```
#include <l4/sys/compiler.h>
```

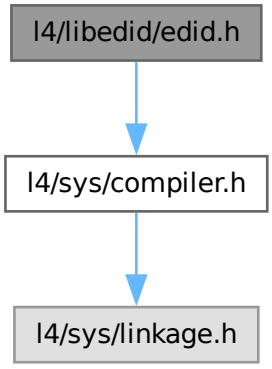
Include dependency graph for edid.h:



Enumerations

- enum Libedid_consts { Libedid_block_size = 128 }

  EDID constants.

Functions

- int libedid_check_header (const unsigned char *edid)

  Check for valid EDID header.
- int libedid_checksum (const unsigned char *edid)

  Calculates the EDID checksum.
- unsigned libedid_version (const unsigned char *edid)

  Returns the EDID version number.
- unsigned libedid_revision (const unsigned char *edid)

  Returns the EDID revision number.
- void libedid_pnp_id (const unsigned char *edid, unsigned char *id)

  Extracts the display's PnP ID.
- void libedid_prefered_resolution (const unsigned char *edid, unsigned *w, unsigned *h)

  Extract the display's prefered mode.
- unsigned libedid_num_ext_blocks (const unsigned char *edid)

  Get the number of EDID extension blocks.
- unsigned libedid_dump_standard_timings (const unsigned char *edid)

  Dump the standard timings to stdout.
- void libedid_dump (const unsigned char *edid)

  Dump raw EDID data to stdout.

```

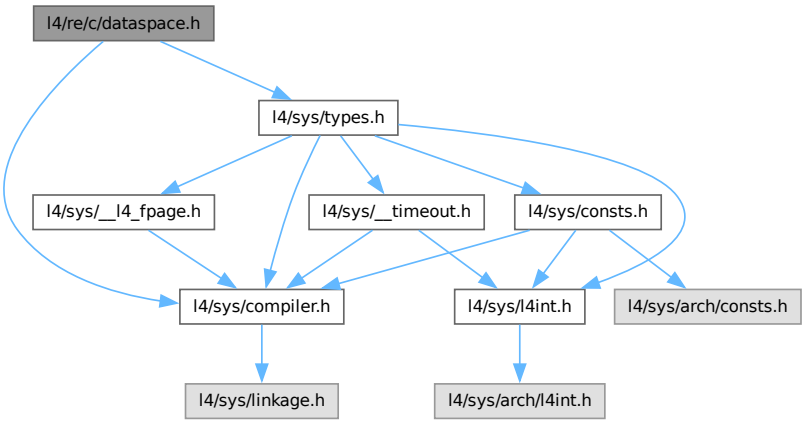
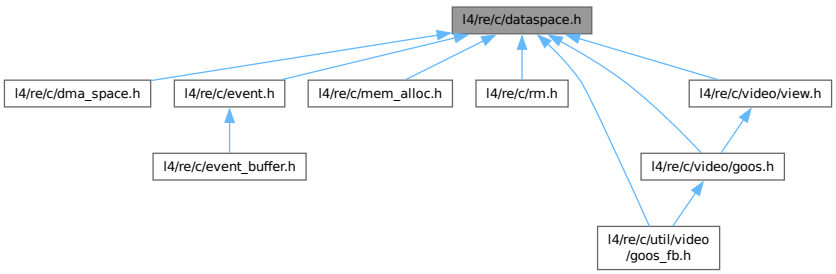
Include dependency graph for dataspace.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4re_ds_stats_t

  Information about the data space.

Enumerations

- enum l4re_ds_map_flags { }

  Flags to specify the memory mapping type of a request.

Functions

- l4_ret_t l4re_ds_clear (l4re_ds_t ds, l4re_ds_offset_t offset, l4re_ds_size_t size) L4_NOTHROW

  Clear parts of a dataspace.
- l4_ret_t l4re_ds_allocate (l4re_ds_t ds, l4re_ds_offset_t offset, l4re_ds_size_t size) L4_NOTHROW

  Allocate a range in the dataspace.
- l4_ret_t l4re_ds_copy_in (l4re_ds_t ds, l4re_ds_offset_t dst_offs, l4re_ds_t src, l4re_ds_offset_t src_offs, l4re_ds_size_t size) L4_NOTHROW

  Copy contents from another dataspace.
- l4re_ds_size_t l4re_ds_size (l4re_ds_t ds) L4_NOTHROW

  Get size of a dataspace.
- l4re_ds_flags_t l4re_ds_flags (l4re_ds_t ds) L4_NOTHROW

  Get flags of the dataspace.
- l4_ret_t l4re_ds_info (l4re_ds_t ds, l4re_ds_stats_t *stats) L4_NOTHROW

  Get information on the dataspace.
- l4_ret_t l4re_ds_map_info (l4re_ds_t ds, l4_addr_t *start_addr, l4_addr_t *end_addr) L4_NOTHROW

  Get mapping range of dataspace.

Variables

- L4_BEGIN_DECLS typedef l4_cap_idx_t **l4re_ds_t**

  Dataspace type.

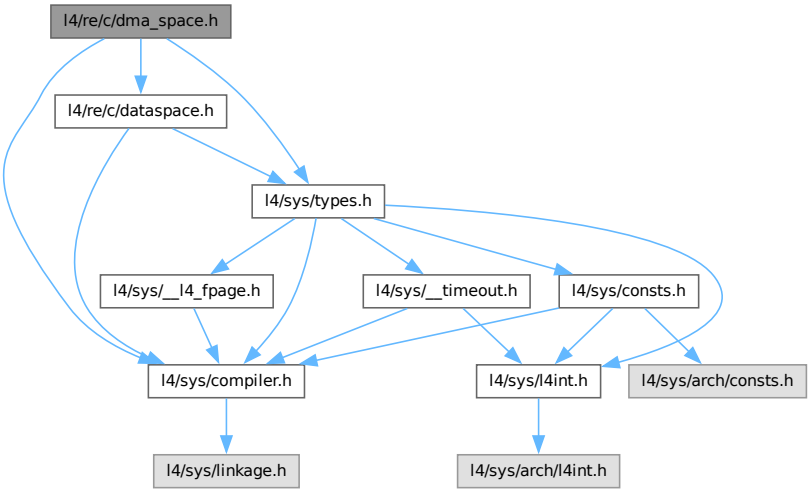
DMA space C interface.

```
#include <l4/sys/compiler.h>
#include <l4/sys/types.h>
#include <l4/re/c/dataspace.h>
```

Include dependency graph for dma_space.h:



Typedefs

- typedef l4_cap_idx_t l4re_dma_space_t

  DMA space capability type.
- typedef l4_cap_idx_t l4re_dma_space_mgr_t

  DMA space manager capability type.
- typedef l4_uint64_t **l4re_dma_space_dma_addr_t**

  Data type for DMA addresses.
- typedef l4_uint64_t **l4re_dma_space_dma_size_t**

  Data type for DMA sizes.

Enumerations

- enum l4re_dma_space_direction { L4RE_DMA_SPACE_BIDIRECTIONAL , L4RE_DMA_SPACE_TO_DEVICE , L4RE_DMA_SPACE_FROM_DEVICE , L4RE_DMA_SPACE_NONE }

  Direction of the DMA transfers.
- enum l4re_dma_space_attributes { L4RE_DMA_SPACE_SEARCH_ADDR = 1U << 0 , L4RE_DMA_SPACE_PARTIAL_MAP = 1U << 1 , L4RE_DMA_SPACE_RESERVE = 1U << 2 , L4RE_DMA_SPACE_REPLACE = 1U << 3 }

  Attributes used for the memory region.
- enum l4re_dma_space_mgr_space_attribs { L4RE_DMA_SPACE_MGR_IDENTITY_MAP = 1U << 0 }

  Attributes assigned to the DMA space when associated with a specific device.
- enum l4re_dma_space_mgr_block_flags { L4RE_DMA_SPACE_MGR_SEARCH_ADDR = 1U << 0 }

  Attributes used when blocking an area.

Functions

- l4_ret_t l4re_dma_space_map (l4re_dma_space_t dma, l4re_ds_t src, l4re_ds_offset_t offset, l4_size_t *size, unsigned long attrs, enum l4re_dma_space_direction dir, l4re_dma_space_dma_addr_t *dma_addr) L4_NOTHROW

  Map the given part of this data space into the DMA address space.
- l4_ret_t l4re_dma_space_unmap (l4re_dma_space_t dma, l4re_dma_space_dma_addr_t dma_addr, l4_size_t size, unsigned long attrs, enum l4re_dma_space_direction dir) L4_NOTHROW

  Unmap the given part of this data space from the DMA address space.
- l4_ret_t l4re_dma_space_mgr_associate (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, l4_cap_idx_t dma_task, enum l4re_dma_space_mgr_space_attribs attr) L4_NOTHROW

  Associate a (kernel) DMA space for a device to a Dma_space.
- l4_ret_t l4re_dma_space_mgr_associate_phys (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, enum l4re_dma_space_mgr_space_attribs attr) L4_NOTHROW

  Register a Dma_space to use for DMA.
- l4_ret_t l4re_dma_space_mgr_disassociate (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space) L4_NOTHROW
- l4_ret_t l4re_dma_space_mgr_block_area (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, l4re_dma_space_dma_addr_t *addr, l4re_dma_space_dma_size_t size, l4re_dma_space_dma_addr_t max_addr, enum l4re_dma_space_mgr_block_flags flags, unsigned char align) L4_NOTHROW
- l4_ret_t l4re_dma_space_mgr_set_limits (l4re_dma_space_mgr_t dma_mgr, l4re_dma_space_t dma_space, l4re_dma_space_dma_addr_t min_addr, l4re_dma_space_dma_addr_t max_addr) L4_NOTHROW

16.291.1 Detailed Description

DMA space C interface.
Definition in file dma_space.h.

16.291.2 Enumeration Type Documentation

16.291.2.1 l4re_dma_space_attributes

`enum l4re_dma_space_attributes`
Attributes used for the memory region.

See also

Attributes

Enumerator

L4RE_DMA_SPACE_SEARCH_ADDR	Search for suitable address. A spot for the whole mapping is searched, starting from the passed start address. Without this flag, the start address is taken literally. Can be combined with Attribute::Partial_map. If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), the flag has no effect. The Dma_space::map() call will always return the physical address.
L4RE_DMA_SPACE_PARTIAL_MAP	Truncate mapping if it does not fit. If there is not enough room after the chosen start address, truncate the mapping instead of failing.

L4RE_DMA_SPACE_RESERVE	Reserve a region instead of mapping pages. If set, the dataspace argument of Dma_space::map() is ignored. Use the Attribute::Replace flag to place dataspace mappings in a reserved region later. The reservation is released with Dma_space::unmap() carrying Unmap↩ _flag::Cancel_reservation. If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), Dma_space::map() will always fail with -L4_EPERM if this flag is present.
L4RE_DMA_SPACE_REPLACE	Replace mappings. The pages in the map region are replaced with mappings from the dataspace. Without this flag, existing mappings cause Dma_space::map() to fail. Areas previously claimed by Dma↩ _space_mgr::block_area() are never replaced and still cause Dma↩ _space::map() to fail. If combined with Attribute::Reserve, no dataspace mapping is established. Instead, the reservation reference count is increased. Only after the matching number of Dma_space::unmap(Cancel_reservation) calls, the reservation is released. If no address remapping is possible (i.e., the Dma_space was associated by Dma_space_mgr::associate_phys()), the flag has no effect. The Dma_space::map() call will always return the physical address. Cannot be combined with Attribute::Search_addr or Attribute::↩ Partial_map.

Definition at line 38 of file dma_space.h.

16.291.2.2 l4re_dma_space_direction

enum l4re_dma_space_direction
Direction of the DMA transfers.

Deprecated Ignored by the API. Use function overloads without the direction parameter instead.

Enumerator

L4RE_DMA_SPACE_BIDIRECTIONAL	device reads and writes to the memory
L4RE_DMA_SPACE_TO_DEVICE	device reads the memory
L4RE_DMA_SPACE_FROM_DEVICE	device writes to the memory
L4RE_DMA_SPACE_NONE	device is coherently connected

Definition at line 27 of file dma_space.h.

16.291.2.3 l4re_dma_space_mgr_block_flags

enum l4re_dma_space_mgr_block_flags
Attributes used when blocking an area.

See also

Block_flags

Enumerator

L4RE_DMA_SPACE_MGR_SEARCH_ADDR	Search suitable address. With this flag, the start address is taken as a lower bound. Without the flag, `start` and `size` are taken literally.

Definition at line 58 of file dma_space.h.

16.291.2.4 l4re_dma_space_mgr_space_attribs

`enum l4re_dma_space_mgr_space_attribs`
Attributes assigned to the DMA space when associated with a specific device.

See also

Space_attribs

Enumerator

L4RE_DMA_SPACE_MGR_IDENTITY_MAP	Request identity mappings. This is needed if some devices are not connected to an IOMMU and need physical addresses.

Definition at line 49 of file dma_space.h.

16.292 dma_space.h

#include <l4/sys/types.h>
```

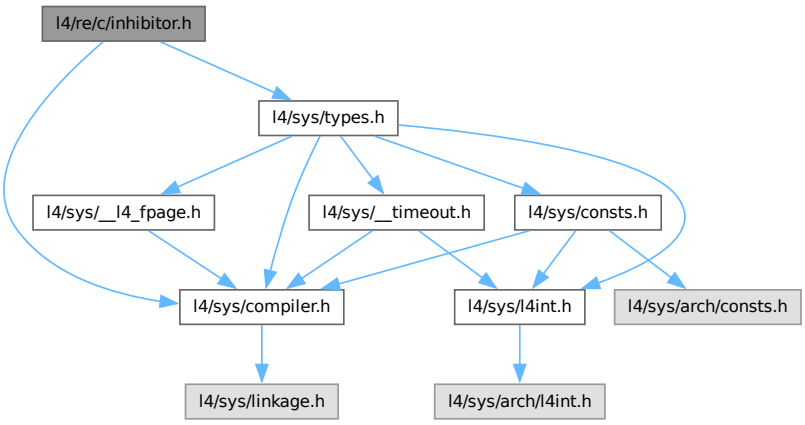
Include dependency graph for inhibitor.h:



Functions

- L4_BEGIN_DECLS l4_ret_t l4re_inhibitor_acquire (l4_cap_idx_t cap, l4_umword_t id, char const *reason)

  Acquire an inhibitor lock.
- l4_ret_t l4re_inhibitor_release (l4_cap_idx_t cap, l4_umword_t id)

  Release an inhibitor lock.
- l4_ret_t l4re_inhibitor_next_lock_info (l4_cap_idx_t cap, char *name, unsigned len, l4_mword_t current_id)

  Get information for the next available inhibitor lock.

16.298.1 Detailed Description

Inhibitor C interface.
Definition in file inhibitor.h.

16.298.2 Function Documentation

16.298.2.1 l4re_inhibitor_acquire()

```
L4_BEGIN_DECLS l4_ret_t l4re_inhibitor_acquire (
             l4_cap_idx_t cap,
             l4_umword_t id,
             char const * reason)
```

Acquire an inhibitor lock.

Parameters

cap	Capability for the Inhibitor object (see L4Re::Inhibitor)
id	ID of the inhibitor lock that shall be acquired.
reason	Reason why the inhibitor lock is acquired. (Used for informing the user or debugging.)

Returns

0 for success, <0 on error.

See also

L4Re::Inhibitor::acquire().

References L4_CV, and L4_EXPORT.

16.298.2.2 l4re_inhibitor_next_lock_info()

```
l4_ret_t l4re_inhibitor_next_lock_info (
             l4_cap_idx_t cap,
             char * name,
             unsigned len,
             l4_mword_t current_id)
```

Get information for the next available inhibitor lock.

Parameters

cap	Capability to the Inhibitor object (see L4Re::Inhibitor)
name	A pointer to a buffer for the name of the lock.
len	The length of the available buffer (usually L4Re::Inhibitor::Name_max is used).
current_id	The ID of the last available lock, use -1 to get the first lock.

Return values

>0	The ID of the next available lock if there is one (in this case name shall contain the name of the inhibitor lock).
-L4_ENODEV	if there are no more locks.
<0	Any other negative failure value.

See also

L4Re::Inhibitor::next_lock_info().

References L4_END_DECLS.

16.298.2.3 l4re_inhibitor_release()

```
l4_ret_t l4re_inhibitor_release (
             l4_cap_idx_t cap,
             l4_umword_t id)
```

Release an inhibitor lock.

Parameters

cap	Capability for the Inhibitor object (see L4Re::Inhibitor).
id	ID of inhibitor that shall be released.

Returns

0 for success, <0 on error.

See also

L4Re::Inhibitor::release().

References L4_CV, and L4_EXPORT.

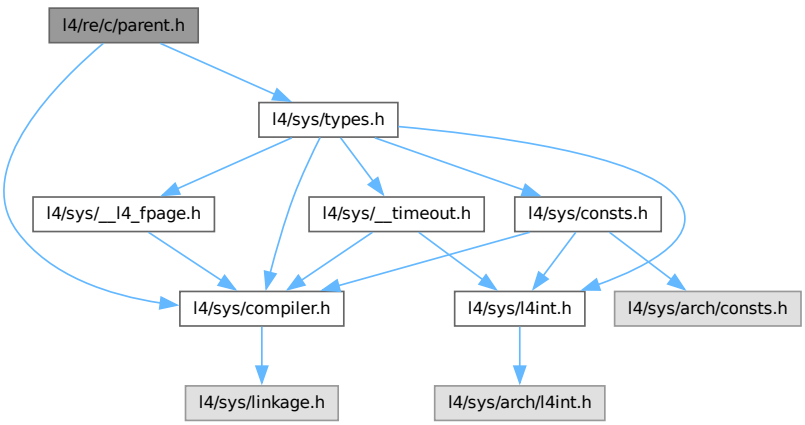
`#include <l4/sys/types.h>`

Include dependency graph for parent.h:



Functions

- L4_BEGIN_DECLS long l4re_parent_signal (l4_cap_idx_t parent, unsigned long sig, unsigned long val)

  Send a signal using the parent protocol.

16.307.1 Detailed Description

Parent C interface.
Definition in file parent.h.

16.307.2 Function Documentation

16.307.2.1 l4re_parent_signal()

```
L4_BEGIN_DECLS long l4re_parent_signal (
             l4_cap_idx_t parent,
             unsigned long sig,
             unsigned long val)
```

Send a signal using the parent protocol.

Parameters

parent	Capability index of parent to send signal to.
sig	Signal to send
val	Value of the signal

Return values

0	Success
<0	IPC error

See also

L4Re::Parent::signal

  Flags for region operations.

Functions

- int l4re_rm_reserve_area (l4_addr_t *start, unsigned long size, l4re_rm_flags_t flags, unsigned char align) L4_NOTHROW

  Reserve the given area in the region map.
- int l4re_rm_free_area (l4_addr_t addr) L4_NOTHROW

  Free an area from the region map.
- int l4re_rm_attach (void **start, unsigned long size, l4re_rm_flags_t flags, l4re_ds_t mem, l4re_rm_offset_t offs, unsigned char align) L4_NOTHROW

  Attach a data space to a region.
- int l4re_rm_attach_w_info (void **start, unsigned long size, l4re_rm_flags_t flags, l4re_ds_t mem, l4re_rm↩_offset_t offs, unsigned char align, char const *name, l4re_ds_offset_t backing_offset) L4_NOTHROW

  Attach a data space to a region.
- int l4re_rm_detach (void *addr) L4_NOTHROW

  Detach and unmap a region from the address space in the current task.
- int l4re_rm_detach_ds (void *addr, l4re_ds_t *ds) L4_NOTHROW

  Detach and unmap a region and return affected dataspace in the current task.

- int l4re_rm_detach_unmap (l4_addr_t addr, l4_cap_idx_t task) L4_NOTHROW

  Detach and unmap in specified task.
- int l4re_rm_detach_ds_unmap (void *addr, l4re_ds_t *ds, l4_cap_idx_t task) L4_NOTHROW

  Detach and unmap in specified task.
- int l4re_rm_find (l4_addr_t *addr, unsigned long *size, l4re_rm_offset_t *offset, l4re_rm_flags_t *flags, l4re_ds_t *m) L4_NOTHROW

  Find a region given an address and size.
- int l4re_rm_get_info (l4_addr_t addr, char *name, unsigned int len, l4re_rm_offset_t *backing_offset) L4_NOTHROW

  Return auxiliary information of a region.
- void l4re_rm_show_lists (void) L4_NOTHROW

  Dump region map internal data structures.
- int l4re_rm_reserve_area_srv (l4_cap_idx_t rm, l4_addr_t *start, unsigned long size, l4re_rm_flags_t flags, unsigned char align) L4_NOTHROW

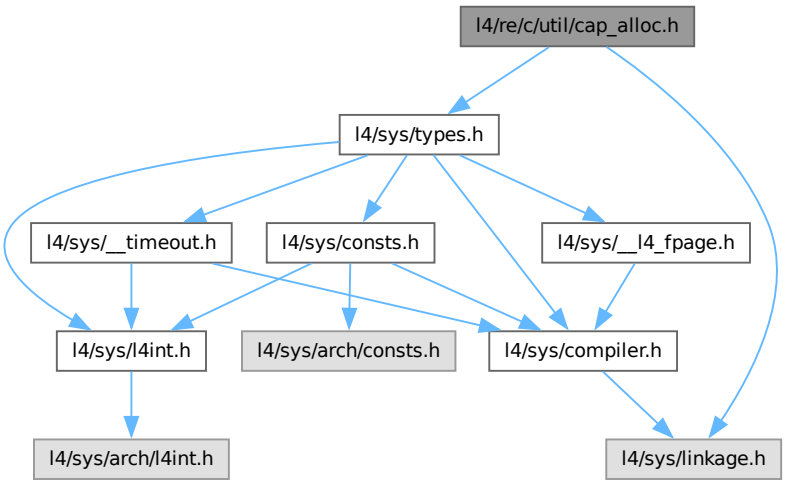
16.311 l4/re/c/util/cap_alloc.h File Reference

Capability allocator C interface.

```
#include <l4/sys/types.h>
#include <l4/sys/linkage.h>
```

Include dependency graph for cap_alloc.h:



Functions

- L4_BEGIN_DECLS l4_cap_idx_t **l4re_util_cap_alloc** (void) L4_NOTHROW

  Get free capability index at capability allocator.
- void **l4re_util_cap_free** (l4_cap_idx_t cap) L4_NOTHROW

  Return capability index to capability allocator.
- void **l4re_util_cap_free_um** (l4_cap_idx_t cap) L4_NOTHROW

  Return capability index to capability allocator, and unmaps the object.
- long l4re_util_cap_last (void) L4_NOTHROW

  Return last capability index the allocator can return.

16.311.1 Detailed Description

Capability allocator C interface.

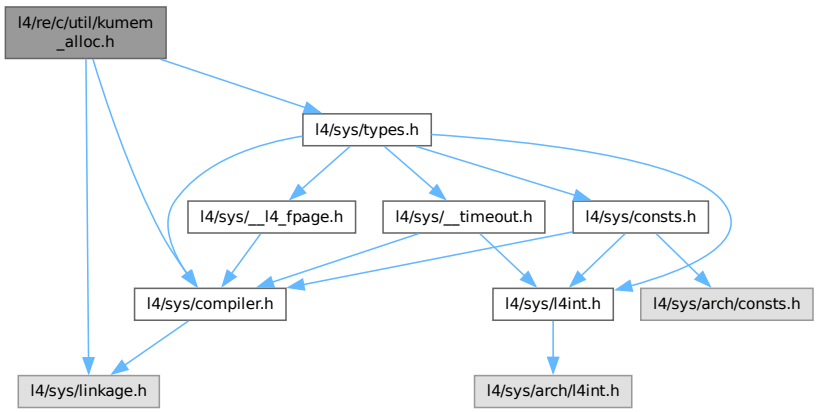
#include <l4/sys/linkage.h>
```

Include dependency graph for kumem_alloc.h:



Functions

- L4_BEGIN_DECLS int l4re_util_kumem_alloc (l4_addr_t *mem, unsigned pages_order, l4_cap_idx_t task, l4_cap_idx_t rm) L4_NOTHROW

  Allocate state area.

16.313.1 Detailed Description

Kumem allocator utility C interface.
Definition in file kumem_alloc.h.

16.313.2 Function Documentation

16.313.2.1 l4re_util_kumem_alloc()

```
L4_BEGIN_DECLS int l4re_util_kumem_alloc (
            l4_addr_t * mem,
            unsigned pages_order,
            l4_cap_idx_t task,
            l4_cap_idx_t rm)
```

Allocate state area.

Parameters

out	*mem*	Pointer to memory that has been allocated.
	pages_order	Size to allocate, in log2 pages.
	task	Task to use for allocation.
	rm	Region manager to use for allocation.

Return values

0	for success
<0	error code on failure

Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

Examples

examples/sys/aliens/main.c, and examples/sys/utcb-ipc/main.c.

```

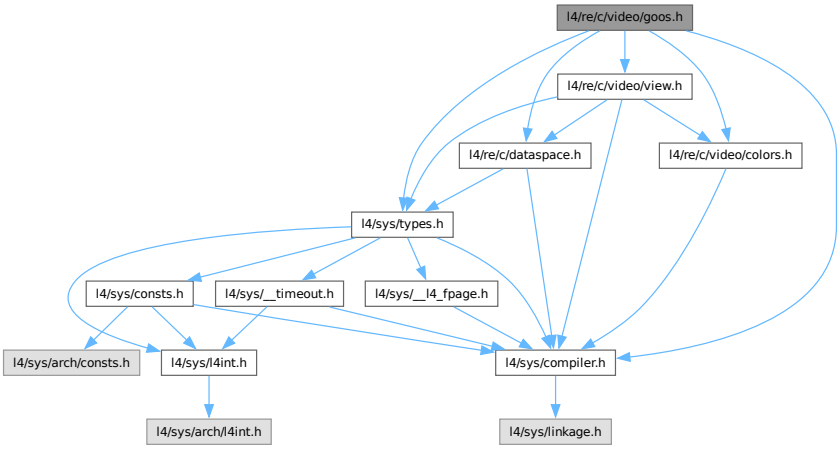
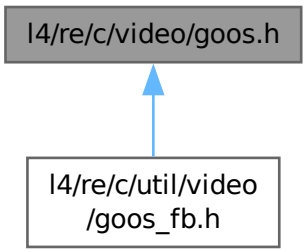
Include dependency graph for goos.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4re_video_goos_info_t

  Goos information structure.

Typedefs

- typedef l4_cap_idx_t **l4re_video_goos_t**

  Goos object type.

Enumerations

- enum l4re_video_goos_info_flags_t { F_l4re_video_goos_auto_refresh = 0x01 , F_l4re_video_goos_pointer = 0x02 , F_l4re_video_goos_dynamic_views = 0x04 , F_l4re_video_goos_dynamic_buffers = 0x08 }

  Flags of information on the goos.

Functions

- L4_BEGIN_DECLS int l4re_video_goos_info (l4re_video_goos_t goos, l4re_video_goos_info_t *ginfo) L4_NOTHROW

Get information on a goos.

- int l4re_video_goos_refresh (l4re_video_goos_t goos, int x, int y, int w, int h) L4_NOTHROW

  Flush a rectangle of pixels of the goos screen.

- int l4re_video_goos_create_buffer (l4re_video_goos_t goos, unsigned long size, l4_cap_idx_t buffer) L4_NOTHROW

  Create a new buffer (memory buffer) for pixel data.

- int l4re_video_goos_delete_buffer (l4re_video_goos_t goos, unsigned idx) L4_NOTHROW

  Delete a pixel buffer.

- int l4re_video_goos_get_static_buffer (l4re_video_goos_t goos, unsigned idx, l4_cap_idx_t buffer) L4_NOTHROW

  Get the data-space capability of the static pixel buffer.

- int l4re_video_goos_create_view (l4re_video_goos_t goos, l4re_video_view_t *view) L4_NOTHROW

  Create a new view (.

- int l4re_video_goos_delete_view (l4re_video_goos_t goos, l4re_video_view_t *view) L4_NOTHROW

  Delete a view.

- int l4re_video_goos_get_view (l4re_video_goos_t goos, unsigned idx, l4re_video_view_t *view) L4_NOTHROW

  Get a view for the given index.

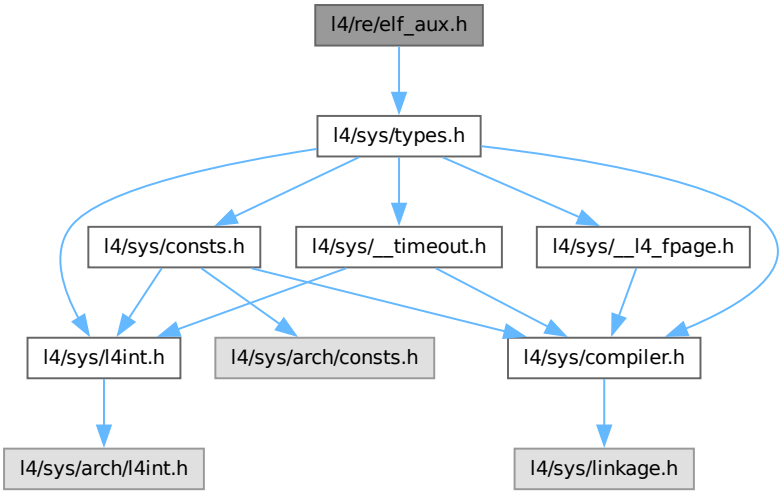
16.329 l4/re/elf_aux.h File Reference

Auxiliary information for binaries.

