  Check if there are no more bytes left in the buffer.

Data Fields

- char * **pos**

  Current buffer position.
- l4_uint32_t **left**

  Bytes left in buffer.

15.409.1 Detailed Description

Abstract data buffer.
Definition at line 306 of file virtio.

15.409.2 Constructor & Destructor Documentation

15.409.2.1 Data_buffer()

```
template<typename T>
L4virtio::Svr::Data_buffer::Data_buffer (
            T * p)  [inline], [explicit]
```

Create buffer for object p.

Template Parameters

T	Type of object (implicit)

Parameters

p	Pointer to object.

The buffer shall point to the start of the object p and the size left is sizeof(T).
Definition at line 323 of file virtio.
References left, and pos.

15.409.3 Member Function Documentation

15.409.3.1 copy_to()

```
l4_uint32_t L4virtio::Svr::Data_buffer::copy_to (
            Data_buffer * dst,
            l4_uint32_t max = UINT_MAX)  [inline]
```

Copy contents from this buffer to the destination buffer.

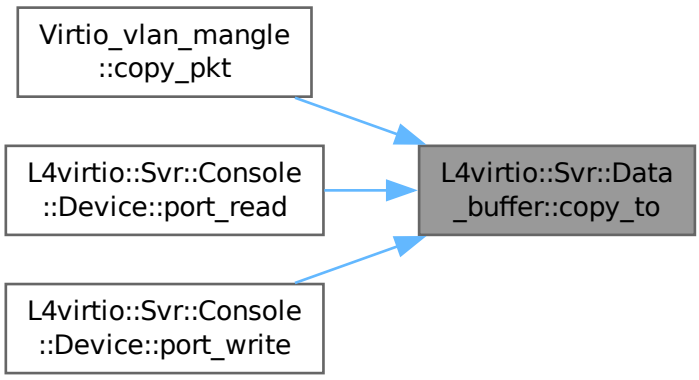
Parameters

dst	Destination buffer.
max	(optional) Maximum number of bytes to copy.

Returns

the number of bytes copied.

This function copies at most `max` bytes from this to `dst`. If `max` is omitted, copies the maximum number of bytes available that fit `dst`.
Definition at line 354 of file virtio.
References left, and pos.
Referenced by Virtio_vlan_mangle::copy_pkt(), L4virtio::Svr::Console::Device::port_read(), and L4virtio::Svr::Console::Device::port_w
Here is the caller graph for this function:



15.409.3.2 done()

```
bool L4virtio::Svr::Data_buffer::done () const  [inline]
```

Check if there are no more bytes left in the buffer.

Returns

true if there are no more bytes left in the buffer.

Definition at line 388 of file virtio.
References left.

15.409.3.3 set()

```
template<typename T>
void L4virtio::Svr::Data_buffer::set (
            T * p)  [inline]
```

Set buffer for object `p`.

Template Parameters

T	Type of object (implicit)

Parameters

p	Pointer to object.

The buffer shall point to the start of the object `p` and the size left is sizeof(T).
Definition at line 337 of file virtio.
References left, and pos.

15.409.3.4 skip()

```
l4_uint32_t L4virtio::Svr::Data_buffer::skip (
            l4_uint32_t bytes)  [inline]
```

Skip given number of bytes in this buffer.

Parameters

bytes	Number of bytes that shall be skipped.

Returns

The number of bytes skipped.

Try to skip the given number of bytes in this buffer, if there are less bytes left in the buffer that given then at most left bytes are skipped and the amount is returned.
Definition at line 375 of file virtio.
References left, and pos.

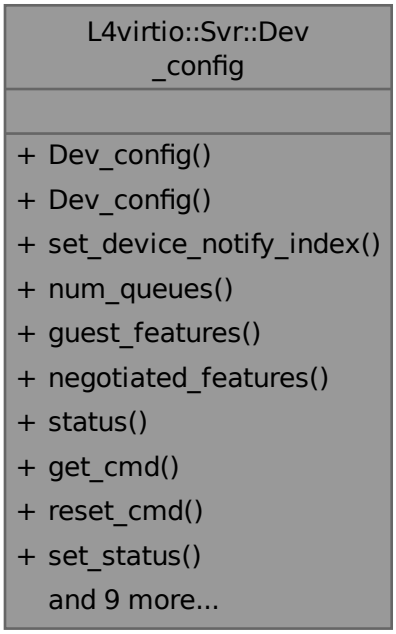
15.410 L4virtio::Svr::Dev_config Class Reference

Abstraction for L4-Virtio device config memory.
`#include <l4virtio>`

Collaboration diagram for L4virtio::Svr::Dev_config:



Public Member Functions

- Dev_config (l4_uint32_t vendor, l4_uint32_t device, unsigned cfg_size, l4_uint32_t num_queues=0)

  Create a L4-Virtio config data space.
- Dev_config (Cfg_cap const &cfg, l4_addr_t cfg_offset, l4_uint32_t vendor, l4_uint32_t device, unsigned cfg↩ _size, l4_uint32_t num_queues=0)

  Setup an L4-Virtio config space in an existing data space.
- void set_device_notify_index (unsigned idx)

  Set index of interrupt that driver should trigger for config notifications.
- l4_uint32_t **num_queues** () const

  Return the number of queues currently usable.
- l4_uint32_t guest_features (unsigned idx) const

  Return a specific set of guest features.
- l4_uint32_t negotiated_features (unsigned idx) const

  Compute a specific set of negotiated features.
- Status status () const

  Get current device status (trusted).
- l4_uint32_t get_cmd () const

  Get the value from the `cmd` register.
- void reset_cmd ()

  Reset the `cmd` register after execution of a command.
- void set_status (Status status)

  Set device status register.
- void add_irq_status (l4_uint32_t status)

  Adds irq status bit.

- void set_device_needs_reset ()

  Set DEVICE_NEEDS_RESET bit in device status register.
- bool change_queue_config (l4_uint32_t num_queues)

  Setup new queue configuration.
- l4virtio_config_queue_t volatile const * qconfig (unsigned index) const

  Get queue read-only config data for queue with the given index.
- void **reset_hdr** (bool inc_generation=false) const

  Reset the config header to the initial contents.
- bool reset_queue (unsigned index, unsigned num_max, bool inc_generation=false, unsigned device_notify_index=0) const

  Reset queue config for the given queue.
- l4virtio_config_hdr_t const volatile * hdr () const

  Get a read-only pointer to the config header.
- L4::Cap< L4Re::Dataspace > ds () const

  Get data-space capability for the shared config data space.
- l4_addr_t **ds_offset** () const

  Return the offset into the config dataspace where the device configuration starts.

15.410.1 Detailed Description

Abstraction for L4-Virtio device config memory.
Virtio defines a device configuration mechanism, L4-Virtio implements this mechanism based on shared memory a set_status() and a config_queue() call. This class provides an abstraction for L4-Virtio host implementations to establish such a shared memory data space and providing the necessary contents and access functions.
Definition at line 52 of file l4virtio.

15.410.2 Constructor & Destructor Documentation

15.410.2.1 Dev_config() [1/2]

```
L4virtio::Svr::Dev_config::Dev_config (
            l4_uint32_t vendor,
            l4_uint32_t device,
            unsigned cfg_size,
            l4_uint32_t num_queues = 0)  [inline]
```

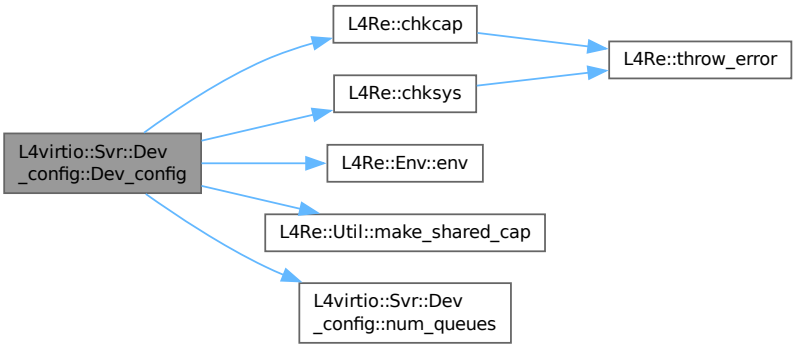
Create a L4-Virtio config data space.

Parameters

vendor	The vendor ID to store in config header.
device	The device ID to store in config header.
cfg_size	The size of the device-specific config data in bytes.
num_queues	The number of queues provided by the device.

This constructor allocates a data space used for L4-virtio config attaches the data space to the local address space and writes the initial contents to the config header.
Definition at line 119 of file l4virtio.
References L4Re::chkcap(), L4Re::chksys(), L4Re::Env::env(), L4_PAGESIZE, L4Re::Util::make_shared_cap(), and num_queues().

Here is the call graph for this function:



15.410.2.2 Dev_config() [2/2]

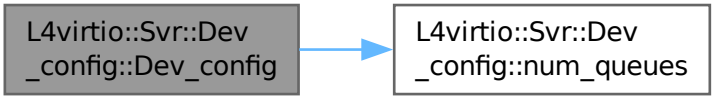
```
L4virtio::Svr::Dev_config::Dev_config (
            Cfg_cap const & cfg,
            l4_addr_t cfg_offset,
            l4_uint32_t vendor,
            l4_uint32_t device,
            unsigned cfg_size,
            l4_uint32_t num_queues = 0)  [inline]
```

Setup an L4-Virtio config space in an existing data space.

Parameters

cfg	Dataspace that should hold the L4-Virtio configuration.
cfg_offset	Offset into the dataspace where the configuration starts.
vendor	The vendor ID to store in config header.
device	The device ID to store in config header.
cfg_size	The size of the device-specific config data in bytes.
num_queues	The number of queues provided by the device.

Definition at line 155 of file l4virtio.
References L4_PAGESIZE, and num_queues().
Here is the call graph for this function:



15.410.3 Member Function Documentation

15.410.3.1 add_irq_status()

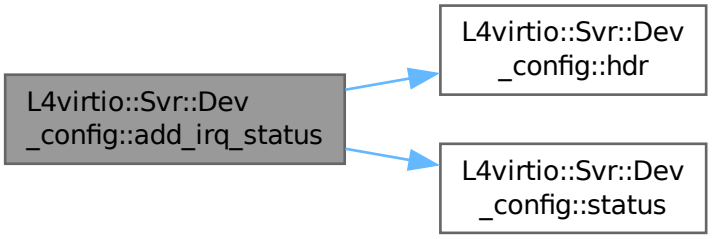
```
void L4virtio::Svr::Dev_config::add_irq_status (
            l4_uint32_t status)  [inline]
```

Adds irq status bit.

Parameters

status	The value to add to the irq status register.

This function adds the status bit to the irq status register.
Definition at line 285 of file l4virtio.
References hdr(), and status().
Here is the call graph for this function:



15.410.3.2 change_queue_config()

```
bool L4virtio::Svr::Dev_config::change_queue_config (
            l4_uint32_t num_queues)  [inline]
```

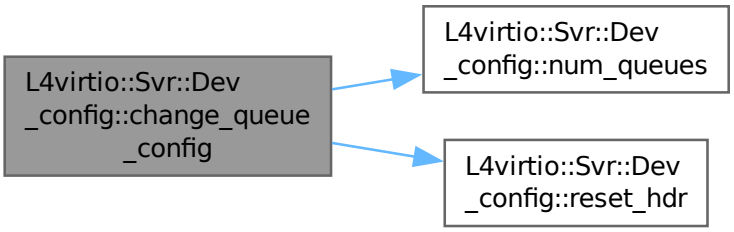
Setup new queue configuration.

Parameters

num_queues	The number of queues provided by the device.

Definition at line 306 of file l4virtio.
References L4_PAGESIZE, num_queues(), and reset_hdr().

Here is the call graph for this function:



15.410.3.3 ds()

`L4::Cap< L4Re::Dataspace > L4virtio::Svr::Dev_config::ds () const [inline]`
Get data-space capability for the shared config data space.

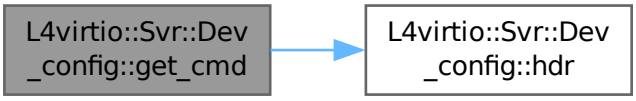
Returns

Capability for the shared config data space.

Definition at line 399 of file l4virtio.

15.410.3.4 get_cmd()

`l4_uint32_t L4virtio::Svr::Dev_config::get_cmd () const [inline]`
Get the value from the `cmd` register.
Note, the most significant eight bits are the command (0 is nothing to do). The upper eight bit are reset to zero after the command was handled.
Definition at line 250 of file l4virtio.
References hdr().
Here is the call graph for this function:



15.410.3.5 guest_features()

```
l4_uint32_t L4virtio::Svr::Dev_config::guest_features (
            unsigned idx) const [inline]
```
Return a specific set of guest features.

Parameters

idx	Index into the guest features array.

Return values

The	selected set of guest features.

This function returns a specific 32bit set of features enabled by the guest/driver. `idx` is the index in the guest features array, resp. the 32 bit set to return.
Definition at line 218 of file l4virtio.

15.410.3.6 hdr()

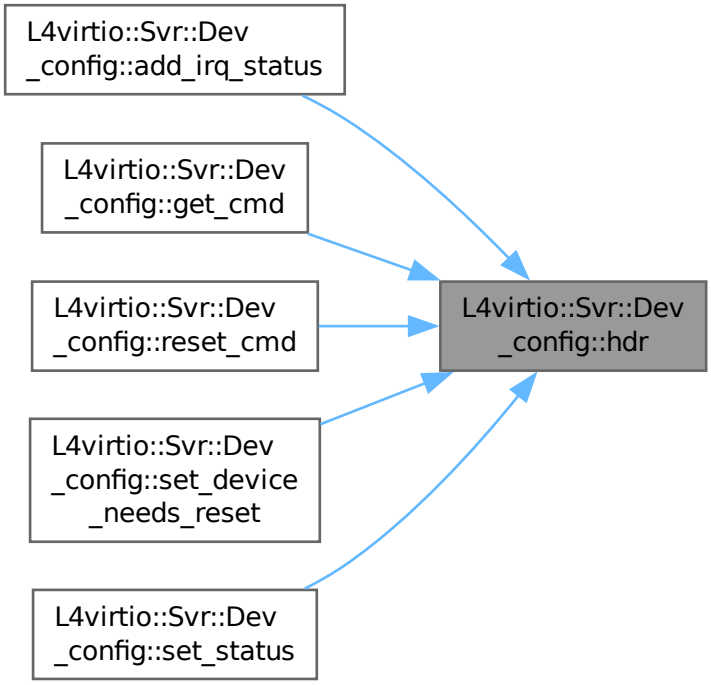
```
l4virtio_config_hdr_t const volatile * L4virtio::Svr::Dev_config::hdr () const  [inline]
```

Get a read-only pointer to the config header.

Returns

Read-only pointer to the shared config header.

Definition at line 392 of file l4virtio.
Referenced by add_irq_status(), get_cmd(), reset_cmd(), set_device_needs_reset(), and set_status().
Here is the caller graph for this function:



15.410.3.7 negotiated_features()

```
l4_uint32_t L4virtio::Svr::Dev_config::negotiated_features (
            unsigned idx) const  [inline]
```

Compute a specific set of negotiated features.

Parameters

idx	Index into the guest/host features array.

Return values

The	selected set of negotiated features.

This function returns a specific 32-bit set of features negotiated by the guest/driver and host/device. `idx` is the index in the guest/host features array, resp. the 32-bit set to return.
Definition at line 232 of file l4virtio.

15.410.3.8 qconfig()

```
l4virtio_config_queue_t volatile const * L4virtio::Svr::Dev_config::qconfig (
            unsigned index) const  [inline]
```

Get queue read-only config data for queue with the given *index*.

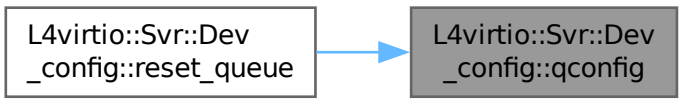
Parameters

index	The index of the queue.

Returns

Read-only pointer to the config of the queue with the given *index*, or NULL if *index* is out of range.

Definition at line 323 of file l4virtio.
References L4_UNLIKELY.
Referenced by reset_queue().
Here is the caller graph for this function:

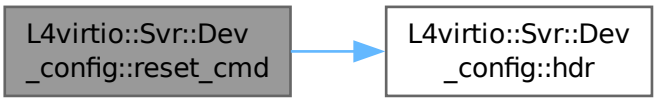


15.410.3.9 reset_cmd()

```
void L4virtio::Svr::Dev_config::reset_cmd ()  [inline]
```

Reset the `cmd` register after execution of a command.
This function resets the `cmd` register in order for the client to detect that the command was executed by the device.
Definition at line 261 of file l4virtio.

References hdr().
Here is the call graph for this function:



15.410.3.10 reset_queue()

```
bool L4virtio::Svr::Dev_config::reset_queue (
            unsigned index,
            unsigned num_max,
            bool inc_generation = false,
            unsigned device_notify_index = 0) const  [inline]
```

Reset queue config for the given queue.

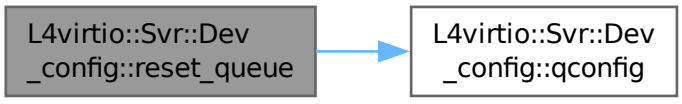
Parameters

index	The index of the queue to reset.
num_max	The maximum number of descriptors supported by this queue.
inc_generation	The config generation will be incremented when this is true.
device_notify_index	Device notification Irq index for this queue. See Device_t::device_notify_irq(unsigned).

Returns

true on success, or false when *index* is out of range.

Definition at line 367 of file l4virtio.
References l4virtio_config_queue_t::device_notify_index, L4_UNLIKELY, l4virtio_config_queue_t::num, l4virtio_config_queue_t::num
qconfig(), and l4virtio_config_queue_t::ready.
Here is the call graph for this function:

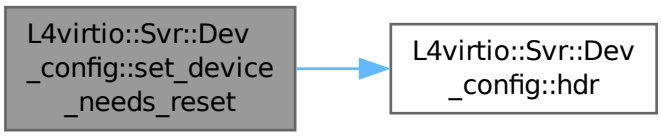


15.410.3.11 set_device_needs_reset()

```
void L4virtio::Svr::Dev_config::set_device_needs_reset ()  [inline]
```

Set DEVICE_NEEDS_RESET bit in device status register.

This function sets the internal status register and also the status register in the shared memory to DEVICE_↩ NEEDS_RESET.
Definition at line 296 of file l4virtio.
References hdr().
Here is the call graph for this function:



15.410.3.12 set_device_notify_index()

```
void L4virtio::Svr::Dev_config::set_device_notify_index (
            unsigned idx)  [inline]
```

Set index of interrupt that driver should trigger for config notifications.
See Device_t::device_notify_irq(unsigned).
Definition at line 198 of file l4virtio.

15.410.3.13 set_status()

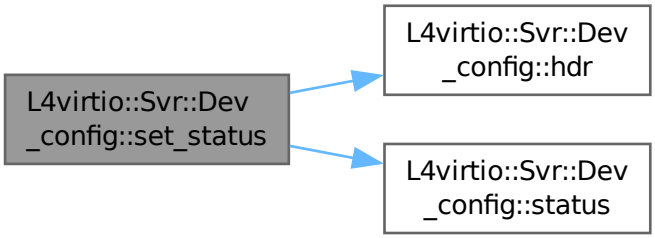
```
void L4virtio::Svr::Dev_config::set_status (
            Status status)  [inline]
```

Set device status register.

Parameters

status	The new value for the device status register.

This function sets the internal status register and also the status register in the shared memory to *status*.
Definition at line 273 of file l4virtio.
References hdr(), and status().
Here is the call graph for this function:



15.410.3.14 status()

```
Status L4virtio::Svr::Dev_config::status () const  [inline]
```

Get current device status (trusted).

Returns

Current device status register (trusted).

The status returned by this function is value stored internally and cannot be written by the guest (i.e., the value can be taken as trusted.)
Definition at line 242 of file l4virtio.
Referenced by add_irq_status(), and set_status().
Here is the caller graph for this function:

Protected Attributes

- Mem_list **_mem_info**

  Memory region list.

15.413.1 Detailed Description

template<typename DATA>
class L4virtio::Svr::Device_t< DATA >

Server-side L4-VIRTIO device stub.
This stub supports new-style multi-event registration (using get_device_config(), bind() and get_device_notification_irq()).
Definition at line 825 of file l4virtio.

15.413.2 Constructor & Destructor Documentation

15.413.2.1 Device_t()

```
template<typename DATA>
L4virtio::Svr::Device_t< DATA >::Device_t (
            Dev_config * dev_config,
            L4Re::Util::Dbg msg_user = L4Re::Util::Dbg{},
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

Make a device for the given config.

Parameters

dev_config	The given configuration.
msg_user	Debug channel for informational messages relevant for the user. Verbosity of L4Re::Util::Dbg() by default.

msg_dev	Debug channel for debugging messages relevant for the developer. Verbosity of L4Re::Util::Dbg(2) by default.

Definition at line 930 of file l4virtio.

15.413.3 Member Function Documentation

15.413.3.1 add_trusted_dataspaces()

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::add_trusted_dataspaces (
            std::shared_ptr< Ds_vector const > ds)  [inline]
```

Provide a list of trusted dataspaces that can be used for validation.

Parameters

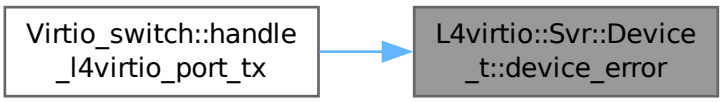
ds	list of trusted dataspaces.

Definition at line 1245 of file l4virtio.

15.413.3.2 device_error()

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::device_error ()  [inline]
```

Transition device into DEVICE_NEEDS_RESET state.
This function does a full reset, sets the DEVICE_NEEDS_RESET bit in the device status register, triggering a guest config IRQ if necessary. The driver still needs to perform its own reset and initialization sequence.
Definition at line 1068 of file l4virtio.
Referenced by Virtio_switch::handle_l4virtio_port_tx().
Here is the caller graph for this function:



15.413.3.3 device_notify_irq()

```
template<typename DATA>
virtual L4::Cap< L4::Irq > L4virtio::Svr::Device_t< DATA >::device_notify_irq (
            unsigned idx)  [inline], [virtual]
```

Callback to gather the device notification IRQ (multi IRQ).
The default implementation maps to the implementation for single IRQ notification points.
Definition at line 904 of file l4virtio.

15.413.3.4 handle_mem_cmd_write()

```
template<typename DATA>
bool L4virtio::Svr::Device_t< DATA >::handle_mem_cmd_write ()  [inline]
```

Check for a value in the cmd register and handle a write.

This function checks for a value in the cmd register and executes the command if there is any, or returns false if there was no command.
Execution of the command is signaled by a zero in the cmd register.
Definition at line 1201 of file l4virtio.

15.413.3.5 init_mem_info()

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::init_mem_info (
            unsigned num)  [inline]
```

Initialize the memory region list to the given maximum.

Parameters

num	Maximum number of memory regions that can be managed.

Definition at line 1056 of file l4virtio.

15.413.3.6 register_driver_irq()

```
template<typename DATA>
virtual void L4virtio::Svr::Device_t< DATA >::register_driver_irq (
            unsigned idx)  [inline], [virtual]
```

Callback for registering an notification IRQ (multi IRQ).
The default implementation maps to the implementation for single IRQ notification points.
Definition at line 890 of file l4virtio.

15.413.3.7 reset_queue_config()

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::reset_queue_config (
            unsigned idx,
            unsigned num_max,
            bool inc_generation = false,
            unsigned device_notify_index = 0)  [inline]
```

Trigger reset for the configuration space for queue *idx*.

Parameters

idx	The queue index to reset.
num_max	Maximum number of entries in this queue.
inc_generation	The config generation will be incremented when this is true.
device_notify_index	Device notification Irq index for this queue. See device_notify_irq(unsigned).

This function resets the driver-readable configuration space for the queue with the given index. The queue configuration is reset to all 0, and the maximum number of entries in the queue is set to *num_max*.
Definition at line 1044 of file l4virtio.

15.413.3.8 setup_queue()

```
template<typename DATA>
bool L4virtio::Svr::Device_t< DATA >::setup_queue (
            Virtqueue * q,
            unsigned qn,
            unsigned num_max)  [inline]
```

Enable/disable the specified queue.

Parameters

q	Pointer to the ring that represents the virtqueue internally.
qn	Index of the queue.
num_max	Maximum number of supported entries in this queue.

Returns

true for success.

- This function calculates the parameters of the virtqueue from the clients configuration space values, checks the accessibility of the queue data structures and initializes *q* to ready state when all checks succeeded.

Definition at line 1091 of file l4virtio.
The documentation for this class was generated from the following file:

- template<typename ARG>
  void load_desc (Virtqueue::Desc const &desc, Request_processor const *p, ARG *data) const

  Default implementation returning generic information.

15.414.1 Detailed Description

template<typename DATA>
class L4virtio::Svr::Driver_mem_list_t< DATA >

List of driver memory regions assigned to a single L4-VIRTIO transport instance.

Note

The regions added to this list *must* never overlap.

Definition at line 653 of file l4virtio.

15.414.2 Member Function Documentation

15.414.2.1 add()

```
template<typename DATA>
Mem_region const * L4virtio::Svr::Driver_mem_list_t< DATA >::add (
              l4_uint64_t drv_base,
              l4_umword_t size,
              l4_addr_t offset,
              Ds_cap && ds)  [inline]
```

Add a new region to the list.

Parameters

drv_base	Driver base address of the region.
size	Size of the region in bytes.
offset	Offset within the data space attached to drv_base.
ds	Data space backing the driver memory.

Returns

A pointer to the new region.

Definition at line 693 of file l4virtio.

15.414.2.2 find()

```
template<typename DATA>
Mem_region * L4virtio::Svr::Driver_mem_list_t< DATA >::find (
              l4_uint64_t base,
              l4_umword_t size) const  [inline]
```

Find memory region containing the given driver address region.

Parameters

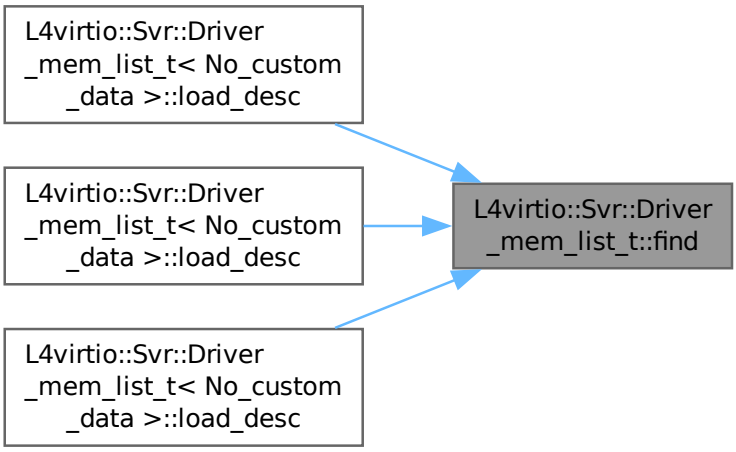
base	Driver base address.
size	Size of the region.

Returns

Pointer to the region containing the given region, NULL if none is found.

Definition at line 727 of file l4virtio.
Referenced by L4virtio::Svr::Driver_mem_list_t< No_custom_data >::load_desc(), L4virtio::Svr::Driver_mem_list_t< No_custom_da
and L4virtio::Svr::Driver_mem_list_t< No_custom_data >::load_desc().

Here is the caller graph for this function:



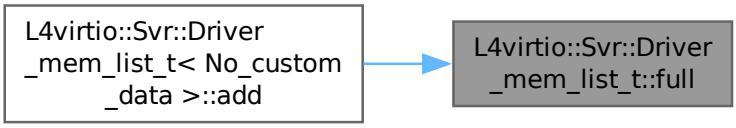
15.414.2.3 full()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_list_t< DATA >::full () const  [inline]
```

Returns

True if the remaining capacity is 0.

Definition at line 682 of file l4virtio.
Referenced by L4virtio::Svr::Driver_mem_list_t< No_custom_data >::add().
Here is the caller graph for this function:



15.414.2.4 init()

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::init (
            unsigned max)  [inline]
```

Make a fresh list with capacity *max*.

Parameters

max	The capacity of this vector.

Definition at line 674 of file l4virtio.

15.414.2.5 load_desc() [1/3]

```
template<typename DATA>
template<typename ARG>
void L4virtio::Svr::Driver_mem_list_t< DATA >::load_desc (
            Virtqueue::Desc const & desc,
            Request_processor const * p,
            ARG * data) const  [inline]
```

Default implementation returning generic information.

Template Parameters

ARG	Abstract argument type used with Request_processor::start() and Request_processor::next() to deliver the result of loading a descriptor. This type must provide a constructor taking three arguments: (1) pointer to a Driver_mem_region, (2) the Virtqueue::Desc descriptor, and (3) a pointer to the calling Request_processor.

Parameters

	desc	The descriptor to load
	p	The request processor calling us
out	*data*	Shall be assigned to ARG(mem, desc, p)

Exceptions

Bad_descriptor	The descriptor address could not be translated.

Definition at line 788 of file l4virtio.

15.414.2.6 load_desc() [2/3]

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::load_desc (
            Virtqueue::Desc const & desc,
            Request_processor const * p,
            Mem_region const ** data) const  [inline]
```

Default implementation returning the Driver_mem_region.

Parameters

	desc	The descriptor to load
	p	The request processor calling us
out	*data*	Shall be set to a pointer to the Driver_mem_region that covers the descriptor.

Exceptions

Bad_descriptor	The descriptor address could not be translated.

Definition at line 761 of file l4virtio.

15.414.2.7 load_desc() [3/3]

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::load_desc (
            Virtqueue::Desc const & desc,
            Request_processor const * p,
            Virtqueue::Desc const ** table) const  [inline]
```

Default implementation for loading an indirect descriptor.

Parameters

	desc	The descriptor to load
	p	The request processor calling us
out	*table*	Shall be set to the loaded descriptor table

Exceptions

Bad_descriptor	The descriptor address could not be translated.

Definition at line 741 of file l4virtio.

15.414.2.8 remove()

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::remove (
            Mem_region const * r)  [inline]
```

Remove the given region from the list.

Parameters

r	The region to remove (result from add(), or find()).

Definition at line 707 of file l4virtio.

15.415.1 Detailed Description

template<typename DATA>
class L4virtio::Svr::Driver_mem_region_t< DATA >

Region of driver memory, that shall be managed locally.

Template Parameters

DATA	Class defining additional information

Definition at line 474 of file l4virtio.

15.415.2 Constructor & Destructor Documentation

15.415.2.1 Driver_mem_region_t()

```
template<typename DATA>
L4virtio::Svr::Driver_mem_region_t< DATA >::Driver_mem_region_t (
            l4_uint64_t drv_base,
            l4_umword_t size,
            l4_addr_t offset,
            Ds_cap && ds)  [inline]
```

Make a local memory region for the given driver values.

Parameters

drv_base	Base address of the memory region used by the driver.
size	Size of the memory region.
offset	Offset within the data space that is mapped to *drv_base* within the driver.
ds	Data space capability backing the memory.

This constructor attaches the region of given data space to the local address space and stores the corresponding data for later reference.
Definition at line 522 of file l4virtio.

15.415.3 Member Function Documentation

15.415.3.1 contains()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_region_t< DATA >::contains (
            l4_uint64_t base,
            l4_umword_t size) const  [inline]
```

Test if the given driver address range is within this region.

Parameters

base	The driver base address.
size	The size of the region to lookup.

Returns

true if the given driver address region is contained in this region, false else.

Definition at line 616 of file l4virtio.

15.415.3.2 drv_base()

```
template<typename DATA>
l4_uint64_t L4virtio::Svr::Driver_mem_region_t< DATA >::drv_base () const  [inline]
```

Returns

The base address used by the driver.

Definition at line 595 of file l4virtio.

15.415.3.3 ds()

```
template<typename DATA>
L4::Cap< L4Re::Dataspace > L4virtio::Svr::Driver_mem_region_t< DATA >::ds () const  [inline]
```

Returns

The data space capability for this region.

Definition at line 607 of file l4virtio.

15.415.3.4 ds_offset()

```
template<typename DATA>
l4_addr_t L4virtio::Svr::Driver_mem_region_t< DATA >::ds_offset () const  [inline]
```

Returns

The offset within the data space.

Definition at line 604 of file l4virtio.

15.415.3.5 empty()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_region_t< DATA >::empty () const  [inline]
```

Returns

True if the region is empty (size == 0), false otherwise.

Definition at line 591 of file l4virtio.

15.415.3.6 flags()

```
template<typename DATA>
Flags L4virtio::Svr::Driver_mem_region_t< DATA >::flags () const  [inline]
```

Returns

The flags for this region.

Definition at line 588 of file l4virtio.

15.415.3.7 is_writable()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_region_t< DATA >::is_writable () const  [inline]
```

Returns

True if the region is writable, false otherwise.

Definition at line 585 of file l4virtio.

15.415.3.8 local()

```
template<typename DATA>
template<typename T>
T * L4virtio::Svr::Driver_mem_region_t< DATA >::local (
            Ptr< T > p) const  [inline]
```

Get the local address for driver address *p*.

Parameters

p	Driver address to translate.

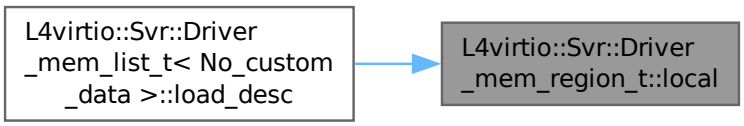
Precondition

p must be contained in this region.

Returns

Local address for the given driver address *p*.

Definition at line 640 of file l4virtio.
Referenced by L4virtio::Svr::Driver_mem_list_t< No_custom_data >::load_desc().
Here is the caller graph for this function:



15.415.3.9 local_base()

```
template<typename DATA>
l4_addr_t L4virtio::Svr::Driver_mem_region_t< DATA >::local_base () const  [inline]
```

Returns

The local base address.

Definition at line 598 of file l4virtio.

15.415.3.10 size()

```
template<typename DATA>
l4_umword_t L4virtio::Svr::Driver_mem_region_t< DATA >::size () const  [inline]
```

Returns

The size of the region in bytes.

Definition at line 601 of file l4virtio.

  Start processing a new request.
- template<typename DESC_MAN, typename ... ARGS>
  Virtqueue::Request const & start (DESC_MAN *dm, Virtqueue::Request const &request, ARGS... args)

  Start processing a new request.
- Virtqueue::Desc::Flags current_flags () const

  Get the flags of the currently processed descriptor.
- bool has_more () const

  Are there more chained descriptors?
- template<typename DESC_MAN, typename ... ARGS>
  bool next (DESC_MAN *dm, ARGS... args)

  Switch to the next descriptor in a descriptor chain.

15.416.1 Detailed Description

Encapsulate the state for processing a VIRTIO request.
A VIRTIO request is a possibly chained list of descriptors retrieved from the available ring of a virtqueue, using Virtqueue::next_avail().
The descriptor processing depends on helper (DESC_MAN) for interpreting the descriptors in the context of the device implementation.
DESC_MAN has to provide the functionality to safely dereference a descriptor from a descriptor list.
The following methods must be provided by DESC_MAN:

- `DESC_MAN::load_desc(Virtqueue::Desc const &desc, Request_processor const *proc, Virtqueue::Desc const **table)`

  This function is used to dereference `desc` as an indirect descriptor table, and must return a pointer to an indirect descriptor table.

- `DESC_MAN::load_desc(Virtqueue::Desc const &desc, Request_processor const *proc, ...)`

  This function is used to dereference a descriptor as a normal data buffer, and '...' are the arguments that are passed to start() and next().

Definition at line 472 of file virtio.

15.416.2 Member Function Documentation

15.416.2.1 current_flags()

`Virtqueue::Desc::Flags L4virtio::Svr::Request_processor::current_flags () const [inline]`
Get the flags of the currently processed descriptor.

Returns

The flags of the currently processed descriptor.

Definition at line 549 of file virtio.
Referenced by L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor::get_request(), and L4virtio::Svr::Virtio_spi< Spi_request_handler, Epiface >::Request_processor::get_request().

bool L4virtio::Svr::Request_processor::next (
            DESC_MAN * dm,
            ARGS... args) [inline]
```

Switch to the next descriptor in a descriptor chain.

Template Parameters

DESC_MAN	Type of descriptor manager (implicit).

Parameters

dm	Descriptor manager that is used to translate VIRTIO descriptor addresses.
args	Extra arguments passed to dm->load_desc()

Return values

true	A next descriptor is available.
false	No descriptor available.

Exceptions

Bad_descriptor	The `next` index of this descriptor is invalid or the chain is longer than the descriptor table.

Definition at line 575 of file virtio.

15.419.1 Detailed Description

Base class for the SCMI performance protocol.
Use this class as a base to implement the performance protocol.
If you want to use this from a Uvmm Linux guest, the device tree needs to look something like this:

```
firmware {
  scmi {
    compatible = "arm,scmi-virtio";

    #address-cells = <1>;
    #size-cells = <0>;

    cpufreq: protocol@13 {
      reg = <0x13>;
      #clock-cells = <1>;
    };
  };
};
....

cpu@0 {
  device_type = "cpu";
  reg = <0x0>;
  clocks = <&cpufreq 0>; // domain_id
};
```

15.424.1 Detailed Description

template<typename OBSERV>
struct L4virtio::Svr::Scmi::Proto< OBSERV >

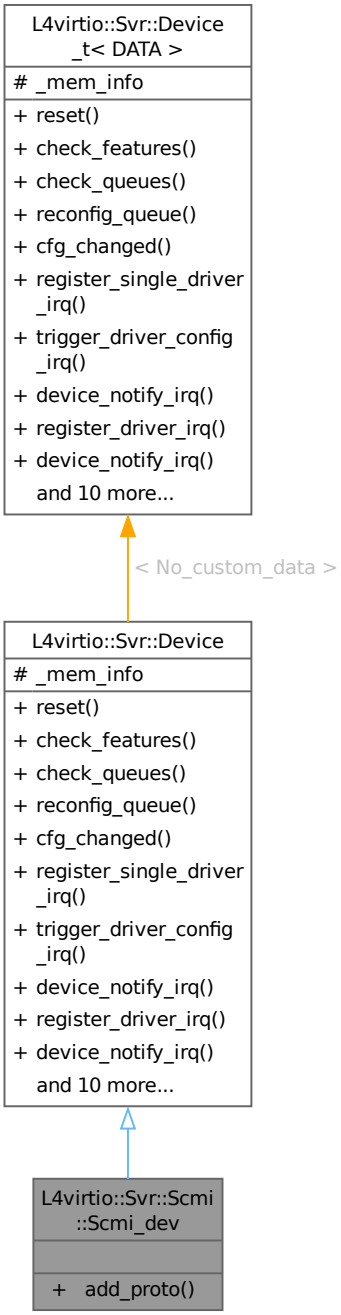
Base class for all protocols.
Defines an interface for processing the virtio buffers for the implemented protocol.