`#include <l4/sys/types.h>`

Include dependency graph for elf_aux.h:



Data Structures

- struct l4re_elf_aux_t

  Generic header for each auxiliary vector element.
- struct l4re_elf_aux_vma_t

  Auxiliary vector element for a reserved virtual memory area.
- struct l4re_elf_aux_mword_t

  Auxiliary vector element for a single unsigned data word.

Macros

- #define L4RE_ELF_AUX_ELEM const __attribute__((used, section(".rol4re_elf_aux"), aligned(sizeof(l4_umword_t))))

  Define an auxiliary vector element.

- #define L4RE_ELF_AUX_ELEM_T(type, id, tag, val...)

  Define an auxiliary vector element.

Typedefs

- typedef struct l4re_elf_aux_t **l4re_elf_aux_t**

  Generic header for each auxiliary vector element.
- typedef struct l4re_elf_aux_vma_t **l4re_elf_aux_vma_t**

  Auxiliary vector element for a reserved virtual memory area.
- typedef struct l4re_elf_aux_mword_t **l4re_elf_aux_mword_t**

  Auxiliary vector element for a single unsigned data word.

Enumerations

- enum {
  L4RE_ELF_AUX_T_NONE = 0 , L4RE_ELF_AUX_T_VMA , L4RE_ELF_AUX_T_STACK_SIZE ,
  L4RE_ELF_AUX_T_STACK_ADDR ,
  L4RE_ELF_AUX_T_KIP_ADDR , L4RE_ELF_AUX_T_EX_REGS_FLAGS }

16.329.1 Detailed Description

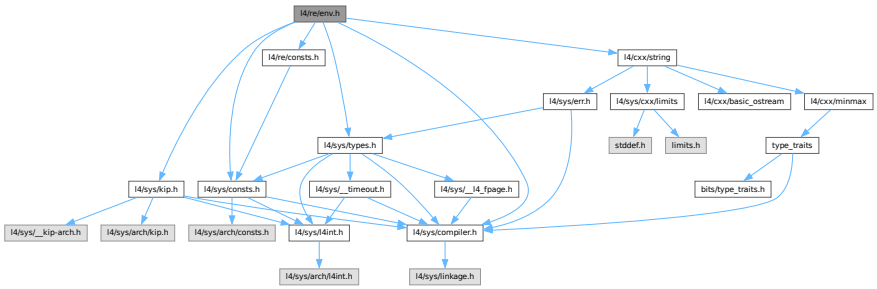
16.333 l4/re/env.h File Reference

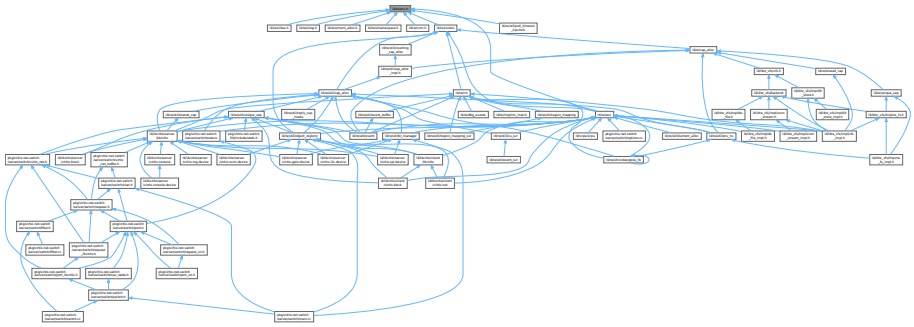
Environment interface.

```
#include <l4/sys/consts.h>
#include <l4/sys/types.h>
#include <l4/sys/kip.h>
#include <l4/sys/compiler.h>
#include <l4/re/consts.h>
#include <l4/cxx/string>
```

Include dependency graph for env.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4re_env_cap_entry_t

  Entry in the L4Re environment array for the named initial objects.
- struct l4re_env_t

  Initial environment data structure.

Typedefs

- typedef struct l4re_env_cap_entry_t **l4re_env_cap_entry_t**

  Entry in the L4Re environment array for the named initial objects.
- typedef struct l4re_env_t l4re_env_t

  Initial environment data structure.

Functions

- l4re_env_t ∗ l4re_env (void) L4_NOTHROW

  Get L4Re initial environment.
- l4_kernel_info_t const ∗ l4re_kip (void) L4_NOTHROW

  Get Kernel Info Page.
- l4_cap_idx_t l4re_env_get_cap (char const ∗name) L4_NOTHROW

  Get the capability index for the object named name.
- l4_cap_idx_t l4re_env_get_cap_e (char const ∗name, l4re_env_t const ∗e) L4_NOTHROW

  Get the capability index for the object named name.
- l4re_env_cap_entry_t const ∗ l4re_env_get_cap_l (char const ∗name, unsigned l, l4re_env_t const ∗e) L4_NOTHROW

  Get the full l4re_env_cap_entry_t for the object named name.

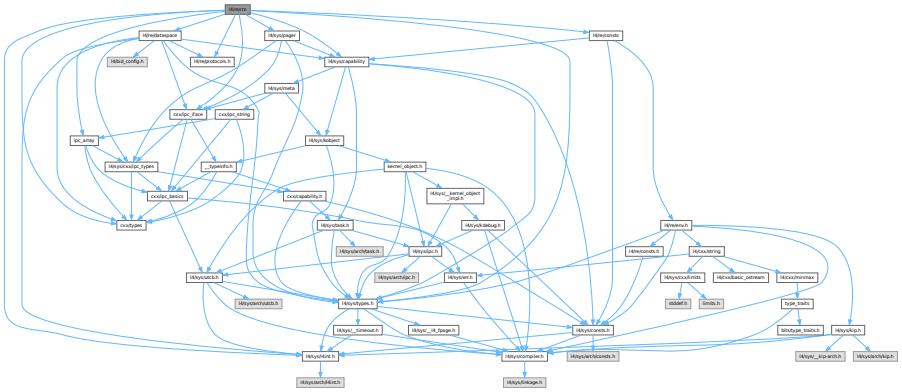
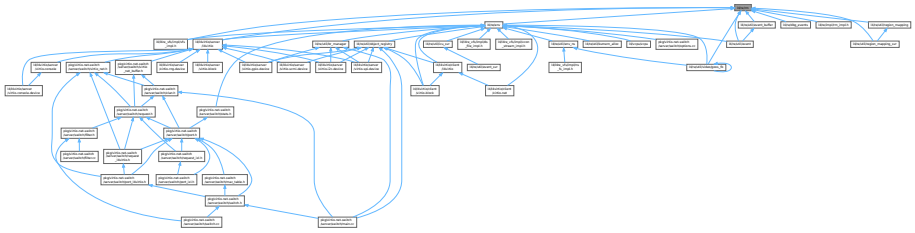
Include dependency graph for rm:



This graph shows which files directly or indirectly include this file:



Data Structures

- class L4Re::Rm

  Region map.
- struct L4Re::Rm::F

  Rm flags definitions.
- class L4Re::Rm::Unique_region< T >

  Unique region.
- struct L4Re::Rm::Region

  A region is a range of virtual addresses which is backed by content.
- struct L4Re::Rm::Area

  An area is a range of virtual addresses which is reserved, see L4Re::Rm::reserve_area().

Namespaces

- namespace L4Re

  L4Re C++ Interfaces.

16.365.1 Detailed Description

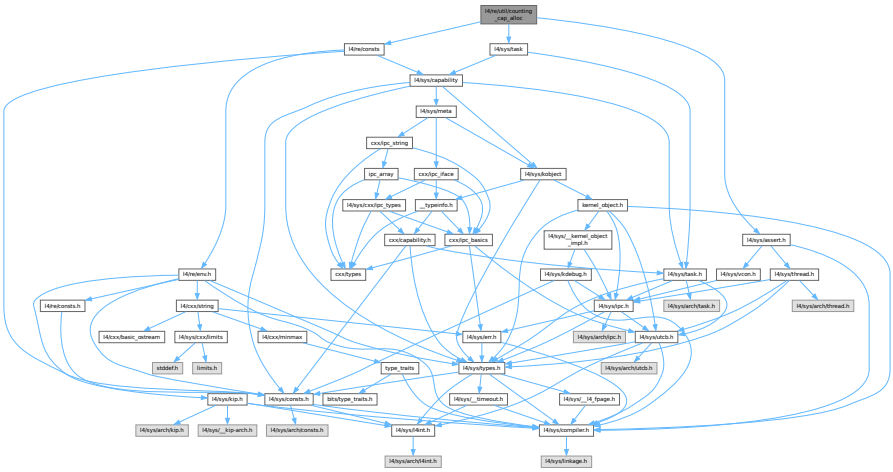
16.378 l4/re/util/counting_cap_alloc File Reference

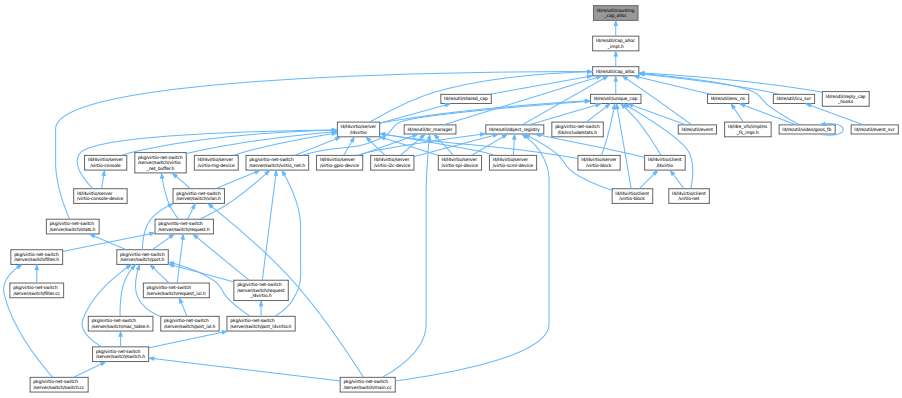
Reference-counting capability allocator.

```
#include <l4/sys/task>
#include <l4/sys/assert.h>
#include <l4/re/consts>
```

Include dependency graph for counting_cap_alloc:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct L4Re::Util::Counter< COUNTER >

  Counter for *Counting_cap_alloc* with variable data width.
- struct L4Re::Util::Counter_atomic< COUNTER >

  Thread safe version of counter for Counting_cap_alloc.

- class L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >

  Internal reference-counting cap allocator.

Namespaces

- namespace L4Re

  L4Re C++ Interfaces.
- namespace L4Re::Util

  Documentation of the L4 Runtime Environment utility functionality in C++.

16.378.1 Detailed Description

Reference-counting capability allocator.
Definition in file counting_cap_alloc.

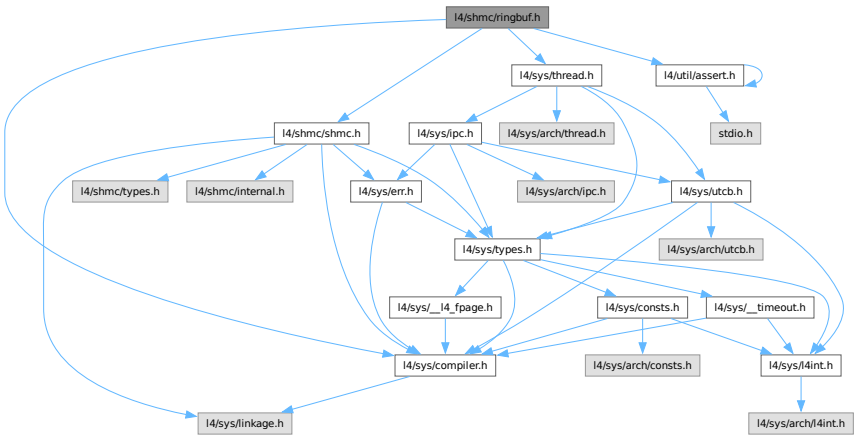
Include dependency graph for ringbuf.h:



Data Structures

- struct l4shmc_ringbuf_head_t

  Head field of a ring buffer.
- struct l4shmc_ringbuf_t

  Ring buffer.

Macros

- #define L4SHMC_RINGBUF_HEAD(ringbuf)

  Get ring buffer head pointer.

- #define L4SHMC_RINGBUF_DATA(ringbuf)

  Get ring buffer data pointer.
- #define L4SHMC_RINGBUF_DATA_SIZE(ringbuf)

  Get size of data area.

Functions

- int l4shmc_rb_init_buffer (l4shmc_ringbuf_t *buf, l4shmc_area_t *area, char const *chunk_name, char const *signal_name, unsigned size)

  Initialize a ring buffer by creating an SHMC chunk and the corresponding signals.
- void l4shmc_rb_deinit_buffer (l4shmc_ringbuf_t *buf)

  De-init a ring buffer.
- int l4shmc_rb_attach_sender (l4shmc_ringbuf_t *buf, char const *signal_name, l4_cap_idx_t owner)

  Attach to sender signal of a ring buffer.
- char * l4shmc_rb_sender_alloc_packet (l4shmc_ringbuf_head_t *head, unsigned psize)

  Allocate a packet of a given size within the ring buffer.
- void l4shmc_rb_sender_put_data (l4shmc_ringbuf_t *buf, char *addr, char *data, unsigned dsize)

  Copy data into a previously allocated packet.
- int l4shmc_rb_sender_next_copy_in (l4shmc_ringbuf_t *buf, char *data, unsigned size, int block_if_necessary)

  Copy in packet from an external data source.
- void l4shmc_rb_sender_commit_packet (l4shmc_ringbuf_t *buf)

  Tell the consumer that new data is available.
- int l4shmc_rb_init_receiver (l4shmc_ringbuf_t *buf, l4shmc_area_t *area, char const *chunk_name, char const *signal_name)

  Initialize receive buffer.
- void l4shmc_rb_attach_receiver (l4shmc_ringbuf_t *buf, l4_cap_idx_t owner)

  Attach to receiver signal of a ring buffer.
- int l4shmc_rb_receiver_wait_for_data (l4shmc_ringbuf_t *buf, int blocking)

  Check if (and optionally block until) new data is ready.
- int l4shmc_rb_receiver_copy_out (l4shmc_ringbuf_head_t *head, char *target, unsigned *tsize)

  Copy data out of the buffer.
- void l4shmc_rb_receiver_notify_done (l4shmc_ringbuf_t *buf)

  Notify producer that space is available.
- int l4shmc_rb_receiver_read_next_size (l4shmc_ringbuf_head_t *head)

  Have a look at the ring buffer and see which size the next packet to be read has.

16.418.1 Function Documentation

16.418.1.1 l4shmc_rb_attach_receiver()

```
void l4shmc_rb_attach_receiver (
            l4shmc_ringbuf_t * buf,
            l4_cap_idx_t owner)
```

Attach to receiver signal of a ring buffer.
Attach owner to the receiver-side signal of a ring buffer, which is triggered whenever new data has been produced. This is split from initialization, because you may not know the owner cap when initializing the buffer.

Parameters

buf	pointer to ring buffer struct
owner	owner thread

References L4_CV.

16.418.1.2 l4shmc_rb_attach_sender()

```
int l4shmc_rb_attach_sender (
             l4shmc_ringbuf_t * buf,
             char const * signal_name,
             l4_cap_idx_t owner)
```

Attach to sender signal of a ring buffer.
Attach owner to the sender-side signal of a ring buffer, which is triggered whenever new space has been freed in the buffer for the sender to write to.
This is split from initialization, because you may not know the owner cap when initializing the buffer.

Parameters

buf	pointer to ring buffer struct
signal_name	signal base name
owner	owner thread

Returns

0 on success, error otherwise

References L4_CV.

16.418.1.3 l4shmc_rb_deinit_buffer()

```
void l4shmc_rb_deinit_buffer (
             l4shmc_ringbuf_t * buf)
```

De-init a ring buffer.

Parameters

buf	pointer to ring buffer struct

References L4_CV.

16.418.1.4 l4shmc_rb_init_buffer()

```
int l4shmc_rb_init_buffer (
             l4shmc_ringbuf_t * buf,
             l4shmc_area_t * area,
             char const * chunk_name,
             char const * signal_name,
             unsigned size)
```

Initialize a ring buffer by creating an SHMC chunk and the corresponding signals.
This needs to be done by one of the participating parties when setting up communication channel.

Precondition

area has been attached using l4shmc_attach().

Parameters

buf	pointer to ring buffer struct
area	pointer to SHMC area
chunk_name	name of SHMC chunk to create in area

signal_name	base name for SHMC signals to create
size	chunk size

Returns

0 on success, error otherwise

References L4_CV.

16.418.1.5 l4shmc_rb_init_receiver()

```
int l4shmc_rb_init_receiver (
              l4shmc_ringbuf_t * buf,
              l4shmc_area_t * area,
              char const * chunk_name,
              char const * signal_name)
```

Initialize receive buffer.

Initialize the receiver-side of a ring buffer. This requires the underlying SHMC chunk and the corresponding signals to be valid already (read: to be initialized by the sender).

Precondition

chunk & signals have been created and initialized by the sender side

Parameters

buf	pointer to ring buffer struct
area	pointer to SHMC area
chunk_name	name of SHMC chunk to create in area
signal_name	base name for SHMC signals to create

Returns

0 on success, error otherwise

References L4_CV.

16.418.1.6 l4shmc_rb_receiver_copy_out()

```
int l4shmc_rb_receiver_copy_out (
              l4shmc_ringbuf_head_t * head,
              char * target,
              unsigned * tsize)
```

Copy data out of the buffer.

Parameters

	head	ring buffer head pointer
	target	valid target buffer
in, out	*tsize*	size of target buffer (must be >= packet size!); contains the real data size

Returns

0 on success, negative error otherwise

References L4_CV.

16.418.1.7 l4shmc_rb_receiver_notify_done()

```
void l4shmc_rb_receiver_notify_done (
            l4shmc_ringbuf_t * buf)
```

Notify producer that space is available.

Parameters

buf	pointer to ring buffer struct

References L4_CV.

16.418.1.8 l4shmc_rb_receiver_read_next_size()

```
int l4shmc_rb_receiver_read_next_size (
            l4shmc_ringbuf_head_t * head)
```

Have a look at the ring buffer and see which size the next packet to be read has.
Does not modify anything.

Returns

size of next buffer or -1 if no data available

References L4_CV, and L4_END_DECLS.

16.418.1.9 l4shmc_rb_receiver_wait_for_data()

```
int l4shmc_rb_receiver_wait_for_data (
            l4shmc_ringbuf_t * buf,
            int blocking)
```

Check if (and optionally block until) new data is ready.

Parameters

buf	pointer to ring buffer struct
blocking	block if data is not available immediately

Returns immediately, if data is available.

Returns

0 success, data available, != 0 otherwise

References L4_CV.

16.418.1.10 l4shmc_rb_sender_alloc_packet()

```
char * l4shmc_rb_sender_alloc_packet (
            l4shmc_ringbuf_head_t * head,
            unsigned psize)
```

Allocate a packet of a given size within the ring buffer.
This packet may wrap around at the end of the buffer. Users need to be aware of that.

Parameters

head	ring buffer head pointer
psize	packet size

Returns

valid address on success

Return values

NULL	if not enough space available

References L4_CV.

16.418.1.11 l4shmc_rb_sender_commit_packet()

```
void l4shmc_rb_sender_commit_packet (
             l4shmc_ringbuf_t * buf)
```

Tell the consumer that new data is available.

Parameters

buf	pointer to ring buffer struct

References L4_CV.

16.418.1.12 l4shmc_rb_sender_next_copy_in()

```
int l4shmc_rb_sender_next_copy_in (
             l4shmc_ringbuf_t * buf,
             char * data,
             unsigned size,
             int block_if_necessary)
```

Copy in packet from an external data source.
This is the function you'll want to use. Just pass it a buffer pointer and let the lib do the work.

Parameters

buf	pointer to ring buffer struct
data	valid buffer
size	data size
block_if_necessary	bool: block if buffer currently full

Return values

0	on success
-L4_ENOMEM	if block == false and no space available

References L4_CV.

16.418.1.13 l4shmc_rb_sender_put_data()

```
void l4shmc_rb_sender_put_data (
             l4shmc_ringbuf_t * buf,
             char * addr,
             char * data,
             unsigned dsize)
```

Copy data into a previously allocated packet.
This function is wrap-around aware.

Parameters

buf	pointer to ring buffer struct
addr	valid destination (allocate with alloc_packet())
data	data source
dsize	data size

References L4_CV.

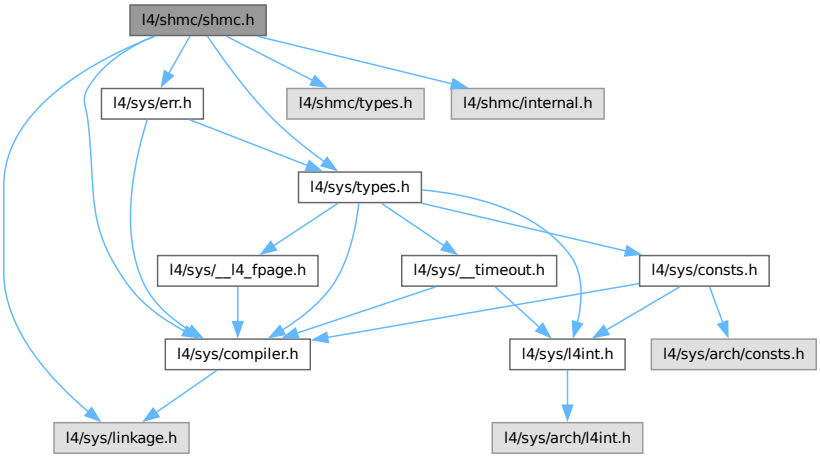
16.420 l4/shmc/shmc.h File Reference

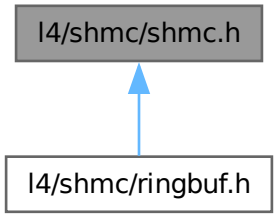
Shared memory library header file.

```
#include <l4/sys/compiler.h>
#include <l4/sys/linkage.h>
#include <l4/sys/types.h>
#include <l4/sys/err.h>
#include <l4/shmc/types.h>
#include <l4/shmc/internal.h>
```

Include dependency graph for shmc.h:



This graph shows which files directly or indirectly include this file:



Functions

- L4_BEGIN_DECLS long l4shmc_create (char const *shmc_name)

Create a shared memory area.

- long l4shmc_attach (char const *shmc_name, l4shmc_area_t *shmarea)

  Attach to a shared memory area.
- long l4shmc_get_client_nr (l4shmc_area_t const *shmarea)

  Determine the client number of the shared memory region.
- long l4shmc_mark_client_initialized (l4shmc_area_t *shmarea)

  Mark this shared memory client as 'initialized'.
- long l4shmc_get_initialized_clients (l4shmc_area_t *shmarea, l4_umword_t *bitmask)

  Fetch the `_clients_init_done` bitmask of the shared memory area.
- long l4shmc_add_chunk (l4shmc_area_t *shmarea, char const *chunk_name, l4_umword_t chunk_capacity, l4shmc_chunk_t *chunk)

  Add a chunk in the shared memory area.
- long l4shmc_add_signal (l4shmc_area_t *shmarea, char const *signal_name, l4shmc_signal_t *signal)

  Add a signal for the shared memory area.
- long l4shmc_trigger (l4shmc_signal_t *signal)

  Trigger a signal.
- long l4shmc_chunk_try_to_take (l4shmc_chunk_t *chunk)

  Try to mark chunk busy.
- long l4shmc_chunk_try_to_take_for_writing (l4shmc_chunk_t *chunk)

  Try to mark chunk busy writing.
- long l4shmc_chunk_try_to_take_for_overwriting (l4shmc_chunk_t *chunk)

  Try to mark the chunk busy writing after it was ready for reading.
- long l4shmc_chunk_try_to_take_for_reading (l4shmc_chunk_t *chunk)

  Try to mark chunk busy reading.
- long l4shmc_chunk_ready (l4shmc_chunk_t *chunk, l4_umword_t size)

  Mark chunk as filled (ready).
- long l4shmc_chunk_ready_sig (l4shmc_chunk_t *chunk, l4_umword_t size)

  Mark chunk as filled (ready) and signal consumer.
- long l4shmc_get_chunk (l4shmc_area_t *shmarea, char const *chunk_name, l4shmc_chunk_t *chunk)

  Get chunk out of shared memory area.
- long l4shmc_get_chunk_to (l4shmc_area_t *shmarea, char const *chunk_name, l4_umword_t timeout_ms, l4shmc_chunk_t *chunk)

  Get chunk out of shared memory area, with timeout.
- long l4shmc_iterate_chunk (l4shmc_area_t const *shmarea, char const **chunk_name, long offs)

  Iterate over names of all existing chunks.
- long l4shmc_attach_signal (l4shmc_area_t *shmarea, char const *signal_name, l4_cap_idx_t thread, l4shmc_signal_t *signal)

  Attach to signal.
- long l4shmc_get_signal (l4shmc_area_t *shmarea, char const *signal_name, l4shmc_signal_t *signal)

  Get signal object from the shared memory area.
- long l4shmc_enable_signal (l4shmc_signal_t *signal)

  Enable a signal.
- long l4shmc_enable_chunk (l4shmc_chunk_t *chunk)

  Enable a signal connected with a chunk.
- long l4shmc_wait_any (l4shmc_signal_t **retsignal)

  Wait on any signal.
- long l4shmc_wait_any_try (l4shmc_signal_t **retsignal)

  Check whether any waited signal has an event pending.
- long l4shmc_wait_any_to (l4_timeout_t timeout, l4shmc_signal_t **retsignal)

  Wait for any signal with timeout.
- long l4shmc_wait_signal (l4shmc_signal_t *signal)

Wait on a specific signal.

- long l4shmc_wait_signal_to (l4shmc_signal_t *signal, l4_timeout_t timeout)

  Wait on a specific signal, with timeout.
- long l4shmc_wait_signal_try (l4shmc_signal_t *signal)

  Check whether a specific signal has an event pending.
- long l4shmc_wait_chunk (l4shmc_chunk_t *chunk)

  Wait on a specific chunk.
- long l4shmc_wait_chunk_to (l4shmc_chunk_t *chunk, l4_timeout_t timeout)

  Check whether a specific chunk has an event pending, with timeout.
- long l4shmc_wait_chunk_try (l4shmc_chunk_t *chunk)

  Check whether a specific chunk has an event pending.
- long l4shmc_chunk_consumed (l4shmc_chunk_t *chunk)

  Mark a chunk as free.
- long l4shmc_connect_chunk_signal (l4shmc_chunk_t *chunk, l4shmc_signal_t *signal)

  Connect a signal with a chunk.
- long l4shmc_is_chunk_ready (l4shmc_chunk_t const *chunk)

  Check whether data is available.
- long l4shmc_is_chunk_clear (l4shmc_chunk_t const *chunk)

  Check whether chunk is free.
- void * l4shmc_chunk_ptr (l4shmc_chunk_t const *chunk)

  Get data pointer to chunk.
- long l4shmc_chunk_size (l4shmc_chunk_t const *chunk)

  Get current size of a chunk.
- long l4shmc_chunk_capacity (l4shmc_chunk_t const *chunk)

  Get capacity of a chunk.
- l4shmc_signal_t * l4shmc_chunk_signal (l4shmc_chunk_t const *chunk)

  Get the registered signal of a chunk.
- l4_cap_idx_t l4shmc_signal_cap (l4shmc_signal_t const *signal)

  Get the signal capability of a signal.
- long l4shmc_check_magic (l4shmc_chunk_t const *chunk)

  Check magic value of a chunk.
- long l4shmc_area_size (l4shmc_area_t const *shmarea)

  Get size of shared memory area.
- long l4shmc_area_size_free (l4shmc_area_t const *shmarea)

  Get free size of shared memory area.
- long l4shmc_area_overhead (void)

  Get memory overhead per area that is not available for chunks.
- long l4shmc_chunk_overhead (void)

  Get memory overhead required in addition to the chunk capacity for adding one chunk.