Definition at line 302 of file virtio-scmi-device.
The documentation for this struct was generated from the following file:

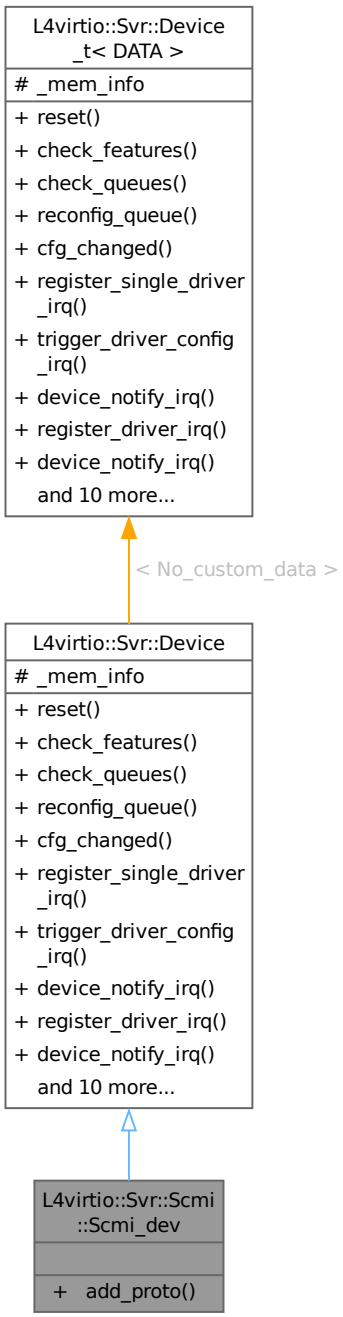
- l4/l4virtio/server/virtio-scmi-device

15.425 L4virtio::Svr::Scmi::Scmi_dev Class Reference

A server implementation of the virtio-scmi protocol.
`#include <virtio-scmi-device>`
Inheritance diagram for L4virtio::Svr::Scmi::Scmi_dev:



Collaboration diagram for L4virtio::Svr::Scmi::Scmi_dev:



Public Member Functions

- void **add_proto** (l4_uint32_t id, Proto< Scmi_dev > *proto)

  Add an actual protocol implementation with the given id to the server.

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual bool **check_features** ()

callback for checking the subset of accepted features

- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_↩ dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_↩ notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Additional Inherited Members

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.425.1 Detailed Description

A server implementation of the virtio-scmi protocol.
Use this class as a base to implement your own specific SCMI device.
SCMI defines multiple protocols which can be optionally handled. This server implementation is flexible enough to handle any combination of them. The user of this server has to deviate from the provided Proto classes (for the protocols he want to handle) and needs to implement the required callbacks.
Right now, support for the base and the performance protocol is provided.
The base protocol is mandatory.
If you want to use this from a Uvmm Linux guest, the device tree needs to look something like this:

```
firmware {
  scmi {
    compatible = "arm,scmi-virtio";

    #address-cells = <1>;
    #size-cells = <0>;

    // ... supported protocols ...
  };
};
```

Definition at line 339 of file virtio-scmi-device.
The documentation for this class was generated from the following file:

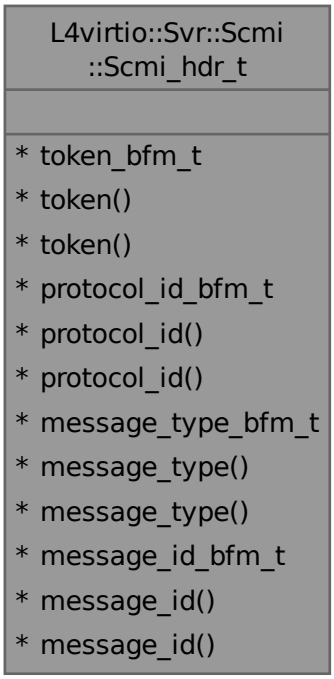
- l4/l4virtio/server/virtio-scmi-device

15.426 L4virtio::Svr::Scmi::Scmi_hdr_t Struct Reference

SCMI header.

`#include <virtio-scmi-device>`

Collaboration diagram for L4virtio::Svr::Scmi::Scmi_hdr_t:



- typedef cxx::Bitfield< decltype(hdr_raw), 18, 27 > **token_bfm_t**

  Type to access the `token` bits (18 to 27) of `hdr_raw`.
- constexpr token_bfm_t::Val **token** () const

  Get the `token` bits (18 to 27) of `hdr_raw`.
- constexpr token_bfm_t::Ref **token** ()

  Get a reference to the `token` bits (18 to 27) of `hdr_raw`.

- typedef cxx::Bitfield< decltype(hdr_raw), 10, 17 > **protocol_id_bfm_t**

  Type to access the `protocol_id` bits (10 to 17) of `hdr_raw`.
- constexpr protocol_id_bfm_t::Val **protocol_id** () const

  Get the `protocol_id` bits (10 to 17) of `hdr_raw`.
- constexpr protocol_id_bfm_t::Ref **protocol_id** ()

  Get a reference to the `protocol_id` bits (10 to 17) of `hdr_raw`.

- typedef cxx::Bitfield< decltype(hdr_raw), 8, 9 > **message_type_bfm_t**

  Type to access the `message_type` bits (8 to 9) of `hdr_raw`.
- constexpr message_type_bfm_t::Val **message_type** () const

  Get the `message_type` bits (8 to 9) of `hdr_raw`.

- constexpr message_type_bfm_t::Ref **message_type** ()

  Get a reference to the `message_type` *bits (8 to 9) of* `hdr_raw`*.*

- typedef cxx::Bitfield< decltype(hdr_raw), 0, 7 > **message_id_bfm_t**

  Type to access the `message_id` *bits (0 to 7) of* `hdr_raw`*.*

- constexpr message_id_bfm_t::Val **message_id** () const

  Get the `message_id` *bits (0 to 7) of* `hdr_raw`*.*

- constexpr message_id_bfm_t::Ref **message_id** ()

  Get a reference to the `message_id` *bits (0 to 7) of* `hdr_raw`*.*

15.426.1 Detailed Description

SCMI header.
Definition at line 45 of file virtio-scmi-device.
The documentation for this struct was generated from the following file:

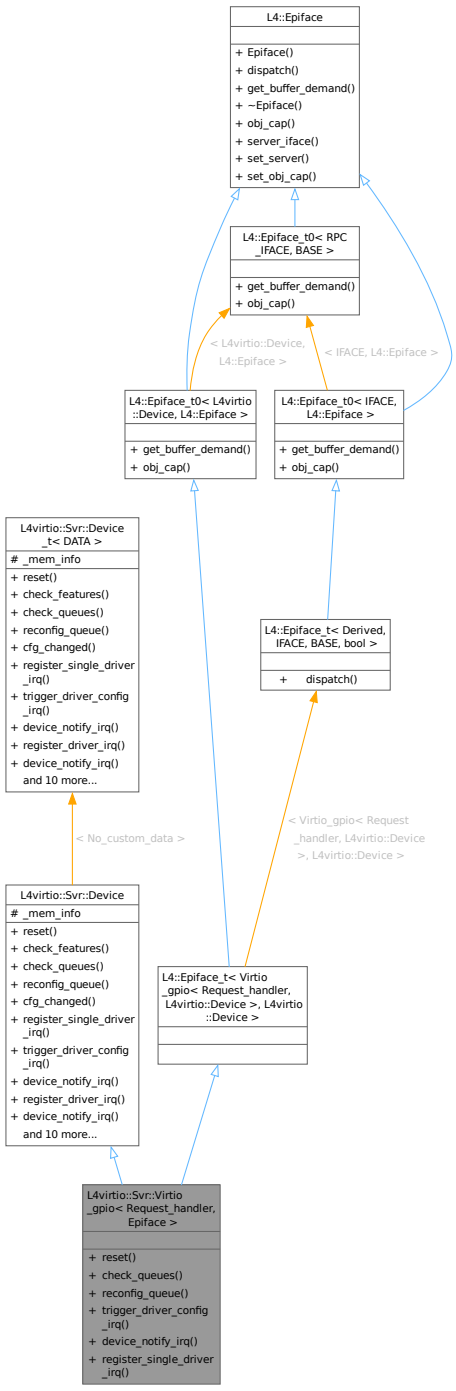
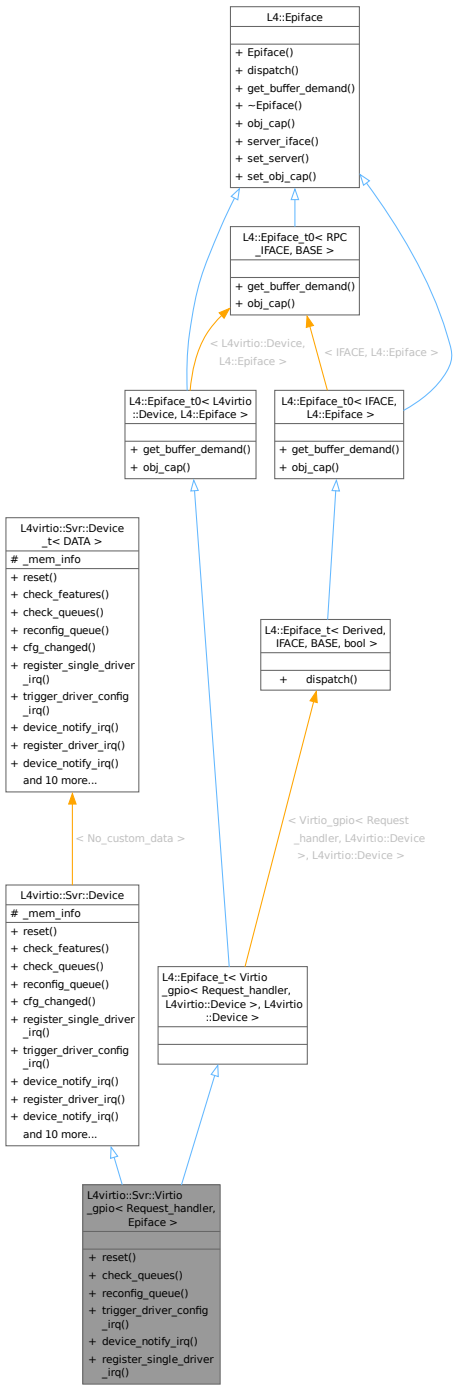
15.427 L4virtio::Svr::Virtio_gpio< Request_handler, Epiface > Class Template Reference

A server implementation of the virtio-gpio protocol.
`#include <virtio-gpio-device>`

Inheritance diagram for L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >:



Collaboration diagram for L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >:



Data Structures

- struct Irq_handler

  Handler for an gpio pin irq.
- struct Host_irq

  Handler for the host irq.
- struct Request_processor

  Generic handler for the Virtio requests.

Public Member Functions

- void **reset** () override

  reset callback, called for doing a device reset
- bool **check_queues** () override

  callback for checking if the queues at DRIVER_OK transition
- int **reconfig_queue** (unsigned idx) override

  callback for client queue-config request
- void **trigger_driver_config_irq** () override

  callback for triggering configuration change notification IRQ
- L4::Cap< L4::Irq > **device_notify_irq** () const override

  callback to gather the device notification IRQ (old-style)
- void **register_single_driver_irq** () override

  callback for registering a single guest IRQ for all queues (old-style)

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual bool **check_features** ()

  callback for checking the subset of accepted features
- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Public Member Functions inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< L4virtio::Device > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.427.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >

A server implementation of the virtio-gpio protocol.

Template Parameters

Request_handler	The type that is used to handle incomming requests. Needs to have: • bool get_direction(l4_uint16_t gpio, l4_uint8_t *dir) • bool set_direction(l4_uint16_t gpio, l4_uint8_t dir) • bool get_value(l4_uint16_t gpio, l4_uint8_t *val) • bool set_value(l4_uint16_t gpio, l4_uint8_t val) • bool set_irq_type(l4_uint16_t gpio, l4_uint8_t mode) • bool enable_irq(l4_uint16_t gpio, std::shared_ptr<Virtio_gpio::Irq_handler> const &hdl) functions.

Epiface	The Epiface to derive from. Defaults to `L4virtio::Device`.

Definition at line 142 of file virtio-gpio-device.
The documentation for this class was generated from the following file:

- l4/l4virtio/server/virtio-gpio-device

15.428 L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Host_irq Struct Reference

Handler for the host irq.
`#include <virtio-gpio-device>`

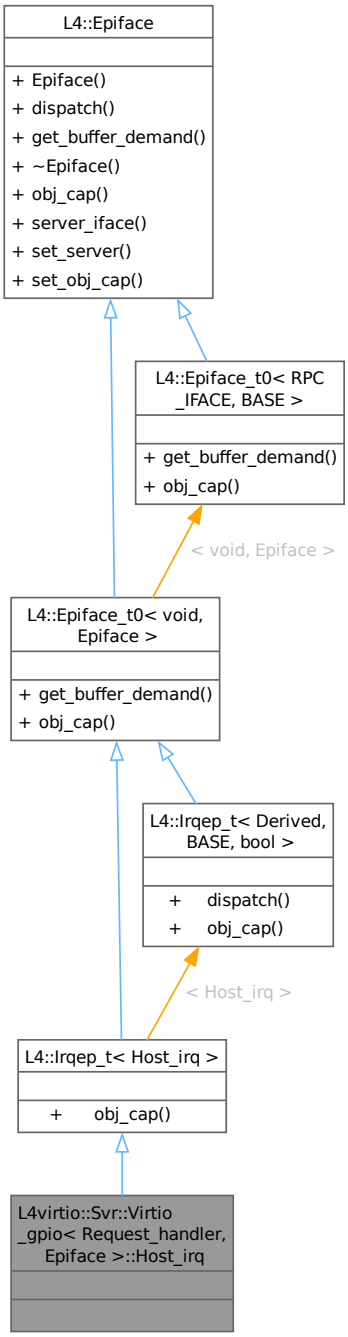
Collaboration diagram for L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Host_irq:



Additional Inherited Members

Public Types inherited from L4::Epiface_t0< void, Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Member Functions inherited from L4::Irqep_t< Host_irq >

- Cap< L4::Irq > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface_t0< void, Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< void > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

15.428.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
struct L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Host_irq

Handler for the host irq.
An `L4::Irqep_t` to handle irqs send to the server.
Definition at line 198 of file virtio-gpio-device.
The documentation for this struct was generated from the following file:

- l4/l4virtio/server/virtio-gpio-device

15.429 L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Irq_handler Struct Reference

Handler for an gpio pin irq.
`#include <virtio-gpio-device>`

Collaboration diagram for L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Irq_handler:

15.429.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
struct L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Irq_handler

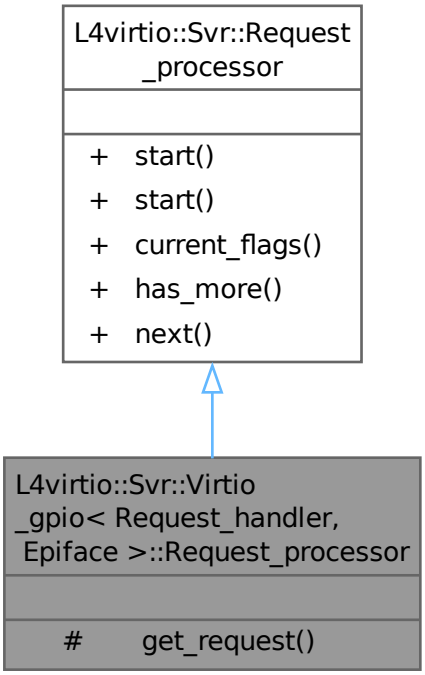
Handler for an gpio pin irq.
This notifies the virtio client that an gpio pin irq happened or the operation was canceled.
This needs to be called by any server implementation of the Virtio_gpio class, after an irq was enabled with the enable method of the Gpio_request_handler.
Definition at line 166 of file virtio-gpio-device.
The documentation for this struct was generated from the following file:

- l4/l4virtio/server/virtio-gpio-device

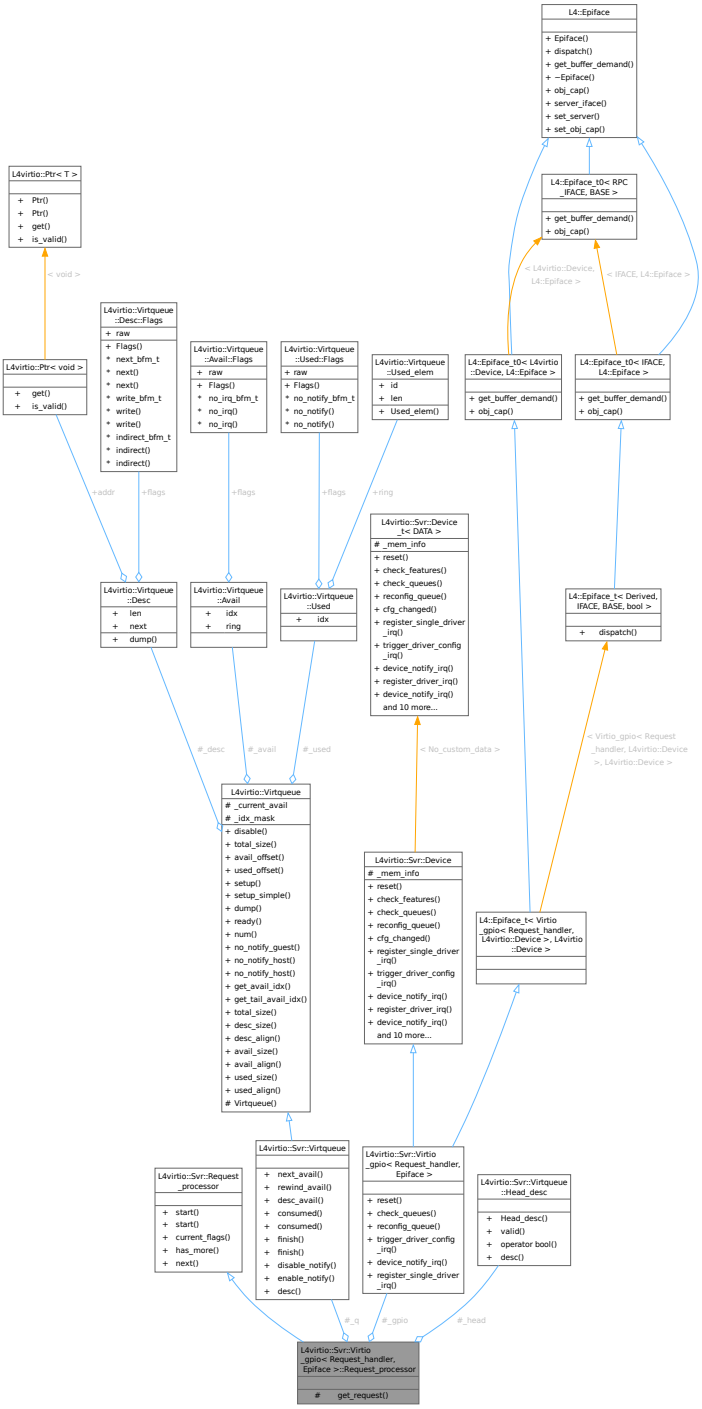
15.430 L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor Struct Reference

Generic handler for the Virtio requests.
`#include <virtio-gpio-device>`

Inheritance diagram for L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor:



Collaboration diagram for L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor:



Protected Member Functions

- template<typename T>
  T get_request ()

  The driver prepares the GPIO request in two data parts: 1st: in_hdr 2rd: out_hdr.

Additional Inherited Members

Public Member Functions inherited from L4virtio::Svr::Request_processor

- template<typename DESC_MAN, typename ... ARGS>
  void start (DESC_MAN *dm, Virtqueue *ring, Virtqueue::Head_desc const &request, ARGS... args)

  Start processing a new request.
- template<typename DESC_MAN, typename ... ARGS>
  Virtqueue::Request const & start (DESC_MAN *dm, Virtqueue::Request const &request, ARGS... args)

  Start processing a new request.
- Virtqueue::Desc::Flags current_flags () const

  Get the flags of the currently processed descriptor.
- bool has_more () const

  Are there more chained descriptors?
- template<typename DESC_MAN, typename ... ARGS>
  bool next (DESC_MAN *dm, ARGS... args)

  Switch to the next descriptor in a descriptor chain.

15.430.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
struct L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor

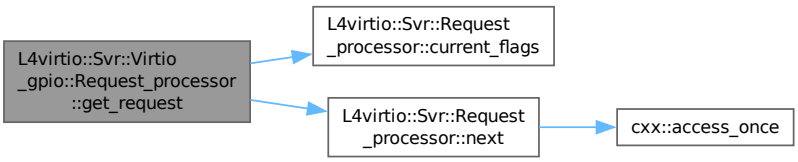
Generic handler for the Virtio requests.
Definition at line 213 of file virtio-gpio-device.

15.430.2 Member Function Documentation

15.430.2.1 get_request()

```
template<typename Request_handler, typename Epiface = L4virtio::Device>
template<typename T>
T L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Request_processor::get_request ()
[inline], [protected]
```

The driver prepares the GPIO request in two data parts: 1st: in_hdr 2rd: out_hdr.
This parses the two Data_buffers and create the Gpio_* structure.
Definition at line 241 of file virtio-gpio-device.
References L4virtio::Svr::Request_processor::current_flags(), and L4virtio::Svr::Request_processor::next().
Here is the call graph for this function:



The documentation for this struct was generated from the following file:

- l4/l4virtio/server/virtio-gpio-device

15.431 L4virtio::Svr::Virtio_i2c< Request_handler, Epiface > Class Template Reference

A server implementation of the virtio-i2c protocol.

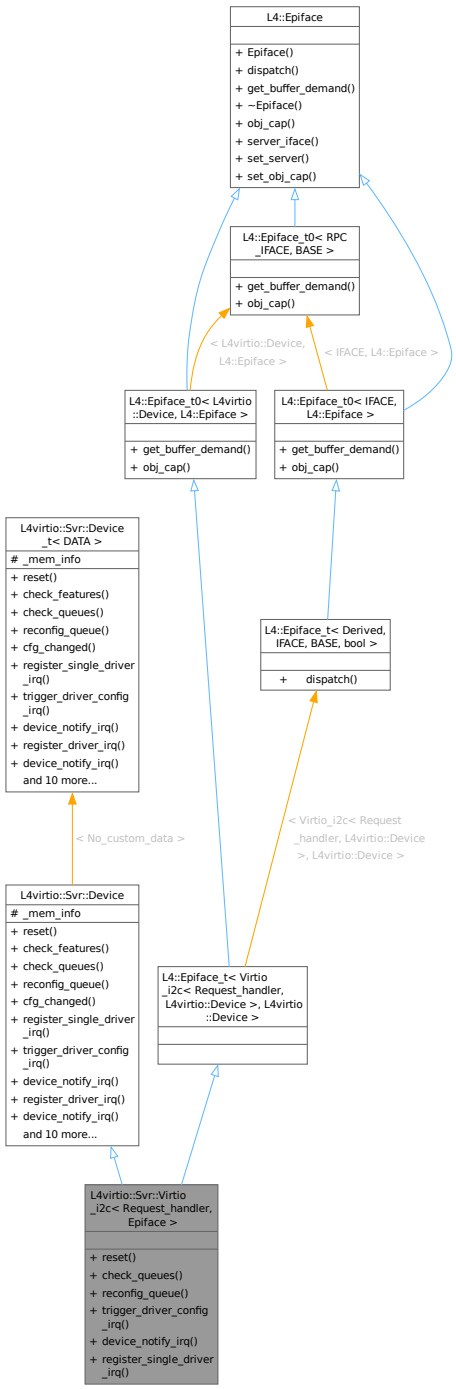
Collaboration diagram for L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >:



Data Structures

- class Host_irq

  Handler for the host irq.
- class Request_processor

  Handler for the Virtio requests.

Public Member Functions

- void **reset** () override

  reset callback, called for doing a device reset
- bool **check_queues** () override

  callback for checking if the queues at DRIVER_OK transition
- int **reconfig_queue** (unsigned idx) override

  callback for client queue-config request
- void **trigger_driver_config_irq** () override

  callback for triggering configuration change notification IRQ
- L4::Cap< L4::Irq > **device_notify_irq** () const override

  callback to gather the device notification IRQ (old-style)
- void **register_single_driver_irq** () override

  callback for registering a single guest IRQ for all queues (old-style)

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual bool **check_features** ()

  callback for checking the subset of accepted features
- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Public Member Functions inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< L4virtio::Device > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.431.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >

A server implementation of the virtio-i2c protocol.

Template Parameters

Request_handler	The type that is used to handle incomming requests. Needs to have `T handle_read(l4_uint8_t *, unsigned)` and `T handle_write(l4_uint8_t const *, unsigned)` functions, with T assignable to `std::optional<bool>`.
Epiface	The Epiface to derive from. Defaults to `L4virtio::Device`.

Definition at line 89 of file virtio-i2c-device.
The documentation for this class was generated from the following file:

- l4/l4virtio/server/virtio-i2c-device

15.432 L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Host_irq Class Reference

Handler for the host irq.

`#include <virtio-i2c-device>`

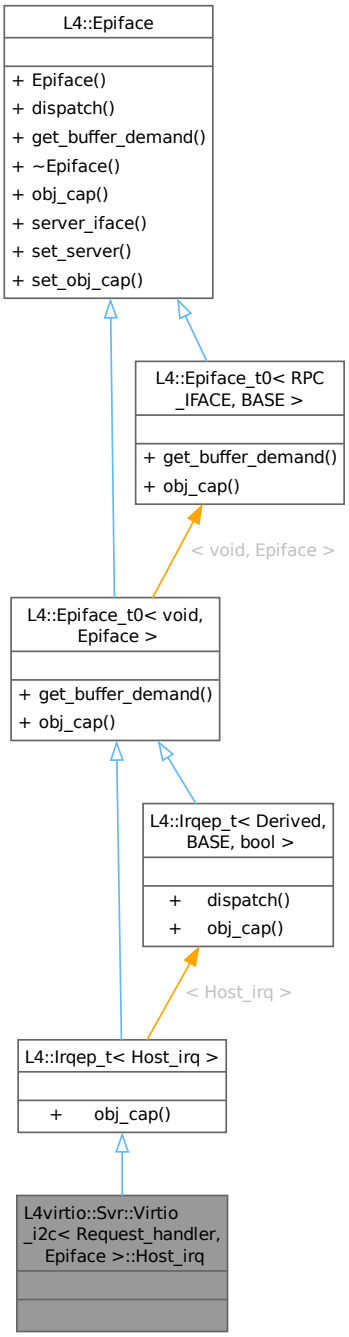
Collaboration diagram for L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Host_irq:



Additional Inherited Members

Public Types inherited from L4::Epiface_t0< void, Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Public Member Functions inherited from L4::Irqep_t< Host_irq >

- Cap< L4::Irq > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface_t0< void, Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< void > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

15.432.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Host_irq

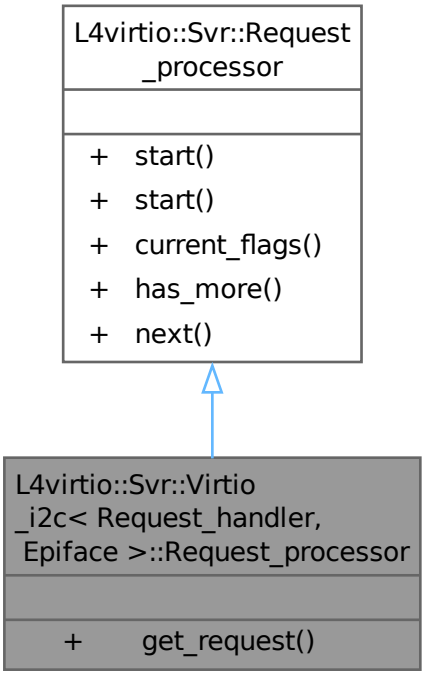
Handler for the host irq.
An `L4::Irqep_t` to handle irqs send to the server.
Definition at line 109 of file virtio-i2c-device.
The documentation for this class was generated from the following file:

- l4/l4virtio/server/virtio-i2c-device

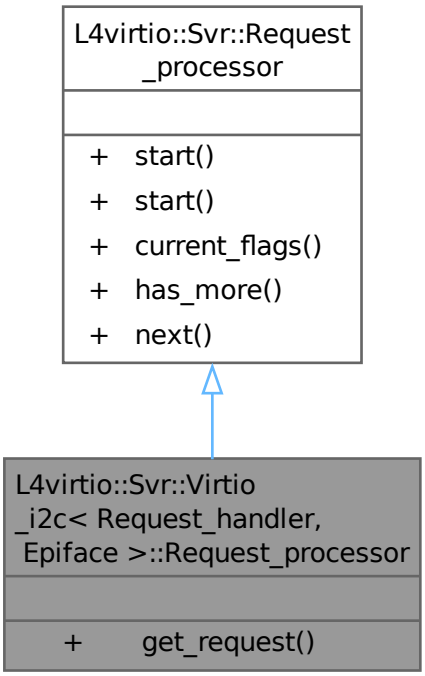
15.433 L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Request_processor Class Reference

Handler for the Virtio requests.
`#include <virtio-i2c-device>`

Inheritance diagram for L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Request_processor:



Collaboration diagram for L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Request_processor:



Public Member Functions

- l2c_req get_request ()
  Linux prepares the I2C request in three data parts: 1st: out_hdr 2nd: buffer (optional) 3rd: in_hdr.

Public Member Functions inherited from L4virtio::Svr::Request_processor

- template<typename DESC_MAN, typename ... ARGS>
  void start (DESC_MAN *dm, Virtqueue *ring, Virtqueue::Head_desc const &request, ARGS... args)
  Start processing a new request.
- template<typename DESC_MAN, typename ... ARGS>
  Virtqueue::Request const & start (DESC_MAN *dm, Virtqueue::Request const &request, ARGS... args)
  Start processing a new request.
- Virtqueue::Desc::Flags current_flags () const
  Get the flags of the currently processed descriptor.
- bool has_more () const
  Are there more chained descriptors?
- template<typename DESC_MAN, typename ... ARGS>
  bool next (DESC_MAN *dm, ARGS... args)
  Switch to the next descriptor in a descriptor chain.

15.433.1 Detailed Description

template<typename Request_handler, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Request_processor

Handler for the Virtio requests.

Definition at line 126 of file virtio-i2c-device.

15.433.2 Member Function Documentation

15.433.2.1 get_request()

```
template<typename Request_handler, typename Epiface = L4virtio::Device>
I2c_req L4virtio::Svr::Virtio_i2c< Request_handler, Epiface >::Request_processor::get_request
() [inline]
```

Linux prepares the I2C request in three data parts: 1st: out_hdr 2nd: buffer (optional) 3rd: in_hdr.
This parses the three Data_buffers and recreate the virtio_i2c_req structure.
Definition at line 162 of file virtio-i2c-device.
References L4_UNLIKELY, L4virtio::Svr::Data_buffer::left, L4virtio::Svr::Request_processor::next(), L4virtio::Svr::Data_buffer::pos, and L4virtio::Svr::Request_processor::start().
Here is the call graph for this function:

  Memory region list.

15.434.1 Detailed Description

template<typename Rnd_state, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >

A server implementation of the virtio-rng protocol.

Template Parameters

Rnd_state	The type that implements the random data generation. `Rnd_state::get_random(int len, unsigned char *buf)` is called to get len random bytes written into buf TODO: virtio-rng supports providing less random bytes then requested. This API currently does not support that, as I do not have a test case.
Epiface	The Epiface to derive from. Defaults to `L4virtio::Device`.

Definition at line 33 of file virtio-rng-device.
The documentation for this class was generated from the following file:

- l4/l4virtio/server/virtio-rng-device

15.435 L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >::Host_irq Class Reference

Handler for the host irq.

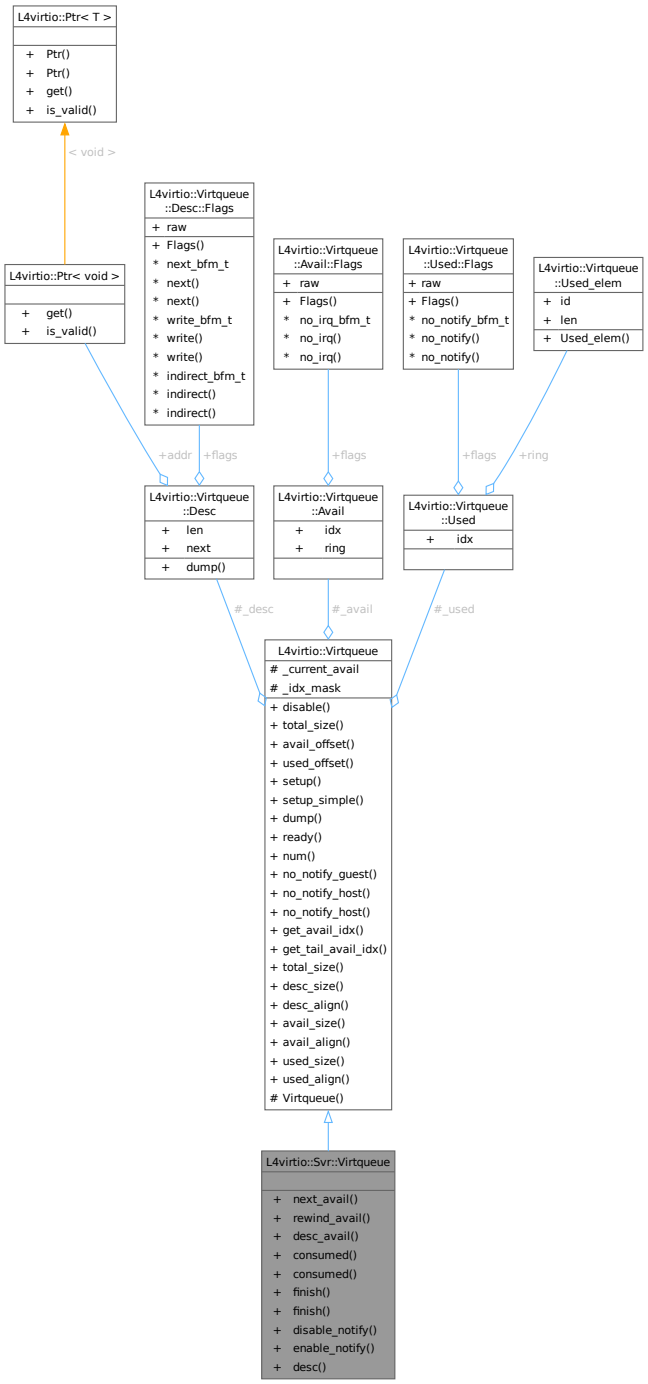
15.440 L4virtio::Svr::Virtqueue Class Reference

Virtqueue implementation for the device.
`#include <virtio>`

Inheritance diagram for L4virtio::Svr::Virtqueue:

Collaboration diagram for L4virtio::Svr::Virtqueue:



Data Structures

- class Head_desc

  VIRTIO request, essentially a descriptor from the available ring.

Public Member Functions

- Request next_avail ()

Get the next available descriptor from the available ring.

- void rewind_avail (Head_desc const &d)

  Return unfinished descriptors to the available ring, i.e.
- bool desc_avail () const

  Test for available descriptors.
- void consumed (Head_desc const &r, l4_uint32_t len=0)

  Put the given descriptor into the used ring.
- template<typename ITER>
  void consumed (ITER const &begin, ITER const &end)

  Put multiple descriptors into the used ring.
- template<typename QUEUE_OBSERVER>
  void finish (Head_desc &d, QUEUE_OBSERVER *o, l4_uint32_t len=0)

  Add a descriptor to the used ring, and notify an observer.
- template<typename ITER, typename QUEUE_OBSERVER>
  void finish (ITER const &begin, ITER const &end, QUEUE_OBSERVER *o)

  Add a range of descriptors to the used ring, and notify an observer once.
- void disable_notify ()

  Set the 'no notify' flag for this queue.
- void enable_notify ()

  Clear the 'no notify' flag for this queue.
- Desc const * desc (unsigned idx) const

  Get a descriptor from the descriptor list.

Public Member Functions inherited from L4virtio::Virtqueue

- void disable ()

  Completely disable the queue.
- unsigned long total_size () const

  Calculate the total size of this virtqueue.
- unsigned long **avail_offset** () const

  Get the offset of the available ring from the descriptor table.
- unsigned long **used_offset** () const

  Get the offset of the used ring from the descriptor table.
- void setup (unsigned num, void *desc, void *avail, void *used, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Enable this queue.
- void setup_simple (unsigned num, void *ring, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Enable this queue.
- void dump (Desc const *d, L4Re::Util::Dbg dbg=L4Re::Util::Dbg{}) const

  Dump a descriptor for this queue.
- bool ready () const

  Test if this queue is in working state.
- unsigned num () const
- bool no_notify_guest () const

  Get the no IRQ flag of this queue.
- bool no_notify_host () const

  Get the no notify flag of this queue.
- void no_notify_host (bool value)

  Set the no-notify flag for this queue.
- l4_uint16_t get_avail_idx () const

  Get available index from available ring (for debugging).
- l4_uint16_t get_tail_avail_idx () const

  Get tail-available index stored in local state (for debugging).

Additional Inherited Members

Public Types inherited from L4virtio::Virtqueue

- enum

  Fixed alignment values for different parts of a virtqueue.

Static Public Member Functions inherited from L4virtio::Virtqueue

- static unsigned long total_size (unsigned num)

  Calculate the total size for a virtqueue of the given dimensions.
- static unsigned long desc_size (unsigned num)

  Calculate the size of the descriptor table for `num` entries.
- static unsigned long desc_align ()

  Get the alignment in zero LSBs needed for the descriptor table.
- static unsigned long avail_size (unsigned num)

  Calculate the size of the available ring for `num` entries.
- static unsigned long avail_align ()

  Get the alignment in zero LSBs needed for the available ring.
- static unsigned long used_size (unsigned num)

  Calculate the size of the used ring for `num` entries.
- static unsigned long used_align ()

  Get the alignment in zero LSBs needed for the used ring.

Protected Member Functions inherited from L4virtio::Virtqueue

- **Virtqueue** ()=default

  Create a disabled virtqueue.

Protected Attributes inherited from L4virtio::Virtqueue

- Desc * **_desc** = nullptr

  pointer to descriptor table, NULL if queue is off.
- Avail * **_avail** = nullptr

  pointer to available ring.
- Used * **_used** = nullptr

  pointer to used ring.
- l4_uint16_t **_current_avail** = 0

  The life counter for the queue.
- l4_uint16_t **_idx_mask** = 0

  mask used for indexing into the descriptor table and the rings.

15.440.1 Detailed Description

Virtqueue implementation for the device.
This class represents a single virtqueue, with a local running available index.

Note

The Virtqueue implementation is not thread-safe.

Definition at line 87 of file virtio.

15.440.2 Member Function Documentation

15.440.2.1 consumed() [1/2]

```
void L4virtio::Svr::Virtqueue::consumed (
            Head_desc const & r,
            l4_uint32_t len = 0)  [inline]
```

Put the given descriptor into the used ring.

Parameters

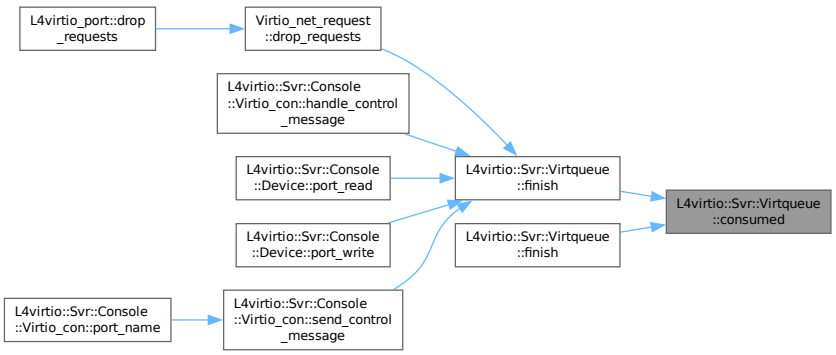
r	Request that shall be marked as finished.
len	The total number of bytes written.