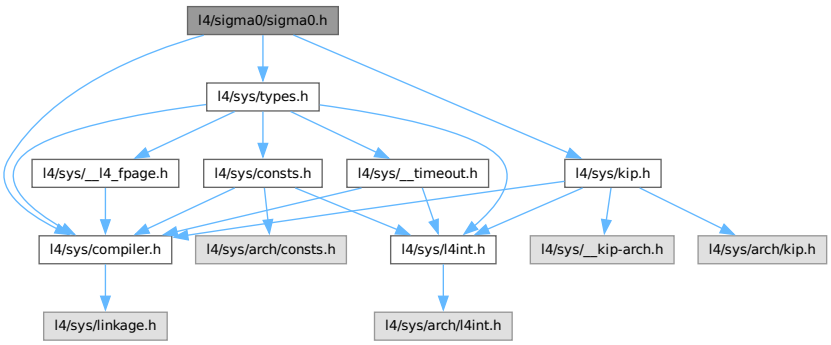
16.422 l4/sigma0/sigma0.h File Reference

Sigma0 interface.

```
#include <l4/sys/compiler.h>
#include <l4/sys/types.h>
#include <l4/sys/kip.h>
```

Include dependency graph for sigma0.h:



Macros

- #define **SIGMA0_REQ_MAGIC** ~0xFFUL

  Request magic.
- #define **SIGMA0_REQ_MASK** ~0xFFUL

  Request mask.
- #define **SIGMA0_REQ_ID_MASK** 0xF0

  ID mask.
- #define **SIGMA0_REQ_ID_FPAGE_RAM** 0x60

  RAM.
- #define **SIGMA0_REQ_ID_FPAGE_IOMEM** 0x70

  I/O memory.
- #define **SIGMA0_REQ_ID_FPAGE_IOMEM_CACHED** 0x80

  Cached I/O memory.
- #define **SIGMA0_REQ_ID_FPAGE_ANY** 0x90

  Any.
- #define **SIGMA0_REQ_ID_KIP** 0xA0

  KIP.
- #define **SIGMA0_REQ_ID_DEBUG_DUMP** 0xC0

  Debug dump.
- #define **SIGMA0_REQ_ID_COV** 0xE0

  Trigger cov dump.
- #define **SIGMA0_IS_MAGIC_REQ**(d1)

  Check if magic.
- #define **SIGMA0_REQ**(x)

  Construct.
- #define **SIGMA0_REQ_FPAGE_RAM** (SIGMA0_REQ(FPAGE_RAM))

  RAM.
- #define **SIGMA0_REQ_FPAGE_IOMEM** (SIGMA0_REQ(FPAGE_IOMEM))

  I/O memory.

- #define **SIGMA0_REQ_FPAGE_IOMEM_CACHED** (SIGMA0_REQ(FPAGE_IOMEM_CACHED))

  Cache I/O memory.
- #define **SIGMA0_REQ_FPAGE_ANY** (SIGMA0_REQ(FPAGE_ANY))

  Any.
- #define **SIGMA0_REQ_KIP** (SIGMA0_REQ(KIP))

  KIP.
- #define **SIGMA0_REQ_DEBUG_DUMP** (SIGMA0_REQ(DEBUG_DUMP))

  Debug dump.
- #define **SIGMA0_REQ_COV** (SIGMA0_REQ(COV))

  Cov.

Enumerations

- enum l4sigma0_return_flags_t {
  L4SIGMA0_OK , L4SIGMA0_NOTALIGNED , L4SIGMA0_IPCERROR , L4SIGMA0_NOFPAGE ,
  L4SIGMA0_4 , **L4SIGMA0_5** , L4SIGMA0_SMALLERFPAGE }

  Return flags of libsigma0 functions.

Functions

- L4_BEGIN_DECLS l4_kernel_info_t ∗ l4sigma0_map_kip (l4_cap_idx_t sigma0, void ∗addr, unsigned log2↩
  _size)

  Map the kernel info page from sigma0 to addr.
- int l4sigma0_map_mem (l4_cap_idx_t sigma0, l4_addr_t phys, l4_addr_t virt, l4_addr_t size)

  Request a memory mapping from sigma0.
- int l4sigma0_map_iomem (l4_cap_idx_t sigma0, l4_addr_t phys, l4_addr_t virt, l4_addr_t size, int cached)

  Request IO memory from sigma0.
- int l4sigma0_map_anypage (l4_cap_idx_t sigma0, l4_addr_t map_area, unsigned log2_map_size, l4_addr_t ∗base, unsigned sz)

  Request an arbitrary free page of RAM.
- void l4sigma0_debug_dump (l4_cap_idx_t sigma0)

  Request sigma0 to dump internal debug information.
- char const ∗ l4sigma0_map_errstr (int err)

  Get user readable error messages for the return codes.

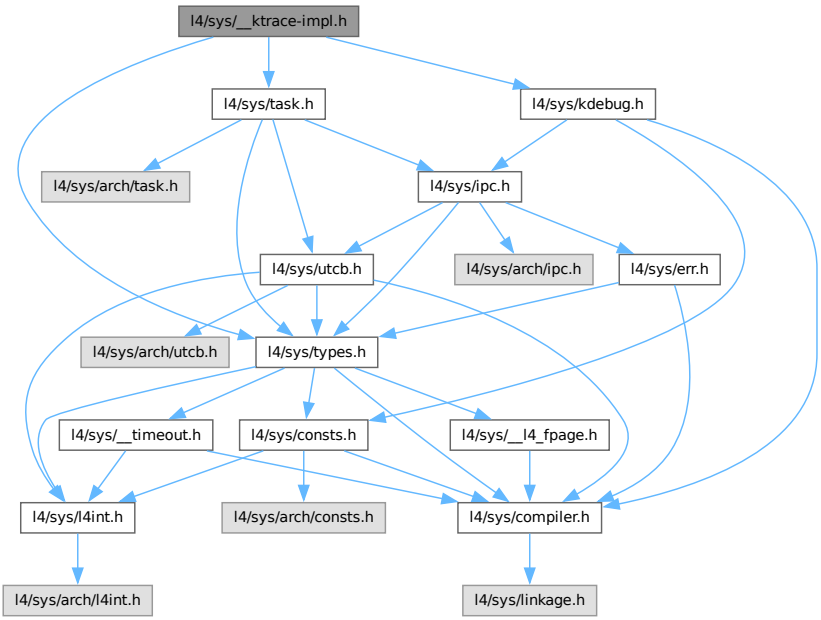
16.425 l4/sys/__ktrace-impl.h File Reference

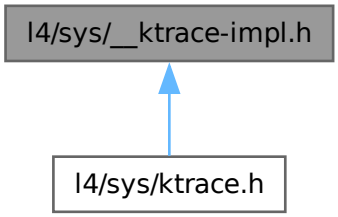
L4 kernel event tracing.

```
#include <l4/sys/types.h>
#include <l4/sys/kdebug.h>
#include <l4/sys/task.h>
```

Include dependency graph for __ktrace-impl.h:



This graph shows which files directly or indirectly include this file:



Functions

- l4_msgtag_t fiasco_tbuf_validate (void)

  Validate the kernel base debugger capability.
- l4_umword_t fiasco_tbuf_log (const char *text)

  Create new trace-buffer entry with describing <text>.
- l4_umword_t fiasco_tbuf_log_3val (const char *text, l4_umword_t v1, l4_umword_t v2, l4_umword_t v3)

  Create new trace-buffer entry with describing <text> and three additional values.
- void **fiasco_tbuf_clear** (void)

  Clear trace-buffer.
- void **fiasco_tbuf_dump** (void)

  Dump trace-buffer to kernel console.
- l4_umword_t fiasco_tbuf_log_binary (const unsigned char *data)

  Create new trace-buffer entry with binary data.
- l4_msgtag_t fiasco_tbuf_map_status (l4_fpage_t *ku_mem)

  Map kernel trace-buffer status page.
- l4_msgtag_t fiasco_tbuf_map_slots (l4_fpage_t *ku_mem)

  Map kernel trace-buffer slots.

16.425.1 Detailed Description

L4 kernel event tracing.

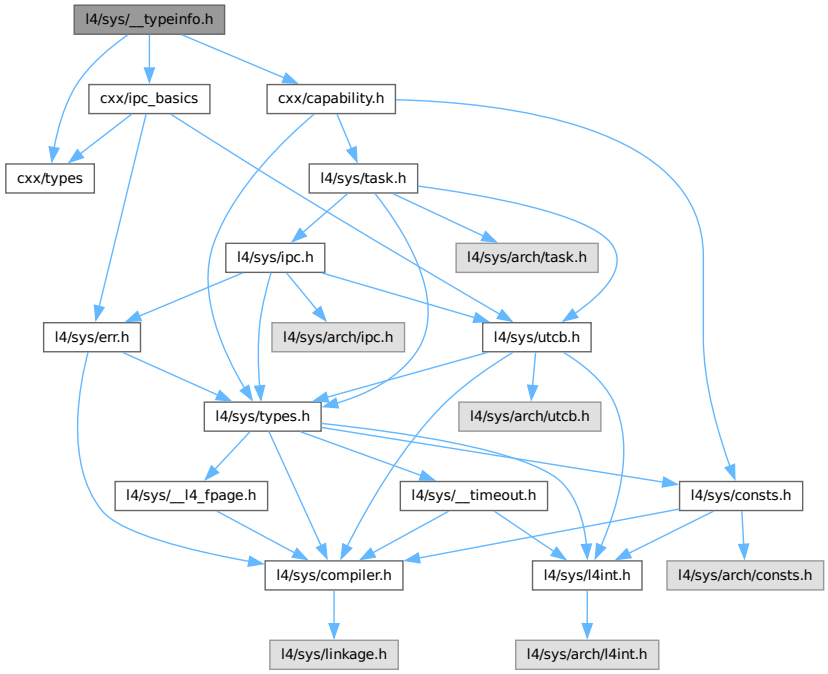
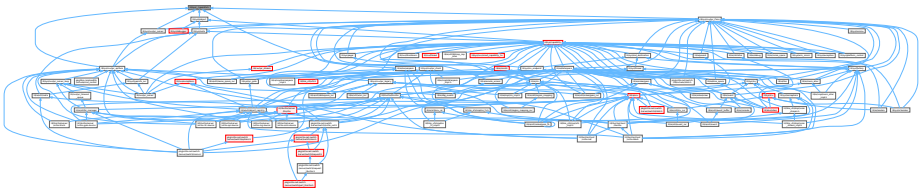
Include dependency graph for __typeinfo.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct L4::Typeid::P_dispatch< LIST >

  Use for protocol based dispatch stage.
- struct L4::Typeid::Detail::Rpcs_end

  Internal end-of-list marker.
- struct L4::Typeid::Detail::_Rpcs< OPCODE, O, X >

  Empty list of RPCs.
- struct L4::Typeid::Detail::_Rpcs< OPCODE, O, R, X... >

  Non-empty list of RPCs.
- struct L4::Typeid::Detail::_Rpcs< OPCODE, O, R, X... >::Rpc< Y >

  Find the given RPC in the list.
- struct L4::Typeid::Detail::_Rpcs< OPCODE, O, Default_op< R > >::Rpc< Y >

  Find the given RPC in the list.
- struct L4::Typeid::Raw_ipc< CLASS >

  RPCs list for passing raw incoming IPC to the server object.
- struct L4::Typeid::Rpcs< RPCS >

  Standard list of RPCs of an interface.

- struct L4::Typeid::Rpcs_code< OPCODE_TYPE >

  List of RPCs of an interface using a special opcode type.
- struct L4::Typeid::Rpcs_code< OPCODE_TYPE >::F< RPCS >
- struct L4::Typeid::Rpc_nocode< OPERATION >

  List of RPCs of an interface using a single operation without an opcode.
- struct L4::Typeid::Rpcs_sys< ARG >

  List of RPCs typically used for kernel interfaces.
- struct L4::Type_info

  Dynamic Type Information for L4Re Interfaces.
- class L4::Type_info::Demand

  Data type for expressing the needed receive buffers at the server-side of an interface.
- struct L4::Type_info::Demand_t< CAPS, FLAGS, MEM, PORTS >

  Template type statically describing demand of receive buffers.
- struct L4::Type_info::Demand_union_t< D1, D2 >

  Template type statically describing the combination of two Demand object.
- struct L4::Kobject_typeid< T >

  Meta object for handling access to type information of Kobjects.
- struct L4::Kobject_typeid< void >

  Minimalistic ID for `void` interface.
- class L4::Kobject_t< Derived, Base, PROTO, S_DEMAND >

  Helper class to create an L4Re interface class that is derived from a single base class.
- class L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >

  Helper class to create an L4Re interface class that is derived from two base classes (see `L4::Kobject_t`).
- struct L4::Kobject_3t< Derived, Base1, Base2, Base3, PROTO, S_DEMAND >

  Helper class to create an L4Re interface class that is derived from three base classes (see `L4::Kobject_t`).
- struct L4::Proto_t< P >

  Data type for defining protocol numbers.

Namespaces

- namespace L4

  L4 low-level kernel interface.
- namespace L4::Typeid

  Definition of interface data-type helpers.

Typedefs

- typedef int **L4::Opcode**

  Data type for RPC opcodes.

Enumerations

- enum : l4_proto_t { L4::PROTO_ANY = 0 , L4::PROTO_EMPTY = -19 }

Functions

- template<typename T>
  Type_info const * L4::kobject_typeid () noexcept

  Get the L4::Type_info for the L4Re interface given in `T`.

  C interface for calling the ARM secure monitor, see L4::Arm_smccc::call() for the C++ interface.

16.438.1 Detailed Description

ARM secure monitor call functions.
Definition in file arm_smccc.h.

16.438.2 Function Documentation

16.438.2.1 l4_arm_smccc_call()

```
l4_msgtag_t l4_arm_smccc_call (
            l4_cap_idx_t pfc,
```

```
l4_umword_t func,
l4_umword_t in0,
l4_umword_t in1,
l4_umword_t in2,
l4_umword_t in3,
l4_umword_t in4,
l4_umword_t in5,
l4_umword_t * out0,
l4_umword_t * out1,
l4_umword_t * out2,
l4_umword_t * out3,
l4_umword_t client_id)  [inline]
```

C interface for calling the ARM secure monitor, see L4::Arm_smccc::call() for the C++ interface.

Parameters

	pfc	Capability of the SMC kernel object. The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.
	func	Function identifier. • Bit 31 has to be set: This marks the call as *Fast Call*. *Yielding Calls* (bit 31 unset) are rejected by the kernel. • Bit 30 defines the calling convention: • Bit 30 == 1: 64-bit calling convention. • Bit 30 == 0: 32-bit calling convention. • Bits 24..29 determine the service call ID. The permitted IDs are set in the kernel configuration. By default only service IDs >= 0x30000000 (*Trusted Application Calls* and *Trusted OS Calls*) are allowed.
in	*in0*	First input parameter.
in	*in1*	Second input parameter.
in	*in2*	Third input parameter.
in	*in3*	Fourth input parameter.
in	*in4*	Fifth input parameter.
in	*in5*	Sixth input parameter.
out	*out0*	First output parameter.
out	*out1*	Second output parameter.
out	*out2*	Third output parameter.
out	*out3*	Fourth output parameter.
in	*client_id*	Client ID. According to the specification, this value might be ignored by certain functions.

Return values

-L4_ENOSYS	Either bit 31 of the function call not set or service ID outside the range permitted by kernel configuration.
-L4_EINVAL	Invalid number of parameters.
<0	Other L4 error.

0	Success.

Cache functions.

Functions

- int l4_cache_clean_data (unsigned long start, unsigned long end) L4_NOTHROW

  Cache clean a range in D-cache; writes back to PoC.
- int l4_cache_flush_data (unsigned long start, unsigned long end) L4_NOTHROW

  Cache flush a range; writes back to PoC.
- int l4_cache_inv_data (unsigned long start, unsigned long end) L4_NOTHROW

  Cache invalidate a range; might write back to PoC.
- int l4_cache_coherent (unsigned long start, unsigned long end) L4_NOTHROW

  Make memory coherent between I-cache and D-cache; writes back to PoU.
- int l4_cache_dma_coherent (unsigned long start, unsigned long end) L4_NOTHROW

  Make memory coherent for use with external memory; writes back to PoC.
- int **l4_cache_dma_coherent_full** (void) L4_NOTHROW

  Make memory coherent for use with external memory; writes back to PoC.

Cache functions.

```
#include <l4/sys/compiler.h>
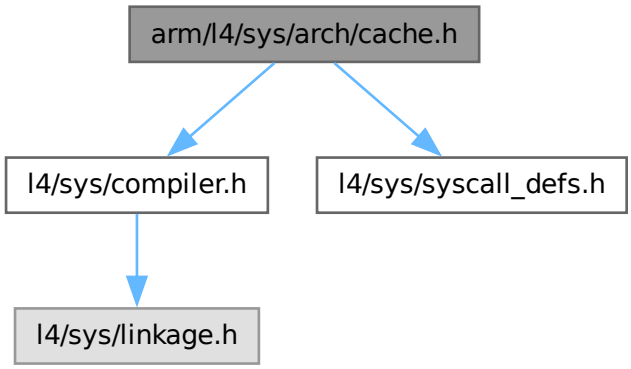
```
Include dependency graph for cache.h:



Functions

- int l4_cache_clean_data (unsigned long start, unsigned long end) L4_NOTHROW

  Cache clean a range in D-cache; writes back to PoC.
- int l4_cache_flush_data (unsigned long start, unsigned long end) L4_NOTHROW

  Cache flush a range; writes back to PoC.
- int l4_cache_inv_data (unsigned long start, unsigned long end) L4_NOTHROW

  Cache invalidate a range; might write back to PoC.
- int l4_cache_coherent (unsigned long start, unsigned long end) L4_NOTHROW

  Make memory coherent between I-cache and D-cache; writes back to PoU.
- int l4_cache_dma_coherent (unsigned long start, unsigned long end) L4_NOTHROW

  Make memory coherent for use with external memory; writes back to PoC.

#include <l4/sys/task.h>
#include <l4/sys/meta>
```

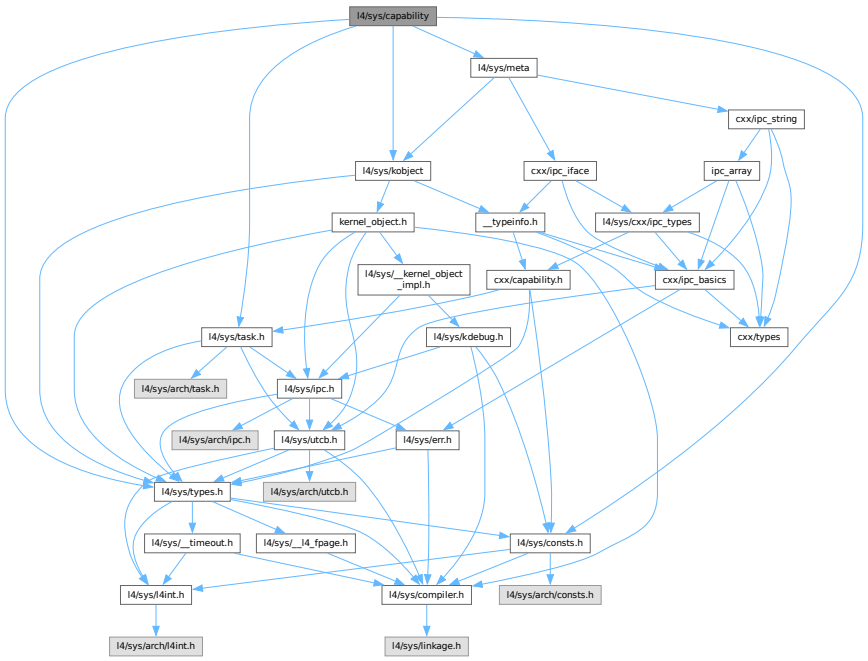
Include dependency graph for capability:



This graph shows which files directly or indirectly include this file:

Namespaces

- namespace L4

  L4 low-level kernel interface.

Macros

- #define L4_DISABLE_COPY(_class)

  Disable copy of a class.

Functions

- template<typename T, typename F>
  Cap< T > L4::cap_dynamic_cast (Cap< F > const &c) noexcept

  `dynamic_cast` *for capabilities.*

16.452.1 Detailed Description

L4::Cap related definitions.

Author

Alexander Warg `alexander.warg@os.inf.tu-dresden.de`

Definition in file capability.

16.452.2 Macro Definition Documentation

16.452.2.1 L4_DISABLE_COPY

```
#define L4_DISABLE_COPY(
              _class)
```

Value:

```
  public:                                          \
    _class(_class const &) = delete;               \
    _class operator = (_class const &) = delete; \
  private:
```

Disable copy of a class.

Parameters

_class	Name of the class that shall not have value copy semantics.

The typical use of this is:

```
class Non_value
{
  L4_DISABLE_COPY(Non_value)

  ...
}
```

Definition at line 52 of file capability.

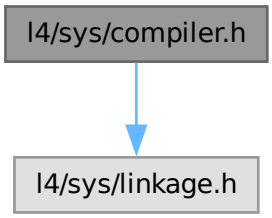
16.454 l4/sys/compiler.h File Reference

L4 compiler related defines.

`#include <l4/sys/linkage.h>`

Include dependency graph for compiler.h:



This graph shows which files directly or indirectly include this file:

Macros

- #define **L4_INLINE**

  L4 Inline function attribute.
- #define **L4_ALWAYS_INLINE**

  Always inline a function.
- #define L4_NOTHROW

  Mark a function declaration and definition as never throwing an exception.
- #define **L4_BEGIN_DECLS**

  Start section with C types and functions.
- #define **L4_END_DECLS**

  End section with C types and functions.
- #define **L4_CONSTEXPR**

  Constexpr function attribute.
- #define **L4_NORETURN**

  Noreturn function attribute.
- #define **L4_NOINSTRUMENT**

  No instrumentation function attribute.
- #define L4_HIDDEN

  Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.
- #define L4_EXPORT

  Attribute to mark functions, variables, and data types as being exported from a library.
- #define **L4_LIKELY**(x)

  Expression is likely to execute.
- #define **L4_UNLIKELY**(x)

  Expression is unlikely to execute.
- #define **L4_STICKY**(x)

  Mark symbol sticky (even not there).
- #define **L4_DEPRECATED**(s)

  Mark symbol deprecated.
- #define **L4_stringify_helper**(x)

  stringify helper.
- #define **L4_stringify**(x)

  stringify.

Functions

- unsigned long l4_align_stack_for_direct_fncall (unsigned long stack)

  Specify the desired alignment of the stack pointer.
- void **l4_barrier** (void)

  Memory barrier.
- void **l4_mb** (void)

  Memory barrier.
- void **l4_wmb** (void)

  Write memory barrier.
- L4_NORETURN void l4_infinite_loop (void)

  Infinite loop.

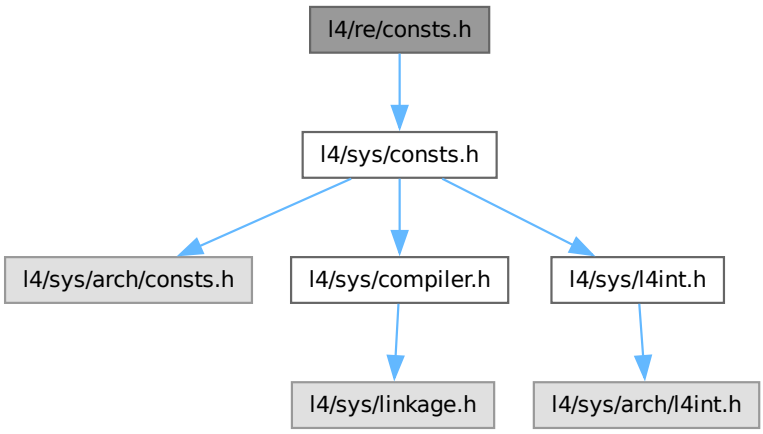
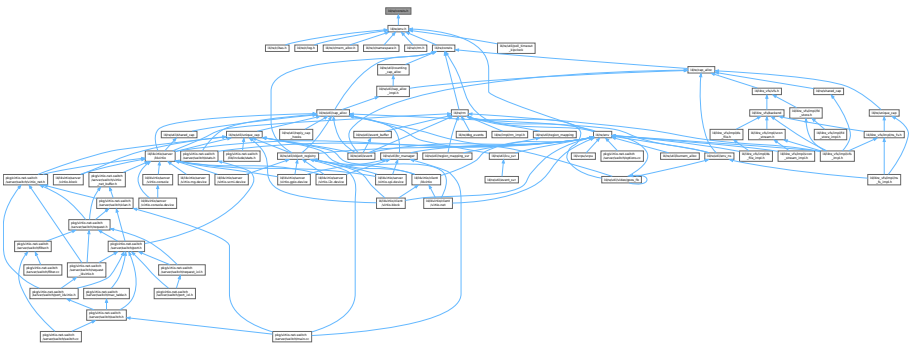
Constants.

`#include <l4/sys/consts.h>`

Include dependency graph for consts.h:



This graph shows which files directly or indirectly include this file:



Enumerations

- enum

  Defaults for local thread priorities.

16.462.1 Detailed Description

Constants.
Definition in file consts.h.

16.462.2 Enumeration Type Documentation

16.462.2.1 anonymous enum

```
anonymous enum
```

Defaults for local thread priorities.
Priorities are to be seen as local. These are used by the loader and libpthread. They are to be understood as 'local', which means the actual priority of the thread (as seen by the kernel) is the base priority as defined by the scheduler plus the local priority.
Definition at line 28 of file consts.h.

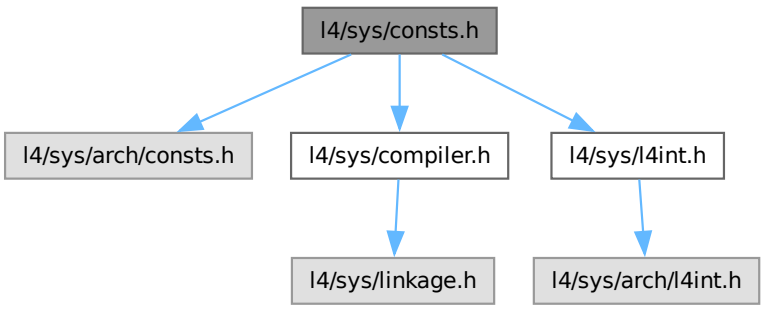
16.464 l4/sys/consts.h File Reference

Common constants.

```
#include <l4/sys/arch/consts.h>
#include <l4/sys/compiler.h>
#include <l4/sys/l4int.h>
```

Include dependency graph for consts.h:



This graph shows which files directly or indirectly include this file:

Macros

- #define **L4_SYSF_NONE**

  Empty set of flags.
- #define L4_SYSF_SEND

  Send-phase flag.
- #define L4_SYSF_RECV

  Receive-phase flag.
- #define L4_SYSF_OPEN_WAIT

  Open-wait flag.
- #define L4_SYSF_REPLY

  Reply flag.
- #define L4_SYSF_CALL

  Call flags (combines send and receive).
- #define L4_SYSF_WAIT

  Wait flags (combines receive and open wait).
- #define L4_SYSF_SEND_AND_WAIT

  Send-and-wait flags.
- #define L4_SYSF_REPLY_AND_WAIT

  Reply-and-wait flags.
- #define **L4_CAP_SHIFT**

  Capability index shift; see l4_cap_idx_t.
- #define L4_CAP_SIZE

  Deprecated.
- #define **L4_CAP_OFFSET**

  Offset of two consecutive capability indices.
- #define **L4_CAP_MASK**

  Mask to get only the relevant bits of an l4_cap_idx_t.
- #define **L4_INVALID_CAP**

  Invalid capability selector; see l4_cap_idx_t.
- #define L4_INVALID_CAP_BIT

  Bit indicating if a capability selector is invalid.
- #define **L4_PAGESIZE**

  Minimal page size (in bytes).
- #define L4_PAGEMASK

  Mask for the page number.
- #define L4_LOG2_PAGESIZE

  Number of bits used for page offset.
- #define L4_SUPERPAGESIZE

  Size of a large page.
- #define L4_SUPERPAGEMASK

  Mask for the number of a large page.
- #define L4_LOG2_SUPERPAGESIZE

  Number of bits used as offset for a large page.
- #define **L4_INVALID_PTR** ((void *)L4_INVALID_ADDR)

  Invalid address as pointer type.

Enumerations

- enum l4_unmap_flags_t { L4_FP_ALL_SPACES , L4_FP_DELETE_OBJ , L4_FP_OTHER_SPACES }

  Flags for the unmap operation.
- enum l4_msg_item_consts_t { L4_ITEM_MAP = 8 , L4_ITEM_CONT = 1 , L4_MAP_ITEM_GRANT = 2 , L4_MAP_ITEM_MAP = 0 , L4_RCV_ITEM_FORWARD_MAPPINGS = 1 , L4_RCV_ITEM_SINGLE_CAP = L4_ITEM_MAP | 2 , L4_RCV_ITEM_LOCAL_ID = 4 }

  Constants for message items.
- enum l4_buffer_desc_consts_t { L4_BDR_MEM_SHIFT = 0 , L4_BDR_IO_SHIFT = 5 , L4_BDR_OBJ_SHIFT = 10 , **L4_BDR_OFFSET_MASK** = (1UL << 20) - 1 }

  Constants for buffer descriptors.
- enum l4_default_caps_t { L4_BASE_TASK_CAP , L4_BASE_FACTORY_CAP , L4_BASE_THREAD_CAP , L4_BASE_PAGER_CAP , L4_BASE_LOG_CAP , L4_BASE_ICU_CAP , L4_BASE_SCHEDULER_CAP , L4_BASE_IOMMU_CAP , L4_BASE_DEBUGGER_CAP , L4_BASE_ARM_SMCCC_CAP , **L4_BASE_CAPS_LAST_P1** , L4_BASE_CAPS_LAST = L4_BASE_CAPS_LAST_P1 - 1 }

  Default capabilities setup for the initial tasks.
- enum l4_addr_consts_t { L4_INVALID_ADDR = ~0UL }

  Address related constants.

Functions

- l4_addr_t l4_trunc_page (l4_addr_t address) L4_NOTHROW

  Round an address down to the next lower page boundary.
- l4_addr_t l4_trunc_size (l4_addr_t address, unsigned char bits) L4_NOTHROW

  Round an address down to the next lower flexpage with size bits.
- l4_addr_t l4_round_page (l4_addr_t address) L4_NOTHROW

  Round address up to the next page.
- l4_addr_t l4_round_size (l4_addr_t value, unsigned char bits) L4_NOTHROW

  Round value up to the next alignment with bits size.
- unsigned l4_bytes_to_mwords (unsigned size) L4_NOTHROW

  Determine how many machine words (l4_umword_t) are required to store a buffer of 'size' bytes.

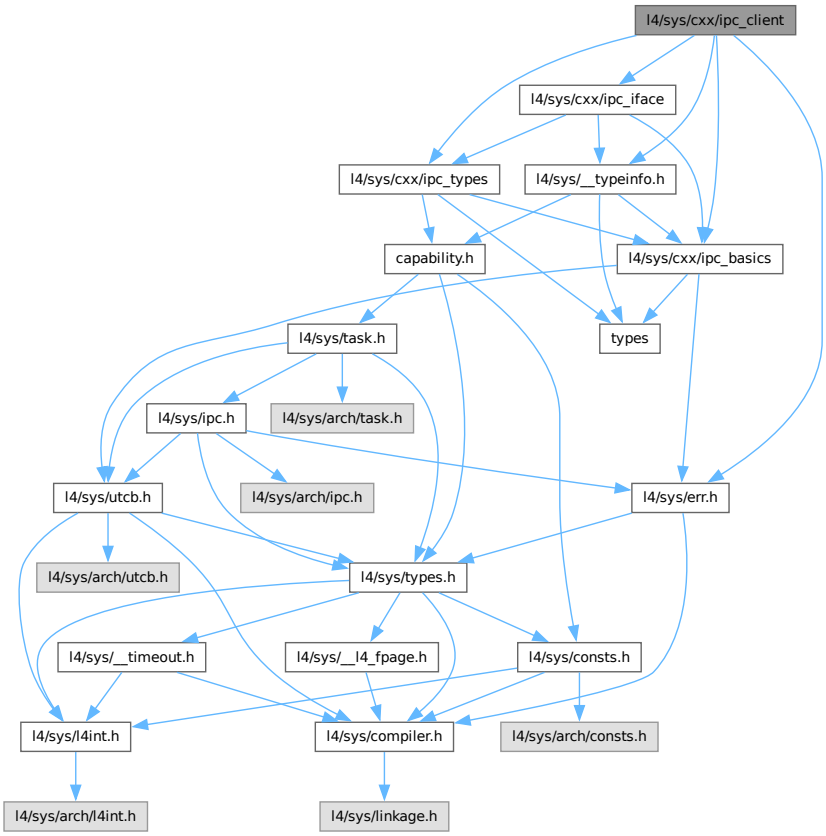
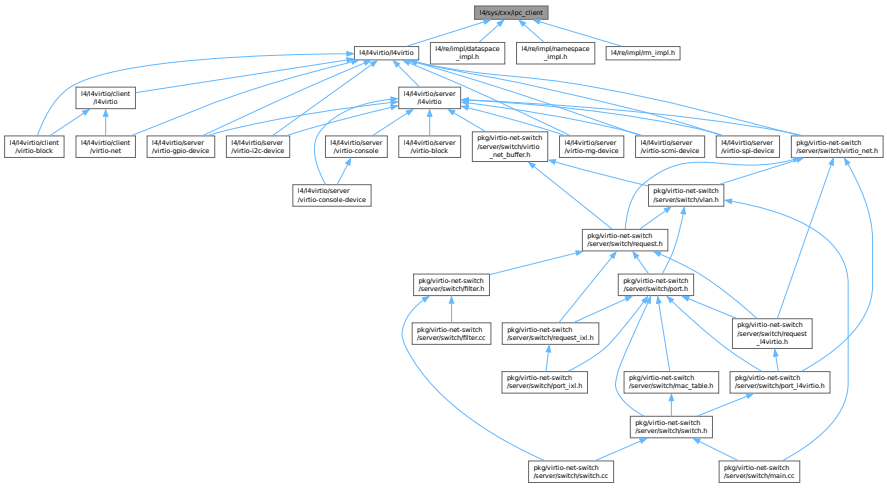
Include dependency graph for ipc_client:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace L4

  L4 low-level kernel interface.

- namespace L4::Ipc

  IPC related functionality.
- namespace L4::Ipc::Msg

  IPC Message related functionality.

Macros

- #define L4_RPC_DEF(name)

  Generate the definition of an RPC stub.

16.476.1 Macro Definition Documentation

16.476.1.1 L4_RPC_DEF

```
#define L4_RPC_DEF(
                name)
```

Value:

```
  template struct  L4::Ipc::Msg::Rpc_call \
    <name##_t, name##_t::class_type, name##_t::ipc_type, name##_t::flags_type>
```

Generate the definition of an RPC stub.

Parameters

name	The fully qualified method name to be implemented, this means `class::method`.

This macro generates the definition (implementation) for the given RPC interface method.
Definition at line 32 of file ipc_client.

16.477 ipc_client

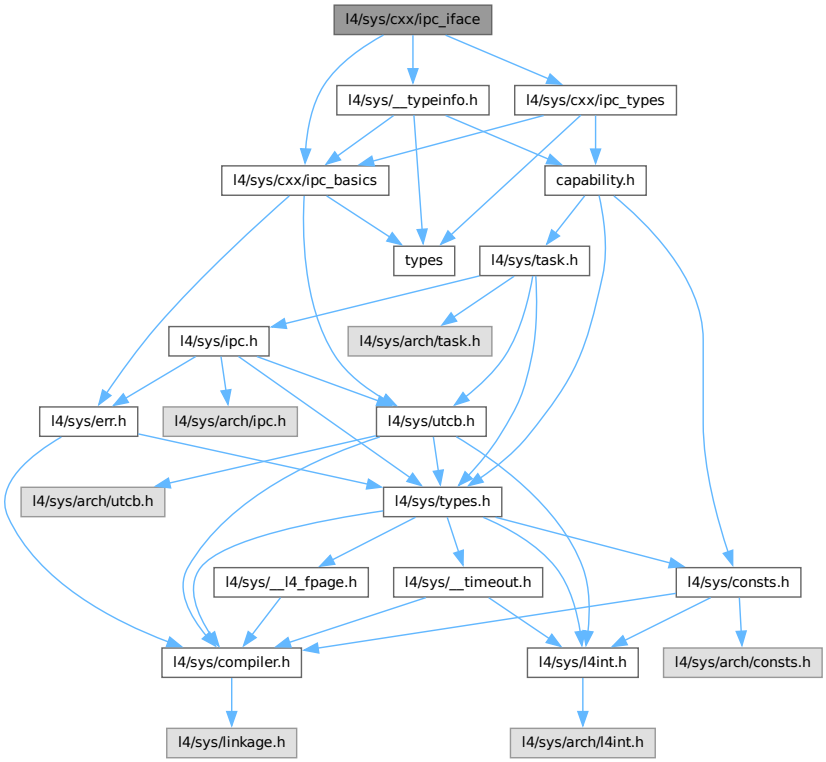
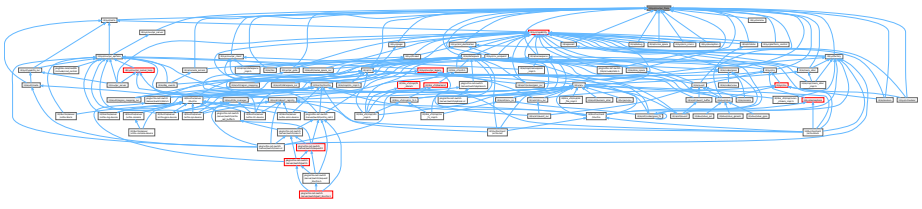
Include dependency graph for ipc_iface:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct L4::Ipc::Call

  RPC attribute for a standard RPC call.
- struct L4::Ipc::Call_zero_send_timeout

  RPC attribute for an RPC call, with zero send timeout.
- struct L4::Ipc::Call_t< RIGHTS >

  RPC attribute for an RPC call with required rights.
- struct L4::Ipc::Send_only

  RPC attribute for a send-only RPC.

Namespaces

- namespace L4

  L4 low-level kernel interface.
- namespace L4::Ipc

  IPC related functionality.
- namespace L4::Ipc::Msg

  IPC Message related functionality.

Macros

- #define L4_INLINE_RPC_NF(res, name, args...)

  Define an inline RPC call type (the type only, no callable).
- #define L4_INLINE_RPC_NF_OP(op, res, name, args...)

  Define an inline RPC call type with specific opcode (the type only, no callable).
- #define L4_INLINE_RPC(res, name, args, attr...)

  Define an inline RPC call (type and callable).
- #define L4_INLINE_RPC_OP(op, res, name, args, attr...)

  Define an inline RPC call with specific opcode (type and callable).
- #define L4_RPC_NF(res, name, args...)

  Define an RPC call type (the type only, no callable).
- #define L4_RPC_NF_OP(op, res, name, args...)

  Define an RPC call type with specific opcode (the type only, no callable).
- #define L4_RPC(res, name, args, attr...)

  Define an RPC call (type and callable).
- #define L4_RPC_OP(op, res, name, args, attr...)

  Define an RPC call with specific opcode (type and callable).

16.479.2 Macro Definition Documentation

16.479.2.1 L4_INLINE_RPC

```
#define L4_INLINE_RPC(
              res,
              name,
              args,
              attr...)
```

Value:

```
res name args
```

Define an inline RPC call (type and callable).

Parameters

res	The result type of the RPC call
name	The name of the function (`name_t` is used for the type.)
args	The argument list of the RPC function.
attr	Optional RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Examples

examples/clntsrv/src/shared.h.

Definition at line 483 of file ipc_iface.
Referenced by L4Re::Mem_alloc::info().

16.479.2.2 L4_INLINE_RPC_NF

```
#define L4_INLINE_RPC_NF(
              res,
              name,
              args...)
```

Value:

```
  struct name##_t : L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args> \
  {                                                                           \
    using type = L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args>;    \
    L4_INLINE_RPC_SRV_FORWARD(name);                                          \
  }
```

Define an inline RPC call type (the type only, no callable).

Parameters

res	The result type of the RPC call
name	The name of the function (`name_t` is used for the type.)
args	The argument list of the RPC function, and RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.
Definition at line 454 of file ipc_iface.

16.479.2.3 L4_INLINE_RPC_NF_OP

```
#define L4_INLINE_RPC_NF_OP(
              op,
              res,
```

```
                name,
                args...)
```

Value:

```
struct name##_t : L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args> \
{                                                                          \
  using type = L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args>;   \
  enum { Opcode = (op) };                                                  \
  L4_INLINE_RPC_SRV_FORWARD(name);                                         \
}
```

Define an inline RPC call type with specific opcode (the type only, no callable).

Parameters

op	The opcode number for this function
res	The result type of the RPC call
name	The name of the function (`name_t` is used for the type.)
args	The argument list of the RPC function, and RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.
Definition at line 467 of file ipc_iface.

16.479.2.4 L4_INLINE_RPC_OP

```
#define L4_INLINE_RPC_OP(
                op,
                res,
                name,
                args,
                attr...)
```

Value:

```
res name args
```

Define an inline RPC call with specific opcode (type and callable).

Parameters

op	The opcode number for this function
res	The result type of the RPC call
name	The name of the function (`name_t` is used for the type.)
args	The argument list of the RPC function.
attr	Optional RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Definition at line 498 of file ipc_iface.

16.479.2.5 L4_RPC

```
#define L4_RPC(
                res,
                name,
                args,
                attr...)
```

Value:

```
res name args
```

Define an RPC call (type and callable).

Parameters

res	The result type of the RPC call
name	The name of the function (name_t is used for the type.)
args	The argument list of the RPC function.
attr	Optional RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Definition at line 542 of file ipc_iface.
Referenced by L4Re::Dataspace::info().

16.479.2.6 L4_RPC_NF

```
#define L4_RPC_NF(
              res,
              name,
              args...)
```

Value:

```
  struct name##_t : L4::Ipc::Msg::Rpc_call<name##_t, Class, res args>        \
  {                                                                          \
    using type = L4::Ipc::Msg::Rpc_call<name##_t, Class, res args>;          \
    L4_INLINE_RPC_SRV_FORWARD(name);                                         \
  }
```

Define an RPC call type (the type only, no callable).

Parameters

res	The result type of the RPC call
name	The name of the function (name_t is used for the type.)
args	The argument list of the RPC function, and RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Definition at line 511 of file ipc_iface.
Referenced by L4Re::Dataspace::info().

16.479.2.7 L4_RPC_NF_OP

```
#define L4_RPC_NF_OP(
              op,
              res,
              name,
              args...)
```

Value:

```
  struct name##_t : L4::Ipc::Msg::Rpc_call<name##_t, Class, res args>        \
  {                                                                          \
    using type = L4::Ipc::Msg::Rpc_call<name##_t, Class, res args>;          \
    enum { Opcode = (op) };                                                  \
    L4_INLINE_RPC_SRV_FORWARD(name);                                         \
  }
```

Define an RPC call type with specific opcode (the type only, no callable).

Parameters

op	The opcode number for this function
res	The result type of the RPC call
name	The name of the function (name_t is used for the type.)
args	The argument list of the RPC function, and RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

Definition at line 526 of file ipc_iface.

16.479.2.8 L4_RPC_OP

```
#define L4_RPC_OP(
              op,
              res,
              name,
              args,
              attr...)
```

Value:

```
res name args
```

Define an RPC call with specific opcode (type and callable).

Parameters

op	The opcode number for this function
res	The result type of the RPC call
name	The name of the function (`name_t` is used for the type.)
args	The argument list of the RPC function.
attr	Optional RPC attributes (L4::Ipc::Call, L4::Ipc::Call_t etc.).

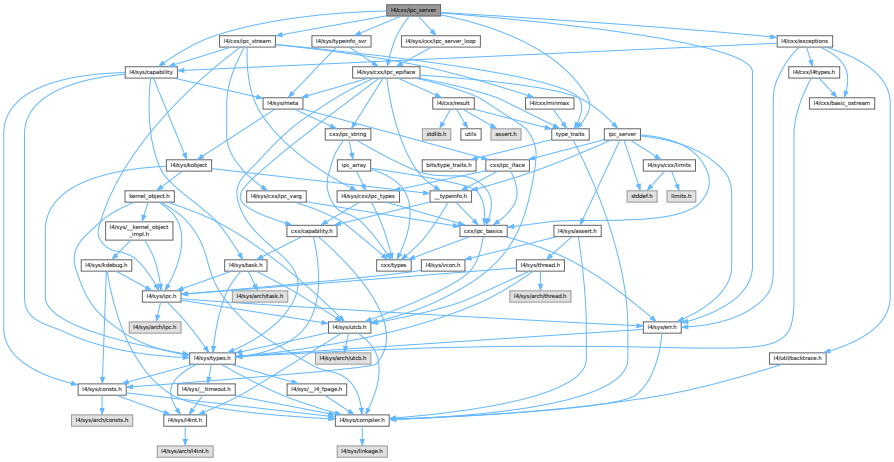
16.482 l4/cxx/ipc_server File Reference

IPC server loop.

```
#include <l4/sys/capability>
#include <l4/sys/typeinfo_svr>
#include <l4/sys/err.h>
#include <l4/cxx/ipc_stream>
#include <l4/sys/cxx/ipc_epiface>
#include <l4/sys/cxx/ipc_server_loop>
#include <l4/cxx/type_traits>
#include <l4/cxx/exceptions>
```

Include dependency graph for ipc_server:



Data Structures

- class L4::Server_object

  Abstract server object to be used with L4::Server and L4::Basic_registry.
- struct L4::Server_object_t< IFACE, BASE >

  Base class (template) for server implementing server objects.
- struct L4::Server_object_x< Derived, IFACE, BASE >

  Helper class to implement p_dispatch based server objects.
- struct L4::Irq_handler_object

  Server object base class for handling IRQ messages.

Namespaces

- namespace L4

  L4 low-level kernel interface.

16.482.1 Detailed Description

IPC server loop.

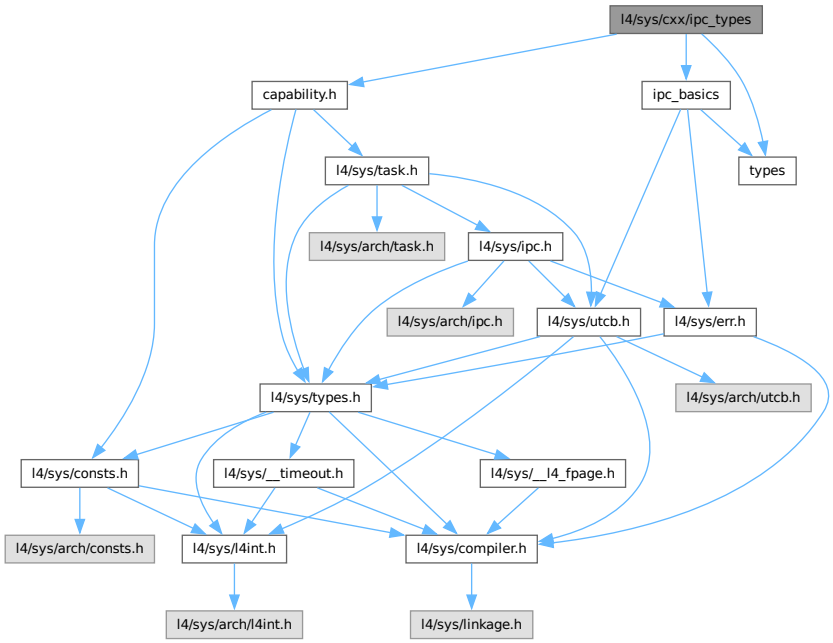
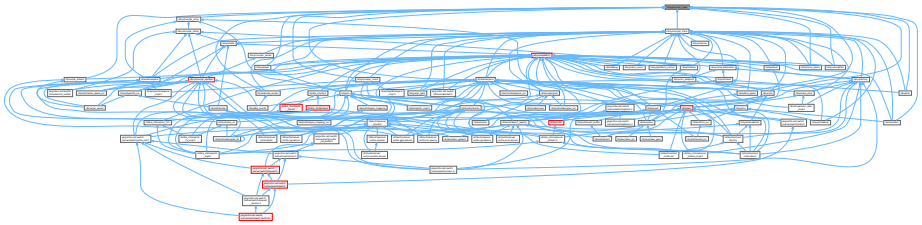
16.487 l4/sys/cxx/ipc_types File Reference

```
#include "capability.h"
#include "types"
#include "ipc_basics"
```

Include dependency graph for ipc_types:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct L4::Ipc::In_out< T >

  Mark an argument as in-out argument.
- struct L4::Ipc::Opt< T >

  Attribute for defining an optional RPC argument.
- class L4::Ipc::Small_buf

  A receive item for receiving a single object capability.
- class L4::Ipc::Gen_fpage

  Generic RPC base for typed message items.
- class L4::Ipc::Snd_fpage

  Send item or return item.
- class L4::Ipc::Rcv_fpage

  Non-small receive item.
- class L4::Ipc::Cap< T >

  Capability type for RPC interfaces (see `L4::Cap<T>`).

Namespaces

- namespace L4

  L4 low-level kernel interface.
- namespace L4::Ipc

  IPC related functionality.
- namespace L4::Ipc::Msg

  IPC Message related functionality.

Functions

- template<typename T>
  Cap< T > L4::Ipc::make_cap (L4::Cap< T > cap, unsigned rights) noexcept

  Make an L4::Ipc::Cap<T> for the given capability and rights.
- template<typename T>
  Cap< T > L4::Ipc::make_cap_rw (L4::Cap< T > cap) noexcept

  Make an L4::Ipc::Cap<T> for the given capability with L4_CAP_FPAGE_RW rights.
- template<typename T>
  Cap< T > L4::Ipc::make_cap_rws (L4::Cap< T > cap) noexcept

  Make an L4::Ipc::Cap<T> for the given capability with L4_CAP_FPAGE_RWS rights.
- template<typename T>
  Cap< T > L4::Ipc::make_cap_full (L4::Cap< T > cap) noexcept

  Make an L4::IPC::Cap<T> for the given capability with full fpage and object-specific rights.
- template<typename T>
  Cap< T > L4::Ipc::make_cap_grant (L4::Cap< T > cap) noexcept

  Make an L4::IPC::Cap<T> for the given capability that shall be granted with full rights.

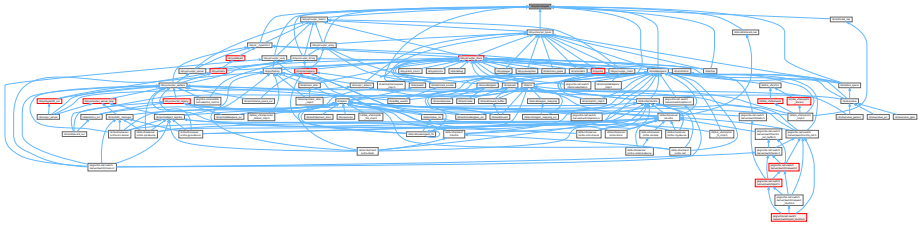
16.493 l4/sys/cxx/types File Reference

This graph shows which files directly or indirectly include this file:



Data Structures

- class L4::Types::Flags< BITS_ENUM, UNDERLYING >

  Template for defining typical Flags bitmaps.
- struct L4::Types::Int_for_type< T >

  Metafunction to get an integral type of the same size as `T`.
- struct L4::Types::Flags_ops_t< DT >

  Mixin class to define a set of friend bitwise operators on `DT`.
- struct L4::Types::Flags_t< DT, T >

  Template type to define a flags type with bitwise operations.
- struct L4::Types::__Add_rvalue_reference_helper< T, typename >

  Helper template for Add_rvalue_reference.
- struct L4::Types::__Add_rvalue_reference_helper< T, Void< T && > >

  Helper template for Add_rvalue_reference.
- struct L4::Types::Add_rvalue_reference< T >

  Create an rvalue reference of the given type.
- struct L4::Types::Bool< V >

  Boolean meta type.
- struct L4::Types::False

  False meta value.
- struct L4::Types::True

  True meta value.
- struct L4::Types::Integral_constant< T, Value >

Wrapper for a static constant of the given type.

- struct L4::Types::Is_enum< T >

  Check whether the given type is an enumeration type.
- struct L4::Types::Is_trivially_copyable< T >

  Check whether the given type is trivially copyable.
- struct L4::Types::__Underlying_type_helper< T, bool >

  Helper template for Underlying_type.
- struct L4::Types::__Underlying_type_helper< T, false >

  Helper template for Underlying_type.
- struct L4::Types::Underlying_type< T >

  Get an underlying type of an enumeration type.
- struct L4::Types::Same< A, B >

  Compare two data types for equality.
- struct L4::Types::Same_template< T, Template >

  Check if a type T is an instantiation of a given template.
- struct Enum_bitops::Has_marker< typename, typename >

  Marker for the opt-in ADL function.
- struct Enum_bitops::Has_marker< T, Void< decltype(enum_bitops_enable(declval< T >()))> >

  Marker for the opt-in ADL function.
- struct Enum_bitops::Enable< T >

  Check whether the given enum type opts in for the bitwise operators.

Namespaces

- namespace L4

  L4 low-level kernel interface.
- namespace L4::Types

  L4 basic type helpers for C++.
- namespace Enum_bitops

  Mechanism to opt-in for enum bitwise operators.
- namespace Enum_bitops_impl

  Bitwise operators on enumeration types.

Typedefs

- template<typename...>
  using **L4::Types::Void** = void

  Map a sequence of any types to the void type.
- template<typename T>
  using **L4::Types::Add_rvalue_reference_t** = typename Add_rvalue_reference<T>::type

  Helper type for the Add_rvalue_reference.
- template<typename T>
  using **L4::Types::Underlying_type_t** = typename Underlying_type<T>::type

  Helper type for Underlying_type.
- template<bool Condition, typename T = void>
  using **L4::Types::Enable_if_t** = typename Enable_if<Condition, T>::type

  Helper type for Enable_if.

Functions

- template<typename T>
  Add_rvalue_reference_t< T > L4::Types::declval () noexcept

  Template for writing typed expressions in unevaluated contexts.
- template<typename T, typename = L4::Types::Enable_if_t<L4::Types::Is_enum<T>::value>>
  constexpr L4::Types::Underlying_type_t< T > **Enum_bitops_impl::to_underlying** (T const arg) noexcept

  Convert enum value to its underlying type value.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **Enum_bitops_impl::operator~** (T const a) noexcept

  Negate enum value.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **Enum_bitops_impl::operator&** (T l, T r) noexcept

  Intersect enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T & **Enum_bitops_impl::operator&=** (T &a, T const b) noexcept

  Intersect and assign enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **Enum_bitops_impl::operator|** (T l, T r) noexcept

  Union enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T & **Enum_bitops_impl::operator|=** (T &a, T const b) noexcept

  Union and assign enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T **Enum_bitops_impl::operator-** (T l, T r) noexcept

  Difference (intersect with negation, clear bits) enum values.
- template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>
  constexpr T & **Enum_bitops_impl::operator-=** (T &a, T const b) noexcept

  Difference (intersect with negation, clear bits) and assign enum values.

Functions

- l4_msgtag_t l4_debugger_set_object_name (l4_cap_idx_t cap, const char *name) L4_NOTHROW
  Set the name of a kernel object.
- l4_ret_t l4_debugger_query_object_name (l4_cap_idx_t cap, unsigned id, char *name, unsigned size) L4_NOTHROW
  Get name of the kernel object with Id `id`.
- l4_ret_t l4_debugger_get_object_name (l4_cap_idx_t cap, char *name, unsigned size) L4_NOTHROW
  Get name of a kernel object.
- unsigned long l4_debugger_global_id (l4_cap_idx_t cap) L4_NOTHROW
  Get the globally unique ID of the object behind a capability.
- unsigned long l4_debugger_kobj_to_id (l4_cap_idx_t cap, l4_addr_t kobjp) L4_NOTHROW
  Get the globally unique ID of the object behind the kobject pointer.
- l4_ret_t l4_debugger_query_log_typeid (l4_cap_idx_t cap, const char *name, unsigned idx) L4_NOTHROW
  Query the log-id for a log type.
- l4_ret_t l4_debugger_query_log_name (l4_cap_idx_t cap, unsigned idx, char *name, unsigned namelen, char *shortname, unsigned shortnamelen) L4_NOTHROW
  Query the name of a log type given the ID.
- l4_msgtag_t l4_debugger_switch_log (l4_cap_idx_t cap, const char *name, int on_off) L4_NOTHROW
  Set or unset log.
- l4_msgtag_t l4_debugger_add_image_info (l4_cap_idx_t cap, l4_addr_t base, const char *name) L4_NOTHROW
  Add loaded image information for a task.

16.497.1 Detailed Description

Debugger related definitions.
Definition in file debugger.h.

16.497.2 Enumeration Type Documentation

16.497.2.1 anonymous enum

`anonymous enum`

Enumerator

L4_DEBUGGER_KOBJ_SET_NAME_OP	Set debug name of kernel object.
L4_DEBUGGER_KOBJ_GET_GLOBAL_ID_OP	Get debug ID of kernel object.
L4_DEBUGGER_KOBJ_PTR_GET_GLOBAL_ID_OP	Get debug ID of kernel object by pointer.
L4_DEBUGGER_LOG_QUERY_TYPEID_OP	Query log-id for log type.
L4_DEBUGGER_LOG_SWITCH_OP	Enable / disable log.
L4_DEBUGGER_GLOBAL_ID_GET_NAME_OP	Get debug name of kernel object by debug ID.
L4_DEBUGGER_LOG_QUERY_NAME_OP	Get name of log type for given log-id.
L4_DEBUGGER_TASK_ADD_IMAGE_INFO_OP	Add image information for task.
L4_DEBUGGER_KOBJ_GET_NAME_OP	Get debug name of kernel object.
L4_DEBUGGER_OBJ_INFO_OP	Query information about all kernel objects.

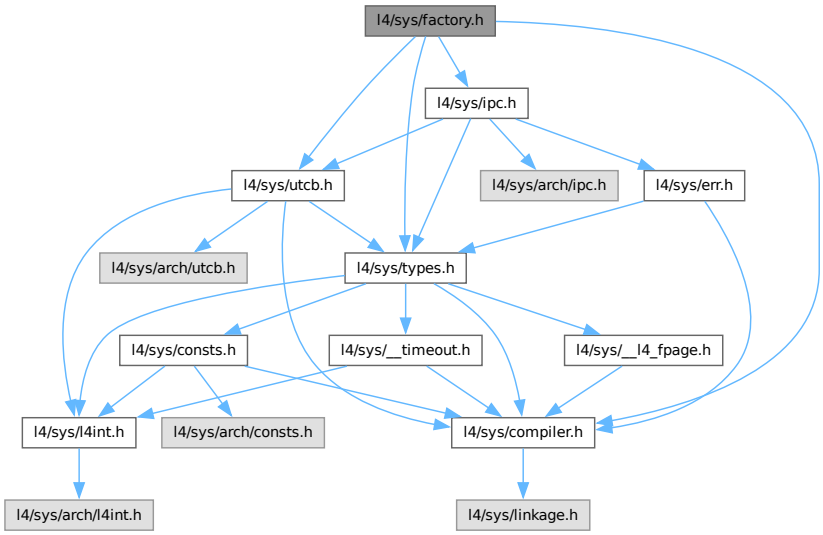
16.505 l4/sys/factory.h File Reference

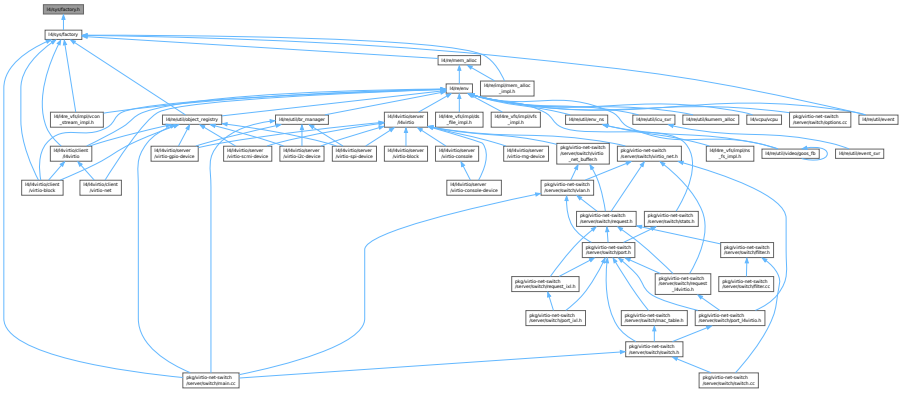
Common factory related definitions.