Precondition

queue must be in working state.

`r` must be a valid request from this queue.

Definition at line 190 of file virtio.
References L4virtio::Virtqueue::_desc, L4virtio::Virtqueue::_idx_mask, and L4virtio::Virtqueue::_used.
Referenced by finish(), and finish().
Here is the caller graph for this function:



15.440.2.2 consumed() [2/2]

```
template<typename ITER>
void L4virtio::Svr::Virtqueue::consumed (
            ITER const & begin,
            ITER const & end)  [inline]
```

Put multiple descriptors into the used ring.
A range of descriptors, specified by `begin` and `end` iterators is added. Each iterator points to a struct that has a `first` member that is a `Head_desc` and a `second` member that is the corresponding number of bytes written.

Template Parameters

ITER	The type of the iterator (inferred).

Parameters

begin	Iterator pointing to first new descriptor.
end	Iterator pointing to one past last entry.

Precondition

queue must be in working state.

Definition at line 213 of file virtio.
References L4virtio::Virtqueue::_desc, L4virtio::Virtqueue::_idx_mask, and L4virtio::Virtqueue::_used.

15.440.2.3 desc()

```
Desc const * L4virtio::Svr::Virtqueue::desc (
            unsigned idx) const  [inline]
```

Get a descriptor from the descriptor list.

Parameters

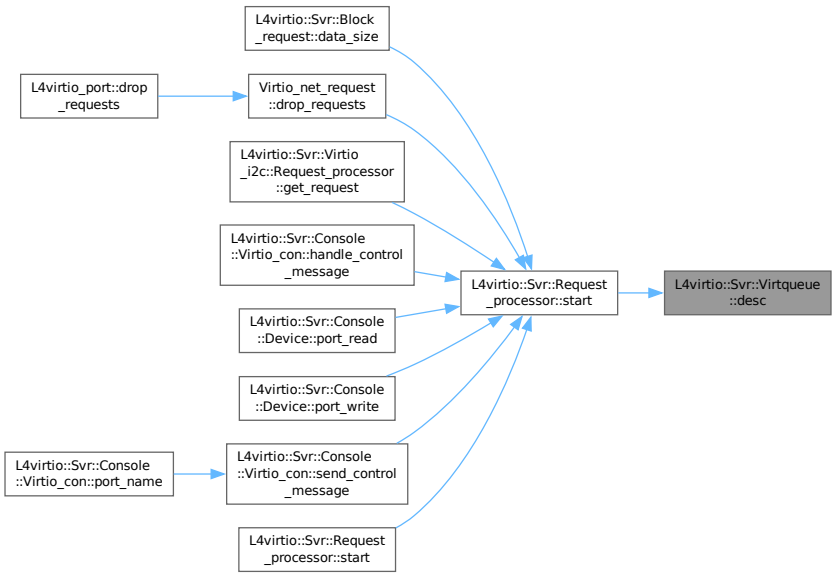
idx	The index of the descriptor.

Precondition

`idx` < `num`

queue must be in working state

Definition at line 298 of file virtio.
References L4virtio::Virtqueue::_desc.
Referenced by L4virtio::Svr::Request_processor::start().
Here is the caller graph for this function:



15.440.2.4 desc_avail()

```
bool L4virtio::Svr::Virtqueue::desc_avail () const  [inline]
```

Test for available descriptors.

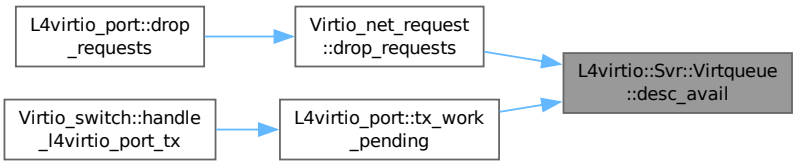
Returns

true if there are descriptors available, false if not.

Precondition

The queue must be in working state.

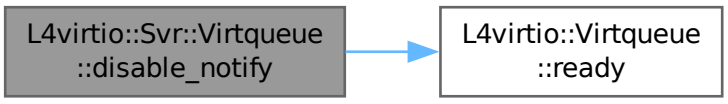
Definition at line 175 of file virtio.
References L4virtio::Virtqueue::_avail, and L4virtio::Virtqueue::_current_avail.
Referenced by Virtio_net_request::drop_requests(), and L4virtio_port::tx_work_pending().
Here is the caller graph for this function:



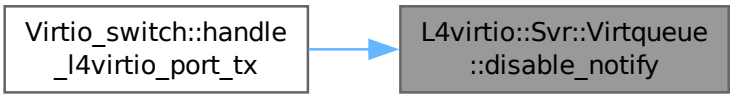
15.440.2.5 disable_notify()

```
void L4virtio::Svr::Virtqueue::disable_notify ()  [inline]
```

Set the 'no notify' flag for this queue.
This function may be called on a disabled queue.
Definition at line 273 of file virtio.
References L4virtio::Virtqueue::_used, L4_LIKELY, and L4virtio::Virtqueue::ready().
Referenced by Virtio_switch::handle_l4virtio_port_tx().
Here is the call graph for this function:



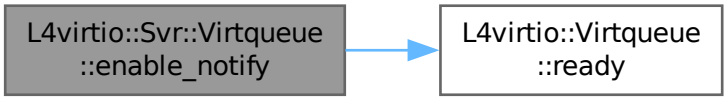
Here is the caller graph for this function:



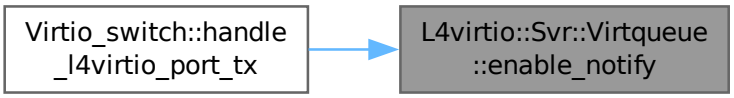
15.440.2.6 enable_notify()

```
void L4virtio::Svr::Virtqueue::enable_notify ()  [inline]
```

Clear the 'no notify' flag for this queue.
This function may be called on a disabled queue.
Definition at line 284 of file virtio.
References L4virtio::Virtqueue::_used, L4_LIKELY, and L4virtio::Virtqueue::ready().
Referenced by Virtio_switch::handle_l4virtio_port_tx().
Here is the call graph for this function:



Here is the caller graph for this function:



15.440.2.7 finish() [1/2]

```
template<typename QUEUE_OBSERVER>
void L4virtio::Svr::Virtqueue::finish (
            Head_desc & d,
            QUEUE_OBSERVER * o,
            l4_uint32_t len = 0)  [inline]
```

Add a descriptor to the used ring, and notify an observer.

Template Parameters

QUEUE_OBSERVER	The type of the observer (inferred).

Parameters

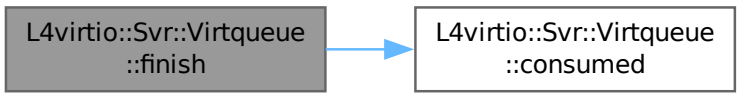
d	descriptor of the request that is to be marked as finished.
o	Pointer to the observer that is notified.
len	Number of bytes written for this request.

Precondition

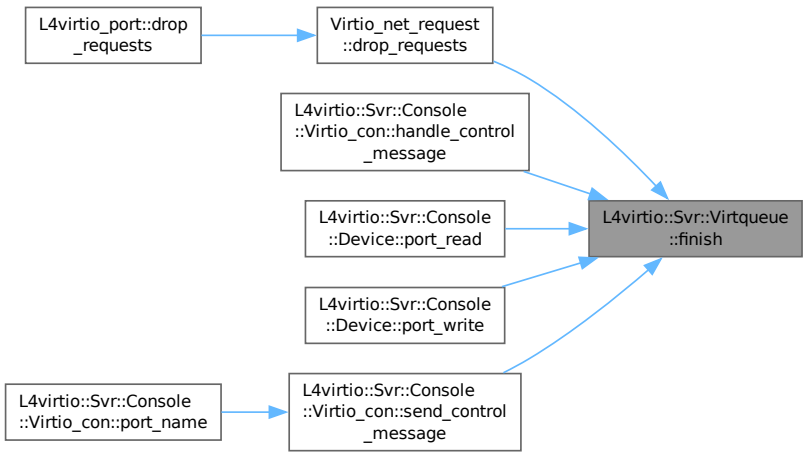
queue must be in working state.

`d` must be a valid request from this queue.

Definition at line 240 of file virtio.
References consumed().
Referenced by Virtio_net_request::drop_requests(), L4virtio::Svr::Console::Virtio_con::handle_control_message(), L4virtio::Svr::Console::Device::port_read(), L4virtio::Svr::Console::Device::port_write(), and L4virtio::Svr::Console::Virtio_con::send_c
Here is the call graph for this function:



Here is the caller graph for this function:



15.440.2.8 finish() [2/2]

```
template<typename ITER, typename QUEUE_OBSERVER>
void L4virtio::Svr::Virtqueue::finish (
             ITER const & begin,
             ITER const & end,
             QUEUE_OBSERVER * o)  [inline]
```

Add a range of descriptors to the used ring, and notify an observer once.
The iterators are passed to consumed<ITER>(ITER const &, ITER const &), and the requirements detailed there apply.

Template Parameters

ITER	type of the iterator (inferred)
QUEUE_OBSERVER	the type of the observer (inferred).

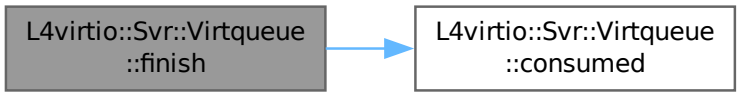
Parameters

begin	iterator pointing to first element.
end	iterator pointing to one past last element.
o	pointer to the observer that is notified.

Precondition

queue must be in working state.

Definition at line 262 of file virtio.
References consumed().
Here is the call graph for this function:



15.440.2.9 next_avail()

```
Request L4virtio::Svr::Virtqueue::next_avail ()  [inline]
```

Get the next available descriptor from the available ring.

Precondition

The queue must be in working state.

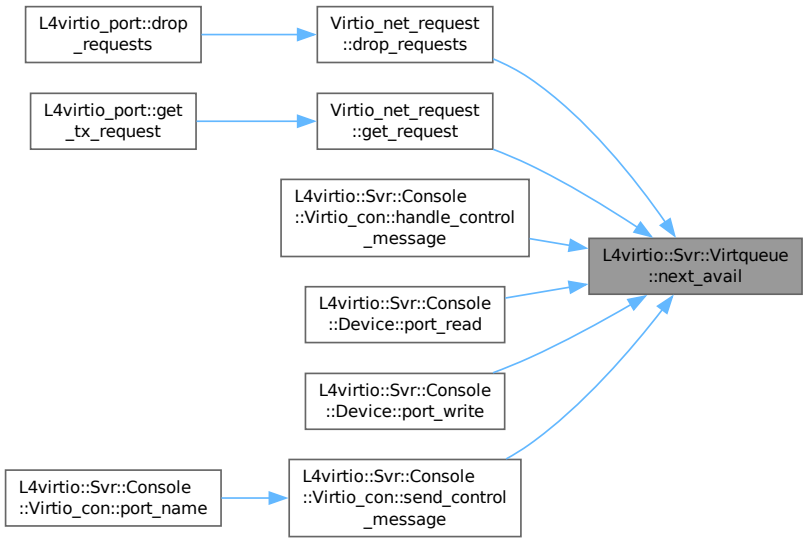
Returns

A Request for the next available descriptor, the Request is invalid if there are no descriptors in the available ring.

Note

The return value must be checked even when a previous desc_avail() returned true.

Definition at line 136 of file virtio.
References L4virtio::Virtqueue::_avail, L4virtio::Virtqueue::_current_avail, L4virtio::Virtqueue::_idx_mask, and L4_LIKELY.
Referenced by Virtio_net_request::drop_requests(), Virtio_net_request::get_request(), L4virtio::Svr::Console::Virtio_con::handle_cont
L4virtio::Svr::Console::Device::port_read(), L4virtio::Svr::Console::Device::port_write(), and L4virtio::Svr::Console::Virtio_con::send_c
Here is the caller graph for this function:



15.440.2.10 rewind_avail()

```
void L4virtio::Svr::Virtqueue::rewind_avail (
            Head_desc const & d)  [inline]
```

Return unfinished descriptors to the available ring, i.e.
reset the local next index of the available ring to the given descriptor.

Parameters

d	descriptor of the request that is to be marked as finished.

Precondition

queue must be in working state.

`d` must be a valid request from this queue, obtained via next_avail(), that has not yet been finished, and in addition, no descriptors following it have been finished.

Definition at line 160 of file virtio.
References L4virtio::Virtqueue::_current_avail, L4virtio::Virtqueue::_desc, and L4virtio::Virtqueue::_idx_mask.
The documentation for this class was generated from the following file:

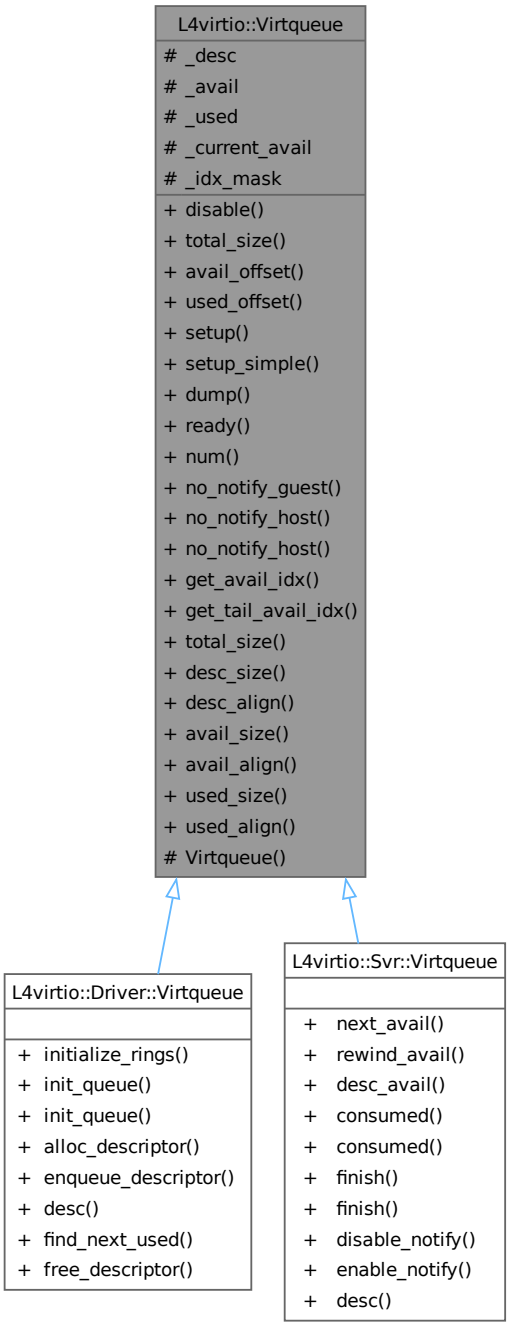
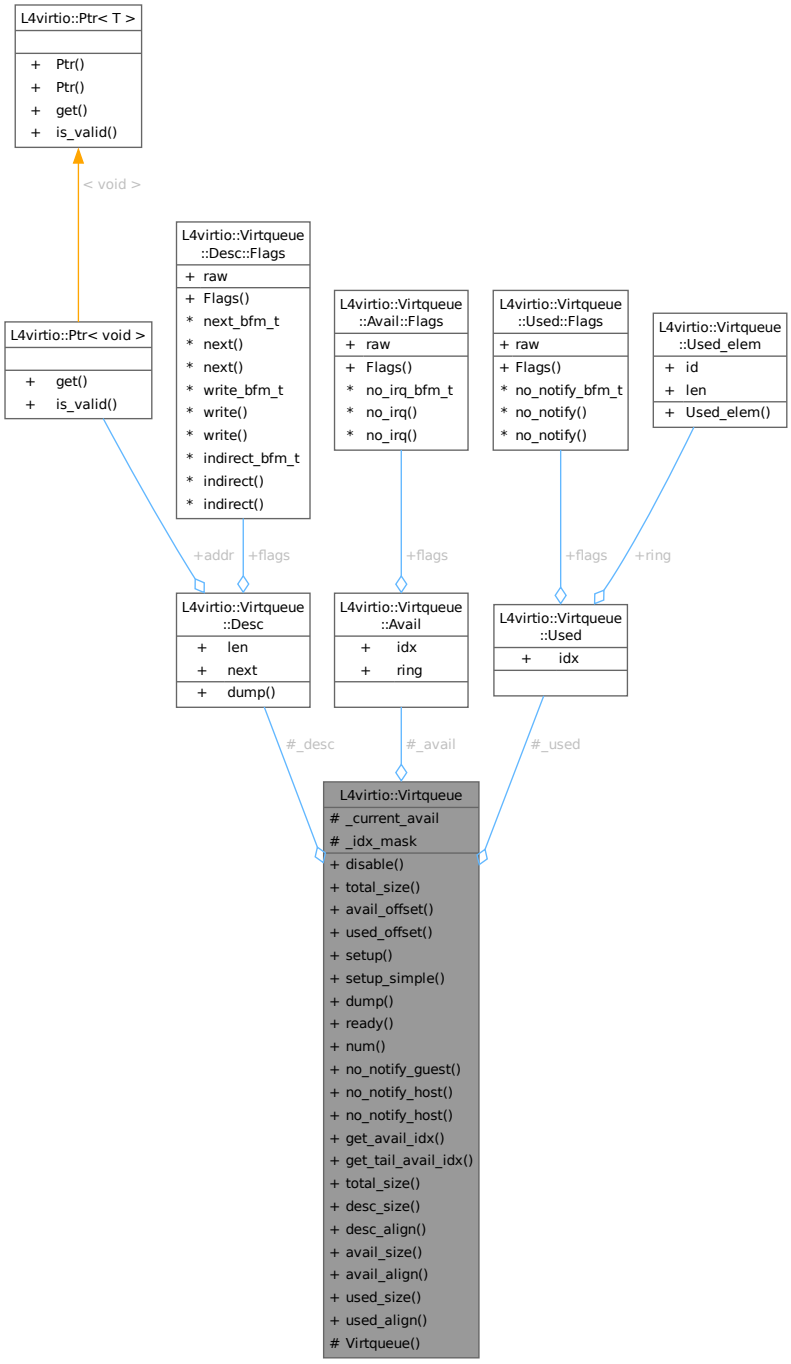
15.442 L4virtio::Virtqueue Class Reference

Low-level Virtqueue.
`#include <virtqueue>`

Inheritance diagram for L4virtio::Virtqueue:



Collaboration diagram for L4virtio::Virtqueue:



Data Structures

- class Desc

  Descriptor in the descriptor table.
- class Avail

  Type of available ring, this is read-only for the host.
- struct Used_elem

  Type of an element of the used ring.

- class Used

  Used ring.

Public Types

- enum

  Fixed alignment values for different parts of a virtqueue.

Public Member Functions

- void disable ()

  Completely disable the queue.
- unsigned long total_size () const

  Calculate the total size of this virtqueue.
- unsigned long **avail_offset** () const

  Get the offset of the available ring from the descriptor table.
- unsigned long **used_offset** () const

  Get the offset of the used ring from the descriptor table.
- void setup (unsigned num, void ∗desc, void ∗avail, void ∗used, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Enable this queue.
- void setup_simple (unsigned num, void ∗ring, L4Re::Util::Dbg msg_dev=L4Re::Util::Dbg{2})

  Enable this queue.
- void dump (Desc const ∗d, L4Re::Util::Dbg dbg=L4Re::Util::Dbg{}) const

  Dump a descriptor for this queue.
- bool ready () const

  Test if this queue is in working state.
- unsigned num () const
- bool no_notify_guest () const

  Get the no IRQ flag of this queue.
- bool no_notify_host () const

  Get the no notify flag of this queue.
- void no_notify_host (bool value)

  Set the no-notify flag for this queue.
- l4_uint16_t get_avail_idx () const

  Get available index from available ring (for debugging).
- l4_uint16_t get_tail_avail_idx () const

  Get tail-available index stored in local state (for debugging).

Static Public Member Functions

- static unsigned long total_size (unsigned num)

  Calculate the total size for a virtqueue of the given dimensions.
- static unsigned long desc_size (unsigned num)

  Calculate the size of the descriptor table for `num` *entries.*
- static unsigned long desc_align ()

  Get the alignment in zero LSBs needed for the descriptor table.
- static unsigned long avail_size (unsigned num)

  Calculate the size of the available ring for `num` *entries.*
- static unsigned long avail_align ()

  Get the alignment in zero LSBs needed for the available ring.
- static unsigned long used_size (unsigned num)

  Calculate the size of the used ring for `num` *entries.*
- static unsigned long used_align ()

  Get the alignment in zero LSBs needed for the used ring.

Protected Member Functions

- **Virtqueue** ()=default

  Create a disabled virtqueue.

Protected Attributes

- Desc * **_desc** = nullptr

  pointer to descriptor table, NULL if queue is off.
- Avail * **_avail** = nullptr

  pointer to available ring.
- Used * **_used** = nullptr

  pointer to used ring.
- l4_uint16_t **_current_avail** = 0

  The life counter for the queue.
- l4_uint16_t **_idx_mask** = 0

  mask used for indexing into the descriptor table and the rings.

15.442.1 Detailed Description

Low-level Virtqueue.
This class represents a single virtqueue, with a local running available index.

Note

The Virtqueue implementation is not thread-safe.

Definition at line 86 of file virtqueue.

15.442.2 Member Function Documentation

15.442.2.1 avail_align()

```
unsigned long L4virtio::Virtqueue::avail_align ()  [inline], [static]
```

Get the alignment in zero LSBs needed for the available ring.

Returns

The alignment in zero LSBs needed for an available ring.

Definition at line 295 of file virtqueue.

15.442.2.2 avail_size()

```
unsigned long L4virtio::Virtqueue::avail_size (
            unsigned num)  [inline], [static]
```

Calculate the size of the available ring for `num` entries.

Parameters

num	The number of entries in the available ring.

Returns

The size in bytes needed for an available ring with `num` entries.

Definition at line 287 of file virtqueue.
References num().
Referenced by L4virtio::Svr::Device_t< No_custom_data >::setup_queue(), and total_size().

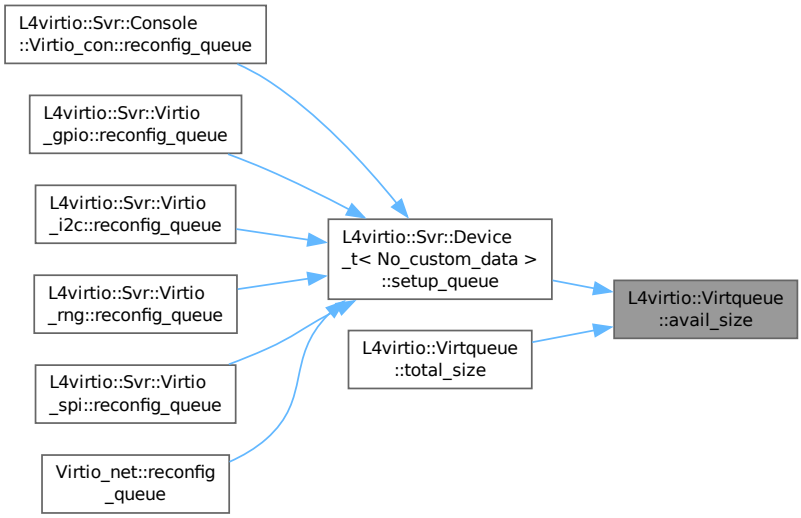
Here is the caller graph for this function:



15.442.2.3 desc_align()

```
unsigned long L4virtio::Virtqueue::desc_align ()  [inline], [static]
```

Get the alignment in zero LSBs needed for the descriptor table.

Returns

The alignment in zero LSBs needed for a descriptor table.

Definition at line 277 of file virtqueue.

15.442.2.4 desc_size()

```
unsigned long L4virtio::Virtqueue::desc_size (
            unsigned num)  [inline], [static]
```

Calculate the size of the descriptor table for num entries.

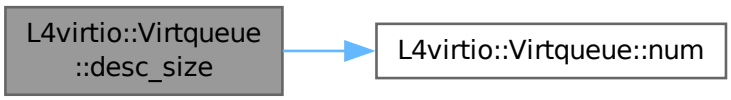
Parameters

num	The number of entries in the descriptor table.

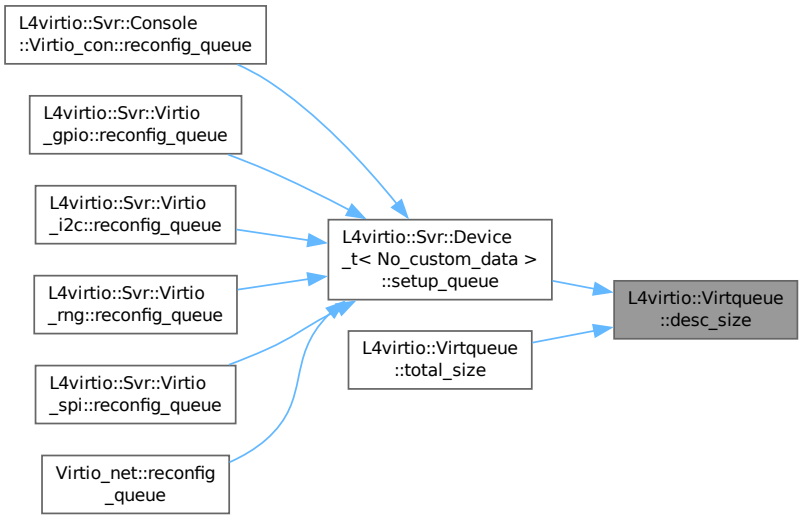
Returns

The size in bytes needed for a descriptor table with num entries.

Definition at line 269 of file virtqueue.
References num().
Referenced by L4virtio::Svr::Device_t< No_custom_data >::setup_queue(), and total_size().
Here is the call graph for this function:



Here is the caller graph for this function:

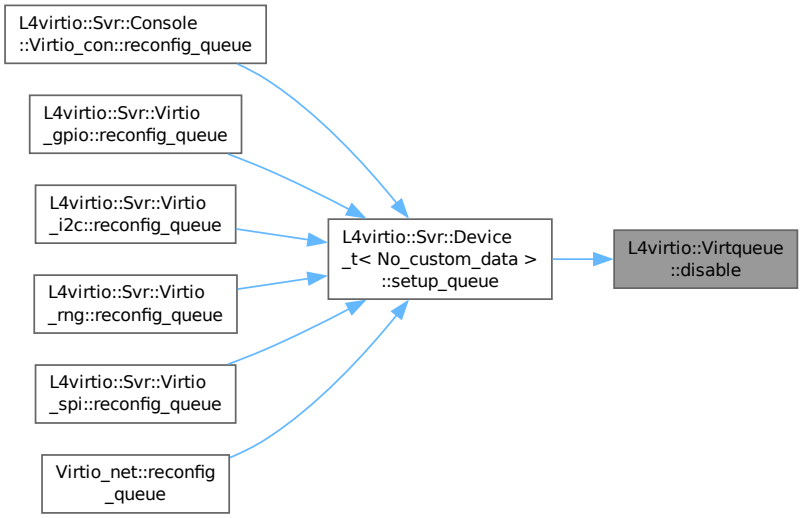


15.442.2.5 disable()

```
void L4virtio::Virtqueue::disable () [inline]
```

Completely disable the queue.
setup() must be used to enable the queue again.
Definition at line 232 of file virtqueue.
References _desc.

Referenced by L4virtio::Svr::Device_t< No_custom_data >::setup_queue().
Here is the caller graph for this function:



15.442.2.6 dump()

```
void L4virtio::Virtqueue::dump (
            Desc const * d,
            L4Re::Util::Dbg dbg = L4Re::Util::Dbg{}) const  [inline]
```

Dump a descriptor for this queue.

Parameters

d	Descriptor pointer.
dbg	Debug channel for printing the information.

Precondition

the queue must be in working state.

Definition at line 411 of file virtqueue.

15.442.2.7 get_avail_idx()

```
l4_uint16_t L4virtio::Virtqueue::get_avail_idx () const  [inline]
```

Get available index from available ring (for debugging).

Precondition

Queue must be in a working state.

Returns

current index in the available ring (shared between device model and device driver).

Definition at line 470 of file virtqueue.
References _avail.

15.442.2.8 get_tail_avail_idx()

```
l4_uint16_t L4virtio::Virtqueue::get_tail_avail_idx () const  [inline]
```

Get tail-available index stored in local state (for debugging).

Returns

current tail index for the the available ring.

Definition at line 477 of file virtqueue.
References _current_avail.

15.442.2.9 no_notify_guest()

```
bool L4virtio::Virtqueue::no_notify_guest () const  [inline]
```

Get the no IRQ flag of this queue.

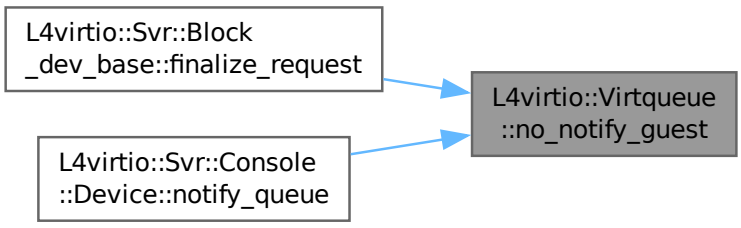
Precondition

queue must be in working state.

Returns

true if the guest does not want to get IRQs (currently).

Definition at line 433 of file virtqueue.
References _avail.
Referenced by L4virtio::Svr::Block_dev_base< Ds_data >::finalize_request(), and L4virtio::Svr::Console::Device::notify_queue().
Here is the caller graph for this function:



15.442.2.10 no_notify_host() [1/2]

```
bool L4virtio::Virtqueue::no_notify_host () const  [inline]
```

Get the no notify flag of this queue.

Precondition

queue must be in working state.

Returns

true if the host does not want to get IRQs (currently).

Definition at line 446 of file virtqueue.
References _used.

15.442.2.11 no_notify_host() [2/2]

```
void L4virtio::Virtqueue::no_notify_host (
            bool value)  [inline]
```

Set the no-notify flag for this queue.

Precondition

Queue must be in a working state.

Definition at line 457 of file virtqueue.
References _used.

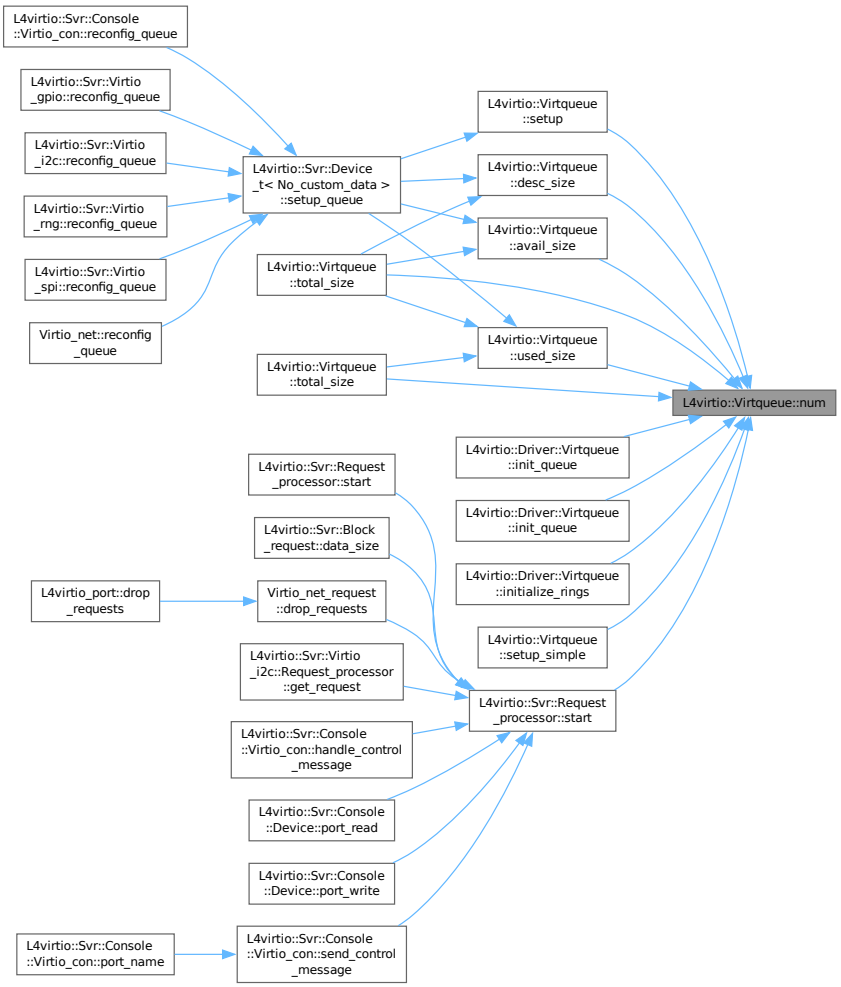
15.442.2.12 num()

```
unsigned L4virtio::Virtqueue::num () const  [inline]
```

Returns

The number of entries in the ring.

Definition at line 423 of file virtqueue.
References _idx_mask.
Referenced by avail_size(), desc_size(), L4virtio::Driver::Virtqueue::init_queue(), L4virtio::Driver::Virtqueue::init_queue(), L4virtio::Driver::Virtqueue::initialize_rings(), setup(), setup_simple(), L4virtio::Svr::Request_processor::start(), total_size(), total_size(), and used_size().
Here is the caller graph for this function:



15.442.2.13 ready()

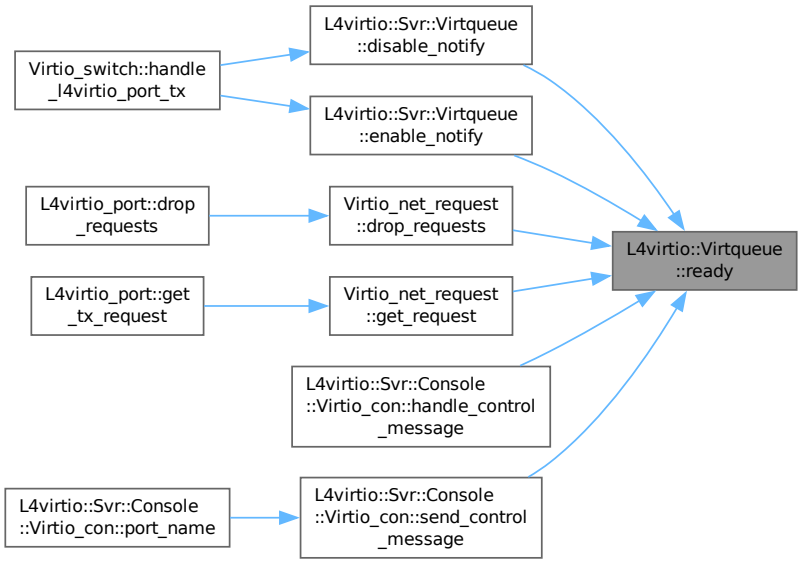
```
bool L4virtio::Virtqueue::ready () const  [inline]
```

Test if this queue is in working state.

Returns

true when the queue is in working state, false else.

Definition at line 419 of file virtqueue.
References _desc, and L4_LIKELY.
Referenced by L4virtio::Svr::Virtqueue::disable_notify(), Virtio_net_request::drop_requests(), L4virtio::Svr::Virtqueue::enable_notify(), Virtio_net_request::get_request(), L4virtio::Svr::Console::Virtio_con::handle_control_message(), and L4virtio::Svr::Console::Virtio_co
Here is the caller graph for this function:



15.442.2.14 setup()

```
void L4virtio::Virtqueue::setup (
            unsigned num,
            void * desc,
            void * avail,
            void * used,
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

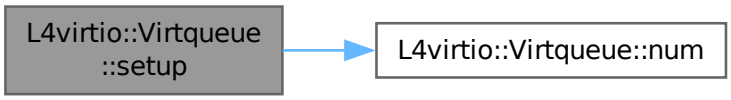
Enable this queue.

Parameters

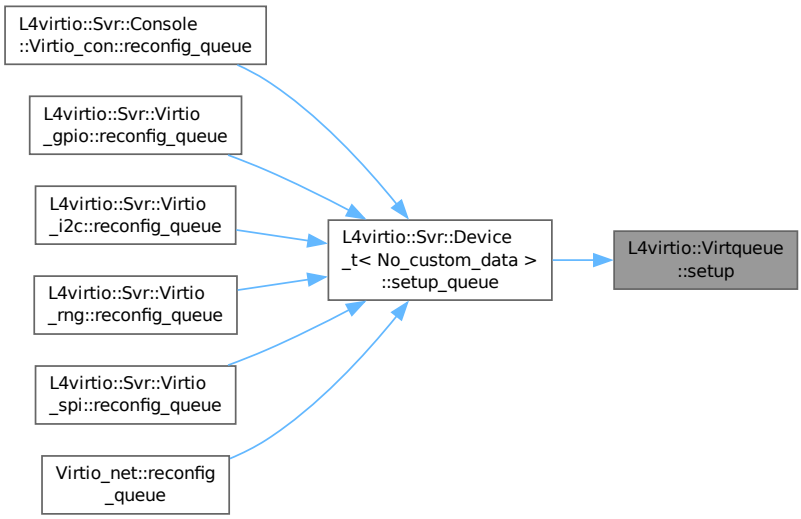
num	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
desc	The address of the descriptor table. (Must be Desc_align aligned and at least `desc_size(num)` bytes in size.)
avail	The address of the available ring. (Must be Avail_align aligned and at least `avail_size(num)` bytes in size.)

used	The address of the used ring. (Must be Used_align aligned and at least `used_size(num)` bytes in size.)
msg_dev	Debug channel for developer-related information. Verbosity of L4Re::Util::Dbg(2) by default.

Due to the data type of the descriptors, the queue can have a maximum size of 2^16.
Definition at line 359 of file virtqueue.
References num().
Referenced by L4virtio::Svr::Device_t< No_custom_data >::setup_queue().
Here is the call graph for this function:



Here is the caller graph for this function:



15.442.2.15 setup_simple()

```
void L4virtio::Virtqueue::setup_simple (
            unsigned num,
            void * ring,
            L4Re::Util::Dbg msg_dev = L4Re::Util::Dbg{2})  [inline]
```

Enable this queue.

Parameters

num	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
ring	The base address for the queue data structure. The memory block at `ring` must be at least `total_size(num)` bytes in size and have an alignment of Desc_align (desc_align()) bits.
msg_dev	Debug channel for developer-related information. Verbosity of L4Re::Util::Dbg(2) by default.

Due to the data type of the descriptors, the queue can have a maximum size of 2^16.

Returns

The alignment in zero LSBs needed for an used ring.

Definition at line 314 of file virtqueue.

15.442.2.19 used_size()

```
unsigned long L4virtio::Virtqueue::used_size (
            unsigned num)  [inline], [static]
```

Calculate the size of the used ring for num entries.

Parameters

num	The number of entries in the used ring.

Returns

The size in bytes needed for an used ring with num entries.

Definition at line 306 of file virtqueue.
References num().
Referenced by L4virtio::Svr::Device_t< No_custom_data >::setup_queue(), total_size(), and total_size().

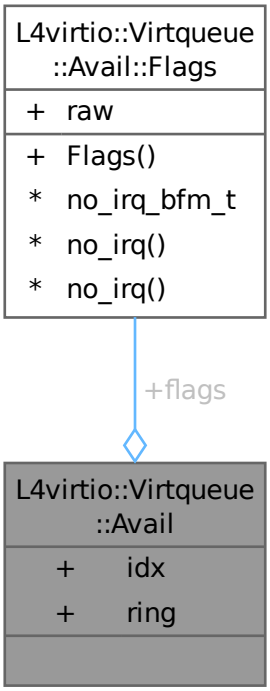
15.443 L4virtio::Virtqueue::Avail Class Reference

Type of available ring, this is read-only for the host.

`#include <virtqueue>`

Collaboration diagram for L4virtio::Virtqueue::Avail:



Data Structures

- struct Flags

  Flags of the available ring.

Data Fields

- Flags **flags**

  flags of available ring
- l4_uint16_t **idx**

  available index written by guest
- l4_uint16_t **ring** [ ]

  array of available descriptor indexes.

15.443.1 Detailed Description

Type of available ring, this is read-only for the host.
Definition at line 136 of file virtqueue.
The documentation for this class was generated from the following file:

- l4/l4virtio/virtqueue

15.444 L4virtio::Virtqueue::Avail::Flags Struct Reference

Flags of the available ring.

`#include <virtqueue>`
Collaboration diagram for L4virtio::Virtqueue::Avail::Flags:

Public Member Functions

- **Flags** (l4_uint16_t v)

  Make Flags from the raw value.

Data Fields

- l4_uint16_t **raw**

  raw 16bit flags value of the available ring.

- typedef cxx::Bitfield< decltype(raw), 0, 0 > no_irq_bfm_t

  Guest does not want to receive interrupts when requests are finished.
- constexpr no_irq_bfm_t::Val **no_irq** () const

  Get the `no_irq` bits (0 to 0) of `raw`.
- constexpr no_irq_bfm_t::Ref **no_irq** ()

  Get a reference to the `no_irq` bits (0 to 0) of `raw`.

15.444.1 Detailed Description

Flags of the available ring.
Definition at line 142 of file virtqueue.

15.444.2 Member Typedef Documentation

15.444.2.1 no_irq_bfm_t

`typedef cxx::Bitfield<decltype(raw), 0, 0> L4virtio::Virtqueue::Avail::Flags::no_irq_bfm_t`
Guest does not want to receive interrupts when requests are finished.
Type to access the `no_irq` bits (0 to 0) of `raw`.
Definition at line 151 of file virtqueue.
The documentation for this struct was generated from the following file:

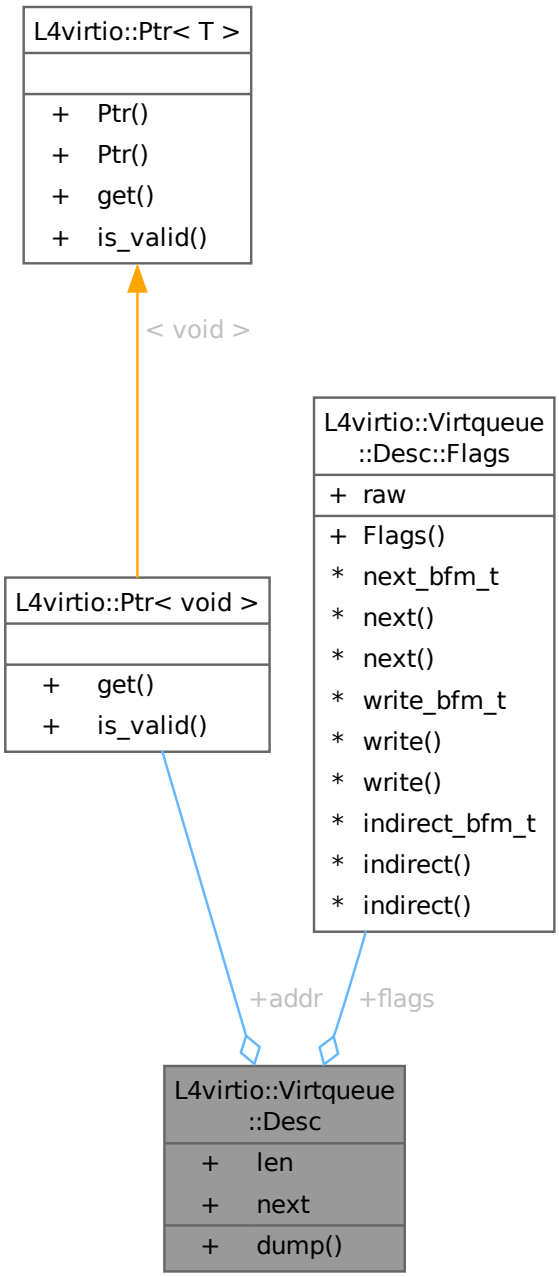
- l4/l4virtio/virtqueue

15.445 L4virtio::Virtqueue::Desc Class Reference

Descriptor in the descriptor table.

`#include <virtqueue>`

Collaboration diagram for L4virtio::Virtqueue::Desc:



Data Structures

- struct Flags

  Type for descriptor flags.

Public Member Functions

- void dump (unsigned idx, L4Re::Util::Dbg dbg=L4Re::Util::Dbg{}) const

  Dump a single descriptor.

Data Fields

- Ptr< void > **addr**

  Address stored in descriptor.
- l4_uint32_t **len**

  Length of described buffer.
- Flags **flags**

  Descriptor flags.
- l4_uint16_t **next**

  Index of the next chained descriptor.

15.445.1 Detailed Description

Descriptor in the descriptor table.
Definition at line 92 of file virtqueue.

15.445.2 Member Function Documentation

15.445.2.1 dump()

```
void L4virtio::Virtqueue::Desc::dump (
            unsigned idx,
            L4Re::Util::Dbg dbg = L4Re::Util::Dbg{}) const  [inline]
```

Dump a single descriptor.

Parameters

idx	Descriptor index.
dbg	Debug channel for printing the information. Verbosity of L4Re::Util::Dbg() by default.

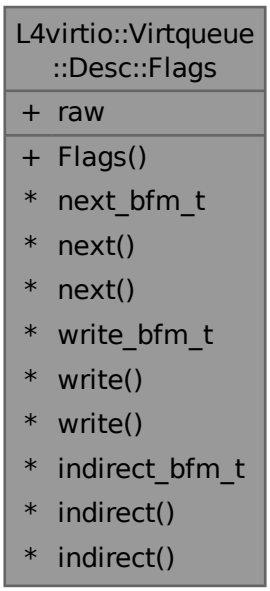
Definition at line 126 of file virtqueue.
The documentation for this class was generated from the following file:

- l4/l4virtio/virtqueue

15.446 L4virtio::Virtqueue::Desc::Flags Struct Reference

Type for descriptor flags.
`#include <virtqueue>`

Collaboration diagram for L4virtio::Virtqueue::Desc::Flags:



Public Member Functions

- **Flags** (l4_uint16_t v)

  Make Flags from raw 16bit value.

Data Fields

- l4_uint16_t **raw**

  raw flags value of a virtio descriptor.

- typedef cxx::Bitfield< decltype(raw), 0, 0 > next_bfm_t

  Part of a descriptor chain which is continued with the next field.

- constexpr next_bfm_t::Val **next** () const

  Get the `next` bits (0 to 0) of `raw`.

- constexpr next_bfm_t::Ref **next** ()

  Get a reference to the `next` bits (0 to 0) of `raw`.

- typedef cxx::Bitfield< decltype(raw), 1, 1 > write_bfm_t

  Block described by this descriptor is writeable.

- constexpr write_bfm_t::Val **write** () const

  Get the `write` bits (1 to 1) of `raw`.

- constexpr write_bfm_t::Ref **write** ()

  Get a reference to the `write` bits (1 to 1) of `raw`.

- typedef cxx::Bitfield< decltype(raw), 2, 2 > indirect_bfm_t

  Indirect descriptor, block contains a list of descriptors.

- constexpr indirect_bfm_t::Val **indirect** () const

  Get the `indirect` bits (2 to 2) of `raw`.

- constexpr indirect_bfm_t::Ref **indirect** ()

  Get a reference to the `indirect` bits (2 to 2) of `raw`.

15.446.1 Detailed Description

Type for descriptor flags.
Definition at line 98 of file virtqueue.

15.446.2 Member Typedef Documentation

15.446.2.1 indirect_bfm_t

```
typedef cxx::Bitfield<decltype(raw), 2, 2> L4virtio::Virtqueue::Desc::Flags::indirect_bfm_t
```

Indirect descriptor, block contains a list of descriptors.
Type to access the `indirect` bits (2 to 2) of `raw`.
Definition at line 111 of file virtqueue.

15.446.2.2 next_bfm_t

```
typedef cxx::Bitfield<decltype(raw), 0, 0> L4virtio::Virtqueue::Desc::Flags::next_bfm_t
```

Part of a descriptor chain which is continued with the next field.
Type to access the `next` bits (0 to 0) of `raw`.
Definition at line 107 of file virtqueue.

15.446.2.3 write_bfm_t

```
typedef cxx::Bitfield<decltype(raw), 1, 1> L4virtio::Virtqueue::Desc::Flags::write_bfm_t
```

Block described by this descriptor is writeable.
Type to access the `write` bits (1 to 1) of `raw`.
Definition at line 109 of file virtqueue.

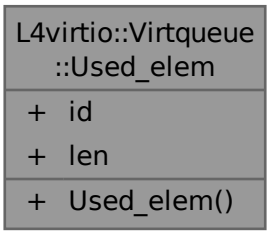
15.449 L4virtio::Virtqueue::Used_elem Struct Reference

Type of an element of the used ring.
`#include <virtqueue>`
Collaboration diagram for L4virtio::Virtqueue::Used_elem:



Public Member Functions

- Used_elem (l4_uint16_t id, l4_uint32_t len)
  Initialize a used ring element.

Data Fields

- l4_uint32_t **id**
  descriptor index
- l4_uint32_t **len**
  length field

15.449.1 Detailed Description

Type of an element of the used ring.
Definition at line 162 of file virtqueue.

15.449.2 Constructor & Destructor Documentation

15.449.2.1 Used_elem()

```
L4virtio::Virtqueue::Used_elem::Used_elem (
            l4_uint16_t id,
            l4_uint32_t len)  [inline]
```

Initialize a used ring element.

Parameters

id	The index of the descriptor to be marked as used.
len	The total bytes written into the buffer of the descriptor chain.

Definition at line 173 of file virtqueue.
References id, and len.

15.453 l4virtio_config_hdr_t Struct Reference

L4-VIRTIO config header, provided in shared data space.
`#include <virtio.h>`
Collaboration diagram for l4virtio_config_hdr_t:

Data Fields

- l4_uint32_t **magic**

  magic value (must be 'virt').
- l4_uint32_t **version**

  VIRTIO version.
- l4_uint32_t **device**

  device ID
- l4_uint32_t **vendor**

  vendor ID
- l4_uint32_t **dev_features**

  device features windows selected by device_feature_sel
- l4_uint32_t **num_queues**

  number of virtqueues
- l4_uint32_t **queues_offset**

  offset of virtqueue config array

15.453.1 Detailed Description

L4-VIRTIO config header, provided in shared data space.
Definition at line 141 of file virtio.h.
The documentation for this struct was generated from the following file:

- l4/l4virtio/virtio.h

15.454 l4virtio_config_queue_t Struct Reference

Queue configuration entry.
`#include <virtio.h>`
Collaboration diagram for l4virtio_config_queue_t:

Data Fields

- l4_uint16_t **num_max**

  R: maximum number of descriptors supported by this queue.
- l4_uint16_t **num**

  RW: number of descriptors configured for this queue.
- l4_uint16_t **ready**

  RW: queue ready flag (read-write).
- l4_uint16_t **driver_notify_index**

  W: Event index to be used for device notifications (device to driver).
- l4_uint64_t **desc_addr**

  W: address of descriptor table.
- l4_uint64_t **avail_addr**

  W: address of available ring.
- l4_uint64_t **used_addr**

  W: address of used ring.
- l4_uint16_t **device_notify_index**

  R: Event index to be used by the driver (driver to device).

15.454.1 Detailed Description

Queue configuration entry.
An array of such entries is available at the l4virtio_config_hdr_t::queues_offset in the config data space.
Consistency rules for the queue config are:

- A driver might read `num_max` at any time.

- A driver must write to num, desc_addr, avail_addr, and used_addr only when ready is zero (0). Values in these fields are validated and used by the device only after successfully setting ready to one (1), either by the IPC or by L4VIRTIO_CMD_CFG_QUEUE.
- The value of device_notify_index is valid only when ready is one.
- The driver might write to device_notify_index at any time, however the change is guaranteed to take effect after a successful L4VIRTIO_CMD_CFG_QUEUE or after a config_queue IPC. Note, the change might also have immediate effect, depending on the device implementation.

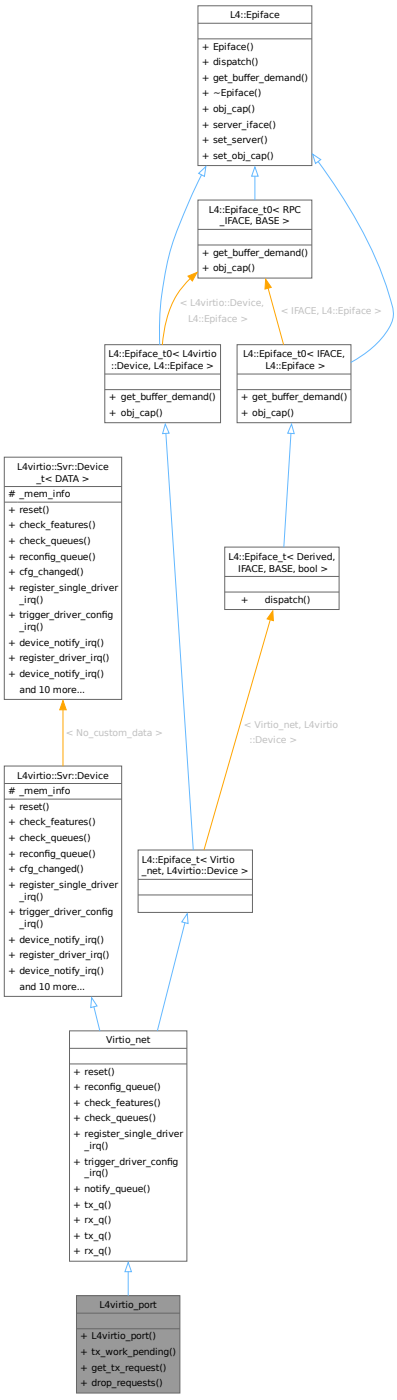
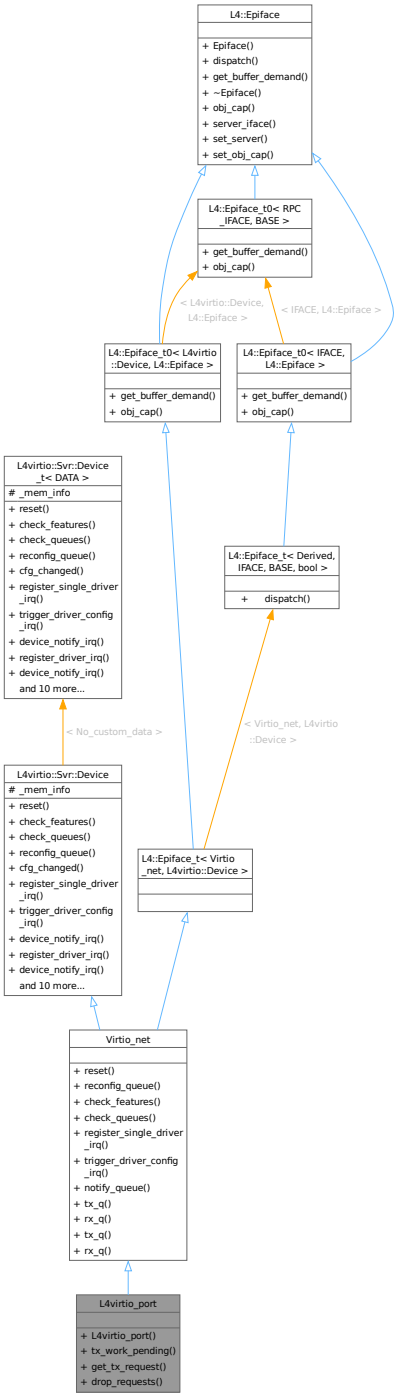
A Port on the Virtio Net Switch.
`#include <port_l4virtio.h>`

Inheritance diagram for L4virtio_port:



Collaboration diagram for L4virtio_port:



Public Member Functions

- **L4virtio_port** (unsigned vq_max, unsigned num_ds, char const ∗name, l4_uint8_t const ∗mac)

  Create a Virtio net port object.
- bool **tx_work_pending** () const

  Check whether there is any work pending on the transmission queue.
- std::optional< Virtio_net_request > **get_tx_request** ()

  Get one request from the transmission queue.

- void drop_requests ()

  Drop all requests pending in the transmission queue.

Public Member Functions inherited from Virtio_net

- void **reset** () override

  reset callback, called for doing a device reset
- int **reconfig_queue** (unsigned index) override

  callback for client queue-config request
- bool **check_features** () override

  callback for checking the subset of accepted features
- bool **check_queues** () override

  Check whether both virtqueues are ready.
- void **register_single_driver_irq** () override

  Save the `_kick_guest_irq` that the client sent via `device_notification_irq()`.
- void **trigger_driver_config_irq** () override

  callback for triggering configuration change notification IRQ
- void notify_queue (L4virtio::Svr::Virtqueue *queue)

  Trigger the `_kick_guest_irq` IRQ.
- Virtqueue * **tx_q** ()

  Getter for the transmission queue.
- Virtqueue * **rx_q** ()

  Getter for the receive queue.
- Virtqueue const * **tx_q** () const

  Getter for the transmission queue.
- Virtqueue const * **rx_q** () const

  Getter for the receive queue.

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual L4::Cap< L4::Irq > **device_notify_irq** () const

  callback to gather the device notification IRQ (old-style)
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config *dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_↩ dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const * **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_↩ notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.

- bool setup_queue (Virtqueue *q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` *register and handle a write.*
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Public Member Functions inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< L4virtio::Device > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.
- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.461.1 Detailed Description

A Port on the Virtio Net Switch.
A Port object gets created by `Virtio_factory::op_create()`. This function actually only instantiates objects of the types `Switch_port` and `Monitor_port`. The created Port registers itself at the switch's server. Usually, the IPC call for port creation comes from ned. To finalize the setup, the client has to initialize the port during the virtio initialization phase. To do this, the client registers a dataspace for queues and buffers and provides an IRQ to notify the client on incoming network requests.
Definition at line 36 of file port_l4virtio.h.

15.461.2 Member Function Documentation

15.461.2.1 drop_requests()

`void L4virtio_port::drop_requests () [inline]`
Drop all requests pending in the transmission queue.
This is used for monitor ports, which are not allowed to send packets.
Definition at line 103 of file port_l4virtio.h.
References Virtio_net_request::drop_requests(), and Virtio_net::tx_q().

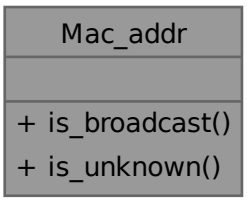
15.462 Mac_addr Class Reference

A wrapper class around the value of a MAC address.
`#include <mac_addr.h>`

Collaboration diagram for Mac_addr:



Public Member Functions

- bool **is_broadcast** () const

  Check if MAC address is a broadcast or multicast address.
- bool **is_unknown** () const

  Check if the MAC address is not yet known.

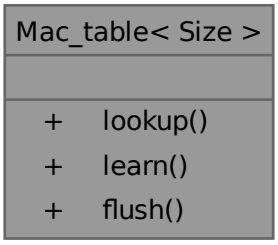
15.462.1 Detailed Description

A wrapper class around the value of a MAC address.
Definition at line 19 of file mac_addr.h.
The documentation for this class was generated from the following file:

- pkg/virtio-net-switch/server/switch/mac_addr.h

15.463 Mac_table< Size > Class Template Reference

Mac_table manages a 1:n association between ports and MAC addresses.
`#include <mac_table.h>`
Collaboration diagram for Mac_table< Size >:



Public Member Functions

- Port_iface * lookup (Mac_addr dst, l4_uint16_t vlan_id) const

  Find the destination port for a MAC address and VLAN id.

- void learn (Mac_addr src, Port_iface *port, l4_uint16_t vlan_id)

  Learn a MAC address (add it to the MAC table).
- void flush (Port_iface *port)

  Flush all associations with a given port.

15.463.1 Detailed Description

template<std::size_t Size = 1024U>
class Mac_table< Size >

Mac_table manages a 1:n association between ports and MAC addresses.
There are different types of devices which might be attached to a port. For a normal device the switch sees exactly one MAC address per port - the MAC address of the device attached to it. But there might be other devices like software bridges attached to the port sending packets with different MAC addresses to the port. Therefore the switch has to manage a 1:n association between ports and MAC addresses. The MAC table manages this association.
When a packet comes in we need to find the destination port for the packet and therefore perform a lookup based on the MAC address.
To prevent unbounded growth of the lookup table, the number of entries is limited. Replacement is done on a round-robin basis. If the capacity was reached, the oldest entry is evicted.
Definition at line 40 of file mac_table.h.

15.463.2 Member Function Documentation

15.463.2.1 flush()

```
template<std::size_t Size = 1024U>
void Mac_table< Size >::flush (
             Port_iface * port)  [inline]
```

Flush all associations with a given port.

Parameters

port	Pointer to port that is to be flushed

This function removes all references to a given port from the MAC table. Since we manage a 1:n association between ports and MAC addresses there might be more than one entry for a given port and we have to iterate over the whole array to delete every reference to the port.
Definition at line 129 of file mac_table.h.

15.463.2.2 learn()

```
template<std::size_t Size = 1024U>
void Mac_table< Size >::learn (
             Mac_addr src,
             Port_iface * port,
             l4_uint16_t vlan_id)  [inline]
```

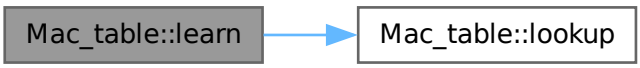
Learn a MAC address (add it to the MAC table).

Parameters

src	MAC address
port	Pointer to the port object that can be used to reach MAC address src
vlan_id	VLAN id of the packet destination.

Will evict the oldest learned address from the table if the maximum capacity was reached and if the MAC address

was not known yet. The source port of the table entry is always updated to cope with clients that move between ports.
Definition at line 78 of file mac_table.h.
References L4_UNLIKELY, and lookup().
Here is the call graph for this function:



15.463.2.3 lookup()

```
template<std::size_t Size = 1024U>
Port_iface * Mac_table< Size >::lookup (
             Mac_addr dst,
             l4_uint16_t vlan_id) const  [inline]
```

Find the destination port for a MAC address and VLAN id.

Parameters

dst	MAC address
vlan_id	VLAN id

Return values

nullptr	The MAC address is not known (yet)
other	Pointer to the destination port

Definition at line 58 of file mac_table.h.
Referenced by learn().

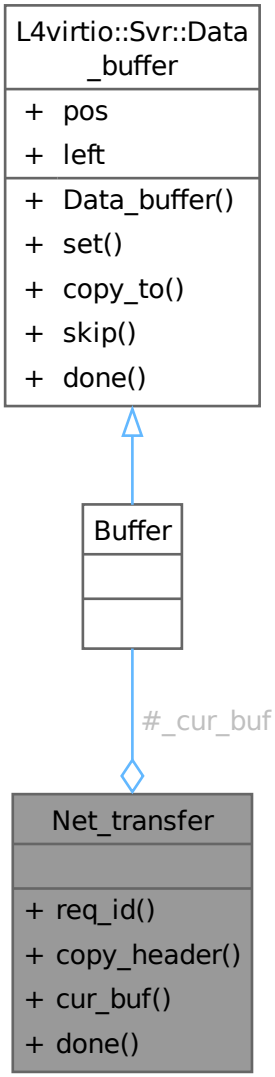
15.464 Net_transfer Class Reference

A network request to only a single destination.
`#include <request.h>`
Collaboration diagram for Net_transfer:



Public Member Functions

- void const ∗ **req_id** () const

  Identifier for the underlying `Net_request`, used for logging purposes.
- virtual void **copy_header** (Virtio_net::Hdr ∗dst_header) const =0

  Populate the virtio-net header for the destination.
- Buffer & cur_buf ()

  Buffer containing (a part of) the packet data.
- virtual bool done ()=0

  Check whether the transfer has been completed, i.e.

15.464.1 Detailed Description

A network request to only a single destination.
A `Net_request` can have multiple destinations (being a broadcast request, for example). That is why it is processed by multiple `Net_transfer`s, each representing the delivery to a single destination port.
`Port_iface::handle_request` uses the `Net_transfer` to move one packet to the destination of the request.
Definition at line 33 of file request.h.

15.464.2 Member Function Documentation

15.464.2.1 cur_buf()

```
Buffer & Net_transfer::cur_buf ()  [inline]
```

Buffer containing (a part of) the packet data.
Once emptied, a call to `done()` might replenish the buffer, in case the net request consisted of multiple chained buffers.
Definition at line 54 of file request.h.

15.464.2.2 done()

```
virtual bool Net_transfer::done ()  [pure virtual]
```

Check whether the transfer has been completed, i.e.
the entire packet data has been copied.

Return values

false	There is remaining packet data that needs to be copied.
true	The entire packet data has been copied.

Exceptions

L4virtio::Svr::Bad_descriptor	Exception raised in SRC port queue.

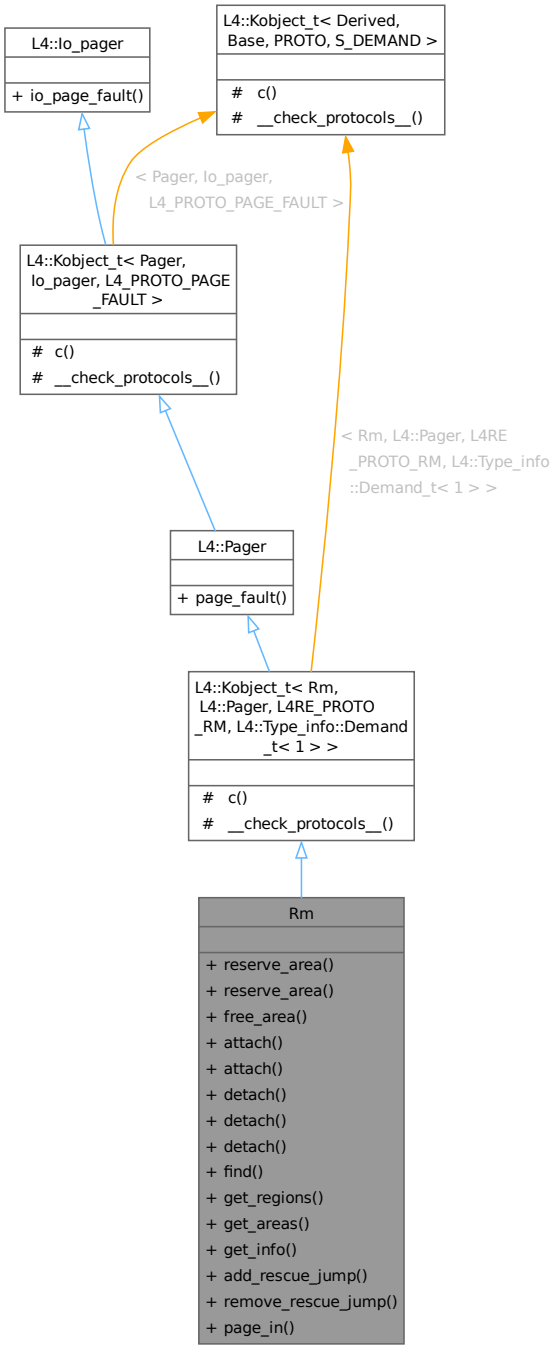
The documentation for this class was generated from the following file:

- pkg/virtio-net-switch/server/switch/request.h

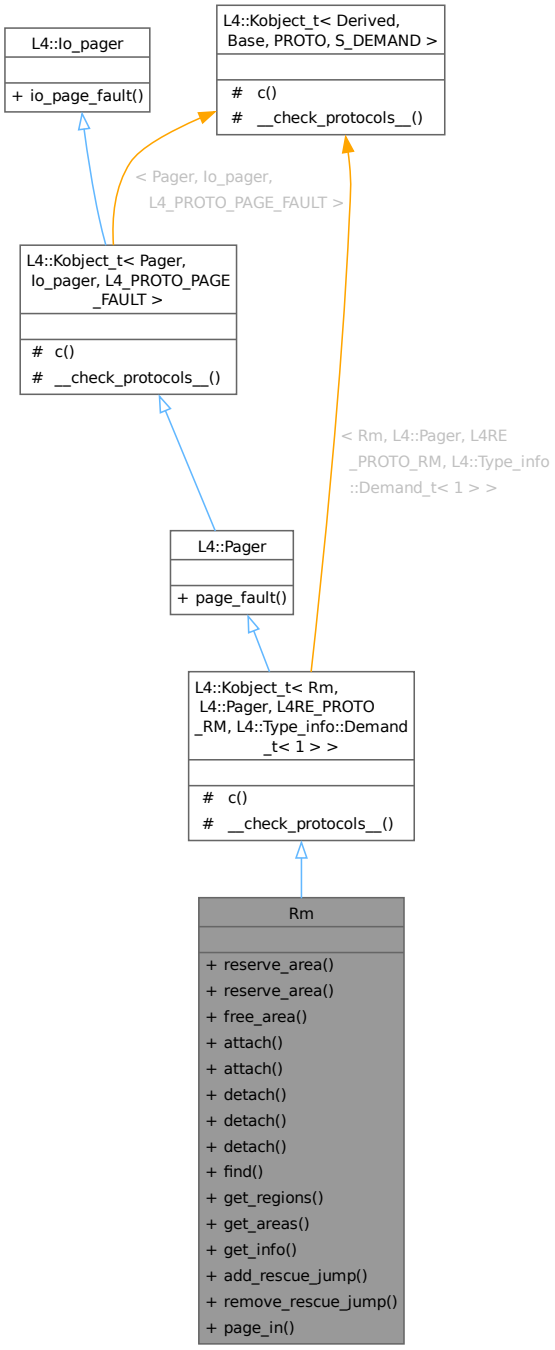
15.465 Rm Class Reference

Region map.
`#include <l4/re/rm>`

Inheritance diagram for Rm:



Collaboration diagram for Rm:



Data Structures

- struct F

  Rm flags definitions.
- class Unique_region

  Unique region.
- struct Region

  A region is a range of virtual addresses which is backed by content.

- struct Area

  An area is a range of virtual addresses which is reserved, see L4Re::Rm::reserve_area().

Public Types

- enum Detach_result {
  Detached_ds = 0 , Kept_ds = 1 , Split_ds = 2 , **Detach_result_mask** = 3 ,
  Detach_again = 4 , Unmapped_range = 8 }

  Result values for detach operation.
- enum Region_flag_shifts { Caching_shift = Dataspace::F::Caching_shift }

  Region flag shifts.
- enum Detach_flags { Detach_exact = 1 , Detach_overlap = 2 }

  Flags for detach operation.
- typedef l4_ret_t(* **page_in_fn**) (l4_addr_t min_addr, l4_addr_t max_addr, Region_flags rights)

  In-thread eager paging function.
- typedef L4::Typeid::Rpcs< attach_t, detach_t, find_t, reserve_area_t, free_area_t, get_regions_t, get_areas_t, get_info_t, add_rescue_jump_t, remove_rescue_jump_t, page_in_t > **Rpcs**

  Eager paging RPC call.

Public Member Functions

- l4_ret_t reserve_area (l4_addr_t *start, unsigned long size, Flags flags=Flags(0), unsigned char align=L4_PAGESHIFT) const noexcept

  Reserve the given area in the region map.
- template<typename T>
  l4_ret_t reserve_area (T **start, unsigned long size, Flags flags=Flags(0), unsigned char align=L4_PAGESHIFT) const noexcept

  Reserve the given area in the region map.
- l4_ret_t free_area (l4_addr_t addr)

  Free an area from the region map.
- l4_ret_t attach (l4_addr_t *start, unsigned long size, Flags flags, L4::Ipc::Cap< Dataspace > mem, Offset offs=0, unsigned char align=L4_PAGESHIFT, L4::Cap< L4::Task > const task=L4::Cap< L4::Task >::Invalid, char const *name=nullptr, Offset backing_offset=0) const noexcept

  Attach a data space to a region.
- template<typename T>
  l4_ret_t attach (T **start, unsigned long size, Flags flags, L4::Ipc::Cap< Dataspace > mem, Offset offs=0, unsigned char align=L4_PAGESHIFT, L4::Cap< L4::Task > const task=L4::Cap< L4::Task >::Invalid, char const *name=nullptr, Offset backing_offset=0) const noexcept

  Attach a data space to a region.
- l4_ret_t detach (l4_addr_t addr, L4::Cap< Dataspace > *mem, L4::Cap< L4::Task > const &task=This_task) const noexcept

  Detach and unmap a region from the address space.
- l4_ret_t detach (void *addr, L4::Cap< Dataspace > *mem, L4::Cap< L4::Task > const &task=This_task) const noexcept

  Detach and unmap a region from the address space.
- l4_ret_t detach (l4_addr_t start, unsigned long size, L4::Cap< Dataspace > *mem, L4::Cap< L4::Task > const &task=This_task) const noexcept

  Detach and unmap all parts of the regions within the specified interval.
- l4_ret_t find (l4_addr_t *addr, unsigned long *size, Offset *offset, L4Re::Rm::Flags *flags, L4::Cap< Dataspace > *m) noexcept

  Find a region given an address and size.
- l4_ret_t get_regions (l4_addr_t start, L4::Ipc::Array_ref< Region > &regions)

  Return the list of regions whose starting addresses are higher or equal to `start` in the address space managed by this region map.

- long get_areas (l4_addr_t start, L4::Ipc::Array_ref< Area > &areas)

  Return the list of areas whose starting addresses are higher or equal to `start` in the address space managed by this region map.
- l4_ret_t get_info (l4_addr_t addr, L4::Ipc::String< char > &name, Offset &backing_offset)

  Return auxiliary information of a region.
- l4_ret_t add_rescue_jump (l4_addr_t pc_begin, l4_addr_t pc_end, l4_addr_t rescue_pc)

  Register a rescue jump for a range of program counters.
- l4_ret_t remove_rescue_jump (l4_addr_t pc)

  Remove a previously registered rescue jump.
- l4_ret_t page_in (l4_addr_t start, unsigned long size, Region_flags rights, L4::Cap< L4::Task > dst=L4::Cap< L4::Task >::Invalid) const noexcept

  Allocate and map pages for the given region.

Public Member Functions inherited from L4::Pager

- l4_msgtag_t page_fault (l4_umword_t pfa, l4_umword_t pc, L4::Ipc::Rcv_fpage rwin, L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)

  Page-fault protocol message.

Public Member Functions inherited from L4::Io_pager

- l4_msgtag_t io_page_fault (l4_fpage_t io_pfa, l4_umword_t pc, L4::Ipc::Rcv_fpage rwin, L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)

  IO page fault protocol message.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Rm, L4::Pager, L4RE_PROTO_RM, L4::Type_info::Demand_t< 1 > >

- typedef Rm **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Rm > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Pager::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Types inherited from L4::Kobject_t< Pager, Io_pager, L4_PROTO_PAGE_FAULT >

- typedef Pager **Class**

  The target interface type (inheriting from Kobject_t).
- typedef Typeid::Iface< PROTO, Pager > **__Iface**

  The interface description for the derived class.
- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename Io_pager::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Rm, L4::Pager, L4RE_PROTO_RM, L4::Type_info::Demand_t< 1 > >

  Helper to check for protocol conflicts.

15.465.1 Detailed Description

Region map.

See also

Region map API .

Definition at line 81 of file rm.

15.465.2 Member Enumeration Documentation

15.465.2.1 Detach_flags

`enum L4Re::Rm::Detach_flags`

Flags for detach operation.

Enumerator

Detach_exact	Do an unmap of the exact region given.
Detach_overlap	Do an unmap of all overlapping regions.

Definition at line 223 of file rm.

15.465.2.2 Detach_result

`enum L4Re::Rm::Detach_result`

Result values for detach operation.

Enumerator

Detached_ds	Detached data space.
Kept_ds	Kept data space.
Split_ds	Split data space, and done.
Detach_again	Detached data space, more to do.
Unmapped_range	The region mananager has already unmapped the pages.

Definition at line 89 of file rm.

15.465.2.3 Region_flag_shifts

```
enum L4Re::Rm::Region_flag_shifts
```
Region flag shifts.

Enumerator

Caching_shift	Start of Rm cache bits.

Definition at line 102 of file rm.

15.465.3 Member Function Documentation

15.465.3.1 add_rescue_jump()

```
l4_ret_t L4Re::Rm::add_rescue_jump (
             l4_addr_t pc_begin,
             l4_addr_t pc_end,
             l4_addr_t rescue_pc)
```
Register a rescue jump for a range of program counters.
If a synchronous exception (e.g. a SIGSEGV with SEGV_MAPERR) is raised by an instruction whose program counter lies in the half-open range `[pc_begin, pc_end)`, execution is diverted to `rescue_pc` instead of delivering the signal to the application.
The registered rescue jumps must not overlap.

Parameters

pc_begin	Inclusive start of the instruction range.
pc_end	Exclusive end of the instruction range.
rescue_pc	Program counter to jump to on a fault in the range.

Return values

0	Success
-L4_EINVAL	Invalid arguments (e.g. `pc_begin >= pc_end`).
-L4_EEXIST	The given range overlaps with an already registered rescue jump.
-L4_ENOMEM	Out of memory.
<0	IPC errors

15.465.3.2 attach() [1/2]

```
l4_ret_t L4Re::Rm::attach (
             l4_addr_t * start,
             unsigned long size,
             Rm::Flags flags,
             L4::Ipc::Cap< Dataspace > mem,
             Rm::Offset offs = 0,
             unsigned char align = L4_PAGESHIFT,
             L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
             char const * name = nullptr,
             Rm::Offset backing_offset = 0) const  [noexcept]
```
Attach a data space to a region.

Parameters

in,out	*start*	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If L4Re::Rm::F::Search_addr is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If L4Re::Rm::F::In_area is given the value is used as a selector for the area (see L4Re::Rm::reserve_area) to attach the data space to.
	size	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	flags	The flags control how and with which rights the dataspace is attached to the region. See L4Re::Rm::F::Attach_flags and L4Re::Rm::F::Region_flags. The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty.
	mem	Data space.
	offs	Offset into the data space to use.
	align	Alignment of the virtual region, log2-size, default: a page (L4_PAGESHIFT). This is only meaningful if the L4Re::Rm::F::Search_addr flag is used.
	task	Optional destination task of mapping if `F::Eager_map` flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	name	Optional name of the region.
	backing_offset	Optional value describing an offset into the backing store of this region.

Return values

0	Success
-L4_ENOENT	No area could be found (see L4Re::Rm::F::In_area)
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see L4Re::Rm::find).

Definition at line 38 of file rm_impl.h.

15.465.3.3 attach() [2/2]