```
#include <l4/sys/compiler.h>
#include <l4/sys/types.h>
#include <l4/sys/utcb.h>
#include <l4/sys/ipc.h>
```

Include dependency graph for factory.h:



This graph shows which files directly or indirectly include this file:



Functions

- l4_msgtag_t l4_factory_create_task (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_fpage_t *utcb_area) L4_NOTHROW

  Create a new task.
- l4_msgtag_t l4_factory_create_thread (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

  Create a new thread.
- l4_msgtag_t l4_factory_create_factory (l4_cap_idx_t factory, l4_cap_idx_t target_cap, unsigned long limit) L4_NOTHROW

  Create a new factory.
- l4_msgtag_t l4_factory_create_gate (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_cap_idx_t snd_dst_↩ cap, l4_umword_t label) L4_NOTHROW

  Create a new IPC gate, optionally bound to a send destination (a thread or thread group).
- l4_msgtag_t l4_factory_create_irq (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

  Create a new IRQ sender.
- l4_msgtag_t l4_factory_create_vm (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

Create a new virtual machine.

- l4_msgtag_t l4_factory_create_vcpu_context (l4_cap_idx_t factory, l4_cap_idx_t target_cap) L4_NOTHROW

  Create a new vCPU context.

- l4_msgtag_t l4_factory_create_thread_group (l4_cap_idx_t factory, l4_cap_idx_t target_cap, unsigned policy) L4_NOTHROW

  Create a new thread group.

- l4_msgtag_t l4_factory_create_pi_mutex (l4_cap_idx_t factory, l4_cap_idx_t target_cap, l4_addr_t ku_status, l4_cap_idx_t task_cap) L4_NOTHROW

  Create a new priority inheritance mutex.

- l4_msgtag_t l4_factory_create (l4_cap_idx_t factory, long obj, l4_cap_idx_t target) L4_NOTHROW

  Create a new object.

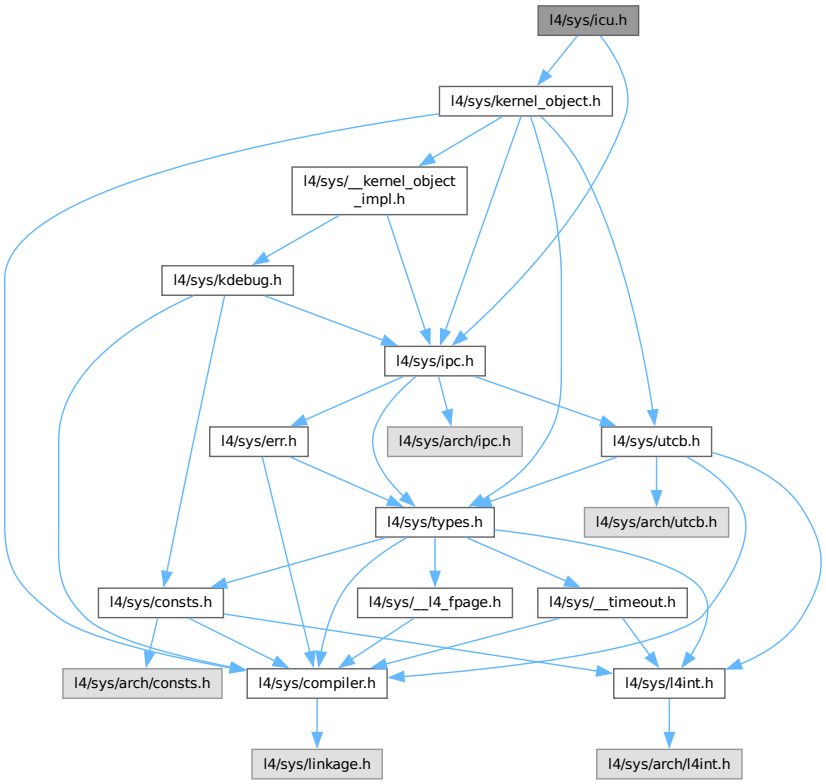
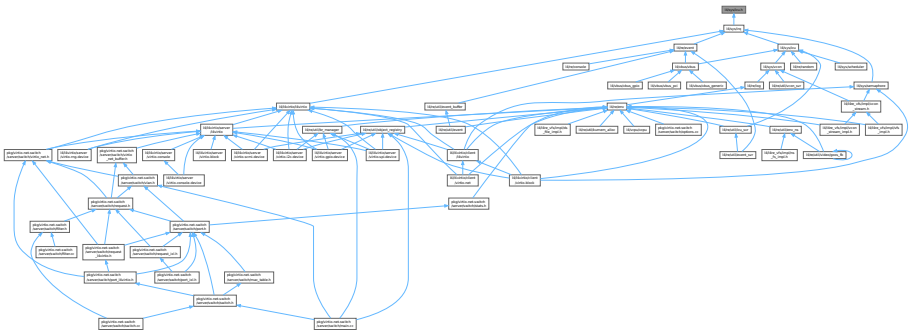
`#include <l4/sys/kernel_object.h>`
`#include <l4/sys/ipc.h>`
Include dependency graph for icu.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4_icu_info_t

Info structure for an ICU.

- struct l4_icu_msi_info_t

  Info to use for a specific MSI.

Typedefs

- typedef struct l4_icu_info_t l4_icu_info_t

  Info structure for an ICU.

- typedef struct l4_icu_msi_info_t **l4_icu_msi_info_t**

  Info to use for a specific MSI.

Enumerations

- enum L4_icu_flags { L4_ICU_FLAG_MSI }

  Flags for IRQ numbers used for the ICU.

- enum L4_irq_mode {
  L4_IRQ_F_NONE = 0 , L4_IRQ_F_SET_MODE = 0x1 , L4_IRQ_F_LEVEL = 0x2 , L4_IRQ_F_EDGE = 0x0 ,
  L4_IRQ_F_POS = 0x0 , L4_IRQ_F_NEG = 0x4 , L4_IRQ_F_BOTH = 0x8 , L4_IRQ_F_LEVEL_HIGH = L4_IRQ_F_SET_MODE | L4_IRQ_F_LEVEL | L4_IRQ_F_POS ,
  L4_IRQ_F_LEVEL_LOW = L4_IRQ_F_SET_MODE | L4_IRQ_F_LEVEL | L4_IRQ_F_NEG , L4_IRQ_F_POS_EDGE = L4_IRQ_F_SET_MODE | L4_IRQ_F_EDGE | L4_IRQ_F_POS , L4_IRQ_F_NEG_EDGE = L4_IRQ_F_SET_MODE | L4_IRQ_F_EDGE | L4_IRQ_F_NEG , L4_IRQ_F_BOTH_EDGE = L4_IRQ_F_SET_MODE | L4_IRQ_F_EDGE | L4_IRQ_F_BOTH ,
  L4_IRQ_F_MASK = 0xf , L4_IRQ_F_SET_WAKEUP = 0x10 , L4_IRQ_F_CLEAR_WAKEUP = 0x20 }

  Interrupt attributes.

- enum L4_icu_opcode {
  L4_ICU_OP_BIND , L4_ICU_OP_UNBIND , L4_ICU_OP_INFO , L4_ICU_OP_MSI_INFO ,
  L4_ICU_OP_UNMASK , L4_ICU_OP_MASK , L4_ICU_OP_SET_MODE }

  Opcodes to the ICU interface.

Functions

- l4_msgtag_t l4_icu_bind (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq) L4_NOTHROW

  Bind an interrupt line of an interrupt controller to an interrupt object.

- l4_msgtag_t l4_icu_bind_u (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Bind an interrupt line of an interrupt controller to an interrupt object.

- l4_msgtag_t l4_icu_unbind (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq) L4_NOTHROW

  Remove binding of an interrupt line from the interrupt controller object.

- l4_msgtag_t l4_icu_unbind_u (l4_cap_idx_t icu, unsigned irqnum, l4_cap_idx_t irq, l4_utcb_t *utcb) L4_NOTHROW

  Remove binding of an interrupt line from the interrupt controller object.

- l4_msgtag_t l4_icu_set_mode (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t mode) L4_NOTHROW

  Set interrupt mode.

- l4_msgtag_t l4_icu_set_mode_u (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t mode, l4_utcb_t *utcb) L4_NOTHROW

  Set interrupt mode.

- l4_msgtag_t l4_icu_info (l4_cap_idx_t icu, l4_icu_info_t *info) L4_NOTHROW

  Get information about the ICU features.

- l4_msgtag_t l4_icu_info_u (l4_cap_idx_t icu, l4_icu_info_t *info, l4_utcb_t *utcb) L4_NOTHROW

  Get information about the ICU features.

- l4_msgtag_t l4_icu_msi_info (l4_cap_idx_t icu, unsigned irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info) L4_NOTHROW

  Get MSI info about IRQ.

- l4_msgtag_t l4_icu_msi_info_u (l4_cap_idx_t icu, unsigned irqnum, l4_uint64_t source, l4_icu_msi_info_t *msi_info, l4_utcb_t *utcb) L4_NOTHROW

  Get MSI info about IRQ.
- l4_msgtag_t l4_icu_unmask (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to) L4_NOTHROW

  Unmask an IRQ line.
- l4_msgtag_t l4_icu_unmask_u (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to, l4_utcb_t *utcb) L4_NOTHROW

  Unmask the given interrupt line.
- l4_msgtag_t l4_icu_mask (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to) L4_NOTHROW

  Mask an IRQ line.
- l4_msgtag_t l4_icu_mask_u (l4_cap_idx_t icu, unsigned irqnum, l4_umword_t *label, l4_timeout_t to, l4_utcb_t *utcb) L4_NOTHROW

  Mask an IRQ line.

  Error codes in the error TCR.

Functions

- l4_umword_t l4_ipc_error (l4_msgtag_t tag, l4_utcb_t *utcb) L4_NOTHROW

  Get the IPC error code for an IPC operation.
- l4_ret_t l4_error (l4_msgtag_t tag) L4_NOTHROW

  Get IPC error code if any or message tag label otherwise for an IPC call.
- int l4_ipc_is_snd_error (l4_utcb_t *utcb) L4_NOTHROW

  Returns whether an error occurred in send phase of an invocation.
- int l4_ipc_is_rcv_error (l4_utcb_t *utcb) L4_NOTHROW

Returns whether an error occurred in receive phase of an invocation.

- int l4_ipc_error_code (l4_utcb_t *utcb) L4_NOTHROW

  Get the error condition of the last invocation from the TCR.

- L4_CONSTEXPR l4_ret_t l4_ipc_to_errno (unsigned long ipc_error_code) L4_NOTHROW

  Get a negative error code for the given IPC error code.

- l4_msgtag_t l4_ipc_send (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW

  *Send a message to an object (do **not** wait for a reply).*

- l4_msgtag_t l4_ipc_wait_ext (l4_cap_idx_t reply_cap, l4_utcb_t *utcb, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Wait for an incoming message from any possible sender.

- l4_msgtag_t **l4_ipc_wait** (l4_utcb_t *utcb, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Same as l4_ipc_wait_ext() with `reply_cap` set to L4_INVALID_CAP to specify the implicit reply capability.

- l4_msgtag_t l4_ipc_receive (l4_cap_idx_t object, l4_utcb_t *utcb, l4_timeout_t timeout) L4_NOTHROW

  Wait for a message from a specific source.

- l4_msgtag_t l4_ipc_call (l4_cap_idx_t object, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW

  Object call (usual invocation).

- l4_msgtag_t l4_ipc_reply (l4_cap_idx_t reply_cap, l4_utcb_t *utcb, l4_msgtag_t tag, l4_timeout_t timeout) L4_NOTHROW

  Reply operation (uses a reply capability).

- l4_msgtag_t l4_ipc_reply_and_wait_ext (l4_cap_idx_t reply_cap, l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Reply and wait operation (uses the reply capability).

- l4_msgtag_t **l4_ipc_reply_and_wait** (l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Same as l4_ipc_reply_and_wait_ext() with `reply_cap` set to L4_INVALID_CAP to specify the implicit reply capability.

- l4_msgtag_t l4_ipc_send_and_wait (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_msgtag_t tag, l4_umword_t *label, l4_timeout_t timeout) L4_NOTHROW

  Send a message and do an open wait.

- l4_msgtag_t l4_ipc (l4_cap_idx_t dest, l4_utcb_t *utcb, l4_umword_t flags, l4_umword_t slabel, l4_msgtag_t tag, l4_umword_t *rlabel, l4_timeout_t timeout) L4_NOTHROW

  Generic L4 object invocation.

- l4_msgtag_t l4_ipc_sleep (l4_timeout_t timeout) L4_NOTHROW

  Sleep for an amount of time.

- l4_msgtag_t l4_ipc_sleep_ms (l4_uint32_t ms) L4_NOTHROW

  Sleep for a certain amount of milliseconds.

- l4_msgtag_t l4_ipc_sleep_us (l4_uint64_t us) L4_NOTHROW

  Sleep for a certain amount of microseconds.

- int l4_sndfpage_add (l4_fpage_t const snd_fpage, unsigned long snd_base, l4_msgtag_t *tag) L4_NOTHROW

  Add a flexpage to be sent to the UTCB.

16.515.1 Detailed Description

Common IPC interface.

```
L4_CONSTEXPR l4_ret_t l4_ipc_to_errno (
            unsigned long ipc_error_code)  [inline]
```

Get a negative error code for the given IPC error code.

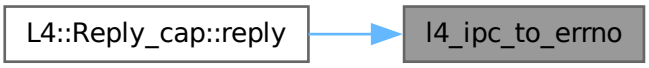
Parameters

ipc_error_code	IPC error code as delivered by the kernel. (or returned by the l4_ipc_error_code() function).

Returns

negative error code in the range of L4_EIPC_LO to L4_EIPC_HI.

Definition at line 621 of file ipc.h.
References L4_EIPC_LO, and L4_NOTHROW.
Referenced by L4::Reply_cap::reply().
Here is the caller graph for this function:



16.516 ipc.h

16.522.1 Detailed Description

The C IPC gate interface, see L4::Ipc_gate for the C++ interface.
IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the Factory interface.
Depending on the permissions of the capability used, an IPC gate forwards IPC to the Thread the IPC gate is *bound* to (cf. l4_rcv_ep_bind_thread() and l4_rcv_ep_bind_snd_destination()). If the capability has the L4_FPAGE_C_IPCGATE_SVR permission, only IPC using a protocol different from the L4_PROTO_KOBJECT protocol is forwarded. Without the L4_FPAGE_C_IPCGATE_SVR permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.
Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the Thread interface of that thread is not accessible via an IPC gate. The IPC-Gate API of an IPC gate is only accessible if the capability used has the L4_FPAGE_C_IPCGATE_SVR permission (cf. previous paragraph). Conversely that means, if the capability used lacks the L4_FPAGE_C_IPCGATE_SVR permission, IPC-Gate API calls are forwarded to the thread or thread group the IPC gate is bound to instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without L4_FPAGE_C_IPCGATE_SVR permission so the client cannot tamper with the IPC gate.
When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. l4_rcv_ep_bind_thread() and l4_rcv_ep_bind_snd_destination()). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the L4_CAP_FPAGE_S and L4_CAP_FPAGE_W permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to upon receive (or to the selected thread from the thread group the IPC gate is bound to). However, the configured label of an IPC gate can also be queried via l4_ipc_gate_get_infos() if the capability used has the L4_FPAGE_C_IPCGATE_SVR permission.
When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, l4_thread_modify_sender_start() shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.

When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

Include File

```
#include <l4/sys/ipc_gate.h>
```

For the C++ interface refer to the L4::Ipc_gate documentation.

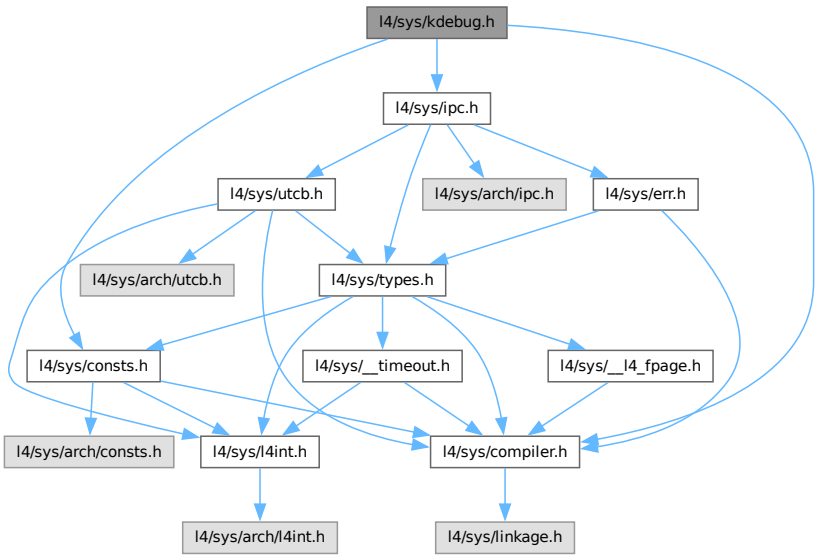
16.526 l4/sys/kdebug.h File Reference

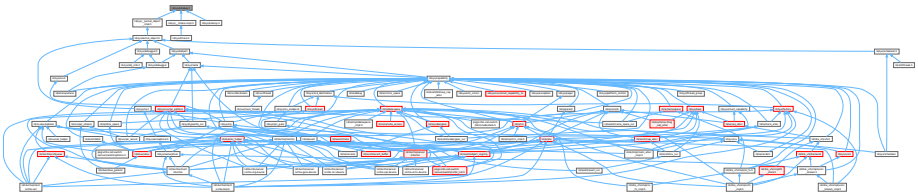
Functionality for invoking the kernel debugger.

```
#include <l4/sys/compiler.h>
#include <l4/sys/consts.h>
#include <l4/sys/ipc.h>
```

Include dependency graph for kdebug.h:



This graph shows which files directly or indirectly include this file:



Enumerations

- enum l4_kdebug_group_t

  Opcode groups for operations that can be invoked on the base debugger capability.
- enum l4_kdebug_ops_t

  Op-codes for operations that can be invoked on the base debugger capability.

Functions

- void l4_kd_enter (char const ∗text) L4_NOTHROW

  Enter the kernel debugger.
- l4_msgtag_t __l4_kdebug_op (unsigned op) L4_NOTHROW

  Invoke a nullary operation on the base debugger capability.
- l4_msgtag_t __l4_kdebug_text (unsigned op, char const ∗text, unsigned len) L4_NOTHROW

  Invoke a text output operation on the base debugger capability.
- l4_msgtag_t __l4_kdebug_3_text (unsigned op, char const ∗text, unsigned len, l4_umword_t v1, l4_umword_t v2, l4_umword_t v3) L4_NOTHROW

  Invoke a text output operation with 3 additional machine word arguments on the base debugger capability.
- l4_msgtag_t __l4_kdebug_op_1 (unsigned op, l4_mword_t val) L4_NOTHROW

  Invoke an unary operation on the base debugger capability.
- void l4_kd_outnstring (char const ∗text, unsigned len)

Output a fixed-length string via the kernel debugger.

- void l4_kd_outstring (char const *text)

  Output a string via the kernel debugger.
- void l4_kd_outchar (char c)

  Output a single character via the kernel debugger.
- void l4_kd_outumword (l4_umword_t number)

  Output a hexadecimal unsigned machine word via the kernel debugger.
- void l4_kd_outhex64 (l4_uint64_t number)

  Output a 64-bit unsigned hexadecimal number via the kernel debugger.
- void l4_kd_outhex32 (l4_uint32_t number)

  Output a 32-bit unsigned hexadecimal number via the kernel debugger.
- void l4_kd_outhex20 (l4_uint32_t number)

  Output a 20-bit unsigned hexadecimal number via the kernel debugger.
- void l4_kd_outhex16 (l4_uint16_t number)

  Output a 16-bit unsigned hexadecimal number via the kernel debugger.
- void l4_kd_outhex12 (l4_uint16_t number)

  Output a 12-bit unsigned hexadecimal number via the kernel debugger.
- void l4_kd_outhex8 (l4_uint8_t number)

  Output an 8-bit unsigned hexadecimal number via the kernel debugger.
- void l4_kd_outdec (l4_mword_t number)

  Output a decimal unsigned machine word via the kernel debugger.

16.526.1 Detailed Description

Functionality for invoking the kernel debugger.
Definition in file kdebug.h.

16.526.2 Enumeration Type Documentation

16.526.2.1 l4_kdebug_ops_t

```
enum l4_kdebug_ops_t
```

Op-codes for operations that can be invoked on the base debugger capability.
See also __ktrace-impl.h for additional op-codes.
Definition at line 44 of file kdebug.h.

16.526.3 Function Documentation

16.526.3.1 __l4_kdebug_3_text()

```
l4_msgtag_t __l4_kdebug_3_text (
             unsigned op,
             char const * text,
             unsigned len,
             l4_umword_t v1,
             l4_umword_t v2,
             l4_umword_t v3)  [inline]
```

Invoke a text output operation with 3 additional machine word arguments on the base debugger capability.

Parameters

op	Text output operation code from l4_kdebug_ops_t or a value above 0x200 used by the kernel trace buffer implementation (__ktrace-impl.h).
text	Output string.

len	Length of the output string. The maximum length is limited to L4_UTCB_GENERIC_DATA_SIZE - 5 machine words. Output strings longer than this limit will be cropped.
v1	First machine word argument.
v2	Second machine word argument.
v3	Third machine word argument.

Return values

Message	tag returned from the IPC on the base debugger capability.

Definition at line 139 of file kdebug.h.
References L4_BASE_DEBUGGER_CAP, l4_bytes_to_mwords(), l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_NOTHROW, L4_PROTO_DEBUGGER, l4_utcb(), and l4_msg_regs_t::mr.

16.526.3.2 __l4_kdebug_op()

```
l4_msgtag_t __l4_kdebug_op (
             unsigned op)  [inline]
```

Invoke a nullary operation on the base debugger capability.

Parameters

op	Nullary operation code from l4_kdebug_ops_t or a value above 0x200 used by the kernel trace buffer implementation (__ktrace-impl.h).

Return values

Message	tag returned from the IPC on the base debugger capability.

Definition at line 68 of file kdebug.h.
References L4_BASE_DEBUGGER_CAP, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_NOTHROW, L4_PROTO_DEBUGGER, l4_utcb(), and l4_msg_regs_t::mr.

16.526.3.3 __l4_kdebug_op_1()

```
l4_msgtag_t __l4_kdebug_op_1 (
             unsigned op,
             l4_mword_t val)  [inline]
```

Invoke an unary operation on the base debugger capability.

Parameters

op	Unary operation code from l4_kdebug_ops_t or a value above 0x200 used by the kernel trace buffer implementation (__ktrace-impl.h).
val	Machine word argument to the unary operation.

Return values

Message	tag returned from the IPC on the base debugger capability.

Definition at line 176 of file kdebug.h.
References L4_BASE_DEBUGGER_CAP, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_NOTHROW, L4_PROTO_DEBUGGER, l4_utcb(), and l4_msg_regs_t::mr.

16.526.3.4 __l4_kdebug_text()

```
l4_msgtag_t __l4_kdebug_text (
             unsigned op,
             char const * text,
             unsigned len)  [inline]
```

Invoke a text output operation on the base debugger capability.

Parameters

op	Text output operation code from l4_kdebug_ops_t or a value above 0x200 used by the kernel trace buffer implementation (__ktrace-impl.h).
text	Output string.
len	Length of the output string. The maximum length is limited to L4_UTCB_GENERIC_DATA_SIZE - 2 machine words. Output strings longer than this limit will be cropped.

Return values

Message	tag returned from the IPC on the base debugger capability.

Definition at line 98 of file kdebug.h.

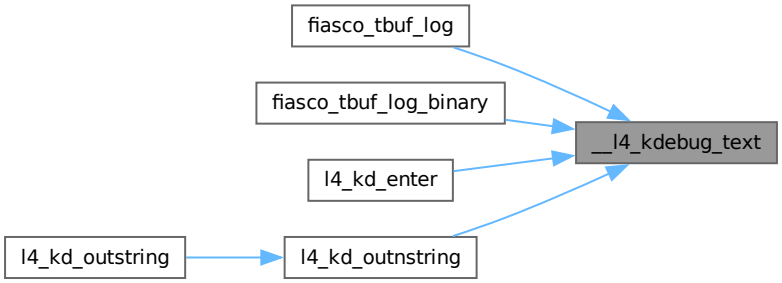
Here is the caller graph for this function:



16.526.3.5 l4_kd_enter()