```
template<typename T>
l4_ret_t L4Re::Rm::attach (
             T ** start,
             unsigned long size,
             Flags flags,
```

```
L4::Ipc::Cap< Dataspace > mem,
Offset offs = 0,
unsigned char align = L4_PAGESHIFT,
L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
char const * name = nullptr,
Offset backing_offset = 0) const  [inline], [noexcept]
```

Attach a data space to a region.

Parameters

in,out	*start*	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If L4Re::Rm::F::Search_addr is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If L4Re::Rm::F::In_area is given the value is used as a selector for the area (see L4Re::Rm::reserve_area) to attach the data space to.
	size	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	flags	The flags control how and with which rights the dataspace is attached to the region. See L4Re::Rm::F::Attach_flags and L4Re::Rm::F::Region_flags. The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty.
	mem	Data space.
	offs	Offset into the data space to use.
	align	Alignment of the virtual region, log2-size, default: a page (L4_PAGESHIFT). This is only meaningful if the L4Re::Rm::F::Search_addr flag is used.
	task	Optional destination task of mapping if `F::Eager_map` flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	name	Optional name of the region.
	backing_offset	Optional value describing an offset into the backing store of this region.

Return values

0	Success
-L4_ENOENT	No area could be found (see L4Re::Rm::F::In_area)
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see L4Re::Rm::find).

Definition at line 405 of file rm.

15.465.3.4 detach() [1/3]

```
l4_ret_t L4Re::Rm::detach (
            l4_addr_t addr,
            L4::Cap< Dataspace > * mem,
            L4::Cap< L4::Task > const & task = This_task) const  [inline], [noexcept]
```

Detach and unmap a region from the address space.

Parameters

	addr	Virtual address of region, any address within the region is valid.
out	*mem*	Dataspace that is affected. Give 0 if not interested.
	task	This argument specifies the task where the pages are unmapped. Provide L4::Cap<L4::Task>::Invalid for none. The default is the current task.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees a region in the virtual address space given by addr (address type). The corresponding part of the address space is now available again.
Definition at line 895 of file rm.

15.465.3.5 detach() [2/3]

```
l4_ret_t L4Re::Rm::detach (
            l4_addr_t start,
            unsigned long size,
            L4::Cap< Dataspace > * mem,
            L4::Cap< L4::Task > const & task = This_task) const  [inline], [noexcept]
```

Detach and unmap all parts of the regions within the specified interval.

Parameters

	start	Start of area to detach, must be within region.
	size	Size of of area to detach (in bytes).
out	*mem*	Dataspace that is affected. Give 0 if not interested.
	task	This argument specifies the task where the pages are unmapped. Provide L4::Cap<L4::Task>::Invalid for none. The default is the current task.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees all regions within the interval given by start and size. If a region overlaps the start or the end of the interval this region is only detached partly. If the interval is within one region the original region is split up into two separate

regions.
Definition at line 908 of file rm.

15.465.3.6 detach() [3/3]

```
l4_ret_t L4Re::Rm::detach (
            void * addr,
            L4::Cap< Dataspace > * mem,
            L4::Cap< L4::Task > const & task = This_task) const  [inline], [noexcept]
```

Detach and unmap a region from the address space.

Parameters

	addr	Virtual address of region, any address within the region is valid.
out	*mem*	Dataspace that is affected. Give 0 if not interested.
	task	This argument specifies the task where the pages are unmapped. Provide L4::Cap<L4::Task>::Invalid for none. The default is the current task.

Return values

L4Re::Rm::Detach_result	On success.
-L4_ENOENT	No region found.
<0	IPC errors

Frees a region in the virtual address space given by addr (address type). The corresponding part of the address space is now available again.
Definition at line 900 of file rm.

15.465.3.7 find()

```
l4_ret_t L4Re::Rm::find (
            l4_addr_t * addr,
            unsigned long * size,
            Offset * offset,
            L4Re::Rm::Flags * flags,
            L4::Cap< Dataspace > * m)  [inline], [noexcept]
```

Find a region given an address and size.

Parameters

in,out	*addr*	Address to look for. Returns the start address of the found region.
in,out	*size*	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	*offset*	Offset at the beginning of the region within the associated dataspace.
out	*flags*	Region flags, see F::Region_flags (and F::In_area).
out	*m*	Associated dataspace or paging service. May be an invalid capability, see below.

Return values

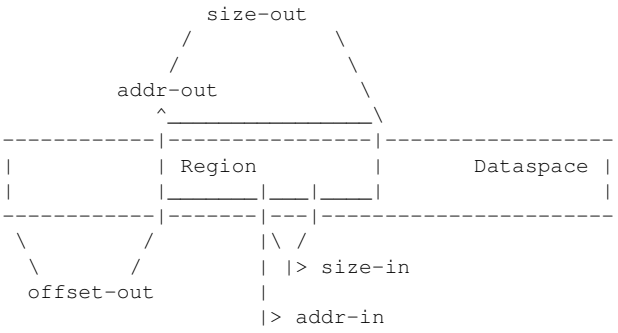
0	Success

-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the addr and size parameter. If no such region is found but a reserved area, the area is returned and F::In_area is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

Note

`m` is the dataspace that was passed when the region was attached. It is L4_INVALID_CAP whenever the region has no such dataspace, which is the case for regions attached with F::Anonymous because the memory is provided by the region manager itself. Additionally, the capability slot may have been reused by the application in the meantime. Thus, callers must be careful when using `m` of regions that have been created or manipulated by other code.



Note

The value of the size input parameter should be 1 to assure that a region can be determined unambiguously.

Definition at line 680 of file rm.

15.465.3.8 free_area()

```
l4_ret_t L4Re::Rm::free_area (
             l4_addr_t addr)
```

Free an area from the region map.

Parameters

addr	An address within the area to free.

Return values

0	Success
-L4_ENOENT	No area found.
<0	IPC errors

Note

The data spaces that are attached to that area are not detached by this operation.

See also

reserve_area() for more information about areas.

15.465.3.9 get_areas()

```
long L4Re::Rm::get_areas (
            l4_addr_t start,
            L4::Ipc::Array_ref< Area > & areas)
```

Return the list of areas whose starting addresses are higher or equal to `start` in the address space managed by this region map.

Parameters

	start	Virtual address from where to start searching.
out	*areas*	List of areas found in this region map.

Return values

>=0	Number of returned areas in the `areas` array.
<0	IPC errors

Note

The returned list of areas might not be complete and the caller shall use the function repeatedly with a start address one larger than the end address of the last area from the previous call.

15.465.3.10 get_info()

```
l4_ret_t L4Re::Rm::get_info (
            l4_addr_t addr,
            L4::Ipc::String< char > & name,
            Offset & backing_offset)
```

Return auxiliary information of a region.
This is a debugging feature and might not be available.

Parameters

	addr	Virtual address of the region.
out	*name*	Name of the region.
out	*backing_offset*	Backing offset information.

Return values

0	Success
-L4_ENOENT	Region not found.
-L4_ENOSYS	Function not available.
<0	IPC errors

15.465.3.11 get_regions()

```
l4_ret_t L4Re::Rm::get_regions (
            l4_addr_t start,
```

```
L4::Ipc::Array_ref< Region > & regions)
```

Return the list of regions whose starting addresses are higher or equal to `start` in the address space managed by this region map.

Parameters

	start	Virtual address from where to start searching.
out	*regions*	List of regions found in this region map.

Return values

>=0	Number of returned regions in the `regions` array.
<0	IPC errors

Note

The returned list of regions might not be complete and the caller shall use the function repeatedly with a start address one larger that the end address of the last region from the previous call.

15.465.3.12 page_in()

```
l4_ret_t L4Re::Rm::page_in (
            l4_addr_t start,
            unsigned long size,
            Rm::Region_flags rights,
            L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid) const  [noexcept]
```

Allocate and map pages for the given region.

Establish mappings of all pages in a region so that no page faults should happen after the call returned. Note that dataspace providers may unmap pages at their own discretion. This call is therefore no guarantee that page faults cannot happen.

The whole range must be backed by attached regions. It is not possible to request more rights than with what the region was attached in the first place.

Parameters

start	Start address.
size	Size of region.
rights	Requested mapping attributes (any combination of F::R, F::W and F::X).
dst	Optional destination task of mapping. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.

Return values

0	Success
-L4_EACCESS	More rights requested than attached region.
-L4_ENOENT	At least some part of the range was not covered by a region.
-L4_ENODEV	Region was not backed by a dataspace.
<0	IPC errors and other errors from dataspace provider (see L4Re::Dataspace::map).

Definition at line 116 of file rm_impl.h.

15.465.3.13 remove_rescue_jump()

```
l4_ret_t L4Re::Rm::remove_rescue_jump (
            l4_addr_t pc)
```

Remove a previously registered rescue jump.
The rescue jump whose instruction range contains `pc` is removed.

Parameters

pc	Any program counter inside the registered range.

Return values

0	Success
-L4_ENOENT	No rescue jump covers `pc`.
<0	IPC errors

15.465.3.14 reserve_area() [1/2]

```
l4_ret_t L4Re::Rm::reserve_area (
            l4_addr_t * start,
            unsigned long size,
            Flags flags = Flags(0),
            unsigned char align = L4_PAGESHIFT) const  [inline], [noexcept]
```

Reserve the given area in the region map.

Parameters

`in,out`	*start*	The virtual start address of the area to reserve. Returns the start address of the area.
	size	The size of the area to reserve (in bytes).
	flags	Flags for the reserved area (see F::Search_addr, F::Kernel and F::Reserved).
	align	Alignment of area if searched as bits (log2 value).

Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
-L4_EINVAL	Invalid parameters
<0	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (*flags* = L4Re::Rm::F::Reserved), where no data spaces can be attached
- Special purpose areas (*flags* = 0), where data spaces can be attached to the area via the L4Re::Rm::F::In_area flag and a start address within the area itself.

Note

When searching for a free place in the virtual address space (with *flags* = L4Re::Rm::F::Search_addr), the space between *start* and the end of the virtual address space is searched.

Definition at line 275 of file rm.

15.465.3.15 reserve_area() [2/2]

```
template<typename T>
l4_ret_t L4Re::Rm::reserve_area (
             T ** start,
             unsigned long size,
             Flags flags = Flags(0),
             unsigned char align = L4_PAGESHIFT) const  [inline], [noexcept]
```

Reserve the given area in the region map.

Parameters

in,out	*start*	The virtual start address of the area to reserve. Returns the start address of the area.
	size	The size of the area to reserve (in bytes).
	flags	Flags for the reserved area (see F::Search_addr, F::Kernel and F::Reserved).
	align	Alignment of area if searched as bits (log2 value).

Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
-L4_EINVAL	Invalid parameters
<0	IPC errors

15.467.2 Member Enumeration Documentation

15.467.2.1 Attach_flags

`enum L4Re::Rm::F::Attach_flags : l4_uint32_t`
Flags for attach operation.

Enumerator

Search_addr	Search for a suitable address range.
In_area	Search only in area, or map into area.
Eager_map	Eagerly map the attached data space in.
No_eager_map	Prevent eager mapping of the attached data space.
Attach_mask	Mask of all attach flags.

Definition at line 112 of file rm.

15.467.2.2 Region_flags

`enum L4Re::Rm::F::Region_flags : l4_uint16_t`
Region flags (permissions, cacheability, special).

Enumerator

Rights_mask	Region rights.
R	Readable region.
W	Writable region.
X	Executable region.
RW	Readable and writable region.
RX	Readable and executable region.
RWX	Readable, writable and executable region.
Kernel	Kernel-provided memory (KUMEM).
Pager	Region has a pager. Page faults in this region are not handled by ITAS but rather forwarded to the external region manager / pager.
Reserved	Region is reserved (blocked).
Private	Attach the dataspace privately with copy-on-write semantics. That is, updates to the mapping are not visible in the underlying dataspace.
Anonymous	Attach anonymous memory in the region. The caller must not pass a dataspace. Instead, the region manager provides anonymous memory for the region.
Caching_mask	Mask of all Rm cache bits.
Cache_normal	Cache bits for normal cacheable memory. This is the default if no other cache-related flag was specified.
Cache_buffered	Cache bits for buffered (write combining) memory.

Cache_uncached	Cache bits for uncached memory.
Ds_map_mask	Mask for all bits for cache options and rights.
Region_flags_mask	Mask of all region flags.

15.469.1 Detailed Description

template<typename T>
class Rm::Unique_region< T >

Unique region.
Capture a single region with automatic detach on destruction and unique ownership. Stores the start address and the region-mapper capability internally. A unique region is valid precisely if the internal region-mapper capability is valid. The features for unique ownership and automatic detach are only active for valid unique regions.
Definition at line 431 of file rm.

15.469.2 Constructor & Destructor Documentation

15.469.2.1 Unique_region() [1/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
            T addr)  [inline], [explicit], [noexcept]
```

Construct a `Unique_region` from an address.
No region manager is set.

Parameters

addr	The new address

Definition at line 452 of file rm.

15.469.2.2 Unique_region() [2/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
            T addr,
            L4::Cap< Rm > const & rm)  [inline], [noexcept]
```

Construct a valid Unique_region from an address and a region manager.

Parameters

addr	The address
rm	The region manager

Definition at line 461 of file rm.

15.469.2.3 Unique_region() [3/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
            Unique_region< T > && o)  [inline], [noexcept]
```

Move-Construct a Unique_region.

- Type_info::Demand **get_buffer_demand** () const

Get the server-side buffer demand based in IFACE.

- Cap< L4::Factory > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.

- virtual ~**Epiface** ()=0

  Destroy the object.

- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.

- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.

- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.

- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< L4::Factory, L4::Epiface >

- using **Interface**

  Data type of the IPC interface definition.

Public Types inherited from L4::Epiface

- using **Server_iface** = Ipc_svr::Server_iface

  Type for abstract server interface.

- using **Demand** = Ipc_svr::Server_iface::Demand

  Type for server-side receive buffer demand.

15.470.1 Detailed Description

The IPC interface for creating ports.
The Switch factory provides an IPC interface to create ports. Ports are the only option for a client to communicate with the switch and, thus, with other network devices.
The `Switch_factory` gets constructed when the net switch application gets started. It thereafter gets registered on the switch's server to serve IPC `create` calls.
Definition at line 114 of file main.cc.

15.470.2 Member Function Documentation

15.470.2.1 op_create()

```
long Switch_factory::op_create (
            L4::Factory::Rights ,
            L4::Ipc::Cap< void > & res,
            l4_umword_t type,
            L4::Ipc::Varg_list_ref va)  [inline]
```

Handle factory protocol.
This function is invoked after an incoming factory::create request and creates a new port or statistics interface if possible.
Definition at line 533 of file main.cc.
References L4_EINVAL.
The documentation for this class was generated from the following file:

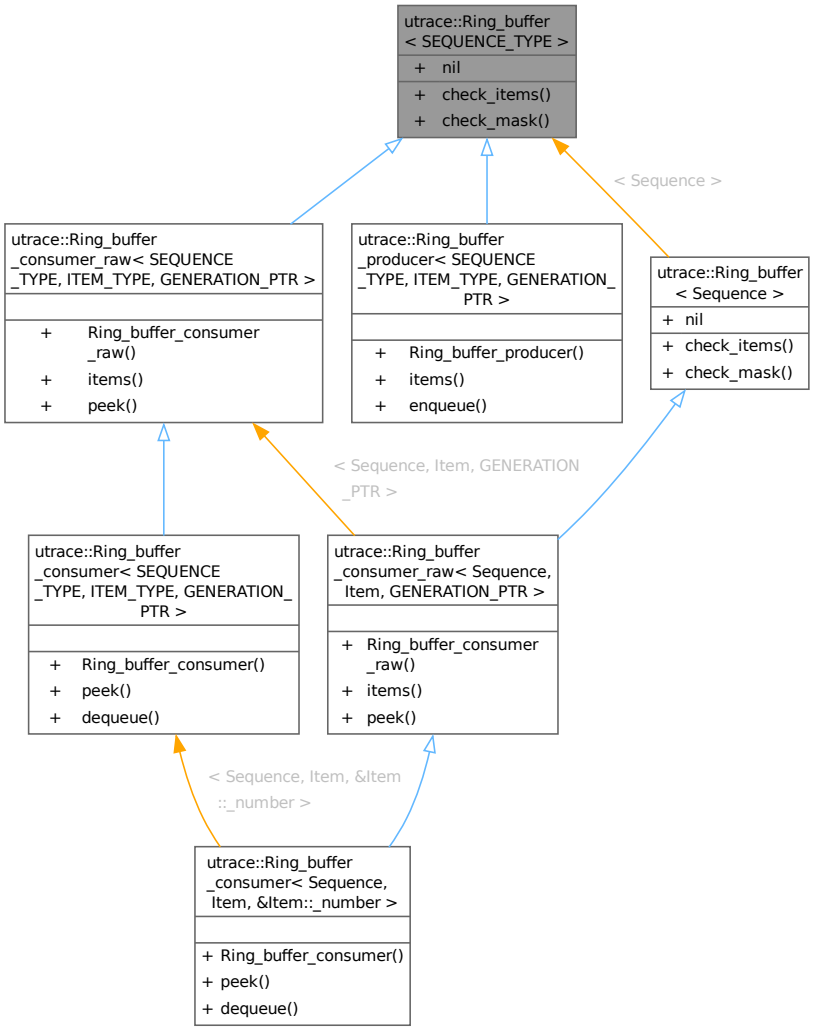
15.471 utrace::Ring_buffer< SEQUENCE_TYPE > Class Template Reference

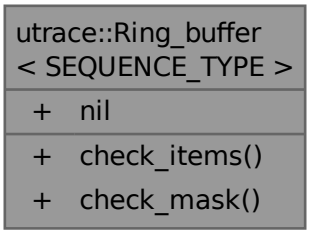
Ring buffer.

`#include <ring_buffer>`

Inheritance diagram for utrace::Ring_buffer< SEQUENCE_TYPE >:



Collaboration diagram for utrace::Ring_buffer< SEQUENCE_TYPE >:



Static Public Member Functions

- static void check_items (size_t const items)

  Check that the number of items is a power of two.
- static void check_mask (size_t const mask)

  Check that the item mask is a power of two minus one.

Static Public Attributes

- static constexpr Sequence const **nil** = 0U

  Invalid (non-committed) items set their sequence counter to 0.

15.471.1 Detailed Description

template<typename SEQUENCE_TYPE>
class utrace::Ring_buffer< SEQUENCE_TYPE >

Ring buffer.
Base class of all ring buffer objects. Not directly usable by the user.

Template Parameters

SEQUENCE_TYPE	Numerical type for storing sequence and generation counters. Must be suitable for atomic access.

Definition at line 63 of file ring_buffer.

15.471.2 Member Function Documentation

15.471.2.1 check_items()

```
template<typename SEQUENCE_TYPE>
void utrace::Ring_buffer< SEQUENCE_TYPE >::check_items (
            size_t const items)  [inline], [static]
```

Check that the number of items is a power of two.
This ring buffer implementation supports a non-zero power of two number of items.

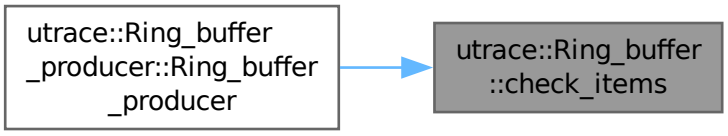
Parameters

items	Number of items.

Exceptions

std::invalid_argument	If the number of items is zero or not a power of two.

Definition at line 83 of file ring_buffer.
Referenced by utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::Ring_buffer_producer().
Here is the caller graph for this function:



15.471.2.2 check_mask()

```
template<typename SEQUENCE_TYPE>
void utrace::Ring_buffer< SEQUENCE_TYPE >::check_mask (
            size_t const mask)  [inline], [static]
```

Check that the item mask is a power of two minus one.
This ring buffer implementation uses the bitwise AND for implementing a modulo operation with the number of items.
Thus the item mask must be a power of two minus one.

Parameters

mask	Item mask.

Exceptions

td::length_error	If the item mask is not a power of two minus one.

Definition at line 103 of file ring_buffer.
Referenced by utrace::Ring_buffer_consumer_raw< Sequence, Item, GENERATION_PTR >::Ring_buffer_consumer_raw().

Here is the caller graph for this function:

- static constexpr Sequence const **nil** = 0U

  Invalid (non-committed) items set their sequence counter to 0.

15.472.1 Detailed Description

template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
class utrace::Ring_buffer_consumer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >

Blocking ring buffer consumer.
Both the ring buffer status area and ring buffer slots are accessed in a read-only fashion.

Template Parameters

SEQUENCE_TYPE	Numerical type for storing sequence and generation counters. Must be suitable for atomic access.
ITEM_TYPE	Actual ring buffer item type.
GENERATION_PTR	Class member pointer to the member that contains the sequence number within the item. The member needs to be suitable for an atomic reference.

Definition at line 507 of file ring_buffer.

15.472.2 Constructor & Destructor Documentation

15.472.2.1 Ring_buffer_consumer()

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
utrace::Ring_buffer_consumer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::Ring_buffer_consumer
(
            Status const & status,
            Slot const * slots)  [inline]
```

Construct ring buffer consumer.

Parameters

status	Ring buffer status area.
slots	Ring buffer slots.

Exceptions

td::length_error	If the item mask (in the ring buffer status area) is not a power of two minus one.

Definition at line 532 of file ring_buffer.

15.472.3 Member Function Documentation

15.472.3.1 dequeue()

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
size_t utrace::Ring_buffer_consumer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::dequeue (
            Item items[],
            size_t capacity,
            size_t burst,
            Drop_policy policy,
            Yield const & yield,
            Sequence * drops = nullptr)  [inline]
```

Dequeue items from the ring buffer.

Dequeue multiple items from the ring buffer. The goal is to dequeue as many items as available from the ring buffer in a single call to avoid overhead. This operation blocks until at least *burst* items have been dequeued (but returns immediately if an item is dropped).

The implementation implicitly spins actively while waiting for items to be dequeued from the ring buffer. The *yield* function can implement passive waiting. Its argument is the number of idle spinning cycles that already happened and if the function returns true, this number is reset.

Parameters

out	*items*	Array to dequeue the next items from the ring buffer into (as copies).
	capacity	Capacity of *items* (in items).
	burst	Minimal number of items that should be collected before returning in case of waiting for items.
	policy	Item drop policy.
	yield	Yield function to implement passive waiting. Executed in every spinning cycle when no next item has been produced yet. Its argument is the current counter of the idle spinning cycles and that counter is reset when the function returns true.
out	*drops*	Pointer to store the number of items that have been dropped. Can be nullptr.

Returns

Number of items dequeued and stored into *items*.

Definition at line 592 of file ring_buffer.

15.472.3.2 peek()

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
State utrace::Ring_buffer_consumer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::peek (
            Item & item,
            Drop_policy policy,
            Sequence * drops = nullptr)  [inline]
```

Poll and possibly dequeue an item from the ring buffer.
This operation never blocks. However, since the expected sequence counter of the next item is managed internally with mutual exclusion, multiple concurrent calls to this method might affect the latency.

Parameters

out	*item*	Reference to dequeue the next item from the ring buffer into (as a copy).
	policy	Item drop policy.
out	*drops*	Pointer to store the number of items that have been dropped. Can be nullptr.

Return values

State::Idle	No next item has been produced yet. No item has been dequeued, no item has been dropped.
State::Ready	A next item has been dequeued from the ring buffer and stored in *item*. No item has been dropped.
State::Drop	Some items have been dropped (missed). No item has been dequeued. The number of dropped items has been stored to *drops* (if non-nullptr).

Definition at line 557 of file ring_buffer.
Referenced by utrace::Ring_buffer_consumer< Sequence, Item, &Item::_number >::dequeue().
Here is the caller graph for this function:

15.473.1 Detailed Description

template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
class utrace::Ring_buffer_consumer_raw< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >

Polling ring buffer consumer.
Both the ring buffer status area and ring buffer slots are accessed in a read-only fashion.

Template Parameters

SEQUENCE_TYPE	Numerical type for storing sequence and generation counters. Must be suitable for atomic access.
ITEM_TYPE	Actual ring buffer item type.
GENERATION_PTR	Class member pointer to the member that contains the sequence number within the item. The member needs to be suitable for an atomic reference.

Definition at line 331 of file ring_buffer.

15.473.2 Member Enumeration Documentation

15.473.2.1 Drop_policy

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
enum class utrace::Ring_buffer_consumer_raw::Drop_policy  [strong]
```

Item drop policy.
This affects the behavior of the consumer when an item drop is detected (i.e. the consumer loses access to an item or multiple items in the ring buffer that have been overwritten by a producer in the meantime).

Enumerator

Conservative	Conservative item drop policy. Continue with the newest item in the ring buffer (i.e. proactively drop all the items except the newest one). This policy is suitable when the production of items is always faster than the consumption and it gives the consumer a chance to dequeue at least some items from the ring buffer before it falls behind again.
Minimal	Minimal item drop policy. Continue with the oldest item in the ring buffer (i.e. do not proactively drop more items than those that have been lost already). This policy is suitable when the production of items is mostly slower than the consumption and the consumer is able to catch up after an occasional drop of items.

Definition at line 350 of file ring_buffer.

15.473.3 Constructor & Destructor Documentation

consumer_raw (
            Status const & status,
            Slot const * slots)  [inline]
```

Construct ring buffer consumer.

Parameters

status	Ring buffer status area.
slots	Ring buffer slots.

Exceptions

td::length_error	If the item mask (in the ring buffer status area) is not a power of two minus one.

Definition at line 391 of file ring_buffer.

15.473.4 Member Function Documentation

15.473.4.1 peek()

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
State utrace::Ring_buffer_consumer_raw< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::peek (
            Item & item,
            Drop_policy policy,
            Sequence & current,
            Sequence * drops = nullptr) const  [inline]
```

Poll and possibly dequeue an item from the ring buffer.
This operation never blocks.

Parameters

out	*item*	Reference to dequeue the next item from the ring buffer into (as a copy).
	policy	Item drop policy.
in,out	*current*	Sequence counter of the next item to be dequeued from the ring buffer. Initialize to Ring_buffer::nil to get the sequence counter of the oldest or the newest item currently available in the ring buffer (depending on the item drop policy).
out	*drops*	Pointer to store the number of items that have been dropped. Can be nullptr.

Return values

State::Idle	The next item with the expected sequence counter has not been produced yet. No item has been dequeued, no item has been dropped, the sequence counter is unchanged.
State::Ready	The next item (with the expected sequence counter) has been dequeued from the ring buffer and stored in *item*. The sequence counter *current* has been advanced to the next expected item. No item has been dropped.
State::Drop	Some items have been dropped (missed). No item has been dequeued. The number of dropped items has been stored to *drops* (if non-nullptr). The sequence counter *current* has been advanced to the oldest (if the drop policy is Minimal) or to the newest (if the drop policy is Conservative), respectively.

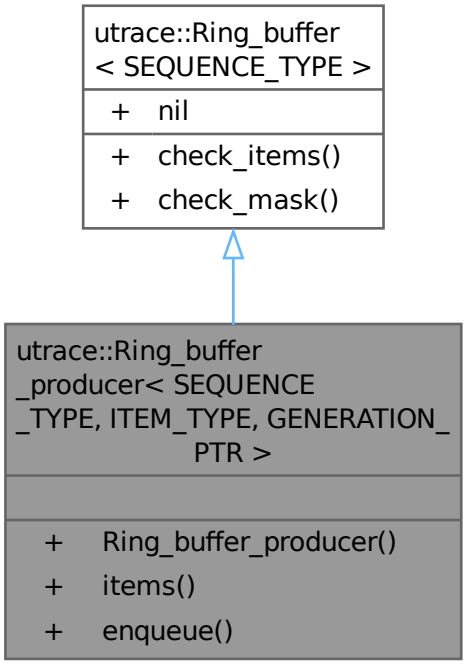
15.474 utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR > Class Template Reference

Ring buffer producer.

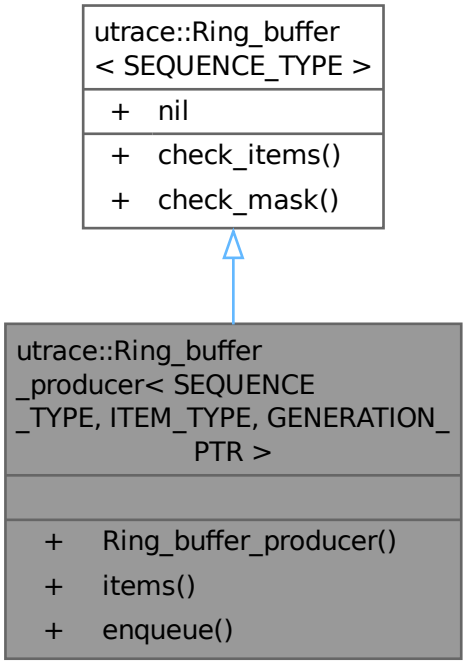
`#include <ring_buffer>`

Inheritance diagram for utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >:



Collaboration diagram for utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR

>:



Public Member Functions

- Ring_buffer_producer (Status &status, Slot &slots, unsigned const version, size_t const items)

  Construct ring buffer producer.
- size_t **items** () const

  Get the number of items.
- void enqueue (Item const &item) const

  Enqueue an item in the ring buffer.

Additional Inherited Members

Static Public Member Functions inherited from utrace::Ring_buffer< SEQUENCE_TYPE >

- static void check_items (size_t const items)

  Check that the number of items is a power of two.
- static void check_mask (size_t const mask)

  Check that the item mask is a power of two minus one.

Static Public Attributes inherited from utrace::Ring_buffer< SEQUENCE_TYPE >

- static constexpr Sequence const **nil** = 0U

  Invalid (non-committed) items set their sequence counter to 0.

15.474.1 Detailed Description

template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
class utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >

Ring buffer producer.

Template Parameters

SEQUENCE_TYPE	Numerical type for storing sequence and generation counters. Must be suitable for atomic access.
ITEM_TYPE	Actual ring buffer item type.
GENERATION_PTR	Class member pointer to the member that contains the sequence number within the item. The member needs to be suitable for an atomic reference.

Definition at line 245 of file ring_buffer.

15.474.2 Constructor & Destructor Documentation

15.474.2.1 Ring_buffer_producer()

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::Ring_buffer_producer
(
            Status & status,
            Slot & slots,
            unsigned const version,
            size_t const items)  [inline]
```

Construct ring buffer producer.
This initializes the ring buffer status area and slots.

Parameters

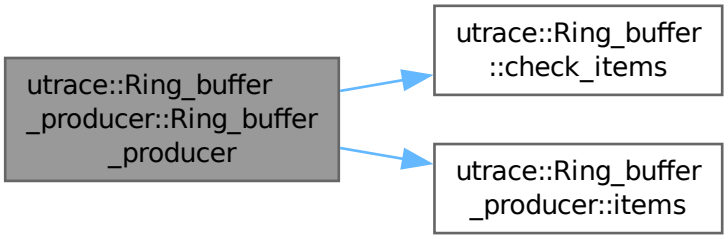
status	Ring buffer status area.
slots	Ring buffer slots.
version	Version of the ring buffer items. The semantics of the version number is defined by the user.
items	Number of items in the ring buffer slots. Must be a non-zero power of two.

Exceptions

std::invalid_argument	If the number of items is zero or not a power of two.

Definition at line 271 of file ring_buffer.
References utrace::Ring_buffer< SEQUENCE_TYPE >::check_items(), items(), and utrace::Ring_buffer< SEQUENCE_TYPE >::nil

Here is the call graph for this function:



15.474.3 Member Function Documentation

15.474.3.1 enqueue()

```
template<typename SEQUENCE_TYPE, typename ITEM_TYPE, auto GENERATION_PTR>
void utrace::Ring_buffer_producer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >::enqueue (
            Item const & item) const  [inline]
```

Enqueue an item in the ring buffer.
This operation never blocks and implements the head-drop policy (i.e. the oldest item is overwritten).

Parameters

item	Item to enqueue (as a copy).

Definition at line 297 of file ring_buffer.
References utrace::Ring_buffer< SEQUENCE_TYPE >::nil.
The documentation for this class was generated from the following file:

- l4/utrace/ring_buffer

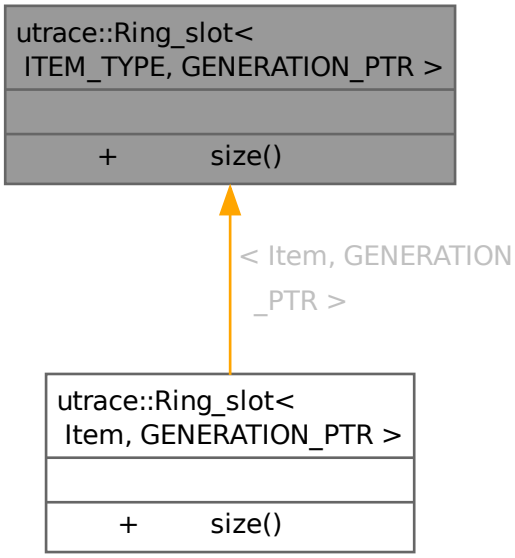
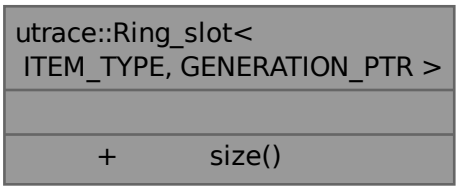
Ring buffer slot.
`#include <ring_buffer>`

Inheritance diagram for utrace::Ring_slot< ITEM_TYPE, GENERATION_PTR >:



Collaboration diagram for utrace::Ring_slot< ITEM_TYPE, GENERATION_PTR >:



Static Public Member Functions

- static size_t size (size_t const items)

  Get the size (in bytes) of the given count of items.

15.475.1 Detailed Description

template<typename ITEM_TYPE, auto GENERATION_PTR>
class utrace::Ring_slot< ITEM_TYPE, GENERATION_PTR >

Ring buffer slot.
The ring buffer slot encapsulates one ring buffer item and makes sure that the item is aligned to the nearest larger power-of-two of its size.
Another purpose of this class is to abstract away the access to the sequence number of the item.

Template Parameters

ITEM_TYPE	Actual ring buffer item type.
GENERATION_PTR	Class member pointer to the member that contains the sequence number within the item. The member needs to be suitable for an atomic reference.

Definition at line 204 of file ring_buffer.

15.475.2 Member Function Documentation

15.475.2.1 size()

```
template<typename ITEM_TYPE, auto GENERATION_PTR>
size_t utrace::Ring_slot< ITEM_TYPE, GENERATION_PTR >::size (
            size_t const items)  [inline], [static]
```

Get the size (in bytes) of the given count of items.

Parameters

items	Count of items.

Returns

Size (in bytes) of the given count of items.

Definition at line 221 of file ring_buffer.

The documentation for this class was generated from the following file:

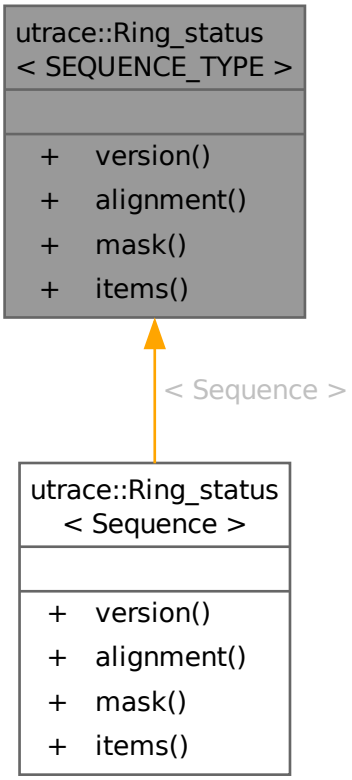
- l4/utrace/ring_buffer

15.476 utrace::Ring_status< SEQUENCE_TYPE > Class Template Reference

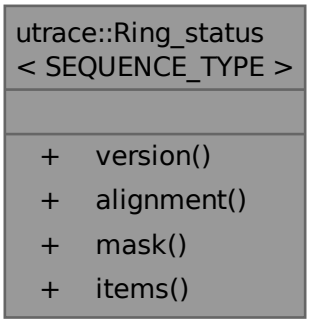
Ring buffer status area.