```
void l4_kd_enter (
            char const * text)  [inline]
```

Enter the kernel debugger.

Parameters

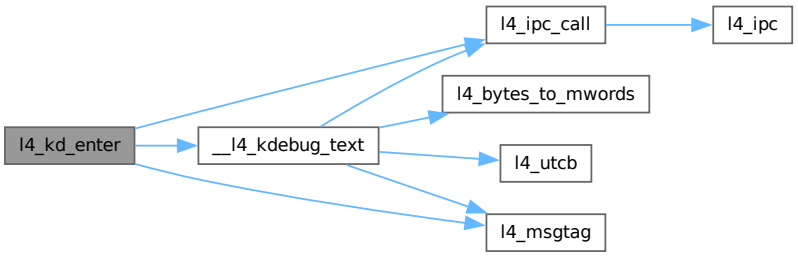
text	Optional message displayed by the kernel debugger when entered.

Enter the kernel debugger, if configured. An optional message can be passed to the kernel debugger which is printed upon the entering of the debugger.

Examples

examples/sys/singlestep/main.c.

Definition at line 204 of file kdebug.h.
References __l4_kdebug_text(), L4_BASE_DEBUGGER_CAP, L4_INLINE, l4_ipc_call(), L4_IPC_NEVER, l4_msgtag(), L4_NOTHROW, and L4_PROTO_DEBUGGER.
Here is the call graph for this function:



16.526.3.6 l4_kd_outchar()

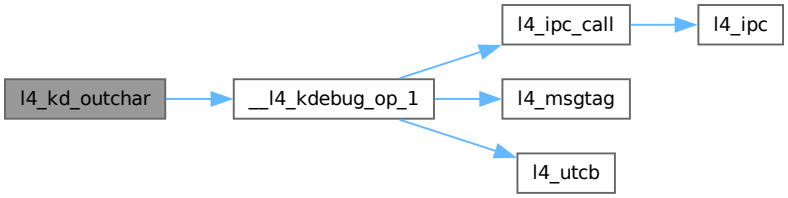
```
void l4_kd_outchar (
            char c)  [inline]
```

Output a single character via the kernel debugger.

Parameters

c	Output character.

Definition at line 245 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.7 l4_kd_outdec()

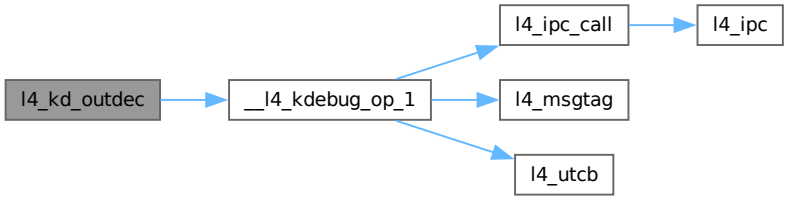
```
void l4_kd_outdec (
            l4_mword_t number)  [inline]
```

Output a decimal unsigned machine word via the kernel debugger.

Parameters

number	Output machine word.

Definition at line 334 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.8 l4_kd_outhex12()

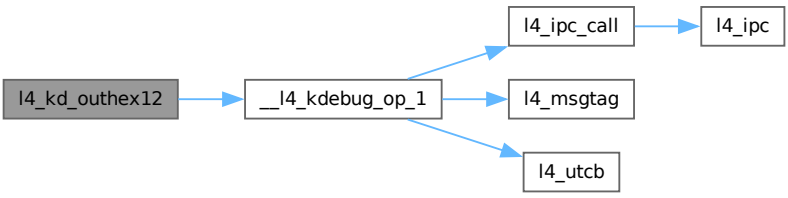
```
void l4_kd_outhex12 (
            l4_uint16_t number)  [inline]
```

Output a 12-bit unsigned hexadecimal number via the kernel debugger.

Parameters

number	Output 12-bit number. Only the 12 LSB bits are used.

Definition at line 314 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.9 l4_kd_outhex16()

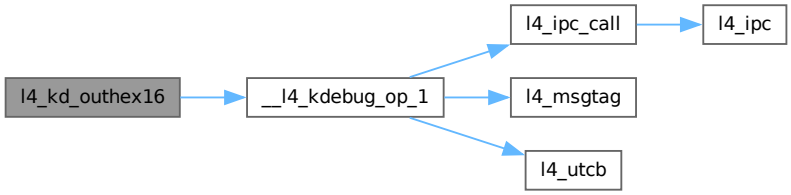
```
void l4_kd_outhex16 (
            l4_uint16_t number)  [inline]
```

Output a 16-bit unsigned hexadecimal number via the kernel debugger.

Parameters

number	Output 16-bit number.

Definition at line 304 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.10 l4_kd_outhex20()

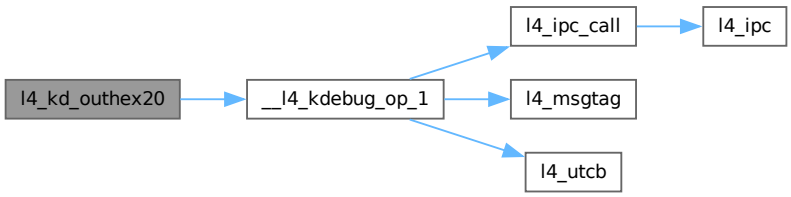
```
void l4_kd_outhex20 (
            l4_uint32_t number)  [inline]
```

Output a 20-bit unsigned hexadecimal number via the kernel debugger.

Parameters

number	Output 20-bit number. Only the 20 LSB bits are used.

Definition at line 294 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.11 l4_kd_outhex32()

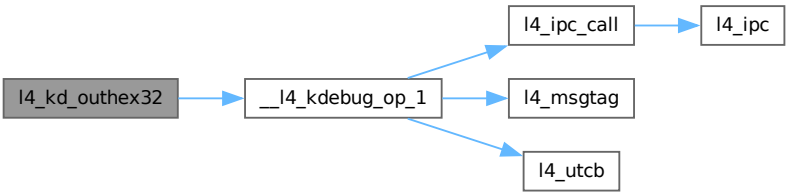
```
void l4_kd_outhex32 (
            l4_uint32_t number)  [inline]
```

Output a 32-bit unsigned hexadecimal number via the kernel debugger.

Parameters

number	Output 32-bit number.

Definition at line 284 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.12 l4_kd_outhex64()

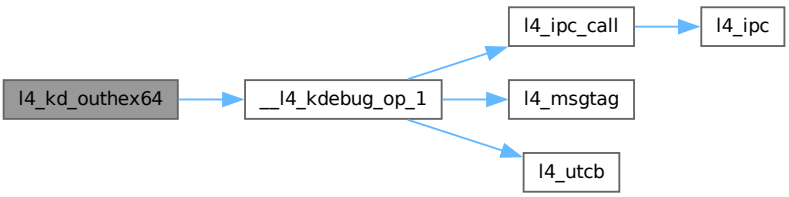
```
void l4_kd_outhex64 (
            l4_uint64_t number)  [inline]
```

Output a 64-bit unsigned hexadecimal number via the kernel debugger.

Parameters

number	Output 64-bit number.

The two 32-bit halves are printed non-atomically.
Definition at line 273 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.13 l4_kd_outhex8()

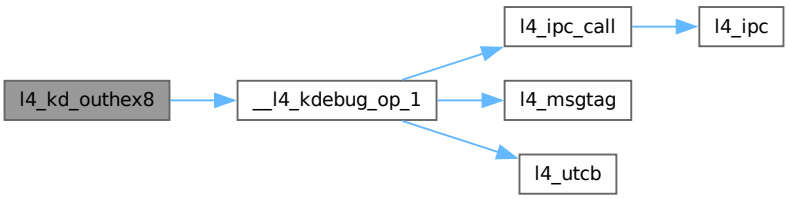
```
void l4_kd_outhex8 (
            l4_uint8_t number)  [inline]
```

Output an 8-bit unsigned hexadecimal number via the kernel debugger.

Parameters

number	Output 8-bit number.

Definition at line 324 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.
Here is the call graph for this function:



16.526.3.14 l4_kd_outnstring()

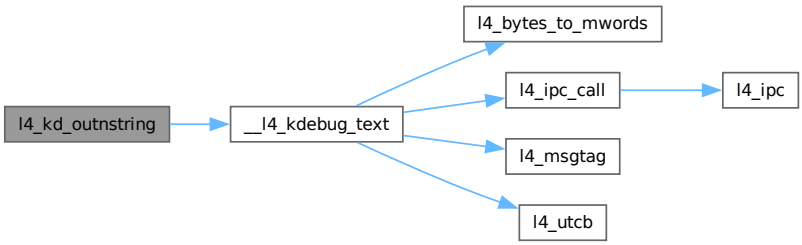
```
void l4_kd_outnstring (
            char const * text,
            unsigned len)  [inline]
```

Output a fixed-length string via the kernel debugger.

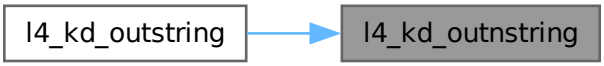
Parameters

text	Beginning of the output string.
len	Length of the output string. The maximum length is limited to L4_UTCB_GENERIC_DATA_SIZE - 2 machine words. Output strings longer than this limit will be cropped.

Definition at line 226 of file kdebug.h.
References __l4_kdebug_text(), and L4_INLINE.
Referenced by l4_kd_outstring().
Here is the call graph for this function:



Here is the caller graph for this function:



16.526.3.15 l4_kd_outstring()

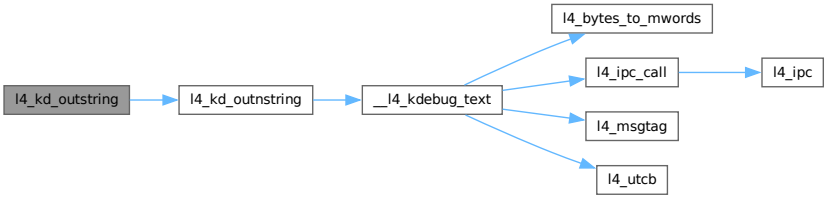
```
void l4_kd_outstring (
            char const * text)  [inline]
```

Output a string via the kernel debugger.

Parameters

text	Beginning of the output string. The maximum length of the output string is limited to L4_UTCB_GENERIC_DATA_SIZE - 2 machine words. Output strings longer than this limit will be cropped.

Definition at line 237 of file kdebug.h.
References L4_INLINE, and l4_kd_outnstring().
Here is the call graph for this function:



16.526.3.16 l4_kd_outumword()

```
void l4_kd_outumword (
            l4_umword_t number)  [inline]
```

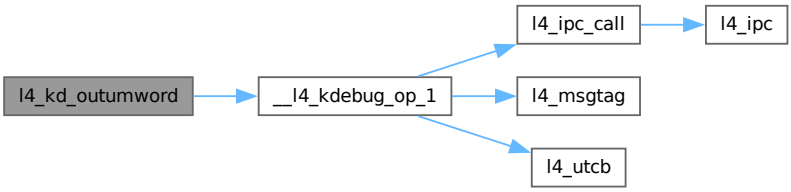
Output a hexadecimal unsigned machine word via the kernel debugger.

Parameters

number	Output machine word.

If the machine word is 64 bits long, it is printed non-atomically as two 32-bit numbers.
Definition at line 258 of file kdebug.h.
References __l4_kdebug_op_1(), and L4_INLINE.

Here is the call graph for this function:



16.527 kdebug.h

- l4_umword_t fiasco_tbuf_log (const char *text)

  Create new trace-buffer entry with describing <text>.
- l4_umword_t fiasco_tbuf_log_3val (const char *text, l4_umword_t v1, l4_umword_t v2, l4_umword_t v3)

  Create new trace-buffer entry with describing <text> and three additional values.
- l4_umword_t fiasco_tbuf_log_binary (const unsigned char *data)

  Create new trace-buffer entry with binary data.
- void **fiasco_tbuf_clear** (void)

  Clear trace-buffer.
- void **fiasco_tbuf_dump** (void)

  Dump trace-buffer to kernel console.
- l4_msgtag_t fiasco_tbuf_map_status (l4_fpage_t *ku_mem)

  Map kernel trace-buffer status page.
- l4_msgtag_t fiasco_tbuf_map_slots (l4_fpage_t *ku_mem)

  Map kernel trace-buffer slots.

16.535.1 Detailed Description

L4 kernel event tracing.

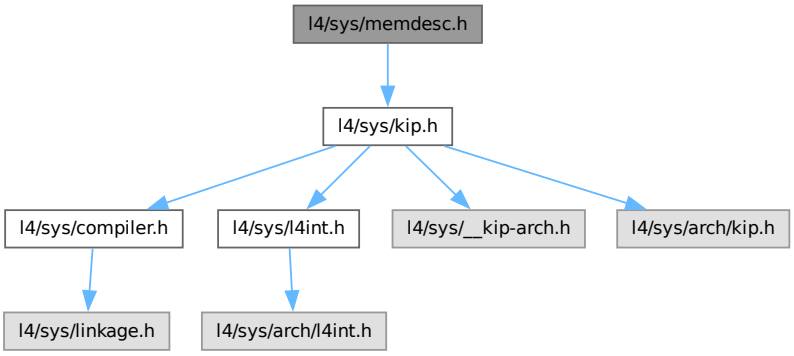
16.549 l4/sys/memdesc.h File Reference

Memory description functions.

```
#include <l4/sys/kip.h>
```

Include dependency graph for memdesc.h:



Data Structures

- struct l4_kernel_info_mem_desc_t

  Memory descriptor data structure.

Typedefs

- typedef struct l4_kernel_info_mem_desc_t l4_kernel_info_mem_desc_t

  Memory descriptor data structure.

Enumerations

- enum l4_mem_type_t {
  l4_mem_type_undefined = 0x0 , l4_mem_type_conventional = 0x1 , l4_mem_type_reserved = 0x2 ,
  l4_mem_type_dedicated = 0x3 ,
  l4_mem_type_shared = 0x4 , l4_mem_type_kmem = 0x5 , l4_mem_type_info = 0xd , l4_mem_type_bootloader = 0xe ,
  l4_mem_type_archspecific = 0xf }

  Type of a memory descriptor.
- enum l4_mem_info_sub_type_t { l4_mem_info_acpi_rsdp = 0 , l4_mem_reserved_kernel = 0 , l4_mem_reserved_heap = 1 , l4_mem_reserved_mmio = 2 }

  Memory sub types for l4_mem_type_info descriptors.
- enum l4_mem_archspecific_sub_type_common_t { l4_mem_archspecific_acpi_tables = 3 , l4_mem_archspecific_acpi_nvs = 4 , l4_mem_archspecific_cpu_fw = 5 }

  Memory sub types for l4_mem_type_archspecific descriptors.

Functions

- l4_kernel_info_mem_desc_t * **l4_kernel_info_get_mem_descs** (l4_kernel_info_t *kip) L4_NOTHROW

  Get pointer to memory descriptors from KIP.
- unsigned l4_kernel_info_get_num_mem_descs (l4_kernel_info_t *kip) L4_NOTHROW

  Get number of memory descriptors in KIP.
- void l4_kernel_info_set_mem_desc (l4_kernel_info_mem_desc_t *md, l4_addr_t start, l4_addr_t end, unsigned type, unsigned virt, unsigned sub_type) L4_NOTHROW

  Populate a memory descriptor.
- l4_umword_t l4_kernel_info_get_mem_desc_start (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

Get start address of the region described by the memory descriptor.

- l4_umword_t l4_kernel_info_get_mem_desc_end (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get end address of the region described by the memory descriptor.

- l4_umword_t l4_kernel_info_get_mem_desc_type (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get type of the memory region.

- l4_umword_t l4_kernel_info_get_mem_desc_subtype (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get sub-type of memory region.

- l4_umword_t l4_kernel_info_get_mem_desc_is_virtual (l4_kernel_info_mem_desc_t *md) L4_NOTHROW

  Get virtual flag of the memory descriptor.

  Retrieve information from the kernel about all objects in the mapping database and write data to the passed KU memory.

16.554.1 Detailed Description

Debugger related functions.

Attention

This API is subject to change!

Definition in file obj_info.h.

16.554.2 Function Documentation

16.554.2.1 l4_debugger_query_obj_infos()

```
l4_msgtag_t l4_debugger_query_obj_infos (
             l4_cap_idx_t cap,
             l4_addr_t ku_mem_addr,
             l4_size_t ku_mem_size,
             l4_umword_t skip,
             l4_umword_t * result_cnt,
             l4_umword_t * result_all)  [inline]
```

Retrieve information from the kernel about all objects in the mapping database and write data to the passed KU memory.

Parameters

	cap	Capability of the debugger object.
	ku_mem_addr	Address of the KU memory for writing the information.
	ku_mem_size	Size of the KU memory for writing the information.
	skip	Number of objects to skip.
out	*result_cnt*	Number of objects in the mapping database.
out	*result_all*	Number of objects written to the KU memory.

Note

The kernel will only write a number of object information which fits to the passed KU memory. To retrieve missing object information, repeat the call and adapt the `skip` parameter accordingly.

If this system call is performed several times, the number of kernel objects might have changed in the meantime.

Definition at line 177 of file obj_info.h.

```

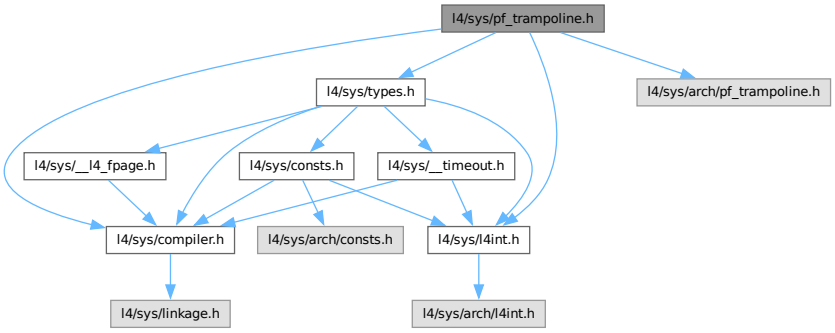
16.564 l4/sys/pf_trampoline.h File Reference

Page fault trampoline handlers.

```
#include <l4/sys/types.h>
#include <l4/sys/compiler.h>
#include <l4/sys/l4int.h>
#include <l4/sys/arch/pf_trampoline.h>
```

Include dependency graph for pf_trampoline.h:



Data Structures

- struct l4_pf_trampoline_t

  State for page fault trampoline handler.

Typedefs

- typedef struct l4_pf_trampoline_regs_t **l4_pf_trampoline_regs_t**

  Opaque type for the page fault trampoline register state.
- typedef struct l4_pf_trampoline_t l4_pf_trampoline_t

  Opaque type for the page fault trampoline state.

Enumerations

- enum L4_pf_trampoline_flags { Page_fault_in_progress = 1 << 0 , Trigger_exception_after_resume = 1 << 1 }

  Definitions for l4_pf_trampoline_t::flags.

16.564.1 Detailed Description

Page fault trampoline handlers.
Definition in file pf_trampoline.h.

  Scheduler parameter set.

Enumerations

- enum L4_scheduler_classes { L4_SCHEDULER_CLASS_FIXED_PRIO = 1UL << 1 , L4_SCHEDULER_CLASS_WFQ = 1UL << 2 }

  Supported scheduler classes.
- enum L4_scheduler_ops { L4_SCHEDULER_INFO_OP = 0UL , L4_SCHEDULER_RUN_THREAD_OP = 1UL , L4_SCHEDULER_IDLE_TIME_OP = 2UL }

  Operations on the Scheduler object.

Functions

- l4_sched_cpu_set_t l4_sched_cpu_set (l4_umword_t offset, unsigned char granularity, l4_umword_t map=1) L4_NOTHROW
- l4_msgtag_t l4_scheduler_info (l4_cap_idx_t scheduler, l4_umword_t *cpu_max, l4_sched_cpu_set_t *cpus) L4_NOTHROW))

  Get scheduler information.
- l4_msgtag_t l4_scheduler_info_with_classes (l4_cap_idx_t scheduler, l4_umword_t *cpu_max, l4_sched_cpu_set_t *cpus, l4_umword_t *sched_classes) L4_NOTHROW))

  Get scheduler information.
- l4_sched_param_t l4_sched_param (unsigned prio, l4_umword_t quantum=0) L4_NOTHROW

  Construct scheduler parameter.
- l4_msgtag_t l4_scheduler_run_thread (l4_cap_idx_t scheduler, l4_cap_idx_t thread, l4_sched_param_t const *sp) L4_NOTHROW)

  Run a thread on a Scheduler.
- l4_msgtag_t l4_scheduler_idle_time (l4_cap_idx_t scheduler, l4_sched_cpu_set_t const *cpus, l4_kernel_clock_t *us) L4_NOTHROW)

  Query the idle time (in µs) of a CPU.
- int l4_scheduler_is_online (l4_cap_idx_t scheduler, l4_umword_t cpu) L4_NOTHROW

  Query if a CPU is online.

16.587.1 Detailed Description

Scheduler object functions.

Functions

- template<typename T, typename F, typename SMART>
  Smart_cap< T, SMART > L4::cap_cast (Smart_cap< F, SMART > const &c) noexcept

  `static_cast` for (smart) capabilities.
- template<typename T, typename F, typename SMART>
  Smart_cap< T, SMART > L4::cap_reinterpret_cast (Smart_cap< F, SMART > const &c) noexcept

  `reinterpret_cast` for (smart) capabilities.

16.593.1 Detailed Description

L4::Capability class.

Author

Alexander Warg alexander.warg@os.inf.tu-dresden.de

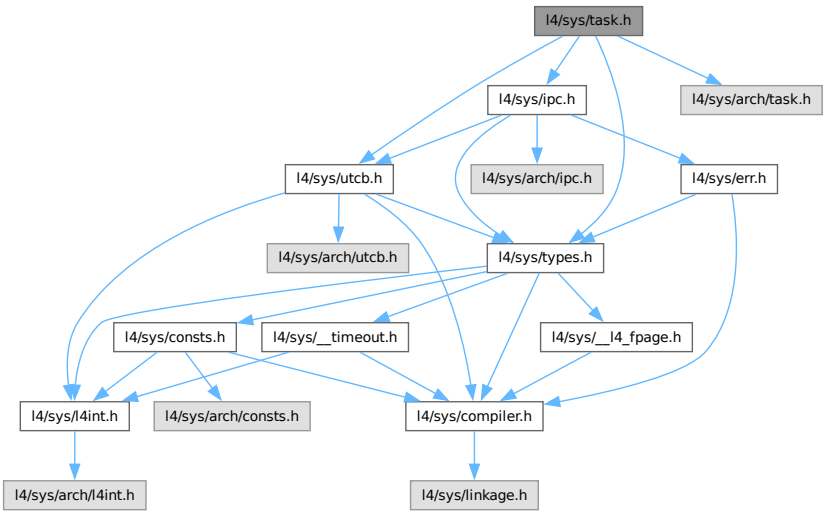
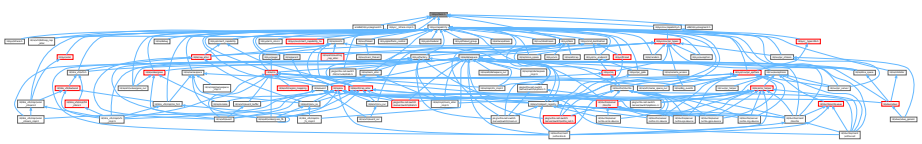
#include <l4/sys/ipc.h>
#include <l4/sys/arch/task.h>
```

Include dependency graph for task.h:



This graph shows which files directly or indirectly include this file:



Enumerations

- enum L4_task_ops {
  L4_TASK_MAP_OP = 0UL , L4_TASK_UNMAP_OP = 1UL , L4_TASK_CAP_INFO_OP = 2UL ,
  L4_TASK_ADD_KU_MEM_OP = 3UL ,
  L4_TASK_LDT_SET_X86_OP = 0x11UL , L4_TASK_MAP_VGICC_ARM_OP = 0x12UL }

  Operations on task objects.

Functions

- l4_msgtag_t l4_task_map (l4_cap_idx_t dst_task, l4_cap_idx_t src_task, l4_fpage_t snd_fpage, l4_umword_t snd_base) L4_NOTHROW

  Map resources available in the source task to a destination task.
- l4_msgtag_t l4_task_unmap (l4_cap_idx_t task, l4_fpage_t fpage, l4_umword_t map_mask) L4_NOTHROW

  Revoke rights from the task.
- l4_msgtag_t l4_task_unmap_batch (l4_cap_idx_t task, l4_fpage_t const *fpages, unsigned num_fpages, l4_umword_t map_mask) L4_NOTHROW

  Revoke rights from a task.
- l4_msgtag_t l4_task_delete_obj (l4_cap_idx_t task, l4_cap_idx_t obj) L4_NOTHROW

  Release capability and delete object.
- l4_msgtag_t l4_task_release_cap (l4_cap_idx_t task, l4_cap_idx_t cap) L4_NOTHROW

  Release object capability.
- l4_msgtag_t l4_task_cap_valid (l4_cap_idx_t task, l4_cap_idx_t cap) L4_NOTHROW

  Check whether a capability is present (refers to an object).
- l4_msgtag_t l4_task_cap_equal (l4_cap_idx_t task, l4_cap_idx_t cap_a, l4_cap_idx_t cap_b) L4_NOTHROW

  Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).
- l4_msgtag_t l4_task_add_ku_mem (l4_cap_idx_t task, l4_fpage_t *ku_mem) L4_NOTHROW

  Add kernel-user memory.

```

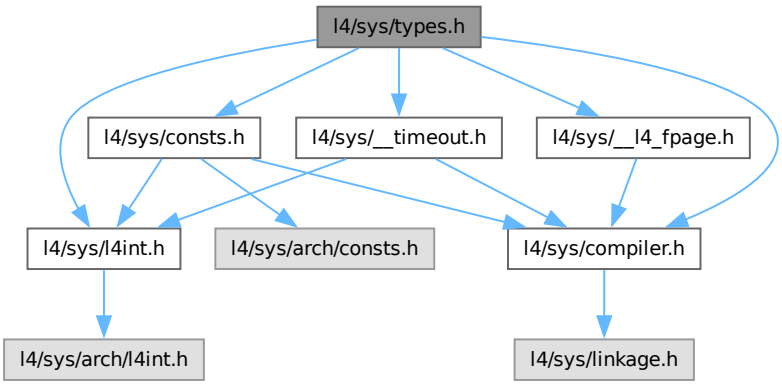
Include dependency graph for types.h:



Data Structures

- struct l4_msgtag_t

  Message tag data structure.

Typedefs

- typedef l4_int16_t l4_ret_t

  Return value of an IPC call as well as an RPC call.
- typedef l4_int16_t l4_proto_t

  Prototype value for RPC calls.
- typedef unsigned long l4_cap_idx_t

  Capability selector type.

Enumerations

- enum L4_msgtag_protocol {
  L4_PROTO_NONE = 0 , L4_PROTO_ALLOW_SYSCALL = 1 , L4_PROTO_PF_EXCEPTION = 1 ,
  L4_PROTO_PLATFORM_CTL = 0L ,

  L4_PROTO_VCPU_CONTEXT = -25L , L4_PROTO_PI_MUTEX = -26L }

  Message tag for IPC operations.
- enum L4_msgtag_flags { L4_MSGTAG_ERROR , L4_MSGTAG_TRANSFER_FPU , L4_MSGTAG_SCHEDULE , **L4_MSGTAG_PROPAGATE** = 0x4000 , L4_MSGTAG_FLAGS }

  Flags for message tags.

Functions

- long l4_msgtag_label (l4_msgtag_t t) L4_NOTHROW

  Get the protocol of tag.
- unsigned l4_msgtag_words (l4_msgtag_t t) L4_NOTHROW

  Get the number of untyped words.
- unsigned l4_msgtag_items (l4_msgtag_t t) L4_NOTHROW

  Get the number of typed items.
- unsigned l4_msgtag_flags (l4_msgtag_t t) L4_NOTHROW

  Get the flags.
- unsigned l4_msgtag_has_error (l4_msgtag_t t) L4_NOTHROW

  Test for error indicator flag.
- unsigned l4_msgtag_is_page_fault (l4_msgtag_t t) L4_NOTHROW

  Test for page-fault protocol.
- unsigned l4_msgtag_is_exception (l4_msgtag_t t) L4_NOTHROW

  Test for exception protocol.
- unsigned l4_msgtag_is_sigma0 (l4_msgtag_t t) L4_NOTHROW

  Test for sigma0 protocol.
- unsigned l4_msgtag_is_io_page_fault (l4_msgtag_t t) L4_NOTHROW

  Test for IO-page-fault protocol.
- l4_msgtag_t l4_msgtag (long label, unsigned words, unsigned items, unsigned flags) L4_NOTHROW

  Create a message tag from the specified values.
- unsigned l4_is_invalid_cap (l4_cap_idx_t c) L4_NOTHROW

  Test if a capability selector is invalid (i.e., L4_INVALID_CAP_BIT is set).
- unsigned l4_is_valid_cap (l4_cap_idx_t c) L4_NOTHROW

  Test if a capability selector is valid (i.e., L4_INVALID_CAP_BIT is not set).
- unsigned l4_capability_equal (l4_cap_idx_t c1, l4_cap_idx_t c2) L4_NOTHROW

  Test if the capability indices of two capability selectors are equal.
- l4_cap_idx_t l4_capability_next (l4_cap_idx_t c) L4_NOTHROW

  Get the next capability index after `c`.

16.619.1 Detailed Description

Common L4 ABI Data Types.
Definition in file types.h.

16.619.2 Typedef Documentation

16.619.2.1 l4_proto_t

```
typedef l4_int16_t l4_proto_t
```

Prototype value for RPC calls.
This type must not be larger than the label part of l4_msgtag_t.
Definition at line 36 of file types.h.

16.619.2.2 l4_ret_t

```
typedef l4_int16_t l4_ret_t
```

Return value of an IPC call as well as an RPC call.
This type must not be larger than the label part of l4_msgtag_t.
Definition at line 29 of file types.h.

16.619.3 Function Documentation

16.619.3.1 l4_capability_next()

```
l4_cap_idx_t l4_capability_next (
             l4_cap_idx_t c)  [inline]
```

Get the next capability index after `c`.

Parameters

c	The capability index for which the next one shall be computed.

Returns

The next capability index after `c`.

Definition at line 496 of file types.h.
References L4_CAP_OFFSET, L4_INLINE, and L4_NOTHROW.

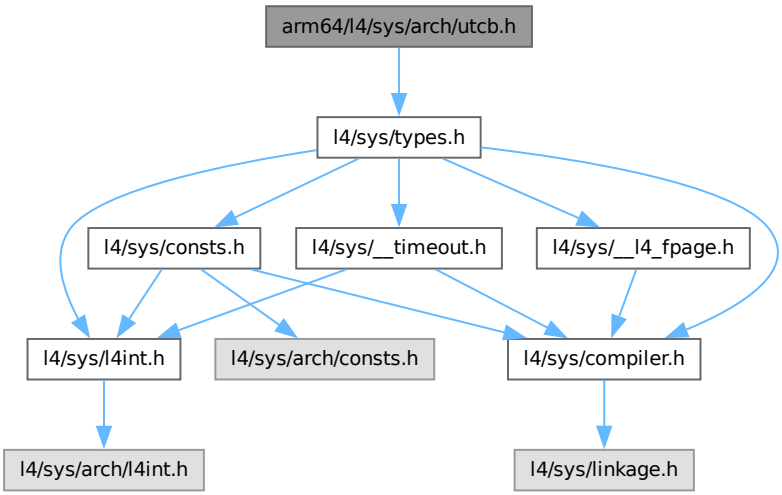
16.625 arm64/l4/sys/arch/utcb.h File Reference

UTCB definitions for ARM64.
`#include <l4/sys/types.h>`
Include dependency graph for utcb.h:



Data Structures

- struct l4_exc_regs_t

  UTCB structure for exceptions.