```
#include <ring_buffer>
```

Inheritance diagram for utrace::Ring_status< SEQUENCE_TYPE >:



Collaboration diagram for utrace::Ring_status< SEQUENCE_TYPE >:



Public Member Functions

- unsigned version () const

Get the version of the ring buffer items.

- size_t alignment () const

  Get the stable alignment of the ring buffer status members.

- size_t **mask** () const

  Get the item mask.

- size_t **items** () const

  Get the number of items.

15.476.1 Detailed Description

template<typename SEQUENCE_TYPE>
class utrace::Ring_status< SEQUENCE_TYPE >

Ring buffer status area.
The ring buffer status area contains run-time configuration information of the ring buffer, most notably the current atomic generation counter (i.e. the last sequence number allocated to an item).
This structure is only written by the producers, it is read-only for the consumers.

Template Parameters

SEQUENCE_TYPE	Numerical type for storing sequence and generation counters. Must be suitable for atomic access.

Definition at line 125 of file ring_buffer.

15.476.2 Member Function Documentation

15.476.2.1 alignment()

```
template<typename SEQUENCE_TYPE>
size_t utrace::Ring_status< SEQUENCE_TYPE >::alignment () const  [inline]
```

Get the stable alignment of the ring buffer status members.
This is relevant for the _mask and _tail members.

Returns

Stable alignment of the ring buffer status members.

Definition at line 152 of file ring_buffer.

15.476.2.2 version()

```
template<typename SEQUENCE_TYPE>
unsigned utrace::Ring_status< SEQUENCE_TYPE >::version () const  [inline]
```

Get the version of the ring buffer items.
The semantics of the version number is defined by the user.

Returns

Version of the ring buffer items.

Definition at line 142 of file ring_buffer.
The documentation for this class was generated from the following file:

- l4/utrace/ring_buffer

15.477 utrace::Tracebuffer Class Reference

Tracebuffer abstraction.

`#include <utrace>`

Collaboration diagram for utrace::Tracebuffer:

Data Structures

- struct Index_desc

  Mapping of the dynamic tracebuffer log indexes to names.

Public Member Functions

- size_t **items** () const

  Get the capacity (in items) of the tracebuffer ring buffer.
- size_t dequeue (Item *items, size_t capacity, size_t burst, Drop_policy policy, Sequence *drops=nullptr)

  Dequeue items from the tracebuffer.

Static Public Member Functions

- static void validate ()

  Check that the base debugger (JDB) capability is valid and accessible.
- static unsigned **version** ()

  Get the tracebuffer format version supported by this class.
- static std::endian **endianness** ()

  Get the endianness supported by this class.
- static std::optional< Index_desc > index (unsigned idx)

  Map a dynamic tracebuffer log index to names.
- static std::vector< Index_desc > indexes ()

  Get all mappings of dynamic tracebuffer log indexes to names.
- static Tracebuffer & **instance** ()

Get the singleton instance of this class.

- static std::optional< Id > ptr_to_id (void *const ptr)

  Convert kernel object pointer to global kernel object ID.

- static std::optional< std::string > id_to_name (Id const id)

  Convert global kernel object ID to object name.

15.477.1 Detailed Description

Tracebuffer abstraction.
Since there is only a single global tracebuffer available in the current implementation, this is a singleton class.
Definition at line 50 of file utrace.

15.477.2 Member Function Documentation

15.477.2.1 dequeue()

```
size_t utrace::Tracebuffer::dequeue (
            Item * items,
            size_t capacity,
            size_t burst,
            Drop_policy policy,
            Sequence * drops = nullptr)
```

Dequeue items from the tracebuffer.
Dequeue multiple items from the tracebuffer. The goal is to dequeue as many items as available from the tracebuffer in a single call to avoid overhead. This operation blocks until at least *burst* items have been dequeued (but returns immediately if an item is dropped).

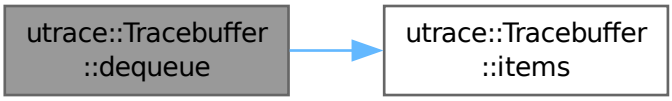
Parameters

out	*items*	Array to dequeue the next items from the tracebuffer into (as copies).
	capacity	Capacity of *items* (in items).
	burst	Minimal number of items that should be collected before returning in case of waiting for items.
	policy	Item drop policy.
out	*drops*	Pointer to store the number of items that have been dropped. Can be nullptr.

Returns

Number of items dequeued and stored into *items*.

References items().
Here is the call graph for this function:



15.477.2.2 id_to_name()

```
std::optional< std::string > utrace::Tracebuffer::id_to_name (
            Id const id)  [static]
```

Convert global kernel object ID to object name.
Some tracebuffer items contain global kernel object IDs that can be associated with human-readable object names.

Parameters

id	Global kernel object ID.

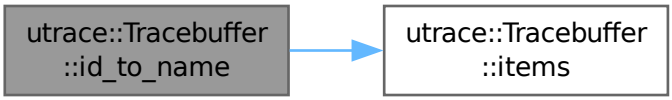
Returns

Object name.

Return values

std::nullopt	No object name was found.

References items().
Here is the call graph for this function:



15.477.2.3 index()

```
std::optional< Index_desc > utrace::Tracebuffer::index (
            unsigned idx)  [static]
```

Map a dynamic tracebuffer log index to names.

Parameters

idx	Dynamic tracebuffer log index to map.

Returns

Mapping of the dynamic tracebuffer index to names.

Return values

std::nullopt	The dynamic tracebuffer log index is not defined.

15.477.2.4 indexes()

```
std::vector< Index_desc > utrace::Tracebuffer::indexes ()  [static]
```

Get all mappings of dynamic tracebuffer log indexes to names.

Returns

Generator (if available) or a vector of all defined mappings of dynamic tracebuffer log indexes to names.

15.477.2.5 ptr_to_id()

```
std::optional< Id > utrace::Tracebuffer::ptr_to_id (
            void *const ptr)  [static]
```

Convert kernel object pointer to global kernel object ID.
Some tracebuffer items contain kernel object pointers that can be converted to global kernel object IDs.

Parameters

ptr	Kernel object pointer.

Returns

Global kernel object ID.

Return values

std::nullopt	No mapping to global kernel object ID was found.

15.477.2.6 validate()

```
void utrace::Tracebuffer::validate ()  [static]
```

Check that the base debugger (JDB) capability is valid and accessible.
The base debugger (JDB) capability is used to access the single global tracebuffer in the current implementation.

Exceptions

std::invalid_argument	If the base debugger (JDB) capability is invalid or inaccessible.

The documentation for this class was generated from the following file:

- l4/utrace/utrace

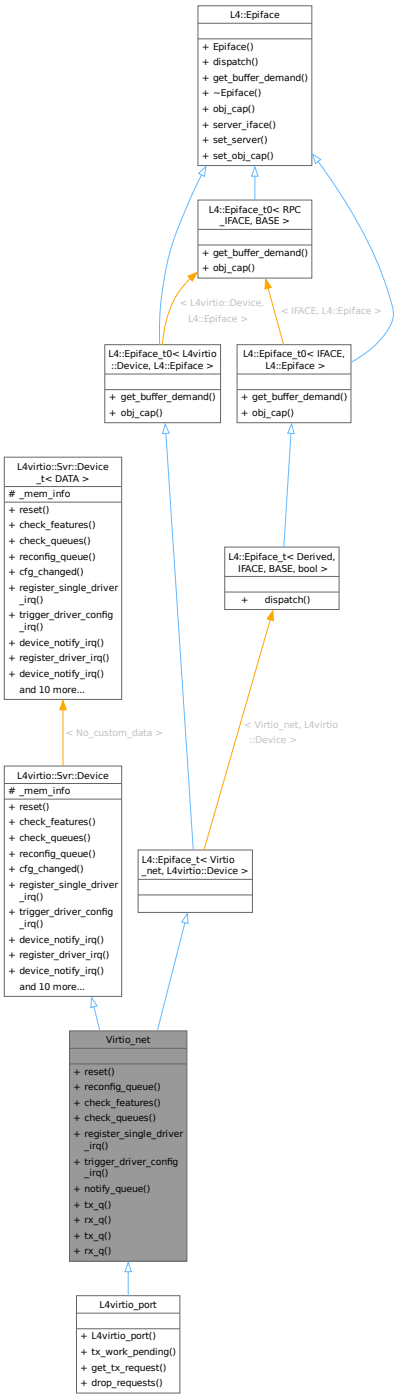
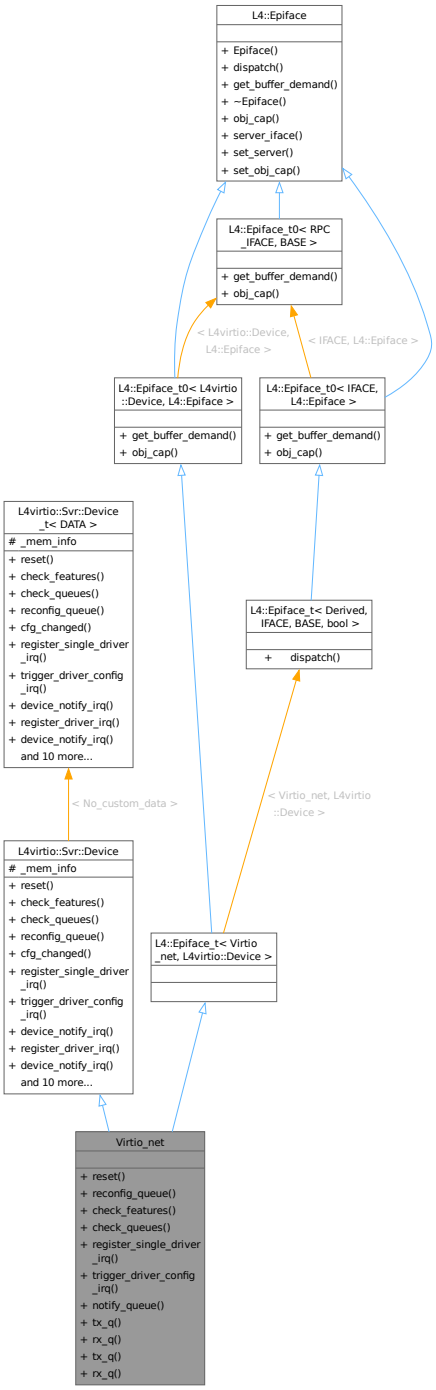
15.479 Virtio_net Class Reference

The Base class of a Port.
`#include <virtio_net.h>`

Inheritance diagram for Virtio_net:



Collaboration diagram for Virtio_net:



Public Member Functions

- void **reset** () override

  reset callback, called for doing a device reset
- int **reconfig_queue** (unsigned index) override

  callback for client queue-config request
- bool **check_features** () override

  callback for checking the subset of accepted features

- bool **check_queues** () override

  Check whether both virtqueues are ready.
- void **register_single_driver_irq** () override

  Save the `_kick_guest_irq` that the client sent via `device_notification_irq()`.
- void **trigger_driver_config_irq** () override

  callback for triggering configuration change notification IRQ
- void notify_queue (L4virtio::Svr::Virtqueue ∗queue)

  Trigger the `_kick_guest_irq` IRQ.
- Virtqueue ∗ **tx_q** ()

  Getter for the transmission queue.
- Virtqueue ∗ **rx_q** ()

  Getter for the receive queue.
- Virtqueue const ∗ **tx_q** () const

  Getter for the transmission queue.
- Virtqueue const ∗ **rx_q** () const

  Getter for the receive queue.

Public Member Functions inherited from L4virtio::Svr::Device_t< No_custom_data >

- virtual void **cfg_changed** (unsigned)

  callback for client device configuration changes
- virtual L4::Cap< L4::Irq > **device_notify_irq** () const

  callback to gather the device notification IRQ (old-style)
- virtual void register_driver_irq (unsigned idx)

  Callback for registering an notification IRQ (multi IRQ).
- virtual L4::Cap< L4::Irq > device_notify_irq (unsigned idx)

  Callback to gather the device notification IRQ (multi IRQ).
- virtual unsigned **num_events_supported** () const

  Return the highest notification index supported.
- Device_t (Dev_config ∗dev_config, L4Re::Util::Dbg msg_user=L4Re::Util::Dbg{}, L4Re::Util::Dbg msg_↩ dev=L4Re::Util::Dbg{2})

  Make a device for the given config.
- Mem_list const ∗ **mem_info** () const

  Get the memory region list used for this device.
- void reset_queue_config (unsigned idx, unsigned num_max, bool inc_generation=false, unsigned device_↩ notify_index=0)

  Trigger reset for the configuration space for queue idx.
- void init_mem_info (unsigned num)

  Initialize the memory region list to the given maximum.
- void device_error ()

  Transition device into DEVICE_NEEDS_RESET state.
- bool setup_queue (Virtqueue ∗q, unsigned qn, unsigned num_max)

  Enable/disable the specified queue.
- bool handle_mem_cmd_write ()

  Check for a value in the `cmd` register and handle a write.
- void **enable_trusted_ds_validation** ()

  Enable trusted dataspace validation.
- void add_trusted_dataspaces (std::shared_ptr< Ds_vector const > ds)

  Provide a list of trusted dataspaces that can be used for validation.

Public Member Functions inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

- Type_info::Demand **get_buffer_demand** () const

  Get the server-side buffer demand based in IFACE.
- Cap< L4virtio::Device > obj_cap () const

  Get the (typed) capability to this object.

Public Member Functions inherited from L4::Epiface

- **Epiface** ()

  Make a server object.
- virtual ~**Epiface** ()=0

  Destroy the object.
- Stored_cap obj_cap () const

  Get the capability to the kernel object belonging to this object.
- Server_iface * server_iface () const

  Get pointer to server interface at which the object is currently registered.
- int set_server (Server_iface *srv, Cap< void > cap, bool managed=false)

  Set server registration info for the object.
- void **set_obj_cap** (Cap< void > const &cap)

  Deprecated server registration function.

Additional Inherited Members

Public Types inherited from L4::Epiface_t0< L4virtio::Device, L4::Epiface >

Protected Attributes inherited from L4virtio::Svr::Device_t< No_custom_data >

- Mem_list **_mem_info**

  Memory region list.

15.479.1 Detailed Description

The Base class of a Port.
This class provides the Virtio network protocol specific implementation aspects of a port.
`Virtio_net` comprises the virtqueues for both, the incoming and the outgoing network requests:

- The transmission queue, containing requests to be transmitted to other ports. The transmission queue is filled by the client, this port relates to.
- The receive queue, containing requests that have been transmitted from other ports. The receive queue is filled by the switch.

Definition at line 71 of file virtio_net.h.

15.479.2 Member Function Documentation

15.479.2.1 notify_queue()

```
void Virtio_net::notify_queue (
            L4virtio::Svr::Virtqueue * queue)  [inline]
```

Trigger the `_kick_guest_irq` IRQ.
This function gets called on the receiving port, when a request was successfully transmitted by the switch.
Definition at line 271 of file virtio_net.h.
References L4VIRTIO_IRQ_STATUS_VRING.
The documentation for this class was generated from the following file:

- pkg/virtio-net-switch/server/switch/virtio_net.h

15.480 Virtio_net_request Class Reference

Abstraction for a network request.
`#include <request_l4virtio.h>`
Collaboration diagram for Virtio_net_request:

Public Member Functions

- Mac_addr **dst_mac** () const

  Get the Mac address of the destination port.
- Mac_addr **src_mac** () const

  Get the Mac address of the source port.

Static Public Member Functions

- static void drop_requests (Virtio_net ∗dev, L4virtio::Svr::Virtqueue ∗queue)

  Drop all requests of a specific queue.
- static std::optional< Virtio_net_request > get_request (Virtio_net ∗dev, L4virtio::Svr::Virtqueue ∗queue)

  Construct a request from the next entry of a provided queue.

15.480.1 Detailed Description

Abstraction for a network request.
A `Virtio_net_request` is constructed by the source port, using the static function `get_request()` as part of `Port_iface::get_tx_request()`.
On destruction, `finish()` will be called, which, will trigger the client IRQ of the source client.
Definition at line 35 of file request_l4virtio.h.

15.480.2 Member Function Documentation

15.480.2.1 drop_requests()

```
void Virtio_net_request::drop_requests (
            Virtio_net * dev,
            L4virtio::Svr::Virtqueue * queue)  [inline], [static]
```

Drop all requests of a specific queue.
This function is used for example to drop all requests in the transmission queue of a monitor port, since monitor ports are not allowed to transmit data.

Parameters

dev	Port of the provided virtqueue.
queue	Virtqueue to drop all requests of.

Definition at line 172 of file request_l4virtio.h.
References L4virtio::Svr::Virtqueue::desc_avail(), L4virtio::Svr::Virtqueue::finish(), L4_UNLIKELY, L4virtio::Svr::Virtqueue::next_avail(), L4virtio::Virtqueue::ready(), and L4virtio::Svr::Request_processor::start().

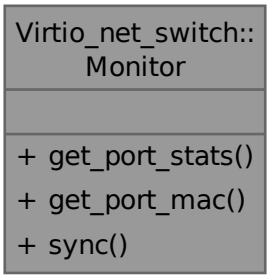
15.481 Virtio_net_switch::Monitor Class Reference

Statistics client interface.
`#include <stats.h>`

Collaboration diagram for Virtio_net_switch::Monitor:



Public Member Functions

- Port_statistics * get_port_stats (char const *name) const

  Retrieve pointer to Port_statistics structure.
- bool get_port_mac (char const *name, unsigned char *mac) const

  Retrieve the MAC address of a port.
- void **sync** () const

  Instruct the network switch to update the statistics information.

15.481.1 Detailed Description

Statistics client interface.
A client can retrieve per port statistics information, such as the number of sent and received packets. The information is shared with a L4Re::Dataspace. The information contained in the L4Re::Dataspace is updated by the switch only on Monitor::sync().
Definition at line 91 of file stats.h.

15.481.2 Member Function Documentation

15.481.2.1 get_port_mac()

```
bool Virtio_net_switch::Monitor::get_port_mac (
            char const * name,
            unsigned char * mac) const  [inline]
```

Retrieve the MAC address of a port.

Parameters

	name	The name of the port.
out	*mac*	A 6 byte buffer allocated by the caller. To be filled with the MAC address of the port.

Definition at line 139 of file stats.h.

15.481.2.2 get_port_stats()

```
Port_statistics * Virtio_net_switch::Monitor::get_port_stats (
            char const * name) const  [inline]
```

Retrieve pointer to Port_statistics structure.

Parameters

name	The name of the port.

Returns

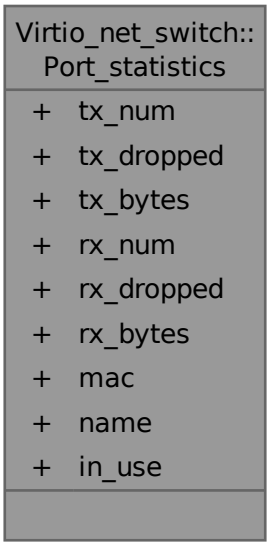
Pointer to the Port_statistics structure or `nullptr` if no port of that name was found.

Definition at line 120 of file stats.h.
The documentation for this class was generated from the following file:

- pkg/virtio-net-switch/lib/include/stats.h

15.482 Virtio_net_switch::Port_statistics Struct Reference

Statistics for one port.
`#include <stats.h>`
Collaboration diagram for Virtio_net_switch::Port_statistics:



Data Fields

- l4_uint64_t **tx_num**
  number of successful send requests
- l4_uint64_t **tx_dropped**
  number of dropped send request
- l4_uint64_t **tx_bytes**
  bytes successfully sent
- l4_uint64_t **rx_num**
  number of successful receive requests
- l4_uint64_t **rx_dropped**
  number of dropped receive requests

- l4_uint64_t **rx_bytes**

  bytes successfully received
- unsigned char **mac** [6]

  MAC address of a port.
- char **name** [20]

  name of a port
- unsigned char **in_use**

  1 iff the data structure is currently in use, 0 otherwise

15.482.1 Detailed Description

Statistics for one port.
Definition at line 27 of file stats.h.
The documentation for this struct was generated from the following file:

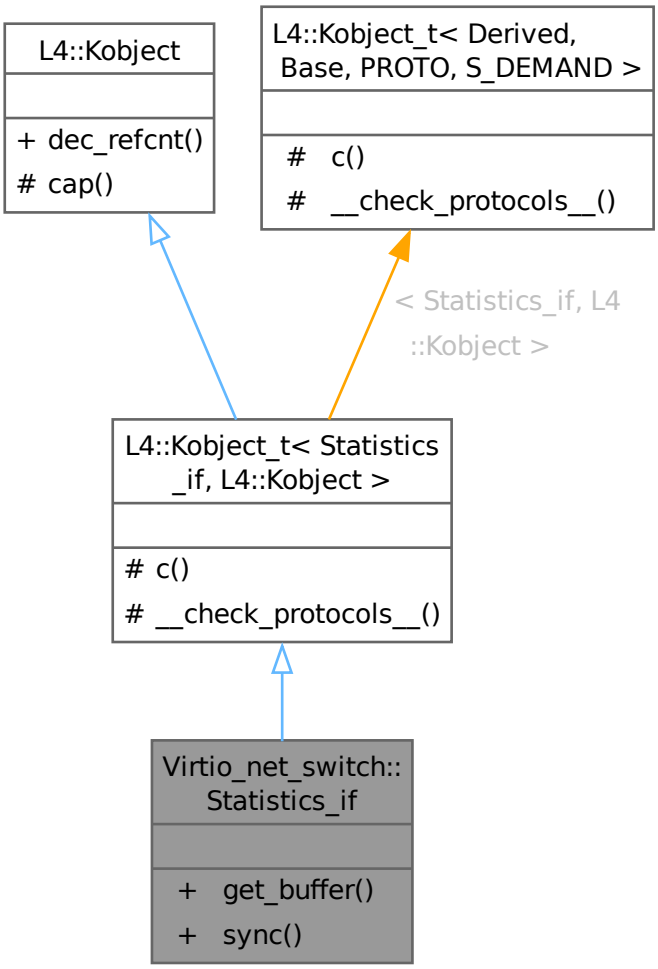
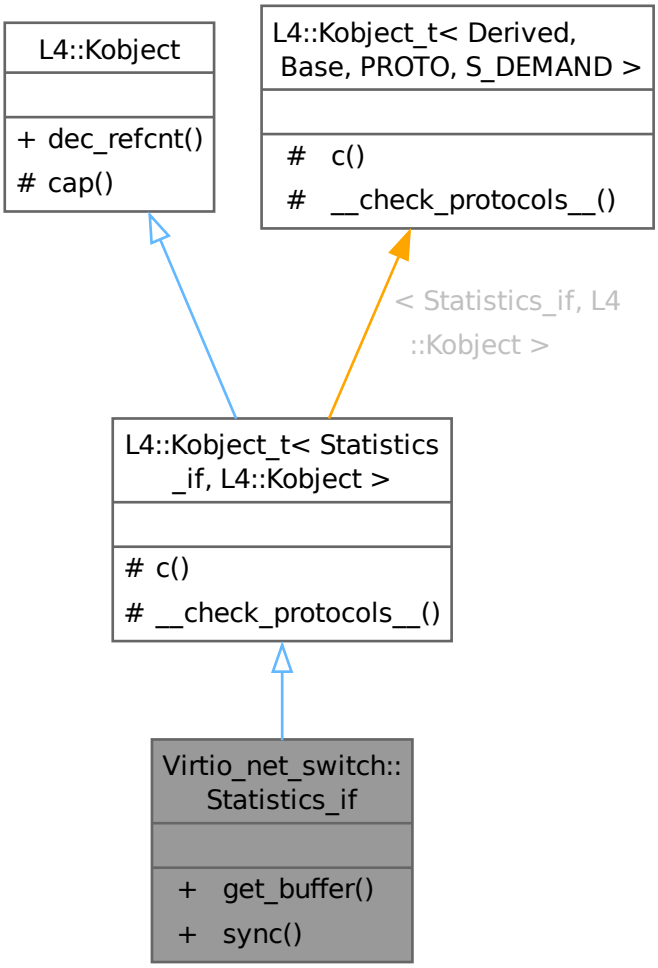
15.484 Virtio_net_switch::Statistics_if Class Reference

IPC interface for the statistics interface.
`#include <stats.h>`
Inheritance diagram for Virtio_net_switch::Statistics_if:



Collaboration diagram for Virtio_net_switch::Statistics_if:



Public Member Functions

- long get_buffer (L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > ds)

  Get shared memory buffer containing port statistics.
- long sync ()

  Instruct the switch to update the statistics information in the shared memory buffer.

Public Member Functions inherited from L4::Kobject

- l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())

  Decrement the in kernel reference counter for the object.

Additional Inherited Members

Protected Types inherited from L4::Kobject_t< Statistics_if, L4::Kobject >

- typedef Statistics_if **Class**

The target interface type (inheriting from Kobject_t).

- typedef Typeid::Iface< PROTO_ANY, Statistics_if > **__Iface**

  The interface description for the derived class.

- typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Kobject::__Iface_list > **__Iface_list**

  The list of all RPC interfaces provided directly or through inheritance.

Protected Member Functions inherited from L4::Kobject_t< Statistics_if, L4::Kobject >

- L4::Cap< Class > **c** () const noexcept

  Get the capability to ourselves.

Protected Member Functions inherited from L4::Kobject

- l4_cap_idx_t cap () const noexcept

  Return capability selector.

Static Protected Member Functions inherited from L4::Kobject_t< Statistics_if, L4::Kobject >

- static void **__check_protocols__** () noexcept

  Helper to check for protocol conflicts.

15.484.1 Detailed Description

IPC interface for the statistics interface.
This interface is plumbing used by the Monitor interface. Clients usually do not invoke this directly.
Definition at line 58 of file stats.h.

15.484.2 Member Function Documentation

15.484.2.1 get_buffer()

```
long Virtio_net_switch::Statistics_if::get_buffer (
            L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > ds)
```

Get shared memory buffer containing port statistics.

Parameters

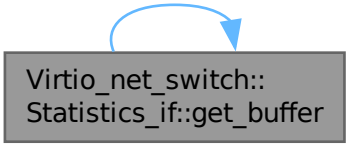
out	*ds*	Capability of the dataspace containing port statistics.

Return values

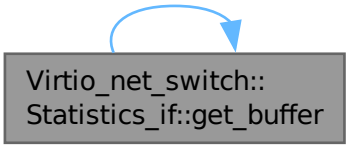
0	Success
<0	Error

References get_buffer().
Referenced by get_buffer().

Here is the call graph for this function:



Here is the caller graph for this function:



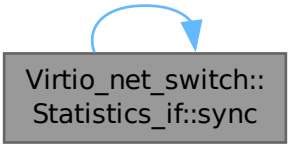
15.484.2.2 sync()

`long Virtio_net_switch::Statistics_if::sync ()`
Instruct the switch to update the statistics information in the shared memory buffer.

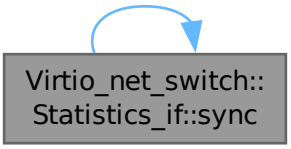
Return values

0	Success
<0	Error

References sync().
Referenced by sync().
Here is the call graph for this function:



Here is the caller graph for this function:



The documentation for this class was generated from the following file:

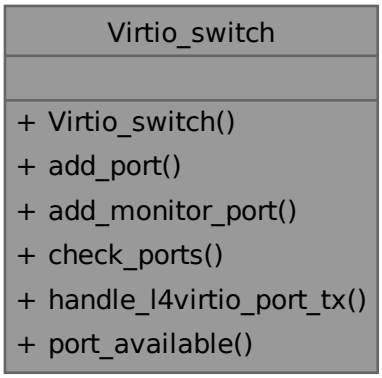
15.485 Virtio_switch Class Reference

The Virtio switch contains all ports and processes network requests.
`#include <switch.h>`
Collaboration diagram for Virtio_switch:



Public Member Functions

- Virtio_switch (unsigned max_ports)
  Create a switch with n ports.
- bool add_port (Port_iface *port)
  Add a port to the switch.
- bool add_monitor_port (Port_iface *port)
  Add a monitor port to the switch.
- void check_ports ()
  Check validity of ports.
- bool handle_l4virtio_port_tx (L4virtio_port *port)
  Handle TX queue of the given port.

- bool port_available (bool monitor)

  Is there still a free port on this switch available?

15.485.1 Detailed Description

The Virtio switch contains all ports and processes network requests.
A Port on its own is not capable to process an incoming network request because it has no knowledge about other ports. The processing of an incoming request therefore gets delegated to the switch.
The `Virtio_switch` is constructed at the start of the Virtio Net Switch application. The factory saves a reference to it to pass it to the `Kick_irq` on port creation.
Definition at line 35 of file switch.h.

15.485.2 Constructor & Destructor Documentation

15.485.2.1 Virtio_switch()

```
Virtio_switch::Virtio_switch (
             unsigned max_ports)  [explicit]
```

Create a switch with n ports.

Parameters

max_ports	maximal number of provided ports

Definition at line 12 of file switch.cc.

15.485.3 Member Function Documentation

15.485.3.1 add_monitor_port()

```
bool Virtio_switch::add_monitor_port (
             Port_iface * port)
```

Add a monitor port to the switch.

Parameters

port	A pointer to an already constructed Port_iface object.

Return values

true	Port was added successfully.
false	Switch was not able to add the port.

Definition at line 41 of file switch.cc.

15.485.3.2 add_port()

```
bool Virtio_switch::add_port (
             Port_iface * port)
```

Add a port to the switch.

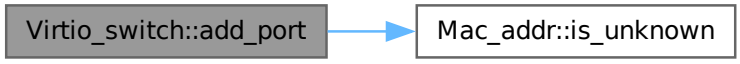
Parameters

port	A pointer to an already constructed Port_iface object.

Return values

true	Port was added successfully.
false	Switch was not able to add the port.

Definition at line 17 of file switch.cc.
References Mac_addr::is_unknown().
Here is the call graph for this function:



15.485.3.3 check_ports()

```
void Virtio_switch::check_ports ()
```

Check validity of ports.
Check whether all ports are still used and remove any unused (unreferenced) ports. Shall be invoked after an incoming cap deletion irq to remove ports without clients.
Definition at line 56 of file switch.cc.

15.485.3.4 handle_l4virtio_port_tx()

```
bool Virtio_switch::handle_l4virtio_port_tx (
            L4virtio_port * port)
```

Handle TX queue of the given port.

Parameters

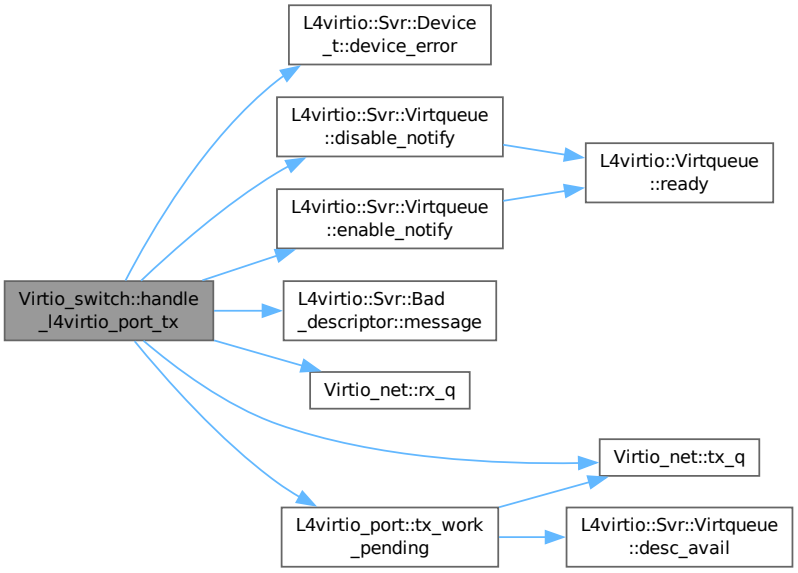
port	L4virtio_port to handle pending TX work for.

Return values

false	Port hit its TX burst limit, and thus a TX pending reschedule notification was queued.
true	Port's entire TX queue was processed.

Definition at line 180 of file switch.cc.
References L4virtio::Svr::Device_t< DATA >::device_error(), L4virtio::Svr::Virtqueue::disable_notify(), L4virtio::Svr::Virtqueue::enable
L4virtio::Svr::Bad_descriptor::message(), Virtio_net::rx_q(), Virtio_net::tx_q(), and L4virtio_port::tx_work_pending().

Here is the call graph for this function:



15.485.3.5 port_available()

```
bool Virtio_switch::port_available (
            bool monitor)  [inline]
```

Is there still a free port on this switch available?

Parameters

monitor	True if we look for a monitor slot.

Return values

true	Port is available.
false	No port available.

Definition at line 146 of file switch.h.
The documentation for this class was generated from the following files:

- pkg/virtio-net-switch/server/switch/switch.h
- pkg/virtio-net-switch/server/switch/switch.cc

15.486 Virtio_vlan_mangle Class Reference

Class for VLAN packet rewriting.
`#include <vlan.h>`

Collaboration diagram for Virtio_vlan_mangle:

Public Member Functions

- Virtio_vlan_mangle ()
  Default constructor.
- l4_uint32_t copy_pkt (Buffer &dst, Buffer &src)
  Copy packet from src to dst.
- void rewrite_hdr (Virtio_net::Hdr *hdr)
  Rewrite the virtio network header.

Static Public Member Functions

- static constexpr Virtio_vlan_mangle add (l4_uint16_t tci)
  Construct an object that adds a VLAN tag.
- static constexpr Virtio_vlan_mangle remove ()
  Construct an object that removes the VLAN tag.

15.486.1 Detailed Description

Class for VLAN packet rewriting.
Definition at line 36 of file vlan.h.

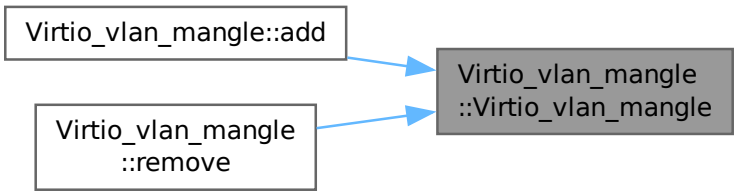
15.486.2 Constructor & Destructor Documentation

15.486.2.1 Virtio_vlan_mangle()

```
Virtio_vlan_mangle::Virtio_vlan_mangle () [inline]
```

Default constructor.
The packet is not touched in any way.
Definition at line 52 of file vlan.h.
Referenced by add(), and remove().

Here is the caller graph for this function:



15.486.3 Member Function Documentation

15.486.3.1 add()

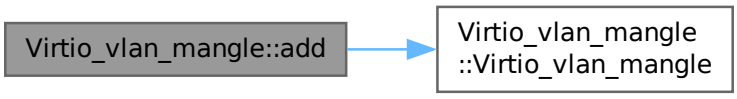
```
constexpr Virtio_vlan_mangle Virtio_vlan_mangle::add (
            l4_uint16_t tci)  [inline], [static], [constexpr]
```

Construct an object that adds a VLAN tag.

Parameters

tci	The TCI field of the VLAN tag to add.

It is the callers responsibility to ensure that the packet is not already tagged.
Definition at line 64 of file vlan.h.
References Virtio_vlan_mangle().
Here is the call graph for this function:



15.486.3.2 copy_pkt()

```
l4_uint32_t Virtio_vlan_mangle::copy_pkt (
            Buffer & dst,
            Buffer & src)  [inline]
```

Copy packet from *src* to *dst*.

Parameters

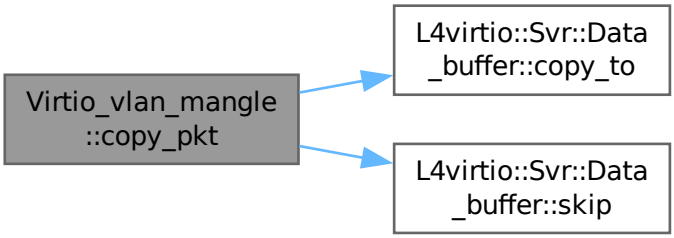
src	Source packet buffer

dst	Destination packet buffer

Returns

The number of bytes copied

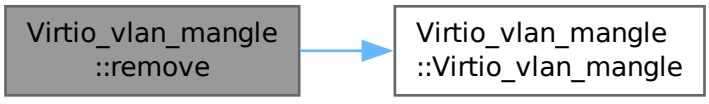
Copy the data from *src* to *dst*, possibly rewriting parts of the packet. The method is expected to be called repeatedly until the source packet is finished. Partial copies are allowed (including reading nothing from the source buffer) as long as progress is made, i.e. repeatedly calling this function eventually consumes the source buffer.
Definition at line 93 of file vlan.h.
References L4virtio::Svr::Data_buffer::copy_to(), L4_LIKELY, L4virtio::Svr::Data_buffer::left, L4virtio::Svr::Data_buffer::pos, and L4virtio::Svr::Data_buffer::skip().
Here is the call graph for this function:



15.486.3.3 remove()

```
constexpr Virtio_vlan_mangle Virtio_vlan_mangle::remove ()  [inline], [static], [constexpr]
```

Construct an object that removes the VLAN tag.
This object assumes that the Ethernet packet has a VLAN tag and will slavishly remove the necessary bytes from the packet.
Definition at line 75 of file vlan.h.
References Virtio_vlan_mangle().
Here is the call graph for this function:



15.486.3.4 rewrite_hdr()

```
void Virtio_vlan_mangle::rewrite_hdr (
            Virtio_net::Hdr * hdr)  [inline]
```

Rewrite the virtio network header.

Parameters

hdr	The virtio header of the packet

This method is called exactly once for every virtio network packet. Any necessary changes to the header are done in-place.
Definition at line 142 of file vlan.h.
References L4_UNLIKELY.

00002
00003 Tutorial lua script for Ned
00004 ===========================
00005
00006 Firstly we have a set of definitions available. Some come from 'ned.lua'
00007 embedded script and others from the C++ bindings within Ned. The whole L4
00008 functionality is in the lua module "L4" (use 'local L4 = require("L4");').
00009 The L4 module classes and functions cope with L4 capabilities and
00010 their invocations, provide a set of constants and access to the L4Re environment of
00011 the running program.  Finally, of course it can also start L4 applications.
00012
00013 L4 Capabilities
00014 ===============
00015
00016 The L4 module defines a user data type for capabilities.  A capability in lua
00017 carries a typed L4 capability and is accompanied with a set of type specific
00018 methods that may be called on the object behind the capability.  There also
00019 exists a way to cast a capability to a capability to a different type of
00020 object using L4.cast(type, cap).
00021
00022 L4.cast(type, cap)
00023
00024 Returns a cap transformed to a capability of the given type, whereas type
00025 is either the fully qualified C++ name of the class encapsulating the object
00026 or the L4 protocol ID assigned to all L4Re and L4 system objects.
00027 If the type is unknown then nil is returned.
00028
00029 Generic capabilities provide the following methods:
00030
00031 is_valid()
00032
00033   Returns true if the capability is not the invalid cap (L4_INVALID_CAP), and
00034   false if it is the invalid cap.
00035
00036
00037 L4Re::Namespace object
00038 ======================
00039
00040 There is a lua type for name spaces that has the following methods:
00041
00042 query(name), or q(name)
00043
00044   Returns a closure (function) that initiates a query for the given name
00045   within the name space.  The function takes no arguments and returns
00046   a capability if successful or nil if name is not found.
00047
00048
00049 link(name), or l(name)
00050
00051   Returns a function that can create a link to the given object in the name
00052   space if put into another name space. The function takes two parameters
00053   the target name space and the name in the target name space.
00054   Loader:create_namespace and Loader.fill_namespace calls this function
00055   when things are really put into an L4Re::Namespace.
00056
```

```
00057
00058 register(name, cap), or r(name, cap)
00059
00060   Registers the given object capability under the given name. cap can
00061   be either a real capability (note query returns a function), a string, or
00062   nil.  If it is a capability it is just put into the name space.
00063   In the case cap is a string a placeholder will be put into the name space
00064   that will be replaced with a real capability later by some program.
00065   And if nil is use the name will be deleted from the name space.
00066
00067
00068 L4::Factory object
00069 ==================
00070
00071 The factory object provides an interface to the generic create method of a
00072 factory.
00073
00074 create(proto, ...)
00075
00076   This method calls the factory to create an object of the given type,
00077   via the L4 protocol number (see L4.Proto table for more) all further
00078   arguments are passed to the factory.
00079
00080
00081 Access to the L4Re Env capabilities
00082 ===================================
00083
00084 The L4 module defines a table L4.Env that contains the capabilities
00085 of the L4Re::Env::env() environment. Namely:
00086
00087 factory      The kernel factory of Ned
00088 log          The log object of Ned
00089 user_factory The factory provided to Ned, including memory
00090 parent       The parent of Ned
00091 rm           The region map of Ned
00092 scheduler    The scheduler of Ned
00093
00094
00095 Some useful constants
00096 ====================
00097
00098 L4.Proto table contains the most important protocol values for
00099 L4 and L4Re objects.
00100
00101   Namespace
00102   Goos
00103   Rm
00104   Irq
00105   Sigma0
00106   Factory
00107   Log
00108   Scheduler
00109
00110 The L4.Info table contains the following functions:
00111
00112   Kip.str()    The banner string found in the kernel info page
00113   arch()       Architecture name, such as: x86, amd64, arm, ppc32
00114   platform()   Platform name, such as: pc, ux, realview, beagleboard
00115   mword_bits() Number of native machine word bits (32, 64)
00116
00117
00118 Support for starting L4 programs
00119 ================================
00120
00121 The L4 module defines two classes that are useful for starting L4 applications.
00122 The class L4.Loader that encapsulates a fairly high level policy
00123 that is useful for starting a whole set of processes. And the class L4.App_env
00124 that encapsulates a more fine-grained policy.
00125
00126 L4.Loader
00127 ---------
00128
00129 The class L4.Loader encapsulates the policy for starting programs with the
00130 basic building blocks for the application coming from a dedicated loader,
00131 such as Moe or a Loader instance. These building blocks are a region map (Rm),
00132 a scheduler, a memory allocator, and a logging facility.
00133 A L4.Loader object is typically used to start multiple applications. There
00134 is a L4.default_loader instance of L4.Loader that uses the L4.Env.mem_alloc
00135 factory of the current Ned instance to create the objects for a new program.
00136 However you may also use a more restricted factory for applications and
00137 instantiate a loader for them.  The L4.Loader objects can already be used
00138 to start a program with L4.Loader:start(app_spec, cmd, ...). Where app_spec
00139 is a table containing parameters for the new application. cmd is the
00140 command to run and the remaining arguments are the command-line options for
00141 the application.
00142
00143 ]==]
```

```
00144
00145 L4.default_loader:start({}, "rom/hello");
00146
00147 local _doc = [==[
00148
00149 This statement does the following:
00150  1. Create a new environment for the application
00151  2. Add the rom name-space into the new environment (thus shares Ned's
00152     'rom' directory with the new program).
00153  3. Creates all the building blocks for the new process and starts the
00154     'l4re' support kernel in the new process which in turn starts 'rom/hello'
00155     in the new process.
00156
00157 Using the app_spec parameter you can modify the behavior in two ways. There are
00158 two supported options 'caps' for providing more capabilities for the
00159 application. And 'log' for modifying the logger tag and color.
00160
00161 ]==]
00162
00163 local my_caps = {
00164   fb = L4.Env.fb;
00165 };
00166
00167 L4.default_loader:start({caps = my_caps, log = {"APP", "blue"}}, "rom/hello");
00168
00169 local _doc = [==[
00170
00171 This snippet creates a caps template (my_caps) and uses it for the
00172 new process and also sets user-defined log tags.  The L4.Loader:start method,
00173 however, automatically adds the 'rom' directory to the caps environment if
00174 not already specified in the template.
00175
00176 Environment variables may be given as a table in the third argument to
00177 start. Argument to the program are given space separated after the program
00178 name within a single string.
00179
00180 ]==]
00181
00182 L4.default_loader:start({}, "rom/program arg1 " .. arg2, { LD_DEBUG = 1 });
00183
00184 local _doc = [==[
00185
00186 L4.default_loader:startv is a variant of the start function that takes the
00187 arguments of the program as a single argument each. If the last argument to
00188 startv is a table it is interpreted as environment variables for the program.
00189 The above example would translate to:
00190
00191 ]==]
00192
00193 L4.default_loader:startv({}, "rom/program", "arg1", arg2, { LD_DEBUG = 1 });
00194
00195 local _doc = [==[
00196
00197 To create a new L4.Loader instance you may use a generic factory for all
00198 building blocks or set individual factories.
00199
00200 ]==]
00201
00202 l = L4.Loader.new({
00203   mem = L4.Env.user_factory:create(L4.Proto.Factory, 512*1024):m("rs")
00204 });
00205
00206 local _doc = [==[
00207
00208 Creates a loader instance that uses the newly created 512 KB factory for
00209 all building blocks. To set individual factories use the options:
00210   'mem'       as memory allocator for the new processes and as
00211               default factory for all objects not explicitely set to a
00212               different factory
00213   'log_fab'   for creating log objects.
00214   'ns_fab'    for creating name-space objects.
00215   'rm_fab'    for creating region-map objects.
00216
00217
00218
00219 L4.App_env
00220 ----------
00221
00222 L4.App_env provides a more fine-grained control for a single process or for a
00223 limited number of processes. L4.App_env uses an L4.Loader object as basic
00224 facility. However you can override the memory allocator 'mem' for for the new
00225 process as well as the kernel factory 'factory', the log capability etc.
00226
00227 ]==]
00228
00229 local e = L4.App_env.new({
00230   loader = l,
```

```
00231   mem = L4.Env.user_factory:create(L4.Proto.Factory, 128*1024):m("rs")
00232 });
00233
00234 e:start("rom/hello");
```

Functions

- new_sched (prio, cpu_mask, ...)
- start_io (busses, cmdline, opts)
- set_sched (opts, prio, cpus, ...)
- start_virtio_switch (ports, prio, cpus, switch_type, ext_caps)
- start_virtio_switch_tbl (options)
- start_vm (options)

16.41.1 Function Documentation

16.41.1.1 new_sched()

```
new_sched (
              prio,
              cpu_mask,
              ...  )
```

Creates a new scheduler proxy at moe.