Functions

- l4_umword_t l4_utcb_exc_pc (l4_exc_regs_t const ∗u) L4_NOTHROW

  Access function to get the program counter of the exception state.
- void l4_utcb_exc_pc_set (l4_exc_regs_t ∗u, l4_addr_t pc) L4_NOTHROW

  Set the program counter register in the exception state.
- l4_umword_t **l4_utcb_exc_typeval** (l4_exc_regs_t const ∗u) L4_NOTHROW

  Get the value out of an exception UTCB that describes the type of exception.
- int l4_utcb_exc_is_pf (l4_exc_regs_t const ∗u) L4_NOTHROW

  Check whether an exception IPC is a page fault.

- l4_addr_t **l4_utcb_exc_pfa** (l4_exc_regs_t const *u) L4_NOTHROW

  Function to get the L4 style page fault address out of an exception.
- int l4_utcb_exc_is_ex_regs_exception (l4_exc_regs_t const *u) L4_NOTHROW

  Check whether an exception IPC was triggered via l4_thread_ex_regs().

16.625.1 Detailed Description

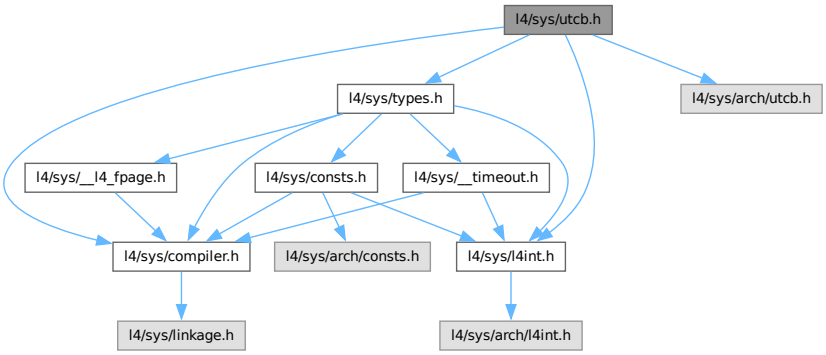
16.627 l4/sys/utcb.h File Reference

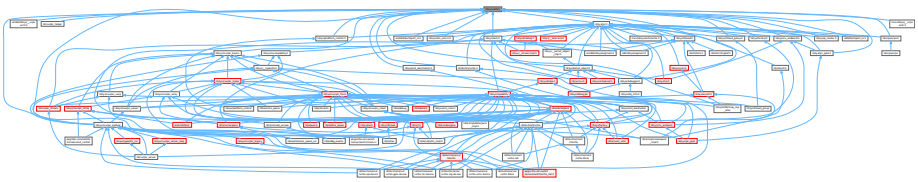
UTCB definitions.

```
#include <l4/sys/types.h>
#include <l4/sys/compiler.h>
#include <l4/sys/l4int.h>
#include <l4/sys/arch/utcb.h>
```

Include dependency graph for utcb.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- union l4_msg_regs_t

  Encapsulation of the message-register block in the UTCB.
- struct l4_buf_regs_t

  Encapsulation of the buffer-registers block in the UTCB.
- struct l4_thread_regs_t

  Encapsulation of the thread-control-register block of the UTCB.

Typedefs

- typedef struct l4_utcb_t l4_utcb_t

  Opaque type for the UTCB.
- typedef union l4_msg_regs_t **l4_msg_regs_t**

  Encapsulation of the message-register block in the UTCB.
- typedef struct l4_buf_regs_t **l4_buf_regs_t**

  Encapsulation of the buffer-registers block in the UTCB.
- typedef struct l4_thread_regs_t **l4_thread_regs_t**

  Encapsulation of the thread-control-register block of the UTCB.

Functions

- l4_umword_t l4_utcb_exc_pc (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE

  Access function to get the program counter of the exception state.
- void l4_utcb_exc_pc_set (l4_exc_regs_t *u, l4_addr_t pc) L4_NOTHROW

  Set the program counter register in the exception state.
- unsigned long **l4_utcb_exc_typeval** (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE

  Get the value out of an exception UTCB that describes the type of exception.
- int l4_utcb_exc_is_pf (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE

  Check whether an exception IPC is a page fault.
- l4_addr_t **l4_utcb_exc_pfa** (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE

  Function to get the L4 style page fault address out of an exception.
- int l4_utcb_exc_is_ex_regs_exception (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE

  Check whether an exception IPC was triggered via l4_thread_ex_regs().
- l4_utcb_t * **l4_utcb** (void) L4_NOTHROW L4_PURE

  Get the UTCB address.
- l4_msg_regs_t * l4_utcb_mr (void) L4_NOTHROW L4_PURE

  Get the message-register block of a UTCB.
- l4_buf_regs_t * l4_utcb_br (void) L4_NOTHROW L4_PURE

  Get the buffer-register block of a UTCB.
- l4_thread_regs_t * l4_utcb_tcr (void) L4_NOTHROW L4_PURE

  Get the thread-control-register block of a UTCB.
- l4_exc_regs_t * l4_utcb_exc (void) L4_NOTHROW L4_PURE

  Get the message-register block of a UTCB (for an exception IPC).
- void **l4_utcb_inherit_fpu** (int switch_on) L4_NOTHROW

  Enable or disable inheritance of FPU state to receiver.
- l4_umword_t l4_bdr (l4_umword_t mem, l4_umword_t io, l4_umword_t obj, l4_umword_t flags) L4_NOTHROW

  Create a buffer descriptor.
- l4_timeout_s l4_timeout_abs (l4_kernel_clock_t pint, int br) L4_NOTHROW

  Set an absolute timeout.
- unsigned l4_utcb_mr64_idx (unsigned idx) L4_NOTHROW

  Get index into 64bit message registers alias from native-sized index.

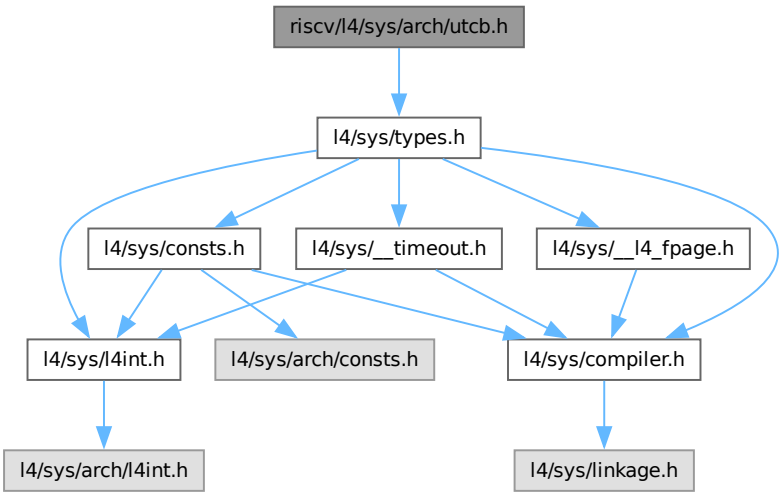
16.629 riscv/l4/sys/arch/utcb.h File Reference

UTCB definitions for RISC-V.

`#include <l4/sys/types.h>`

Include dependency graph for utcb.h:



Data Structures

- struct l4_exc_regs_t

  UTCB structure for exceptions.

Functions

- l4_umword_t l4_utcb_exc_pc (l4_exc_regs_t const *u) L4_NOTHROW

  Access function to get the program counter of the exception state.
- void l4_utcb_exc_pc_set (l4_exc_regs_t *u, l4_addr_t pc) L4_NOTHROW

  Set the program counter register in the exception state.
- l4_umword_t **l4_utcb_exc_typeval** (l4_exc_regs_t const *u) L4_NOTHROW

  Get the value out of an exception UTCB that describes the type of exception.
- int l4_utcb_exc_is_pf (l4_exc_regs_t const *u) L4_NOTHROW

  Check whether an exception IPC is a page fault.
- l4_addr_t **l4_utcb_exc_pfa** (l4_exc_regs_t const *u) L4_NOTHROW

  Function to get the L4 style page fault address out of an exception.
- int l4_utcb_exc_is_ex_regs_exception (l4_exc_regs_t const *u) L4_NOTHROW

  Check whether an exception IPC was triggered via l4_thread_ex_regs().

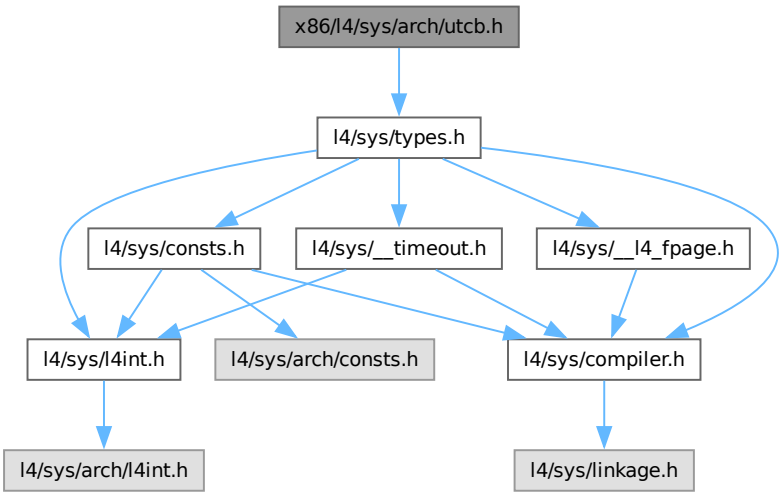
16.631 x86/l4/sys/arch/utcb.h File Reference

UTCB definitions for x86.

```
#include <l4/sys/types.h>
```
Include dependency graph for utcb.h:



Data Structures

- struct l4_exc_regs_t

  UTCB structure for exceptions.

Macros

- #define **L4_UTCB_EXCEPTION_REGS_SIZE** (sizeof(l4_exc_regs_t) / sizeof(l4_umword_t))

  Number of message registers used for exception IPC.
- #define **L4_UTCB_GENERIC_DATA_SIZE** 63

  Total number of message register (MRs) available.
- #define **L4_UTCB_GENERIC_BUFFERS_SIZE** 58

  Total number of buffer registers (BRs) available.
- #define **L4_UTCB_MSG_REGS_OFFSET** 0

  Offset of MR[0] relative to the UTCB pointer.
- #define **L4_UTCB_BUF_REGS_OFFSET** (64 * sizeof(l4_umword_t))

  Offset of BR[0] relative to the UTCB pointer.
- #define **L4_UTCB_THREAD_REGS_OFFSET** (123 * sizeof(l4_umword_t))

  Offset of TCR[0] relative to the UTCB pointer.
- #define **L4_UTCB_INHERIT_FPU** (1UL << 24)

  BDR flag to accept reception of FPU state.
- #define **L4_UTCB_OFFSET** 512

  Offset of two consecutive UTCBs.

Functions

- l4_umword_t l4_utcb_exc_pc (l4_exc_regs_t const *u) L4_NOTHROW

  Access function to get the program counter of the exception state.
- void l4_utcb_exc_pc_set (l4_exc_regs_t *u, l4_addr_t pc) L4_NOTHROW

  Set the program counter register in the exception state.

- l4_umword_t **l4_utcb_exc_typeval** (l4_exc_regs_t const *u) L4_NOTHROW

  Get the value out of an exception UTCB that describes the type of exception.
- int l4_utcb_exc_is_pf (l4_exc_regs_t const *u) L4_NOTHROW

  Check whether an exception IPC is a page fault.
- l4_addr_t **l4_utcb_exc_pfa** (l4_exc_regs_t const *u) L4_NOTHROW

  Function to get the L4 style page fault address out of an exception.
- int l4_utcb_exc_is_ex_regs_exception (l4_exc_regs_t const *u) L4_NOTHROW

  Check whether an exception IPC was triggered via l4_thread_ex_regs().

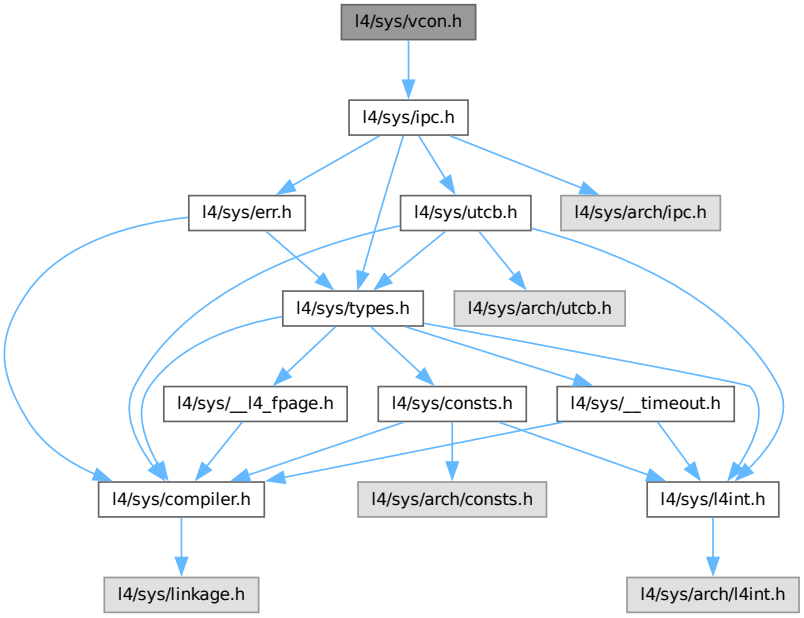
16.635 l4/sys/vcon.h File Reference

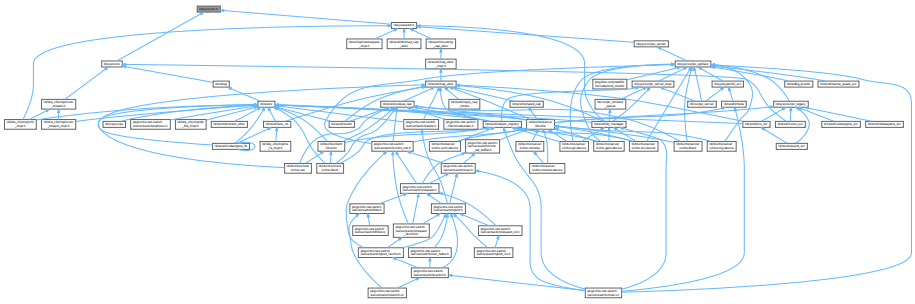
Virtual console interface.

```
#include <l4/sys/ipc.h>
```

Include dependency graph for vcon.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4_vcon_attr_t

  Vcon attribute structure.

Typedefs

- typedef struct l4_vcon_attr_t l4_vcon_attr_t

  Vcon attribute structure.

Enumerations

- enum L4_vcon_size_consts { L4_VCON_WRITE_SIZE = (L4_UTCB_GENERIC_DATA_SIZE - 2) * sizeof(l4_umword_t) , L4_VCON_READ_SIZE = (L4_UTCB_GENERIC_DATA_SIZE - 1) * sizeof(l4_↩ umword_t) }

  Size constants.

- enum L4_vcon_read_flags { L4_VCON_READ_SIZE_MASK = 0x3fffffff , L4_VCON_READ_STAT_BREAK = 1 << 30 , L4_VCON_READ_STAT_DONE = 1 << 31 }

  Vcon read flags.
- enum L4_vcon_i_flags { L4_VCON_INLCR = 000100 , L4_VCON_IGNCR = 000200 , L4_VCON_ICRNL = 000400 }

  Input flags.
- enum L4_vcon_o_flags { L4_VCON_ONLCR = 000004 , L4_VCON_OCRNL = 000010 , L4_VCON_ONLRET = 000040 }

  Output flags.
- enum L4_vcon_l_flags { L4_VCON_ICANON = 000002 , L4_VCON_ECHO = 000010 }

  Local flags.
- enum L4_vcon_ops { L4_VCON_WRITE_OP = 0UL , L4_VCON_READ_OP = 1UL , L4_VCON_SET_ATTR_OP = 2UL , L4_VCON_GET_ATTR_OP = 3UL }

  Operations on vcon objects.

Functions

- l4_msgtag_t l4_vcon_send (l4_cap_idx_t vcon, char const *buf, unsigned size) L4_NOTHROW

  Send data to virtual console.
- l4_msgtag_t l4_vcon_send_u (l4_cap_idx_t vcon, char const *buf, unsigned size, l4_utcb_t *utcb) L4_NOTHROW

  Send data to `this` virtual console.
- long l4_vcon_write (l4_cap_idx_t vcon, char const *buf, unsigned size) L4_NOTHROW

  Write data to virtual console.
- long l4_vcon_write_u (l4_cap_idx_t vcon, char const *buf, unsigned size, l4_utcb_t *utcb) L4_NOTHROW

  Write data to `this` virtual console.
- int l4_vcon_read (l4_cap_idx_t vcon, char *buf, unsigned size) L4_NOTHROW

  Read data from virtual console.
- int l4_vcon_read_u (l4_cap_idx_t vcon, char *buf, unsigned size, l4_utcb_t *utcb) L4_NOTHROW

  Read data from `this` virtual console.
- int l4_vcon_read_with_flags (l4_cap_idx_t vcon, char *buf, unsigned size) L4_NOTHROW

  Read data from virtual console, extended version including flags.
- l4_msgtag_t l4_vcon_set_attr (l4_cap_idx_t vcon, l4_vcon_attr_t const *attr) L4_NOTHROW

  Set attributes of a Vcon.
- l4_msgtag_t l4_vcon_set_attr_u (l4_cap_idx_t vcon, l4_vcon_attr_t const *attr, l4_utcb_t *utcb) L4_NOTHROW

  Set the attributes of `this` virtual console.
- l4_msgtag_t l4_vcon_get_attr (l4_cap_idx_t vcon, l4_vcon_attr_t *attr) L4_NOTHROW

  Get attributes of a Vcon.
- l4_msgtag_t l4_vcon_get_attr_u (l4_cap_idx_t vcon, l4_vcon_attr_t *attr, l4_utcb_t *utcb) L4_NOTHROW

  Get attributes of `this` virtual console.
- void l4_vcon_set_attr_raw (l4_vcon_attr_t *attr) L4_NOTHROW

  Set terminal attributes to disable all special processing.

16.635.1 Detailed Description

Virtual console interface.
Definition in file vcon.h.

16.635.2 Enumeration Type Documentation

16.635.2.1 L4_vcon_read_flags

enum L4_vcon_read_flags
Vcon read flags.

Enumerator

L4_VCON_READ_SIZE_MASK	Size mask.
L4_VCON_READ_STAT_BREAK	Break condition flag.
L4_VCON_READ_STAT_DONE	Done condition flag.

Definition at line 170 of file vcon.h.

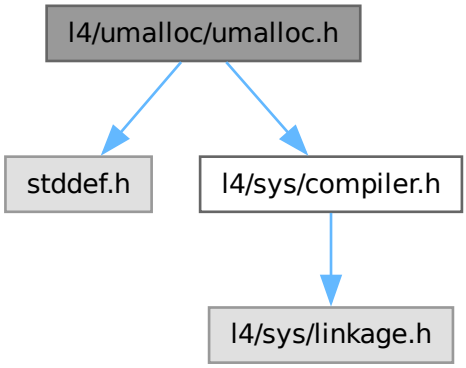
16.642 l4/umalloc/umalloc.h File Reference

Public API for the basic next-fit memory allocator.

```
#include <stddef.h>
#include <l4/sys/compiler.h>
```

Include dependency graph for umalloc.h:



Functions

- void * umalloc_area_create (size_t area_size) L4_NOTHROW

  Create a new heap area.

Variables

- L4_BEGIN_DECLS size_t umalloc_area_granularity

  Heap area granularity.

16.642.1 Detailed Description

Public API for the basic next-fit memory allocator.
The user of this allocator is required to provide the implementation of the umalloc_area_create() function and provide the umalloc_area_granularity symbol with a value.

Note

The current implementation is NOT thread-safe. If the user wants to use this allocator concurrently, they need to deploy their custom mutual exclusion mechanism around the public calls to the allocator.

Definition in file umalloc.h.

16.642.2 Function Documentation

16.642.2.1 umalloc_area_create()

```
void * umalloc_area_create (
            size_t area_size)
```

Create a new heap area.

Parameters

area_size	Requested heap area size. Always a multiple of the heap area granularity as reported by umalloc_area_granularity().

Returns

Pointer to the successfully created heap area of (at least) the requested size. It is assumed that the pointer satisfies at least the umalloc::Base_alignment alignment. If the value is nullptr, then it is assumed that the creation of the heap area failed.

References L4_END_DECLS, and L4_NOTHROW.

16.642.3 Variable Documentation

16.642.3.1 umalloc_area_granularity

```
L4_BEGIN_DECLS size_t umalloc_area_granularity  [extern]
```

Heap area granularity.
The allocator only requests the creation of heap areas with this granularity.

16.643 umalloc.h

Macros

- #define l4_assert(expr)

  Low-level assert.

16.644.1 Detailed Description

Low-level assert implementation.
Definition in file assert.h.

16.644.2 Macro Definition Documentation

16.644.2.1 l4_assert

```
#define l4_assert(
              expr)
```

Value:

```
l4_assert_fn(!!(expr), __FILE__ ":" L4_stringify(__LINE__) ": Assertion \"" \
                       L4_stringify(expr) "\" failed.\n")
```

Low-level assert.

Parameters

expr	Expression to be evaluated for the assertion.

This assertion is a low-level implementation that directly uses kernel primitives. Only use l4_assert() when the standard assert() functionality is not available.
Definition at line 32 of file assert.h.
Referenced by L4Re::Util::Cap_alloc_base::free(), L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::free(), L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::release(), and L4Re::Util::Br_manager::set_rcv_cap_flags().

16.651.1 Detailed Description

atomic operations header and generic implementations

Date

10/20/2000

Author

Lars Reuther reuther@os.inf.tu-dresden.de, Jork Loeser jork@os.inf.tu-dresden.de

Definition in file atomic.h.

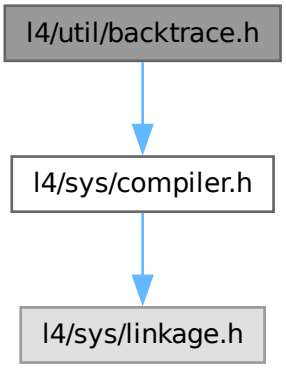
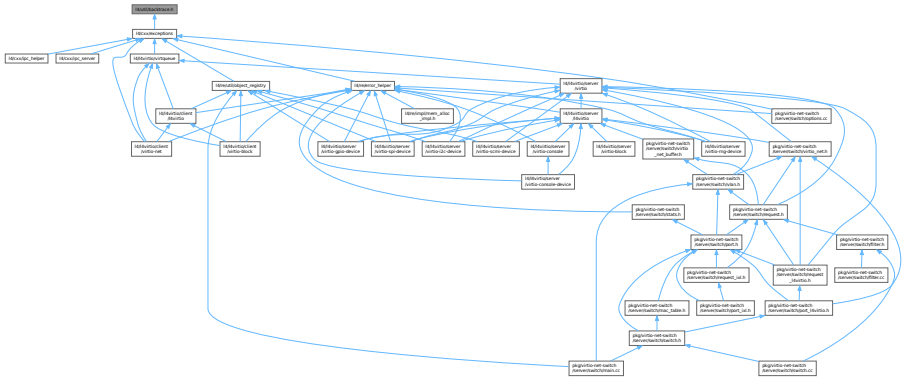
Backtrace.

```
#include <l4/sys/compiler.h>
```
Include dependency graph for backtrace.h:



This graph shows which files directly or indirectly include this file:



Functions

- L4_BEGIN_DECLS int l4util_backtrace (void **pc_array, int max_len)

  Fill backtrace structure.

16.653.1 Detailed Description

Backtrace.
Definition in file backtrace.h.

16.653.2 Function Documentation

16.653.2.1 l4util_backtrace()

```
L4_BEGIN_DECLS int l4util_backtrace (
            void ** pc_array,
            int max_len)
```
Fill backtrace structure.

Parameters

pc_array	Array of instruction pointers.
max_len	Length of array.

Returns

Number of entries

References L4_END_DECLS.
Referenced by L4::Exception_tracer::Exception_tracer().
Here is the caller graph for this function:

16.659.1 Detailed Description

ELF definition.

Date

08/18/2000

Author

Frank Mehnert fm3@os.inf.tu-dresden.de Alexander Warg aw11@os.inf.tu-dresden.de

Many structs from "Executable and Linkable Format (ELF)", Portable Formats Specification, Version 1.1 and "System V Application Binary Interface - DRAFT - April 29, 1998" The Santa Cruz Operation, Inc. (see http://www.sco.com/developer/gabi/contents.html)
Definition in file elf.h.

16.660 elf.h

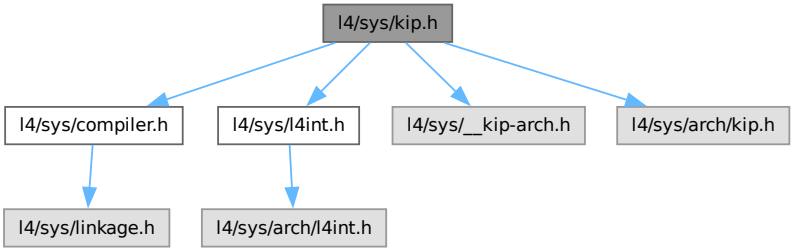
16.668 l4/sys/kip.h File Reference

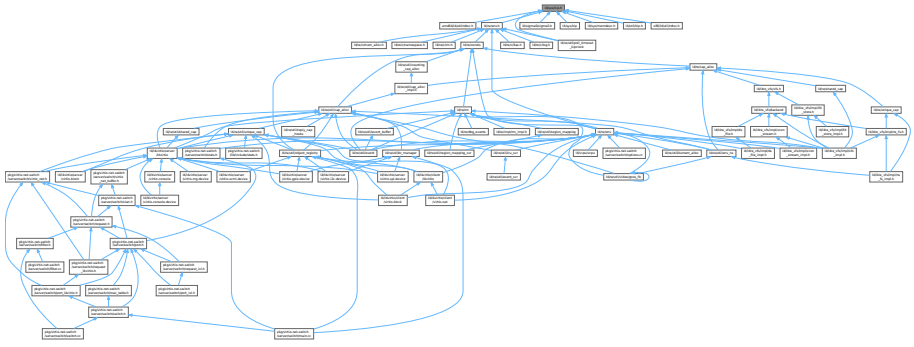
Kernel Info Page access functions.

```
#include <l4/sys/compiler.h>
#include <l4/sys/l4int.h>
#include <l4/sys/__kip-arch.h>
#include <l4/sys/arch/kip.h>
```

Include dependency graph for kip.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4_kernel_info_t

  L4 Kernel Interface Page.

Macros

- #define **L4_KERNEL_INFO_MAGIC** (0x4BE6344CL) /* "L4µK" */

  Kernel Info Page identifier ("L4µK").
- #define l4_kip_for_each_feature(s)

  Cycle through kernel features given in the KIP.

Typedefs

- typedef struct l4_kernel_info_t l4_kernel_info_t

  L4 Kernel Interface Page.

Enumerations

- enum { L4_KIP_OFFS_READ_US = 0x900 , L4_KIP_OFFS_READ_NS = 0x980 }

Functions

- l4_kernel_info_t const * l4_kip (void) L4_NOTHROW

  Get Kernel Info Page.
- l4_umword_t l4_kip_version (l4_kernel_info_t const *kip) L4_NOTHROW

  Get the kernel version.
- const char * l4_kip_version_string (l4_kernel_info_t const *kip) L4_NOTHROW

  Get the kernel version string.
- int l4_kernel_info_version_offset (l4_kernel_info_t const *kip) L4_NOTHROW

  Return offset in bytes of version_strings relative to the KIP base.
- l4_cpu_time_t l4_kip_clock (l4_kernel_info_t const *kip) L4_NOTHROW

  Return clock value from the KIP.
- l4_umword_t l4_kip_clock_lw (l4_kernel_info_t const *kip) L4_NOTHROW

  Return least significant machine word of clock value from the KIP.
- l4_uint64_t l4_kip_clock_ns (l4_kernel_info_t const *kip) L4_NOTHROW

  Return current clock using the KIP in nanoseconds.
- int l4_kip_kernel_has_feature (l4_kernel_info_t const *kip, char const *str)

  Check if kernel supports a feature.

16.668.1 Detailed Description

Kernel Info Page access functions.
Definition in file kip.h.

16.668.2 Macro Definition Documentation

16.668.2.1 l4_kip_for_each_feature

```
#define l4_kip_for_each_feature(
            s)
```

Value:

```
for (s += __builtin_strlen(s) + 1; *s; s += __builtin_strlen(s) + 1)
```

Cycle through kernel features given in the KIP.
Cycles through all KIP kernel feature strings. `s` must be a character pointer (`char const *`) initialized with l4_kip_version_string().
Definition at line 272 of file kip.h.
Referenced by l4_kip_kernel_has_feature().

16.668.3 Function Documentation

16.668.3.1 l4_kip_kernel_has_feature()

```
int l4_kip_kernel_has_feature (
             l4_kernel_info_t const * kip,
             char const * str)  [inline]
```

Check if kernel supports a feature.

Parameters

kip	Pointer to the kernel info page (KIP).
str	Feature name to check.