Parameters

prio	Base priority of the threads running in the scheduler proxy
cpu_mask	First of a list of CPU masks for the first 64 CPUs to use for the scheduler proxy
...	more CPU masks

Returns

created scheduler

16.41.1.2 set_sched()

```
set_sched (
              opts,
              prio,
              cpus,
              ...  )
```

Create scheduler proxy and add it into the `opts` table under the key `scheduler`.

Parameters

`in,out`	*opts*	option table
	prio	thread priority (or `nil`)
	cpus	cpu mask (or `nil`)
	...	more CPU masks

There are four possibilities for values of prio and cpus:

- No prio and no cpus: No scheduler proxy created.
- A prio, but no cpus: Create a scheduler proxy with only a priority limit.
- No Prio, but cpus: Create a scheduler proxy with default prio and cpus limit.
- A prio and cpus: Create a scheduler proxy with given limits.

16.41.1.3 start_io()

```
start_io (
              busses,
              cmdline,
              opts)
```

Start IO service with the given options

Parameters

`in,out`	*busses*	table of vBus names as keys. Uses io config `<name>.vbus` to fill vBus `<name>`.
	cmdline	io command line parameters
	opts	Option table for loader.start function, e.g. scheduler or ext_caps. Entries from ext_caps have precedence over default caps created by this function.

After this function returns the created vBusses are located in the table passed as `busses`.

16.41.1.4 start_virtio_switch()

```
start_virtio_switch (
              ports,
              prio,
              cpus,
              switch_type,
              ext_caps)
```

Start virtio network application.

Deprecated This function exists for backwards compatiblity reasons and calls start_virtio_switch_tbl with an appropriate `options` table

Parameters

`in,out`	*ports*	table with port names as keys
	prio	priority for started thread
	cpus	cpu mask for started thread
	switch_type	Selects application to start. Either `switch` or `p2p`
	ext_caps	Extra capabilities to pass to the started application

The switch_type `switch` can take additional arguments to create a port at the switch. To pass these arguments for a specific port, pass a table as value for a key in the ports table.

16.41.1.5 start_virtio_switch_tbl()

```
start_virtio_switch_tbl (
              options)
```

Start virtio network application.

Parameters

options	A table of parameters

The following keys are supported in the `options` table:

table key	value
`ports`	table with port names as keys
`scheduler`	scheduler (e.g. created with new_sched)
`switch_type`	selects application to start. Either `switch` or `p2p`
`ext_caps`	Extra capabilities to pass to the started application
`svr_cap`	cap slot to be used for the server interface
`port_limit`	the maximum number of dynamic ports the switch shall support

The switch_type `switch` can take additional arguments to create a port at the switch. To pass these arguments for a specific port, pass a table as value for a key in the ports table.

Note

The `svr_cap` capability requires server rights, use ":svr()".

16.41.1.6 start_vm()

```
start_vm (
              options)
```

Start UVMM

Parameters

options	A table of parameters

The following keys are supported in the `options` table:

table key	value
`bootargs`	command line for guest kernel
`cpus`	cpu mask
`ext_args`	additional arguments to pass to UVMM
`fdt`	file name of the device tree
`id`	an integer identifying the VM
`jdb`	jdb capability
`kernel`	file name of the guest kernel binary
`mem`	RAM size in MiB *or* dataspace cap for guest memory.
`mem_align`	alignment for the guest memory in bits. Ignored if mem is a cap.
`mon`	monitor application file name
`net`	a virtio cap, e.g. for network
`prio`	thread priority
`ram_base`	start of guest memory
`rd`	file name of the ramdisk
`scheduler`	a scheduler cap. If used, prio and cpus are ignored.
`vbus`	the vBus to attach to the VM

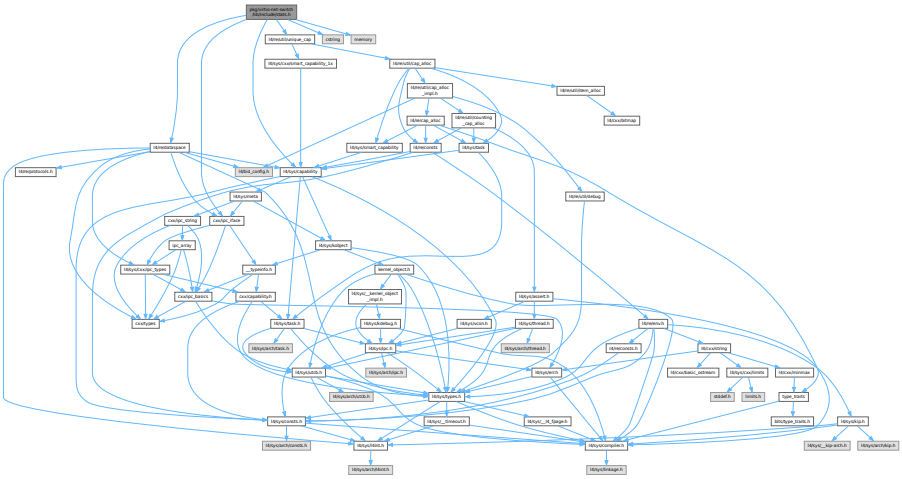
16.43 pkg/virtio-net-switch/lib/include/stats.h File Reference

Client interface for port statistics.

```
#include <l4/sys/capability>
#include <l4/sys/cxx/ipc_iface>
#include <l4/re/dataspace>
#include <l4/re/util/unique_cap>
#include <cstring>
#include <memory>
```

Include dependency graph for stats.h:



Data Structures

- struct Virtio_net_switch::Port_statistics

  Statistics for one port.
- struct Virtio_net_switch::Statistics

  Base statistics data structure, resides at the beginning of shared memory.
- class Virtio_net_switch::Statistics_if

  IPC interface for the statistics interface.
- class Virtio_net_switch::Monitor

  Statistics client interface.

16.43.1 Detailed Description

Client interface for port statistics.

00193                  * Header and csum offloading/general segmentation offloading
00194                  *
00195                  * We just copy the original header from source to
00196                  * destination and have to consider three different
00197                  * cases:
00198                  * - no flags are set
00199                  *   - we got a packet that is completely checksummed
00200                  *     and correctly fragmented, there is nothing to
00201                  *     do other then copying.
00202                  * - virtio_net_hdr_f_needs_csum set
00203                  *   - the packet is partially checksummed; if we would
00204                  *     send the packet out on the wire we would have
00205                  *     to calculate checksums now. But here we rely on
00206                  *     the ability of our guest to handle partially
00207                  *     checksummed packets and simply delegate the
00208                  *     checksum calculation to them.
00209                  * - gso_type != gso_none
00210                  *   - the packet needs to be segmented; if we would
00211                  *     send it out on the wire we would have to
00212                  *     segment it now. But again we rely on the
00213                  *     ability of our guest to handle gso
00214                  *
00215                  * We currently assume that our guests negotiated
00216                  * virtio_net_f_guest_*, this needs to be checked in
00217                  * the future.
00218                  *
00219                  * We also discussed the usage of
00220                  * virtio_net_hdr_f_data_valid to remove the need to
00221                  * checksum packets at all. But since our clients send
00222                  * partially checksummed packets anyway the only
00223                  * interesting case would be a packet without
00224                  * net_hdr_f_needs_checksum set. In that case we would
00225                  * signal that we checked the checksum and the
00226                  * checksum is actually correct. Since we do not know
00227                  * the origin of the packet (it could have been send
00228                  * by an external node and could have been routed to
00229                  * u) we can not signal this without actually
00230                  * verifying the checksum. Otherwise a packet with an

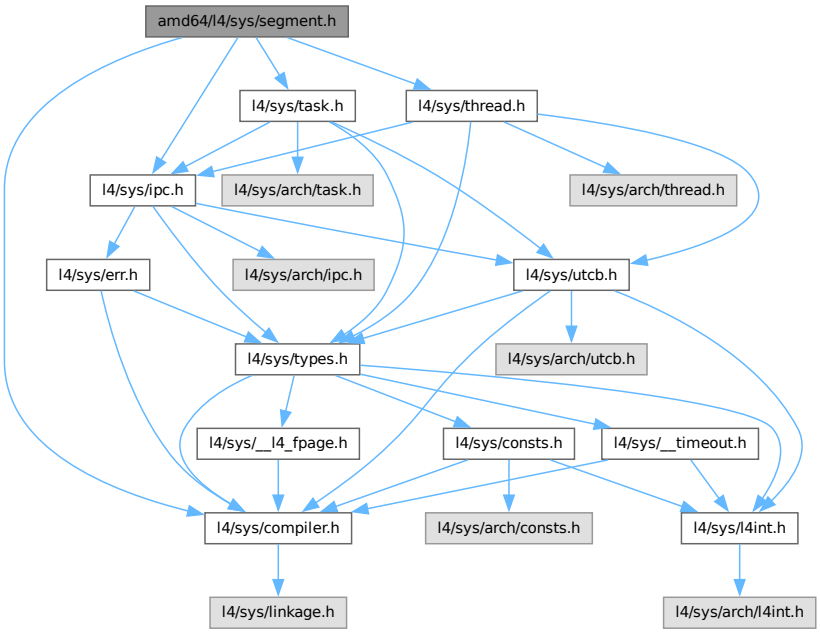
16.72 amd64/l4/sys/segment.h File Reference

Segment handling (AMD64).

```
#include <l4/sys/ipc.h>
#include <l4/sys/task.h>
#include <l4/sys/thread.h>
#include <l4/sys/compiler.h>
```

Include dependency graph for segment.h:



Enumerations

- enum L4_task_ldt_x86_consts { L4_TASK_LDT_X86_ENTRY_SIZE = 8 , L4_TASK_LDT_X86_MAX_ENTRIES }

  Constants for LDT handling.

- enum L4_sys_segment { L4_AMD64_SEGMENT_FS = 0 , L4_AMD64_SEGMENT_GS = 1 }

  Constants for identifying segments.

Functions

- long fiasco_ldt_set (l4_cap_idx_t task, void *ldt, unsigned int num_desc, unsigned int entry_number_start, l4_utcb_t *utcb)

  Set LDT segments descriptors.
- long fiasco_gdt_set (l4_cap_idx_t thread, void *desc, unsigned int size, unsigned int entry_number_start, l4_utcb_t *utcb)

  Set GDT segment descriptors.
- unsigned fiasco_gdt_get_entry_offset (l4_cap_idx_t thread, l4_utcb_t *utcb)

  Return the offset of the entry in the GDT.
- long fiasco_amd64_set_fs (l4_cap_idx_t thread, l4_umword_t base, l4_utcb_t *utcb)

  Set the base address for the FS segment.
- long fiasco_amd64_set_segment_base (l4_cap_idx_t thread, enum L4_sys_segment segr, l4_umword_t base, l4_utcb_t *utcb)

  Set the base address for a segment.
- long fiasco_amd64_segment_info (l4_cap_idx_t thread, unsigned *user_ds, unsigned *user_cs, unsigned *user32_cs, l4_utcb_t *utcb)

  Get segment information.

16.72.1 Detailed Description

Segment handling (AMD64).
Definition in file segment.h.

16.72.2 Enumeration Type Documentation

16.72.2.1 L4_sys_segment

```
enum L4_sys_segment
```

Constants for identifying segments.

Enumerator

L4_AMD64_SEGMENT_FS	Constant identifying the FS segment.
L4_AMD64_SEGMENT_GS	Constant identifying the GS segment.

Definition at line 106 of file segment.h.

16.72.2.2 L4_task_ldt_x86_consts

```
enum L4_task_ldt_x86_consts
```

Constants for LDT handling.

Enumerator

L4_TASK_LDT_X86_ENTRY_SIZE	Size of an LDT entry.
L4_TASK_LDT_X86_MAX_ENTRIES	Maximum number of LDT entries that can be written with one call.

Definition at line 75 of file segment.h.

16.72.3 Function Documentation

16.72.3.1 fiasco_amd64_segment_info()

```
long fiasco_amd64_segment_info (
            l4_cap_idx_t thread,
```

```
unsigned * user_ds,
unsigned * user_cs,
unsigned * user32_cs,
l4_utcb_t * utcb)  [inline]
```

Get segment information.

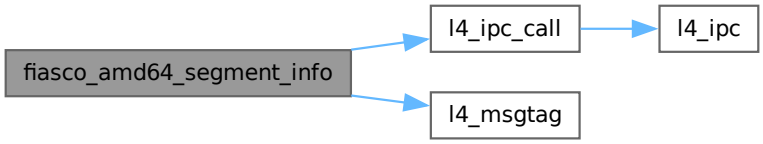
Parameters

in	*thread*	Thread to get info from.
out	*user_ds*	DS segment selector.
out	*user_cs*	64-bit CS segment selector.
out	*user32_cs*	32-bit CS segment selector.
	utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Returns

System call error

Definition at line 175 of file segment.h.
References l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_PROTO_THREAD, L4_THREAD_AMD64_GET_SEGMENT_INFO_OP, and l4_msg_regs_t::mr.
Here is the call graph for this function:



16.72.3.2 fiasco_amd64_set_fs()

```
long fiasco_amd64_set_fs (
l4_cap_idx_t thread,
l4_umword_t base,
l4_utcb_t * utcb)  [inline]
```

Set the base address for the FS segment.

Parameters

thread	Thread for which the FS base address shall be modified.
base	Base address.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

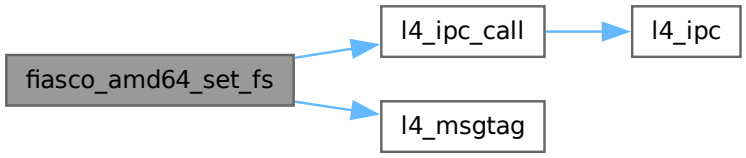
Return values

L4_EOK	Success.
-L4_EINVAL	Invalid base address (`base`).
-L4_ENOSYS	Operation not supported with current kernel configuration.

Note

Calling this function is equivalent to calling `fiasco_amd64_set_segment_base(thread, L4_↩ AMD64_SEGMENT_FS, base, utcb)`.

Definition at line 203 of file segment.h.
References L4_AMD64_SEGMENT_FS, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_PROTO_THREAD, and L4_THREAD_AMD64_SET_SEGMENT_BASE_OP.
Here is the call graph for this function:



16.72.3.3 fiasco_amd64_set_segment_base()

```
long fiasco_amd64_set_segment_base (
            l4_cap_idx_t thread,
            enum L4_sys_segment segr,
            l4_umword_t base,
            l4_utcb_t * utcb)  [inline]
```

Set the base address for a segment.

Parameters

thread	Thread for which the base address of the selected segment shall be modified.
segr	Segment to modify (one of L4_sys_segment).
base	Base address.
utcb	UTCB to be used for this operation, shall be the UTCB of the calling thread. See l4_utcb.

Return values

L4_EOK	Success.
-L4_EINVAL	Invalid segment (`segr`) or base address (`base`).
-L4_ENOSYS	Operation not supported with current kernel configuration.

Definition at line 211 of file segment.h.
References l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_PROTO_THREAD, and L4_THREAD_AMD64_SET_SEGMENT_BASE_

Here is the call graph for this function:

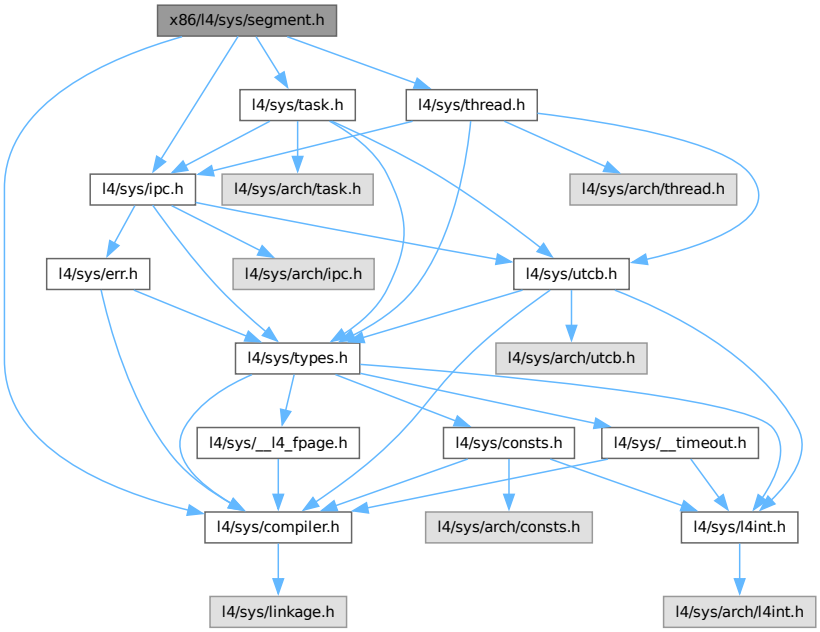
#include <l4/sys/task.h>
#include <l4/sys/thread.h>
```

Include dependency graph for segment.h:



Enumerations

- enum L4_task_ldt_x86_consts { L4_TASK_LDT_X86_ENTRY_SIZE = 8 , L4_TASK_LDT_X86_MAX_ENTRIES }

  Constants for LDT handling.

Functions

- long fiasco_ldt_set (l4_cap_idx_t task, void *ldt, unsigned int num_desc, unsigned int entry_number_start, l4_utcb_t *utcb)

  Set LDT segments descriptors.
- long fiasco_gdt_set (l4_cap_idx_t thread, void *desc, unsigned int size, unsigned int entry_number_start, l4_utcb_t *utcb)

  Set GDT segment descriptors.
- unsigned fiasco_gdt_get_entry_offset (l4_cap_idx_t thread, l4_utcb_t *utcb)

  Return the offset of the entry in the GDT.

16.74.1 Detailed Description

Segment handling (x86).
Definition in file segment.h.

16.74.2 Enumeration Type Documentation

16.74.2.1 L4_task_ldt_x86_consts

enum L4_task_ldt_x86_consts
Constants for LDT handling.

Enumerator

L4_TASK_LDT_X86_ENTRY_SIZE	Size of an LDT entry.
L4_TASK_LDT_X86_MAX_ENTRIES	Maximum number of LDT entries that can be written with one call.

Definition at line 75 of file segment.h.

16.75 segment.h

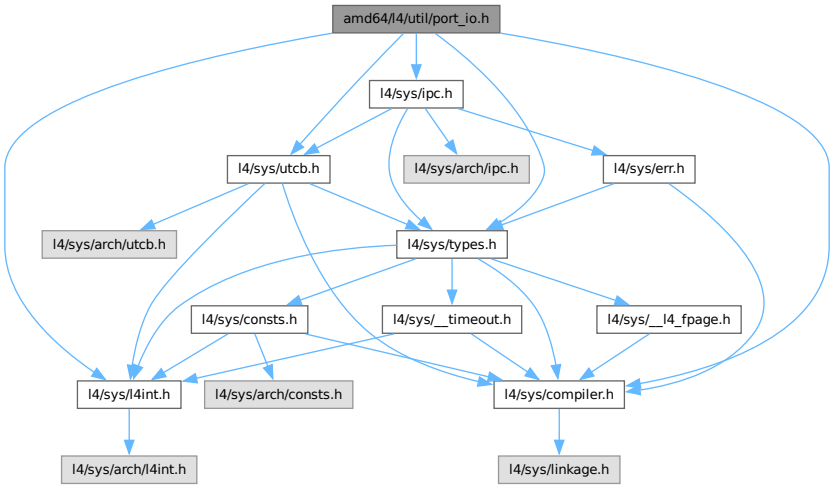
Include dependency graph for port_io.h:



Functions

- l4_uint8_t l4util_in8 (l4_uint16_t port)

  Read byte from I/O port.
- l4_uint16_t l4util_in16 (l4_uint16_t port)

  Read 16-bit-value from I/O port.
- l4_uint32_t l4util_in32 (l4_uint16_t port)

  Read 32-bit-value from I/O port.
- void l4util_ins8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Read a block of 8-bit-values from I/O ports.
- void l4util_ins16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Read a block of 16-bit-values from I/O ports.
- void l4util_ins32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Read a block of 32-bit-values from I/O ports.
- void l4util_out8 (l4_uint8_t value, l4_uint16_t port)

  Write byte to I/O port.
- void l4util_out16 (l4_uint16_t value, l4_uint16_t port)

  Write 16-bit-value to I/O port.
- void l4util_out32 (l4_uint32_t value, l4_uint16_t port)

  Write 32-bit-value to I/O port.
- void l4util_outs8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write a block of bytes to I/O port.
- void l4util_outs16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write a block of 16-bit-values to I/O port.
- void l4util_outs32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write block of 32-bit-values to I/O port.
- void **l4util_iodelay** (void)

  delay I/O port access by writing to port 0x80
- int l4util_ioport_map (l4_cap_idx_t sigma0id, unsigned port_start, unsigned log2size)

  Map a range of I/O ports.

16.80.1 Detailed Description

x86 port I/O

Date

06/2003

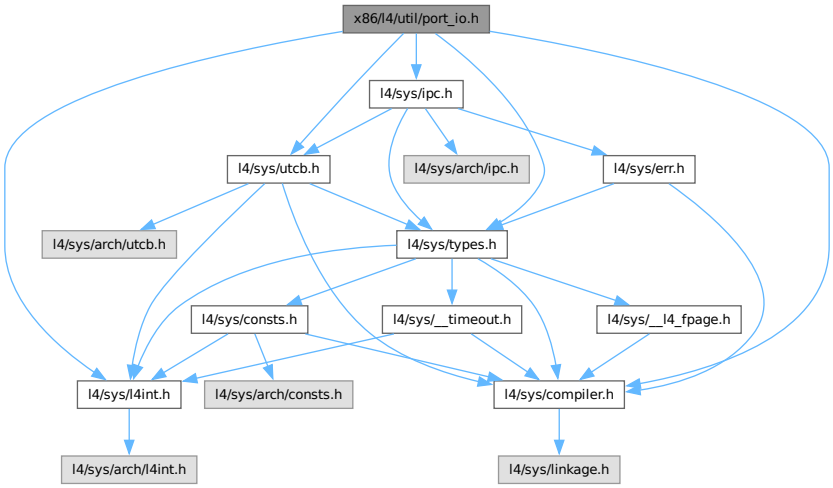
x86 port I/O

```
#include <l4/sys/l4int.h>
#include <l4/sys/compiler.h>
#include <l4/sys/types.h>
#include <l4/sys/utcb.h>
#include <l4/sys/ipc.h>
```

Include dependency graph for port_io.h:



Functions

- l4_uint8_t l4util_in8 (l4_uint16_t port)

  Read byte from I/O port.
- l4_uint16_t l4util_in16 (l4_uint16_t port)

  Read 16-bit-value from I/O port.
- l4_uint32_t l4util_in32 (l4_uint16_t port)

  Read 32-bit-value from I/O port.
- void l4util_ins8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Read a block of 8-bit-values from I/O ports.
- void l4util_ins16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Read a block of 16-bit-values from I/O ports.
- void l4util_ins32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Read a block of 32-bit-values from I/O ports.
- void l4util_out8 (l4_uint8_t value, l4_uint16_t port)

  Write byte to I/O port.
- void l4util_out16 (l4_uint16_t value, l4_uint16_t port)

  Write 16-bit-value to I/O port.
- void l4util_out32 (l4_uint32_t value, l4_uint16_t port)

  Write 32-bit-value to I/O port.
- void l4util_outs8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write a block of bytes to I/O port.
- void l4util_outs16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write a block of 16-bit-values to I/O port.
- void l4util_outs32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)

  Write block of 32-bit-values to I/O port.
- void **l4util_iodelay** (void)

  delay I/O port access by writing to port 0x80
- int l4util_ioport_map (l4_cap_idx_t sigma0id, unsigned port_start, unsigned log2size)

  Map a range of I/O ports.

Functions

- l4_cpu_time_t l4_rdtsc (void)
  Read current value of CPU-internal timestamp counter.
- l4_uint32_t l4_rdtsc_32 (void)
  Read the lest significant 32 bit of the TSC.
- l4_uint64_t l4_rdpmc (int ecx)
  Return current value of CPU-internal performance measurement counter.
- l4_uint32_t l4_rdpmc_32 (int ecx)
  Return the least significant 32 bit of a performance counter.
- l4_uint64_t l4_tsc_to_ns (l4_cpu_time_t tsc)
  Convert timestamp to ns value.
- l4_uint64_t l4_tsc_to_us (l4_cpu_time_t tsc)
  Convert timestamp into micro seconds value.
- void l4_tsc_to_s_and_ns (l4_cpu_time_t tsc, l4_uint32_t *s, l4_uint32_t *ns)
  Convert timestamp to s.ns value.
- l4_cpu_time_t l4_ns_to_tsc (l4_uint64_t ns)
  Convert nano seconds into CPU ticks.
- void l4_busy_wait_ns (l4_uint64_t ns)
  Wait busy for a small amount of time.
- void l4_busy_wait_us (l4_uint64_t us)
  Wait busy for a small amount of time.
- l4_uint32_t l4_calibrate_tsc (l4_kernel_info_t const *kip)
  Determine scalers for timestamp calculations.
- l4_uint32_t l4_tsc_init (l4_kernel_info_t const *kip)
  Initialize scaler for TSC calibrations from the kernel.
- l4_uint32_t l4_get_hz (void)
  Get CPU frequency in Hz.

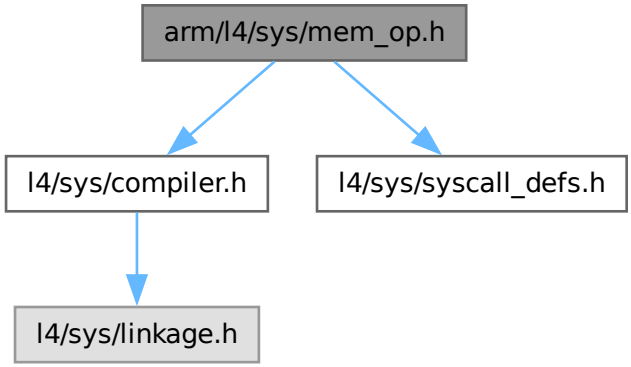
16.121 arm/l4/sys/mem_op.h File Reference

Memory access functions (ARM specific).

```
#include <l4/sys/compiler.h>
#include <l4/sys/syscall_defs.h>
```

Include dependency graph for mem_op.h:



Enumerations

- enum L4_mem_op_widths { L4_MEM_WIDTH_1BYTE = 0 , L4_MEM_WIDTH_2BYTE = 1 , L4_MEM_WIDTH_4BYTE = 2 }

  Memory access width definitions.

Functions

- unsigned long l4_mem_read (unsigned long virtaddress, unsigned width)

  Read user task memory from kernel privilege level.
- void l4_mem_write (unsigned long virtaddress, unsigned width, unsigned long value)

  Write user task memory from kernel privilege level.
- unsigned long **l4_mem_arm_op_call** (unsigned long op, unsigned long va, unsigned long width, unsigned long value)

Implementations.

16.121.1 Detailed Description

Memory access functions (ARM specific).

  Sub-opcodes for L4_THREAD_PF_TRAMP_CONTROL_OP.

Functions

- l4_msgtag_t l4_thread_ex_regs (l4_cap_idx_t thread, l4_addr_t ip, l4_addr_t sp, l4_umword_t flags) L4_NOTHROW

  Exchange basic thread registers.
- l4_msgtag_t l4_thread_ex_regs_u (l4_cap_idx_t thread, l4_addr_t ip, l4_addr_t sp, l4_umword_t flags, l4_utcb_t *utcb) L4_NOTHROW

  Exchange basic thread registers.
- l4_msgtag_t l4_thread_ex_regs_ret (l4_cap_idx_t thread, l4_addr_t *ip, l4_addr_t *sp, l4_umword_t *flags) L4_NOTHROW

  Exchange basic thread registers and return previous values.
- l4_msgtag_t l4_thread_ex_regs_ret_u (l4_cap_idx_t thread, l4_addr_t *ip, l4_addr_t *sp, l4_umword_t *flags, l4_utcb_t *utcb) L4_NOTHROW

  Exchange basic thread registers and return previous values.
- void l4_thread_control_start (void) L4_NOTHROW

  Start a thread control API sequence.
- void l4_thread_control_pager (l4_cap_idx_t pager) L4_NOTHROW

  Set the pager.
- void l4_thread_control_exc_handler (l4_cap_idx_t exc_handler) L4_NOTHROW

  Set the exception handler.
- void l4_thread_control_bind (l4_utcb_t *thread_utcb, l4_cap_idx_t task) L4_NOTHROW

  Bind the thread to a task.
- void l4_thread_control_alien (int on) L4_NOTHROW

  Enable alien mode.
- l4_msgtag_t l4_thread_control_commit (l4_cap_idx_t thread) L4_NOTHROW

  Commit the thread control parameters.
- l4_msgtag_t l4_thread_yield (void) L4_NOTHROW

  Yield current time slice.
- l4_msgtag_t l4_thread_switch (l4_cap_idx_t to_thread) L4_NOTHROW

  Switch to another thread (and donate the remaining time slice).
- l4_msgtag_t l4_thread_stats_time (l4_cap_idx_t thread, l4_kernel_clock_t *us) L4_NOTHROW

  Get consumed time of thread in µs.
- l4_msgtag_t l4_thread_vcpu_resume_start (void) L4_NOTHROW

vCPU return from event handler.

- l4_msgtag_t l4_thread_vcpu_resume_commit (l4_cap_idx_t thread, l4_msgtag_t tag) L4_NOTHROW

  Commit vCPU resume.
- l4_msgtag_t l4_thread_vcpu_control (l4_cap_idx_t thread, l4_addr_t vcpu_state) L4_NOTHROW

  Enable the vCPU feature for the thread.
- l4_msgtag_t l4_thread_vcpu_control_u (l4_cap_idx_t thread, l4_addr_t vcpu_state, l4_utcb_t *utcb) L4_NOTHROW

  Enable the vCPU feature for the thread.
- l4_msgtag_t l4_thread_vcpu_control_ext (l4_cap_idx_t thread, l4_addr_t ext_vcpu_state) L4_NOTHROW

  Enable the extended vCPU feature for the thread.
- l4_msgtag_t l4_thread_vcpu_control_ext_u (l4_cap_idx_t thread, l4_addr_t ext_vcpu_state, l4_utcb_t *utcb) L4_NOTHROW

  Enable the extended vCPU feature for the thread.
- l4_msgtag_t l4_thread_register_del_irq (l4_cap_idx_t thread, l4_cap_idx_t irq) L4_NOTHROW

  Register an IRQ that will trigger upon deletion events.
- l4_msgtag_t l4_thread_modify_sender_start (void) L4_NOTHROW

  Start a thread sender modification sequence.
- int l4_thread_modify_sender_add (l4_umword_t match_mask, l4_umword_t match, l4_umword_t del_bits, l4_umword_t add_bits, l4_msgtag_t *tag) L4_NOTHROW

  Add a modification pattern to a sender modification sequence.
- l4_msgtag_t l4_thread_modify_sender_commit (l4_cap_idx_t thread, l4_msgtag_t tag) L4_NOTHROW

  Apply (commit) a sender modification sequence.
- l4_msgtag_t l4_thread_register_doorbell_irq (l4_cap_idx_t thread, l4_cap_idx_t irq) L4_NOTHROW

  Register an IRQ that will trigger when a forwarded virtual interrupt is pending.
- l4_msgtag_t l4_thread_pf_trampoline_setup (l4_cap_idx_t thread, l4_addr_t pf_tramp_state) L4_NOTHROW

  Setup page fault trampoline handler.
- l4_msgtag_t l4_thread_pf_trampoline_resume (l4_cap_idx_t thread) L4_NOTHROW

  Resume from page fault trampoline handler.
- l4_msgtag_t l4_thread_pf_trampoline_reflect (l4_cap_idx_t thread) L4_NOTHROW

  Page fault trampoline handler reflects page fault to exception handler.
- l4_msgtag_t l4_thread_pf_trampoline_disable (l4_cap_idx_t thread, int *was_enabled) L4_NOTHROW

  Disable the page fault trampoline handling for this thread.
- l4_msgtag_t l4_thread_pf_trampoline_enable (l4_cap_idx_t thread) L4_NOTHROW

  Re-enable the page fault trampoline handling for this thread.

Macros

- #define __L4UTIL_THREAD_FUNC(name)

  Defines a wrapper function that sets up the registers according to the calling conventions for the architecture.
- #define _L4UTIL_THREAD_CXX_FUNC_IMPL_(suffix, class, fn_name, from_asm_name, ...)

  Implement stub and handler.
- #define L4UTIL_THREAD_CXX_FUNC_PROTO(fn_name, ...)

  Declare static C++ class method which can be called as handler were only stack and instruction pointer are in a well-defined state.
- #define L4UTIL_THREAD_CXX_FUNC_IMPL(class, fn_name, ...)

  Implement static C++ class method which can be called as handler were only stack and instruction pointer are in a well-defined state.
- #define L4UTIL_THREAD_CXX_FUNC_INTERRUPT_IMPL(class, fn_name, ...)

  Implement static C++ class method which can be called as handler were only stack and instruction pointer are in a well-defined state.

16.148.2 Macro Definition Documentation

16.148.2.1 __L4UTIL_THREAD_FUNC

```
#define __L4UTIL_THREAD_FUNC(
              name)
```

Value:

```
void L4_NORETURN name(void)
```

Defines a wrapper function that sets up the registers according to the calling conventions for the architecture.
Use this as a function header when starting a low-level thread where only stack and instruction pointer are in a well-defined state.
Example:

```
L4UTIL_THREAD_FUNC(helper_thread)
{
  l4_infinite_loop();
}

thread_cap->ex_regs((l4_umword_t)helper_thread, stack_addr);
```

Definition at line 74 of file thread.h.

16.148.2.2 _L4UTIL_THREAD_CXX_FUNC_IMPL_

```
#define _L4UTIL_THREAD_CXX_FUNC_IMPL_(
              suffix,
              class,
              fn_name,
              from_asm_name,
              ...)
```

Value:

```
  asm (".global " L4_stringify(fn_name ## _stub)                  "\n"          \
       ".type " L4_stringify(fn_name ## _stub) " STT_FUNC          \n"          \
       L4_stringify(fn_name ## _stub) ":                           \n"          \
  L4UTIL_THREAD_CXX_FUNC_IMPL ## suffix ## _STUB(from_asm_name)                  \
      );                                                                         \
                                                                                 \
  [[noreturn]] void __attribute__((used)) class::from_asm_name(__VA_ARGS__)
```

Implement stub and handler.
For 'Foo::foo(int a, int b)' this macro expands into:

```
asm (".global foo_stub    \n"
     "foo_stub:           \n"
     ... align stack pointer ...
     "<call> foo_from_asm \n");

[[noreturn]] static void __attribute__((used))
Foo::foo(int a, int b) asm ("foo_from_asm")
```

Definition at line 102 of file thread.h.

16.148.2.3 L4UTIL_THREAD_CXX_FUNC_IMPL

```
#define L4UTIL_THREAD_CXX_FUNC_IMPL(
              class,
              fn_name,
              ...)
```

Value:

```
  [[noreturn]] void class::fn_name(__VA_ARGS__)
```

Implement static C++ class method which can be called as handler were only stack and instruction pointer are in a well-defined state.
This is important for certain architectures defining global registers or for architectures like AMD64 defining a "red zone" (a reserved fixed-size area below the current stack pointer to be used for temporary data).
The first two parameters of this macro define class name and method name, followed by up to three function parameters.
Use these macros like follows:

```
class Foo
{
  L4UTIL_THREAD_CXX_FUNC_PROTO(handler, int param1, long param2);
```

```
};

L4UTIL_THREAD_CXX_FUNC_IMPL(Foo, handler, int param1, long param2)
{
  printf("param1 = %d, param2 = %ld\n", param1, param2);
}
```

to declare the method

```
[[noreturn]] void Foo::handler(int param1, long param2);
```

Note

Use together with L4UTIL_THREAD_CXX_FUNC_PROTO().

Definition at line 176 of file thread.h.

16.148.2.4 L4UTIL_THREAD_CXX_FUNC_INTERRUPT_IMPL

```
#define L4UTIL_THREAD_CXX_FUNC_INTERRUPT_IMPL(
                class,
                fn_name,
                ...)
```

Value:

```
  _L4UTIL_THREAD_CXX_FUNC_IMPL(_INTERRUPT, class, fn_name, ##__VA_ARGS__)
```

Implement static C++ class method which can be called as handler were only stack and instruction pointer are in a well-defined state.
In contrast to L4UTIL_THREAD_CXX_FUNC_IMPL(), assume that this function may interrupt code executed at another user-level context and there are adaptions required to the stack pointer (alignment, consider the "red zone" on AMD64, etc.)
Definition at line 194 of file thread.h.

16.148.2.5 L4UTIL_THREAD_CXX_FUNC_PROTO

```
#define L4UTIL_THREAD_CXX_FUNC_PROTO(
                fn_name,
                ...)
```

Value:

```
   [[noreturn]] static void fn_name(__VA_ARGS__) \
   asm (L4_stringify(fn_name ## _stub)); \
   [[noreturn]] static void fn_name ## _from_asm(__VA_ARGS__) \
   asm (L4_stringify(fn_name ## _from_asm))
```

Declare static C++ class method which can be called as handler were only stack and instruction pointer are in a well-defined state.
Architecture-specific implementations may override this macro to use certain function attributes (e.g. **attribute**((regparm(3))) on x86).

Note

Use together with L4UTIL_THREAD_CXX_FUNC_IMPL() or L4UTIL_THREAD_CXX_FUNC_IMPL_SAME↩_STACK().

Definition at line 127 of file thread.h.

00022  * Note: The following Assembler statement may produce wrong code:
00023  *   asm volatile ("btsl %1, %2" : "=@ccc"(r) : "Jr"(63), "m"(m) : "memory");
00024  *
00025  * The compiler might chose the first variant because the bit number is smaller
00026  * than 64. However, 'bts' is encoded as 32-bit variant ('btsl') and thus only
00027  * supports immediate bit values up to 31. Some assemblers support immediate
00028  * offsets > 31 by adapting the memory address accordingly but GAS does not.
00029  * With GAS, the instruction will encode an immediate value of 63 but the CPU
00030  * will set bit 31 instead of bit 63!
00031  *
00032  * Therefore, if we would use 'btsl' instead of 'btsq', the correct constraint
00033  * for the bit number parameter would be "Ir" instead of "Jr".

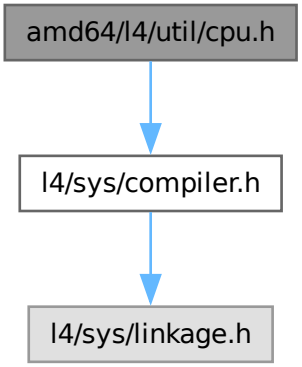
16.159 amd64/l4/util/cpu.h File Reference

CPU related functions.

`#include <l4/sys/compiler.h>`
Include dependency graph for cpu.h:



Functions

- int l4util_cpu_has_cpuid (void)

  Check whether the CPU supports the "cpuid" instruction.
- unsigned int l4util_cpu_capabilities (void)

  Returns the CPU capabilities if the "cpuid" instruction is available.
- unsigned int l4util_cpu_capabilities_nocheck (void)

  Returns the CPU capabilities.
- void **l4util_cpu_cpuid** (unsigned long mode, unsigned long ∗eax, unsigned long ∗ebx, unsigned long ∗ecx, unsigned long ∗edx)

  Generic CPUID access function.

CPU related functions.

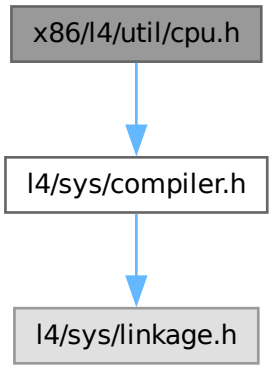
`#include <l4/sys/compiler.h>`

Include dependency graph for cpu.h:



Functions

- int l4util_cpu_has_cpuid (void)

  Check whether the CPU supports the "cpuid" instruction.
- unsigned int l4util_cpu_capabilities (void)

  Returns the CPU capabilities if the "cpuid" instruction is available.
- unsigned int l4util_cpu_capabilities_nocheck (void)

  Returns the CPU capabilities.
- void **l4util_cpu_cpuid** (unsigned long mode, unsigned long ∗eax, unsigned long ∗ebx, unsigned long ∗ecx, unsigned long ∗edx)

  Generic CPUID access function.

Functions

- l4_cap_idx_t l4io_request_icu (void)

  Request the ICU object of the client.

- long l4io_request_iomem (l4_addr_t phys, unsigned long size, int flags, l4_addr_t *virt)

  Request an IO memory region.

- long l4io_request_iomem_region (l4_addr_t phys, l4_addr_t virt, unsigned long size, int flags)

  Request an IO memory region and map it to a specified region.
- long l4io_release_iomem (l4_addr_t virt, unsigned long size)

  Release an IO memory region.
- long l4io_request_ioport (unsigned portnum, unsigned len)

  Request an IO port region.
- long l4io_release_ioport (unsigned portnum, unsigned len)

  Release an IO port region.
- l4io_device_handle_t l4io_get_root_device (void)

  Get root device handle of the device bus.
- int l4io_iterate_devices (l4io_device_handle_t *devhandle, l4io_device_t *dev, l4io_resource_handle_t *reshandle)

  Iterate over the device bus.
- int l4io_lookup_device (const char *devname, l4io_device_handle_t *dev_handle, l4io_device_t *dev, l4io_resource_handle_t *res_handle)

  Find a device by name.
- int l4io_lookup_resource (l4io_device_handle_t devhandle, enum l4io_resource_types_t type, l4io_resource_handle_t *reshandle, l4io_resource_t *res)

  Request a specific resource from a device description.
- l4_addr_t l4io_request_resource_iomem (l4io_device_handle_t devhandle, l4io_resource_handle_t *reshandle)

  Request IO memory.
- void l4io_request_all_ioports (void(*res_cb)(l4vbus_resource_t const *res))

  Request all available IO-port resources.
- int l4io_has_resource (enum l4io_resource_types_t type, l4vbus_paddr_t start, l4vbus_paddr_t end)

  Check if a resource is available.

16.171.1 Function Documentation

16.171.1.1 l4io_get_root_device()

```
l4io_device_handle_t l4io_get_root_device (
            void )  [inline]
```

Get root device handle of the device bus.

Returns

root device handle

Definition at line 257 of file io.h.

16.171.1.2 l4io_iterate_devices()

```
int l4io_iterate_devices (
            l4io_device_handle_t * devhandle,
            l4io_device_t * dev,
            l4io_resource_handle_t * reshandle)
```

Iterate over the device bus.

Parameters

in,out	*devhandle*	Device handle to start iterating at. The next device handle is returned here.
out	*dev*	Device information, may be NULL.
out	*reshandle*	Resource handle.

Returns

0 on success, error code otherwise

References L4_CV, and L4_EXPORT.

16.171.1.3 l4io_request_all_ioports()

```
void l4io_request_all_ioports (
            void(* res_cb )(l4vbus_resource_t const *res))
```

Request all available IO-port resources.

Parameters

res_cb	Callback function called for every port resource found, give NULL for no callback.

References L4_CV, and L4_EXPORT.

16.171.1.4 l4io_request_icu()

```
l4_cap_idx_t l4io_request_icu (
            void )
```

Request the ICU object of the client.

Returns

Client ICU object, an invalid capability selector is returned if no ICU is available.

References L4_CV, and L4_EXPORT.

16.172 io.h

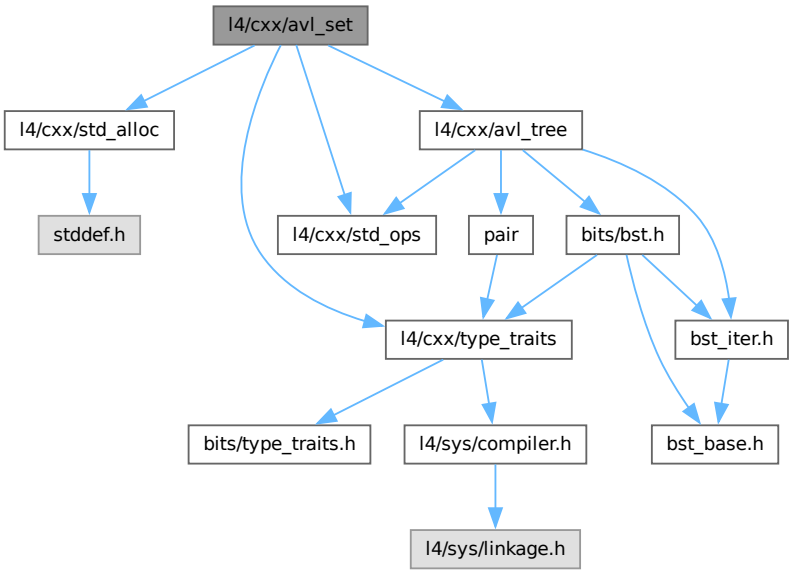
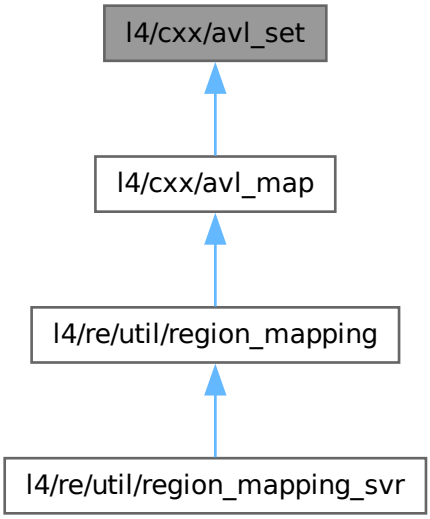
Include dependency graph for avl_set:



This graph shows which files directly or indirectly include this file:



Data Structures

- class cxx::Bits::Avl_set_iter< Node, Key, Node_op >

  Generic iterator for the AVL-tree based set.
- struct cxx::Bits::Avl_set_get_key< KEY_TYPE >

Internal, key-getter for Avl_set nodes.

- class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >

  AVL set with internally managed nodes.
- class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node

  A smart pointer to a tree item.
- class cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >

  AVL set for simple comparable items.

Namespaces

- namespace cxx

  Our C++ library.
- namespace cxx::Bits

  Internal helpers for the cxx package.

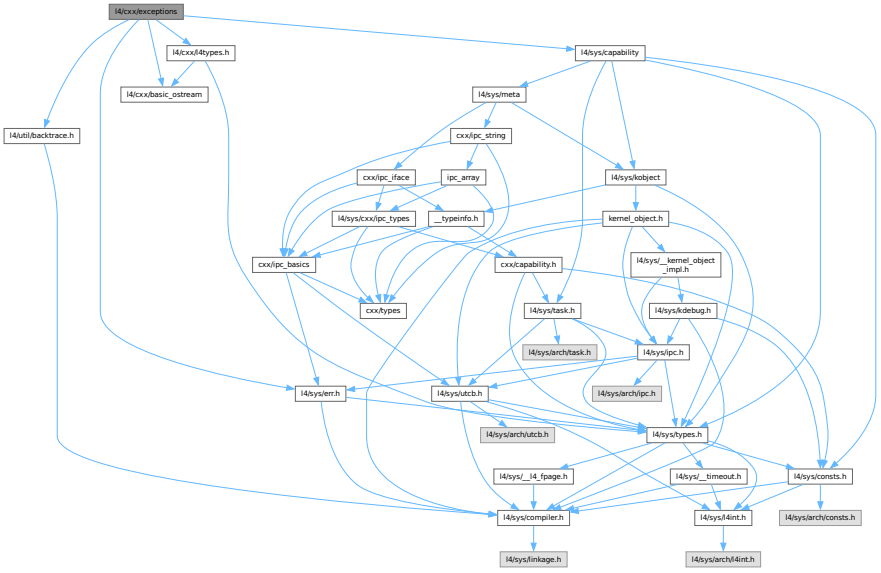
16.201 l4/cxx/exceptions File Reference

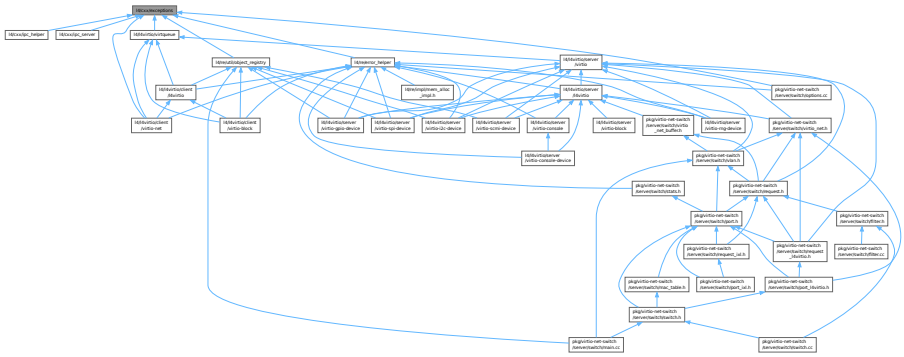
Base exceptions.

```
#include <l4/cxx/l4types.h>
#include <l4/cxx/basic_ostream>
#include <l4/sys/err.h>
#include <l4/sys/capability>
#include <l4/util/backtrace.h>
```

Include dependency graph for exceptions:



This graph shows which files directly or indirectly include this file:



Data Structures

- class L4::Exception_tracer

  Back-trace support for exceptions.
- class L4::Base_exception

  Base class for all exceptions, thrown by the L4Re framework.
- class L4::Runtime_error

  Exception for an abstract runtime error.
- class L4::Out_of_memory

  Exception signalling insufficient memory.
- class L4::Element_already_exists

  Exception for duplicate element insertions.
- class L4::Unknown_error

  Exception for an unknown condition.
- class L4::Element_not_found

  Exception for a failed lookup (element not found).
- class L4::Invalid_capability

  Indicates that an invalid object was invoked.
- class L4::Com_error

  Error conditions during IPC.
- class L4::Bounds_error

  Access out of bounds.

Namespaces

- namespace L4

  L4 low-level kernel interface.

Macros

- #define **L4_CXX_EXCEPTION_BACKTRACE** 20

  Number of instruction pointers in backtrace.

16.201.1 Detailed Description

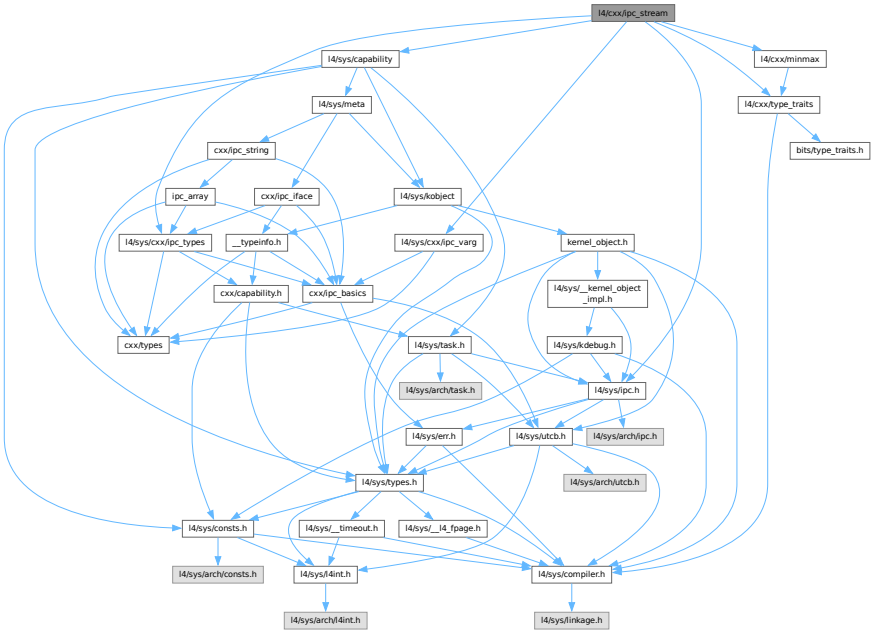
16.208 l4/cxx/ipc_stream File Reference

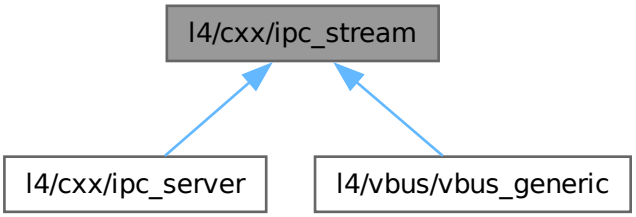
IPC stream.

```
#include <l4/sys/ipc.h>
#include <l4/sys/capability>
#include <l4/sys/cxx/ipc_types>
#include <l4/sys/cxx/ipc_varg>
#include <l4/cxx/type_traits>
#include <l4/cxx/minmax>
```

Include dependency graph for ipc_stream:



This graph shows which files directly or indirectly include this file:



Data Structures

- class L4::Ipc::Str_cp_in< T >

  Abstraction for extracting a zero-terminated string from an Ipc::Istream.
- class L4::Ipc::Msg_ptr< T >

  Pointer to an element of type T in an Ipc::Istream.
- class L4::Ipc::Istream

  Input stream for IPC unmarshalling.
- class L4::Ipc::Ostream

  Output stream for IPC marshalling.
- class L4::Ipc::Iostream

  Input/Output stream for IPC [un]marshalling.

Namespaces

- namespace L4

  L4 low-level kernel interface.
- namespace L4::Ipc

  IPC related functionality.

Functions

- template<typename T>
  Internal::Buf_cp_out< T > L4::Ipc::buf_cp_out (T const *v, unsigned long size)

  Insert an array into an Ipc::Ostream.
- template<typename T>
  Internal::Buf_cp_in< T > L4::Ipc::buf_cp_in (T *v, unsigned long &size)

  Extract an array from an Ipc::Istream.
- template<typename T>
  Str_cp_in< T > L4::Ipc::str_cp_in (T *v, unsigned long &size)

  Create a Str_cp_in for the given values.
- template<typename T>
  Msg_ptr< T > L4::Ipc::msg_ptr (T *&p)

  Create an Msg_ptr to adjust the given pointer.
- template<typename T>
  Internal::Buf_in< T > L4::Ipc::buf_in (T *&v, unsigned long &size)

  Return a pointer to stream array data.
- L4::Ipc::Istream & operator>> (L4::Ipc::Istream &s, bool &v)

Extract one element of type T from the stream s.

- L4::Ipc::Istream & operator>> (L4::Ipc::Istream &s, l4_msgtag_t &v)

  Extract the L4 message tag from the stream s.

- template<typename T>
  L4::Ipc::Istream & operator>> (L4::Ipc::Istream &s, L4::Ipc::Internal::Buf_in< T > const &v)

  Extract an array of T elements from the stream s.

- template<typename T>
  L4::Ipc::Istream & operator>> (L4::Ipc::Istream &s, L4::Ipc::Msg_ptr< T > const &v)

  Extract an element of type T from the stream s.

- template<typename T>
  L4::Ipc::Istream & operator>> (L4::Ipc::Istream &s, L4::Ipc::Internal::Buf_cp_in< T > const &v)

  Extract an array of T elements from the stream s.

- template<typename T>
  L4::Ipc::Istream & operator>> (L4::Ipc::Istream &s, L4::Ipc::Str_cp_in< T > const &v)

  Extract a zero-terminated string from the stream.

- L4::Ipc::Ostream & operator<< (L4::Ipc::Ostream &s, bool v)

  Insert an element to type T into the stream s.

- L4::Ipc::Ostream & operator<< (L4::Ipc::Ostream &s, l4_msgtag_t const &v)

  Insert the L4 message tag into the stream s.

- template<typename T>
  L4::Ipc::Ostream & operator<< (L4::Ipc::Ostream &s, L4::Ipc::Internal::Buf_cp_out< T > const &v)

  Insert an array with elements of type T into the stream s.

- L4::Ipc::Ostream & operator<< (L4::Ipc::Ostream &s, char const *v)

  Insert a zero terminated character string into the stream s.

- template<typename T>
  T L4::Ipc::read (Istream &s)

  Read a value out of a stream.

16.208.1 Detailed Description

IPC stream.
Definition in file ipc_stream.

16.208.2 Function Documentation

16.208.2.1 operator<<() [1/4]

```
L4::Ipc::Ostream & operator<< (
            L4::Ipc::Ostream & s,
            bool v)  [inline]
```

Insert an element to type T into the stream s.

Parameters

s	The stream to insert the element v.
v	The element to insert.

Returns

The stream `s`.

Definition at line 1197 of file ipc_stream.
References L4::Ipc::Ostream::put().
Here is the call graph for this function:

16.208.2.2 operator<<() [2/4]

```
L4::Ipc::Ostream & operator<< (
            L4::Ipc::Ostream & s,
            char const * v)  [inline]
```

Insert a zero terminated character string into the stream `s`.

Parameters

s	The stream to insert the string `v`.
v	The string to insert.

Returns

The stream `s`.

This operator produces basically the same content as the array insertion, however the length of the array is calculated using `strlen(v) + 1` The string is copied into the message including the trailing zero.
Definition at line 1269 of file ipc_stream.
References L4::Ipc::Ostream::put().
Here is the call graph for this function:

16.208.2.3 operator<<() [3/4]

```
template<typename T>
L4::Ipc::Ostream & operator<< (
            L4::Ipc::Ostream & s,
            L4::Ipc::Internal::Buf_cp_out< T > const & v)  [inline]
```

Insert an array with elements of type T into the stream s.

Parameters

s	The stream to insert the array v.
v	The array to insert (see Ipc::Buf_cp_out()).

Returns

The stream s.

Definition at line 1248 of file ipc_stream.
References L4::Ipc::Ostream::put().
Here is the call graph for this function:

16.208.2.4 operator<<() [4/4]

```
L4::Ipc::Ostream & operator<< (
            L4::Ipc::Ostream & s,
            l4_msgtag_t const & v)  [inline]
```

Insert the L4 message tag into the stream s.

Parameters

s	The stream to insert the tag v.
v	The L4 message tag to insert.

Returns

The stream s.

Note

Only one message tag can be inserted into a stream. Multiple insertions simply overwrite previous insertions.

Definition at line 1232 of file ipc_stream.
References L4::Ipc::Ostream::tag().
Here is the call graph for this function:

16.208.2.5 operator>>() [1/6]

```
L4::Ipc::Istream & operator>> (
            L4::Ipc::Istream & s,
            bool & v)  [inline]
```

Extract one element of type T from the stream s.

Parameters

	s	The stream to extract from.
out	*v*	Extracted value.

Returns

The stream s.

Definition at line 1044 of file ipc_stream.
References L4::Ipc::Istream::get().
Here is the call graph for this function:

16.208.2.6 operator>>() [2/6]

```
template<typename T>
L4::Ipc::Istream & operator>> (
            L4::Ipc::Istream & s,
            L4::Ipc::Internal::Buf_cp_in< T > const & v)  [inline]
```

Extract an array of T elements from the stream s.

Parameters

	s	The stream to extract from.
out	*v*	Buffer description to copy the array to (Ipc::Buf_cp_out()).

Returns

The stream `s`.

This operator does a copy out of the data into the given buffer.
See Ipc::Buf_in, Ipc::Buf_cp_in, and Ipc::Buf_cp_out.
Definition at line 1151 of file ipc_stream.
References L4::Ipc::Istream::get().
Here is the call graph for this function:

16.208.2.7 operator>>() [3/6]

```
template<typename T>
L4::Ipc::Istream & operator>> (
            L4::Ipc::Istream & s,
            L4::Ipc::Internal::Buf_in< T > const & v)  [inline]
```

Extract an array of `T` elements from the stream `s`.

Parameters

	s	The stream to extract from.
out	*v*	Pointer to the extracted array (ipc_buf_in()).

Returns

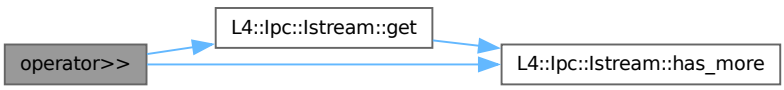
The stream `s`.

This operator actually does not copy out the data in the array, but returns a pointer into the message buffer itself. This means that the data is only valid as long as there is no new data inserted into the stream.

Note

If array does not fit into transmitted words size will be set to zero. Client has to implement check against zero.

See Ipc::Buf_in, Ipc::Buf_cp_in, and Ipc::Buf_cp_out.
Definition at line 1103 of file ipc_stream.
References L4::Ipc::Istream::get(), and L4::Ipc::Istream::has_more().
Here is the call graph for this function:



16.208.2.8 operator>>() [4/6]

```
template<typename T>
L4::Ipc::Istream & operator>> (
            L4::Ipc::Istream & s,
            L4::Ipc::Msg_ptr< T > const & v)  [inline]
```

Extract an element of type T from the stream s.

Parameters

	s	The stream to extract from.
out	*v*	Pointer to the extracted element.

Returns

The stream s.

This operator actually does not copy out the data, but returns a pointer into the message buffer itself. This means that the data is only valid as long as there is no new data inserted into the stream.
See Msg_ptr.
Definition at line 1130 of file ipc_stream.
References L4::Ipc::Istream::get().
Here is the call graph for this function:

16.208.2.9 operator>>() [5/6]

```
template<typename T>
L4::Ipc::Istream & operator>> (
            L4::Ipc::Istream & s,
            L4::Ipc::Str_cp_in< T > const & v)  [inline]
```

Extract a zero-terminated string from the stream.

Parameters

	s	The stream to extract from.
out	*v*	Buffer description to copy the array to (Ipc::Str_cp_out()).

Returns

The stream `s`.

This operator does a copy out of the data into the given buffer.
Definition at line 1172 of file ipc_stream.
References L4::Ipc::Istream::get().
Here is the call graph for this function:

16.208.2.10 operator>>() [6/6]

```
L4::Ipc::Istream & operator>> (
            L4::Ipc::Istream & s,
            l4_msgtag_t & v)  [inline]
```

Extract the L4 message tag from the stream `s`.

Parameters

	s	The stream to extract from.
out	*v*	The extracted tag.

Returns

The stream `s`.

Definition at line 1078 of file ipc_stream.
References L4::Ipc::Istream::tag().

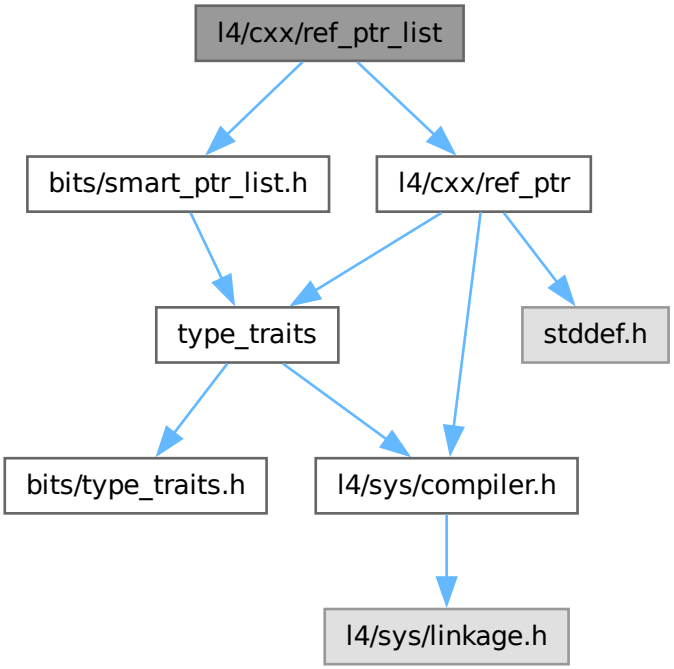
16.227 l4/cxx/ref_ptr_list File Reference

Implementation of a list of ref-ptr-managed objects.

```
#include <l4/cxx/ref_ptr>
#include "bits/smart_ptr_list.h"
```

Include dependency graph for ref_ptr_list:



Data Structures

- struct cxx::Ref_obj_list_item< T >

  Item for list linked via cxx::Ref_ptr with default refence counting.

Namespaces

- namespace cxx

  Our C++ library.

Typedefs

- template<typename T>
  using **cxx::Ref_ptr_list_item** = Bits::Smart_ptr_list_item<T, cxx::Ref_ptr<T> >

  Item for list linked with cxx::Ref_ptr.
- template<typename T>
  using **cxx::Ref_ptr_list** = Bits::Smart_ptr_list<Ref_ptr_list_item<T> >

  Single-linked list where elements are connected via a cxx::Ref_ptr.

16.227.1 Detailed Description

Implementation of a list of ref-ptr-managed objects.
Definition in file ref_ptr_list.

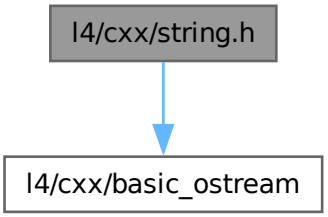
16.237 l4/cxx/string.h File Reference

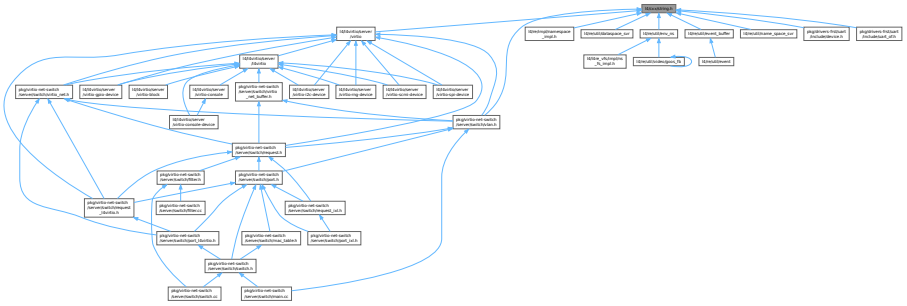
String.

`#include <l4/cxx/basic_ostream>`

Include dependency graph for string.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- class L4::String

  A null-terminated string container class.

Namespaces

- namespace L4

  L4 low-level kernel interface.

16.237.1 Detailed Description

String.
Definition in file string.h.

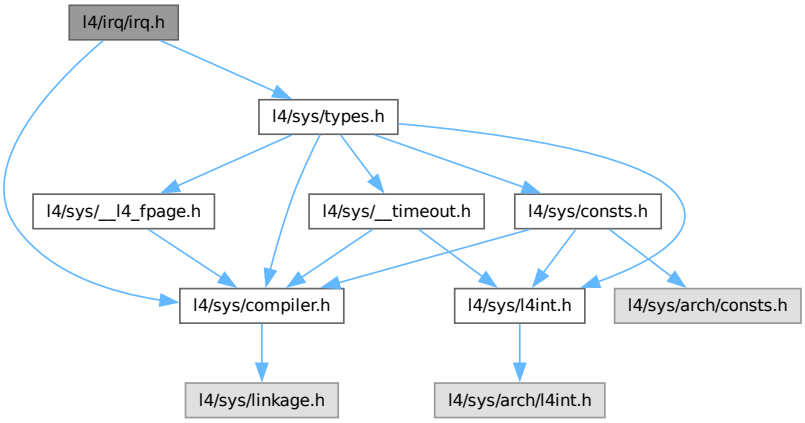
16.251 l4/irq/irq.h File Reference

IRQ handling routines.

```
#include <l4/sys/compiler.h>
#include <l4/sys/types.h>
```

Include dependency graph for irq.h:



Functions

- l4irq_t * l4irq_attach (int irqnum)

  Attach/connect to IRQ.
- l4irq_t * l4irq_attach_ft (int irqnum, unsigned mode)

  Attach/connect to IRQ using given type.
- l4irq_t * l4irq_attach_thread (int irqnum, l4_cap_idx_t to_thread)

  Attach/connect to IRQ.
- l4irq_t * l4irq_attach_thread_ft (int irqnum, l4_cap_idx_t to_thread, unsigned mode)

  Attach/connect to IRQ using given type.
- long l4irq_wait (l4irq_t *irq)

  Wait for specified IRQ.
- long l4irq_unmask_and_wait_any (l4irq_t *unmask_irq, l4irq_t **ret_irq)

  Unmask a specific IRQ and wait for any attached IRQ.
- long l4irq_wait_any (l4irq_t **irq)

  Wait for any attached IRQ.
- long l4irq_unmask (l4irq_t *irq)

  Unmask a specific IRQ.
- long l4irq_detach (l4irq_t *irq)

  Detach from IRQ.
- l4irq_t * l4irq_request (int irqnum, void(*isr_handler)(void *), void *isr_data, int irq_thread_prio, unsigned mode)

  Attach asychronous ISR handler to IRQ.
- long l4irq_release (l4irq_t *irq)

  Release asynchronous ISR handler and free resources.
- l4irq_t * l4irq_attach_cap (l4_cap_idx_t irqcap)

  Attach/connect to IRQ.
- l4irq_t * l4irq_attach_cap_ft (l4_cap_idx_t irqcap, unsigned mode)

  Attach/connect to IRQ using given type.
- l4irq_t * l4irq_attach_thread_cap (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread)

  Attach/connect to IRQ.
- l4irq_t * l4irq_attach_thread_cap_ft (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread, unsigned mode)

  Attach/connect to IRQ using given type.

- l4irq_t * l4irq_request_cap (l4_cap_idx_t irqcap, void(*isr_handler)(void *), void *isr_data, int irq_thread_↩ prio, unsigned mode)

  Attach asychronous ISR handler to IRQ.

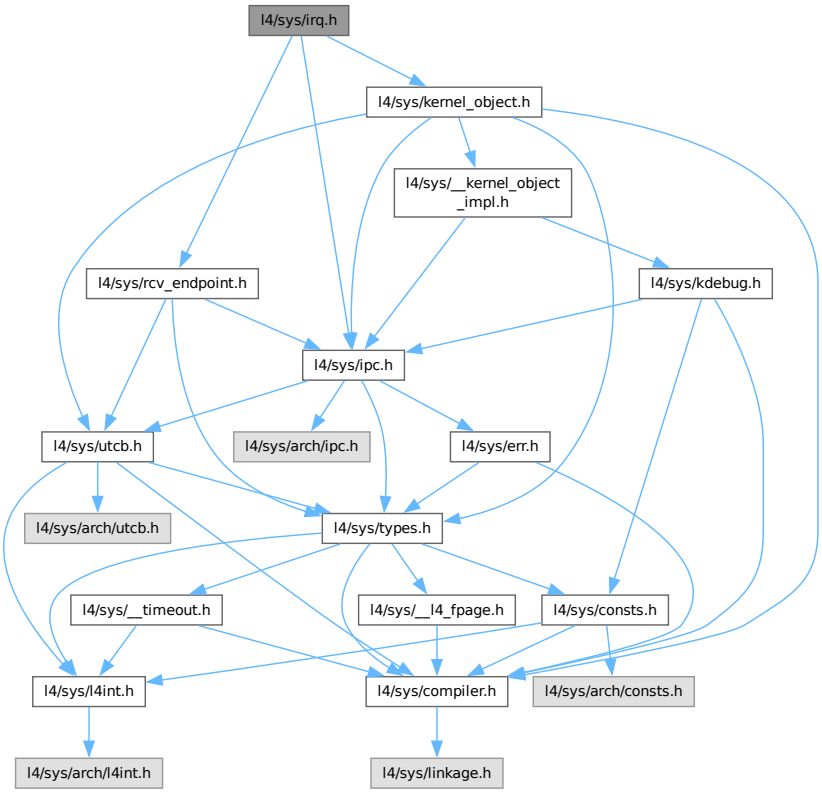
16.253 l4/sys/irq.h File Reference

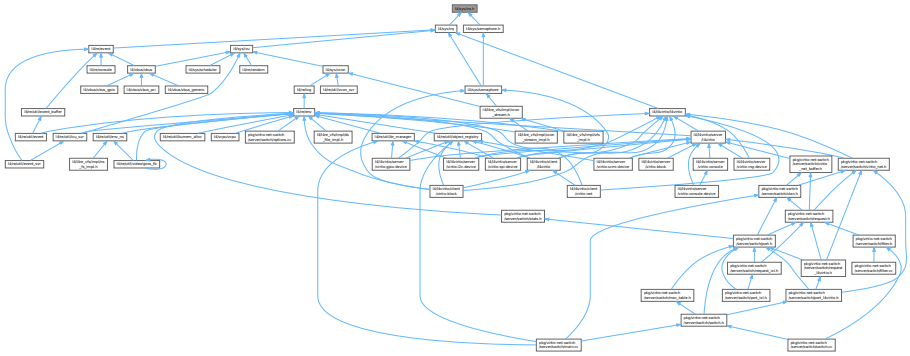
C Irq interface.

```
#include <l4/sys/kernel_object.h>
#include <l4/sys/ipc.h>
#include <l4/sys/rcv_endpoint.h>
```

Include dependency graph for irq.h:



This graph shows which files directly or indirectly include this file:



Functions

- l4_msgtag_t l4_irq_detach (l4_cap_idx_t irq) L4_NOTHROW

  Detach from an interrupt source.
- l4_msgtag_t l4_irq_detach_u (l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Detach from this interrupt.
- l4_msgtag_t l4_irq_bind_vcpu (l4_cap_idx_t irq, l4_cap_idx_t thread, l4_umword_t cfg) L4_NOTHROW

  Bind a thread to this Irq for vCPU interrupt forwarding.
- l4_msgtag_t l4_irq_bind_vcpu_u (l4_cap_idx_t irq, l4_cap_idx_t thread, l4_umword_t cfg, l4_utcb_t *utcb) L4_NOTHROW

  Bind a thread to this Irq for vCPU interrupt forwarding.
- l4_msgtag_t l4_irq_trigger (l4_cap_idx_t irq) L4_NOTHROW

  Trigger an IRQ.
- l4_msgtag_t l4_irq_trigger_u (l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Trigger the object.
- l4_msgtag_t l4_irq_receive (l4_cap_idx_t irq, l4_timeout_t to) L4_NOTHROW

  Unmask and wait for specified IRQ.
- l4_msgtag_t l4_irq_receive_u (l4_cap_idx_t irq, l4_timeout_t timeout, l4_utcb_t *utcb) L4_NOTHROW

  Unmask and wait for this IRQ.
- l4_msgtag_t l4_irq_wait (l4_cap_idx_t irq, l4_umword_t *label, l4_timeout_t to) L4_NOTHROW

  Unmask IRQ and wait for any message.
- l4_msgtag_t l4_irq_wait_u (l4_cap_idx_t irq, l4_umword_t *label, l4_timeout_t timeout, l4_utcb_t *utcb) L4_NOTHROW

  Unmask IRQ and (open) wait for any message.
- l4_msgtag_t l4_irq_unmask (l4_cap_idx_t irq) L4_NOTHROW

  Unmask IRQ.
- l4_msgtag_t l4_irq_unmask_u (l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Unmask this IRQ.