Returns

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.
Definition at line 286 of file kip.h.
References l4_kip_for_each_feature, and l4_kip_version_string().
Here is the call graph for this function:

16.669 kip.h

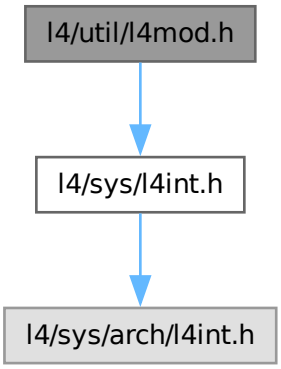
L4mod structures and constants.
`#include <l4/sys/l4int.h>`
Include dependency graph for l4mod.h:



Data Structures

- struct l4util_l4mod_mod
  A single module.
- struct l4util_l4mod_info
  Base module structure.

Enumerations

- enum l4util_l4mod_mod_info_flag {
  L4util_l4mod_mod_flag_unspec = 0 , L4util_l4mod_mod_flag_kernel = 1 , L4util_l4mod_mod_flag_sigma0 = 2 , L4util_l4mod_mod_flag_roottask = 3 ,
  L4util_l4mod_mod_flag_cpu_fw = 4 , L4util_l4mod_mod_flag_mask = 7 << 0 }
  Flags for l4util_l4mod_mod.flags.

16.676.1 Detailed Description

L4mod structures and constants.
Definition in file l4mod.h.

16.676.2 Enumeration Type Documentation

16.676.2.1 l4util_l4mod_mod_info_flag

`enum l4util_l4mod_mod_info_flag`
Flags for l4util_l4mod_mod.flags.

Enumerator

L4util_l4mod_mod_flag_unspec	A generic module.
L4util_l4mod_mod_flag_kernel	The kernel module.

L4util_l4mod_mod_flag_sigma0	The sigma0 module.
L4util_l4mod_mod_flag_roottask	The root task module.
L4util_l4mod_mod_flag_cpu_fw	A CPU firmware module containing one or several firmware update blobs. Such modules are announced via L4::Kip::Mem_desc::Arch regions. These regions are exclusively used by the kernel.
L4util_l4mod_mod_flag_mask	Mask for specified flags.

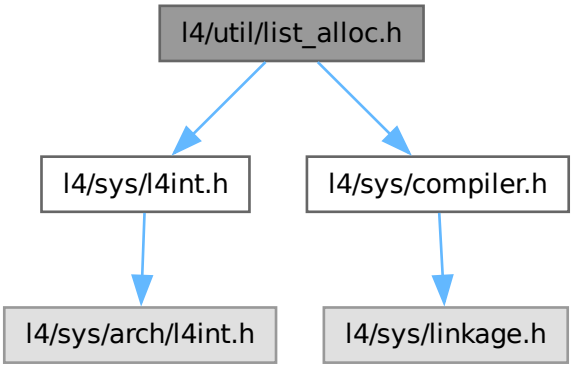
16.678 l4/util/list_alloc.h File Reference

Simple list-based allocator.

```
#include <l4/sys/l4int.h>
#include <l4/sys/compiler.h>
```

Include dependency graph for list_alloc.h:



Functions

- L4_BEGIN_DECLS void l4la_free (l4la_free_t **first, void *block, l4_size_t size)

  Add free memory to memory pool.
- void * l4la_alloc (l4la_free_t **first, l4_size_t size, unsigned align)

  Allocate memory from pool.
- void l4la_dump (l4la_free_t **first)

  Show all list members.
- void l4la_init (l4la_free_t **first)

  Init memory pool.
- l4_size_t l4la_avail (l4la_free_t **first)

  Show available memory in pool.

16.678.1 Detailed Description

Simple list-based allocator.
Taken from the Fiasco kernel.

Date

Alexander Warg <aw11os.inf.tu-dresden.de> Frank Mehnert fm3@os.inf.tu-dresden.de

Definition in file list_alloc.h.

16.678.2 Function Documentation

16.678.2.1 l4la_alloc()

```
void * l4la_alloc (
            l4la_free_t ** first,
            l4_size_t size,
            unsigned align)
```

Allocate memory from pool.

Parameters

first	list identifier
size	length of memory block to allocate
align	alignment

References L4_CV.

16.678.2.2 l4la_avail()

```
l4_size_t l4la_avail (
            l4la_free_t ** first)
```

Show available memory in pool.

Parameters

first	list identifier

References L4_CV, and L4_END_DECLS.

16.678.2.3 l4la_dump()

```
void l4la_dump (
            l4la_free_t ** first)
```

Show all list members.

Parameters

first	list identifier

References L4_CV.

16.678.2.4 l4la_free()

```
L4_BEGIN_DECLS void l4la_free (
            l4la_free_t ** first,
            void * block,
            l4_size_t size)
```

Add free memory to memory pool.

Parameters

first	list identifier
block	address of unused memory block
size	size of memory block

References L4_CV.

16.678.2.5 l4la_init()

```
void l4la_init (
            l4la_free_t ** first)
```

Init memory pool.

Parameters

first	list identifier

References L4_CV.

Data Structures

- struct l4util_mb_mod_t

  The structure type "mod_list" is used by the multiboot_info structure.
- struct l4util_mb_addr_range_t

  INT-15, AX=E820 style "AddressRangeDescriptor" ...with a "size" parameter on the front which is the structure size - 4, pointing to the next one, up until the full buffer length of the memory map has been reached.
- struct l4util_mb_drive_t

  Drive Info structure.
- struct l4util_mb_apm_t

  APM BIOS info.
- struct l4util_mb_vbe_ctrl_t

  VBE controller information.
- struct l4util_mb_vbe_mode_t

  VBE mode information.
- struct l4util_mb_info_t

  MultiBoot Info description.

Macros

- #define **MB_ARD_MEMORY** 1

  usable memory "Type", all others are reserved.
- #define MB_ART_MEMORY 1

  Address Range Types (ART) from "Advanced Configuration and Power Interface Specification" Rev3.0a (p.
- #define **MB_ART_RESERVED** 2

  in use or reserved by system
- #define **MB_ART_ACPI** 3

  ACPI Reclaim Memory (RAM that contains ACPI tables).
- #define **MB_ART_NVS** 4

  ACPI NVS Memory (must not be used by the OS.
- #define **MB_ART_UNUSABLE** 5

  memory in which errors have been detected
- #define l4util_mb_for_each_mmap_entry(i, mbi)

Iterate over a memory map provided in a Multiboot info.

- #define L4UTIL_MB_MEMORY 0x00000001

  Flags to be set in the 'flags' parameter above.
- #define **L4UTIL_MB_BOOTDEV** 0x00000002

  is there a boot device set?
- #define **L4UTIL_MB_CMDLINE** 0x00000004

  is the command-line defined?
- #define **L4UTIL_MB_MODS** 0x00000008

  are there modules to do something with?
- #define **L4UTIL_MB_AOUT_SYMS** 0x00000010

  is there a symbol table loaded?
- #define **L4UTIL_MB_ELF_SHDR** 0x00000020

  is there an ELF section header table?
- #define **L4UTIL_MB_MEM_MAP** 0x00000040

  is there a full memory map?
- #define **L4UTIL_MB_DRIVE_INFO** 0x00000080

  Is there drive info?
- #define **L4UTIL_MB_CONFIG_TABLE** 0x00000100

  Is there a config table?
- #define **L4UTIL_MB_BOOT_LOADER_NAME** 0x00000200

  Is there a boot loader name?
- #define **L4UTIL_MB_APM_TABLE** 0x00000400

  Is there a APM table?
- #define **L4UTIL_MB_VIDEO_INFO** 0x00000800

  Is there video information?
- #define **L4UTIL_MB_VALID** 0x2BADB002UL

  If we are multiboot-compliant, this value is present in the eax register.

16.682.1 Detailed Description

Multiboot info structure as defined by GRUB.
Definition in file mb_info.h.

16.682.2 Macro Definition Documentation

16.682.2.1 l4util_mb_for_each_mmap_entry

```
#define l4util_mb_for_each_mmap_entry(
              i,
              mbi)
```

Value:

```
  for (i = l4util_mb_first_mmap_entry(mbi);                                    \
       (unsigned long)i < (unsigned long)mbi->mmap_addr + mbi->mmap_length;    \
       i = l4util_mb_next_mmap_entry(i))
```

Iterate over a memory map provided in a Multiboot info.

Parameters

i	Name of a variable of type l4util_mb_addr_range_t * that is consecutively assigned pointers to the entries of the memory map.
mbi	Pointer to the l4util_mb_info_t where the memory map can be found.

Definition at line 332 of file mb_info.h.

16.682.2.2 L4UTIL_MB_MEMORY

```
#define L4UTIL_MB_MEMORY 0x00000001
```

Flags to be set in the 'flags' parameter above.
is there basic lower/upper memory information?
Definition at line 344 of file mb_info.h.

16.682.2.3 MB_ART_MEMORY

```
#define MB_ART_MEMORY 1
```

Address Range Types (ART) from "Advanced Configuration and Power Interface Specification" Rev3.0a (p. 390). Other values are undefined. available, usable RAM
Definition at line 64 of file mb_info.h.

16.683 mb_info.h

  Polling ring buffer consumer.
- class utrace::Ring_buffer_consumer< SEQUENCE_TYPE, ITEM_TYPE, GENERATION_PTR >
  Blocking ring buffer consumer.

16.692.1 Detailed Description

Shared-memory multiple-producer multiple-consumer head-drop ring buffer implementation.
This implements a generic ring buffer for transferring fixed-sized items in shared memory between producers and consumers without coupling. This means that the pace of producers is never affected by the pace of consumers (producers never block and never wait for the consumers).
When consumers are unable to dequeue items from the ring buffer quickly enough, they lose access to the oldest items (head-drop policy), but this condition is always detected.
When there are more producers than the total number of items actively enqueuing items into the ring buffer, the state of the ring buffer is undefined. When the sequence/generation counter of the items in the ring buffer overflow, the state of the ring buffer is undefined.
Definition in file ring_buffer.

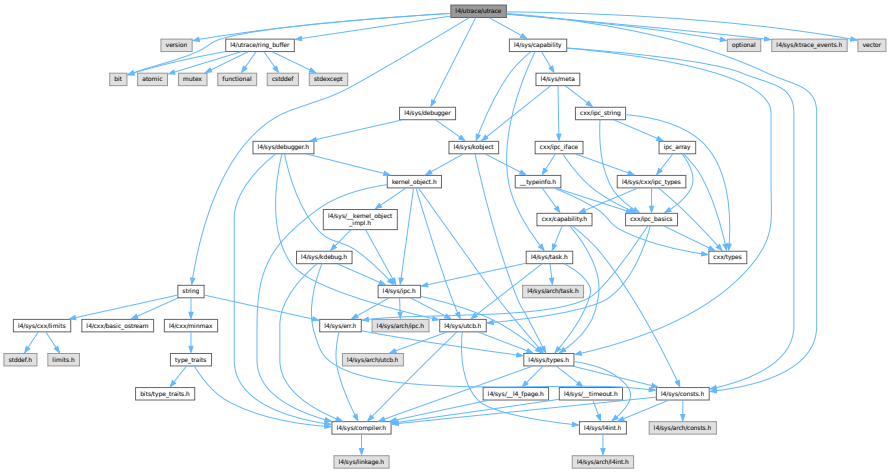
Include dependency graph for utrace:



Data Structures

- class utrace::Tracebuffer

  Tracebuffer abstraction.
- struct utrace::Tracebuffer::Index_desc

  Mapping of the dynamic tracebuffer log indexes to names.

16.694.1 Detailed Description

L4Re tracebuffer access.

This is an abstraction for processing the L4Re tracebuffer events. In the current implementation, there is only a single global tracebuffer available via the base debugger (JDB) capability.

Definition in file utrace.

16.695 utrace

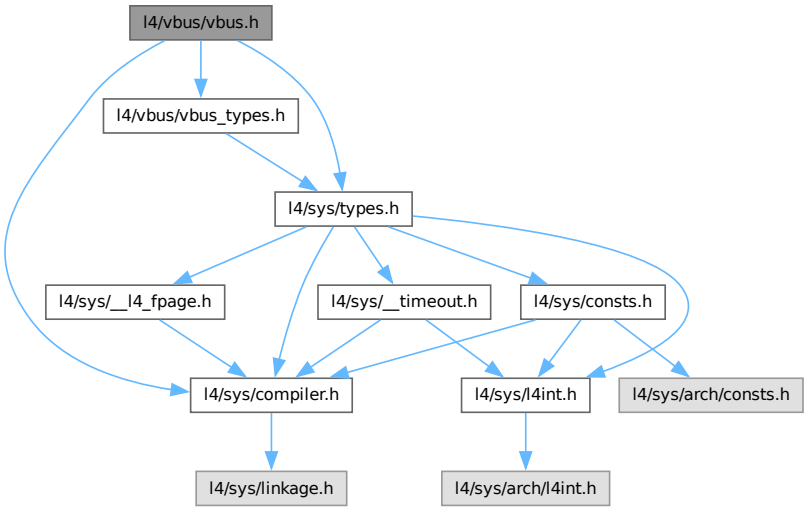
16.697 l4/vbus/vbus.h File Reference

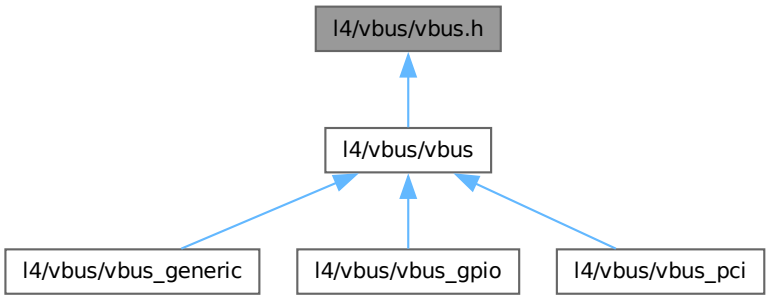
Description of the vbus C API.

```
#include <l4/sys/compiler.h>
#include <l4/vbus/vbus_types.h>
#include <l4/sys/types.h>
```

Include dependency graph for vbus.h:



This graph shows which files directly or indirectly include this file:



Enumerations

- enum { L4VBUS_NULL = -1L , L4VBUS_ROOT_BUS = 0 }

  Constants for device nodes.
- enum l4vbus_icu_src_types { L4VBUS_ICU_SRC_DEV_HANDLE = 1ULL << 63 }

  Flags that can be used with the ICU on a vbus device.
- enum L4vbus_dma_domain_assign_flags { L4VBUS_DMAD_UNBIND = 0 , L4VBUS_DMAD_BIND = 1 , L4VBUS_DMAD_L4RE_DMA_SPACE = 0 }

  Flags for l4vbus_assign_dma_domain().

Functions

- L4_BEGIN_DECLS int l4vbus_get_device_by_hid (l4_cap_idx_t vbus, l4vbus_device_handle_t parent, l4vbus_device_handle_t *child, char const *hid, int depth, l4vbus_device_t *devinfo)

  Find a device by the hardware interface identifier (HID).
- int l4vbus_get_next_device (l4_cap_idx_t vbus, l4vbus_device_handle_t parent, l4vbus_device_handle_t *child, int depth, l4vbus_device_t *devinfo)

  Find next child following `child`.
- int l4vbus_get_device (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, l4vbus_device_t *devinfo)

  Obtain detailed information about a Vbus device.
- int l4vbus_get_resource (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, unsigned res_idx, l4vbus_resource_t *res)

  Obtain the resource description of an individual device resource.
- int l4vbus_is_compatible (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, char const *cid)

  Check if the given device has a compatibility ID (CID) or HID that matches cid.
- int l4vbus_get_hid (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, char *hid, unsigned long max_len)

  Get the HID (hardware identifier) of a device.
- int l4vbus_get_adr (l4_cap_idx_t vbus, l4vbus_device_handle_t dev, l4_uint32_t *adr)

  Get the bus-specific address of a device.
- int l4vbus_request_ioport (l4_cap_idx_t vbus, l4vbus_resource_t const *res)

  Request an IO port resource.
- int l4vbus_assign_dma_domain (l4_cap_idx_t vbus, unsigned domain_id, unsigned flags, l4_cap_idx_t dma_space)

  Bind or unbind a kernel DMA space or a L4Re::Dma_space to a DMA domain.
- int l4vbus_release_ioport (l4_cap_idx_t vbus, l4vbus_resource_t const *res)

  Release a previously requested IO port resource.
- int l4vbus_vicu_get_cap (l4_cap_idx_t vbus, l4vbus_device_handle_t icu, l4_cap_idx_t cap)

  Get capability of ICU.

16.697.1 Detailed Description

Description of the vbus C API.
Definition in file vbus.h.

16.697.2 Enumeration Type Documentation

16.697.2.1 anonymous enum

`anonymous enum`
Constants for device nodes.

Enumerator

L4VBUS_NULL	NULL device.
L4VBUS_ROOT_BUS	Root device on the vbus.

Definition at line 20 of file vbus.h.

16.697.2.2 l4vbus_icu_src_types

`enum l4vbus_icu_src_types`
Flags that can be used with the ICU on a vbus device.

Enumerator

L4VBUS_ICU_SRC_DEV_HANDLE	Flag to denote that the value should be interpreted as a device handle. This flag may be used in the `source` parameter in l4_icu_msi_info() to denote that the ICU should interpret the source ID as a device handle.

Definition at line 26 of file vbus.h.

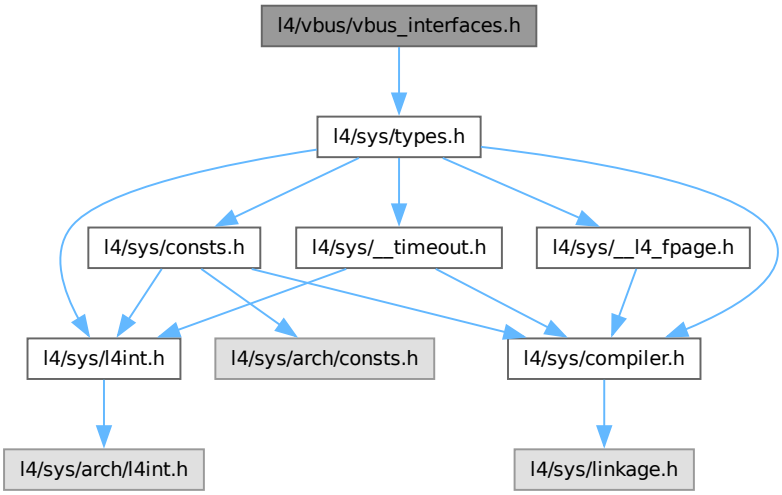
16.705 l4/vbus/vbus_interfaces.h File Reference

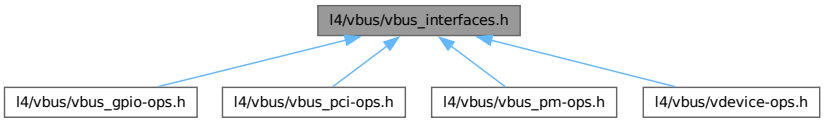
This header contains the definition of VBUS sub-interfaces and convenience functions to work with the interface IDs.

```
#include <l4/sys/types.h>
```

Include dependency graph for vbus_interfaces.h:



This graph shows which files directly or indirectly include this file:



Typedefs

- typedef enum l4vbus_iface_type_t l4vbus_iface_type_t

  Different sub-interfaces a vbus device may support.

Enumerations

- enum l4vbus_iface_type_t {
  L4VBUS_INTERFACE_ICU = 0 , L4VBUS_INTERFACE_GPIO , L4VBUS_INTERFACE_PCI , L4VBUS_INTERFACE_PCIDEV
  ,
  L4VBUS_INTERFACE_PM , L4VBUS_INTERFACE_BUS , L4VBUS_INTERFACE_GENERIC = 0x20 }

  Different sub-interfaces a vbus device may support.
- enum { L4VBUS_IFACE_SHIFT = 26 }

Functions

- unsigned **l4vbus_subinterface** (unsigned opcode)

  Return the ID of the vbus sub-interface.
- unsigned **l4vbus_interface_opcode** (unsigned opcode)

  Return the function opcode within the sub-interface of the vbus command.
- int l4vbus_subinterface_supported (l4_uint32_t dev_type, l4vbus_iface_type_t iface_type)

  Check if a vbus device supports a given sub-interface.

16.705.1 Detailed Description

This header contains the definition of VBUS sub-interfaces and convenience functions to work with the interface IDs.
Definition in file vbus_interfaces.h.

16.705.2 Typedef Documentation

16.705.2.1 l4vbus_iface_type_t

```
typedef enum l4vbus_iface_type_t l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.
The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.
The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see L4VBUS_IFACE_SHIFT). They also make up a bitmask that specify the type of the device, i.e. from the point of view of the client a device is defined by the kinds of sub-interfaces it supports.

16.705.3 Enumeration Type Documentation

16.705.3.1 anonymous enum

```
anonymous enum
```

Enumerator

L4VBUS_IFACE_SHIFT	Sub-interface ID shift. Divides the function opcode sent via IPC into a sub-interface ID and the actual function opcode within the sub-interface.

Definition at line 48 of file vbus_interfaces.h.

16.705.3.2 l4vbus_iface_type_t

```
enum l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.
The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.
The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see L4VBUS_IFACE_SHIFT). They also make up a bitmask that specify the type of the device, i.e. from the point of view of the client a device is defined by the kinds of sub-interfaces it supports.

Enumerator

L4VBUS_INTERFACE_ICU	Interrupt Controller.
L4VBUS_INTERFACE_GPIO	GPIO.
L4VBUS_INTERFACE_PCI	PCI.
L4VBUS_INTERFACE_PCIDEV	PCI Device.
L4VBUS_INTERFACE_PM	Power Management.
L4VBUS_INTERFACE_BUS	VBus.
L4VBUS_INTERFACE_GENERIC	No specific sub interface.

Definition at line 29 of file vbus_interfaces.h.

16.705.4 Function Documentation

16.705.4.1 l4vbus_subinterface_supported()

```
int l4vbus_subinterface_supported (
            l4_uint32_t dev_type,
            l4vbus_iface_type_t iface_type)  [inline]
```

Check if a vbus device supports a given sub-interface.

Parameters

dev_type	Device type as reported in l4vbus_device_t.
iface_type	Sub-interface type to check for.

Returns

True if the device supports the sub-interface.

Definition at line 99 of file vbus_interfaces.h.
References L4_INLINE, and L4VBUS_INTERFACE_GENERIC.

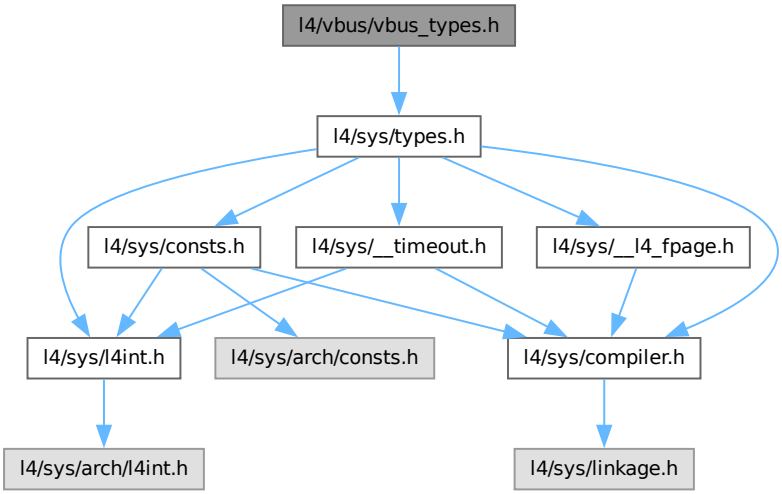
16.713 l4/vbus/vbus_types.h File Reference

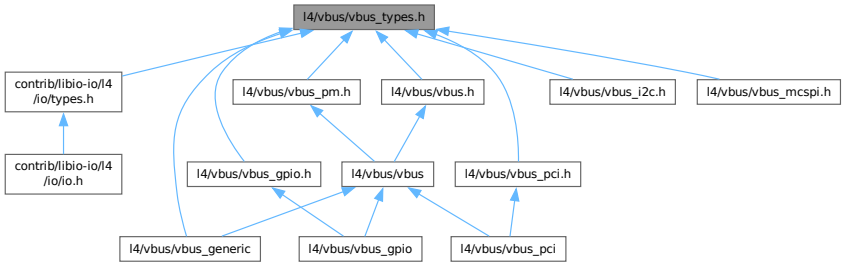
This header file contains descriptions of vbus related data types and constants.

```
#include <l4/sys/types.h>
```

Include dependency graph for vbus_types.h:



This graph shows which files directly or indirectly include this file:



Data Structures

- struct l4vbus_resource_t

  Description of a single vbus resource.
- struct l4vbus_device_t

  Detailed information about a vbus device.

Typedefs

- typedef l4_mword_t **l4vbus_device_handle_t**

  Device handle for a device on the vbus.
- typedef l4_addr_t **l4vbus_paddr_t**

  Address of resources on the vbus.

Enumerations

- enum l4vbus_resource_type_t {
  L4VBUS_RESOURCE_INVALID = 0 , L4VBUS_RESOURCE_IRQ , L4VBUS_RESOURCE_MEM ,

L4VBUS_RESOURCE_PORT ,
L4VBUS_RESOURCE_BUS , L4VBUS_RESOURCE_GPIO , L4VBUS_RESOURCE_DMA_DOMAIN ,
L4VBUS_RESOURCE_CLOCK ,
L4VBUS_RESOURCE_MAX }

Description of vbus resource types.

- enum l4vbus_resource_flags_t {
L4VBUS_RESOURCE_F_MEM_R = 0x1 , L4VBUS_RESOURCE_F_MEM_W = 0x2 , L4VBUS_RESOURCE_F_MEM_PREFE
= 0x10 , L4VBUS_RESOURCE_F_MEM_CACHEABLE = 0x20 ,
L4VBUS_RESOURCE_F_MEM_MMIO_READ = 0x2000 , L4VBUS_RESOURCE_F_MEM_MMIO_WRITE
= 0x4000 }

  Description of vbus resource flags.

- enum l4vbus_device_flags_t { L4VBUS_DEVICE_F_CHILDREN = 0x10 }

  Flags describing device properties, see l4vbus_device_t.

16.713.1 Detailed Description

This header file contains descriptions of vbus related data types and constants.
Definition in file vbus_types.h.

16.713.2 Enumeration Type Documentation

16.713.2.1 l4vbus_device_flags_t

`enum l4vbus_device_flags_t`
Flags describing device properties, see l4vbus_device_t.

Enumerator

L4VBUS_DEVICE_F_CHILDREN	Device has child devices.

Definition at line 93 of file vbus_types.h.

16.713.2.2 l4vbus_resource_flags_t

`enum l4vbus_resource_flags_t`
Description of vbus resource flags.

Enumerator

L4VBUS_RESOURCE_F_MEM_R	Memory resource is readable.
L4VBUS_RESOURCE_F_MEM_W	Memory resource is writeable.
L4VBUS_RESOURCE_F_MEM_PREFETCHABLE	Memory resource is prefetchable. Clients may map it buffered or non-cached.
L4VBUS_RESOURCE_F_MEM_CACHEABLE	Memory resource is cacheable. This implies that the memory resource is prefetchable. If not set, clients must not map it cached. If the resource is neither cacheable nor prefetchable, clients must map it non-cached!
L4VBUS_RESOURCE_F_MEM_MMIO_READ	Reading needs to be performed using the MMIO space protocol.
L4VBUS_RESOURCE_F_MEM_MMIO_WRITE	Writing needs to be performed using the MMIO space protocol.

Definition at line 52 of file vbus_types.h.

16.713.2.3 l4vbus_resource_type_t

enum l4vbus_resource_type_t
Description of vbus resource types.

Enumerator

L4VBUS_RESOURCE_INVALID	Invalid type.
L4VBUS_RESOURCE_IRQ	Interrupt resource.
L4VBUS_RESOURCE_MEM	I/O memory resource.
L4VBUS_RESOURCE_PORT	I/O port resource (x86 only).
L4VBUS_RESOURCE_BUS	Bus resource.
L4VBUS_RESOURCE_GPIO	Gpio resource.
L4VBUS_RESOURCE_DMA_DOMAIN	DMA domain.
L4VBUS_RESOURCE_CLOCK	Clock with dedicated frequency.
L4VBUS_RESOURCE_MAX	Maximum resource id.

Definition at line 39 of file vbus_types.h.

  L4_VCPU_F_FPU_ENABLED = 0x80 }

  State flags of a vCPU.
- enum L4_vcpu_sticky_flags { L4_VCPU_SF_IRQ_PENDING = 0x01 }

  Sticky flags of a vCPU.

Functions

- int l4_vcpu_check_version (l4_vcpu_state_t const *vcpu) L4_NOTHROW

  Check if a vCPU state has the right version.

16.718.1 Detailed Description

vCPU API
Definition in file vcpu.h.

16.718.2 Function Documentation

16.718.2.1 l4_vcpu_check_version()

```
int l4_vcpu_check_version (
            l4_vcpu_state_t const * vcpu)  [inline]
```

Check if a vCPU state has the right version.

Parameters

vcpu	A pointer to an initialized vCPU state.

Return values

1	If the vCPU state has a matching version ID for the current vCPU user-level structures.
0	If the vCPU state has a different (incompatible) version ID than the current vCPU user-level structures.

Definition at line 191 of file vcpu.h.
References L4_NOTHROW, and L4_VCPU_STATE_VERSION.

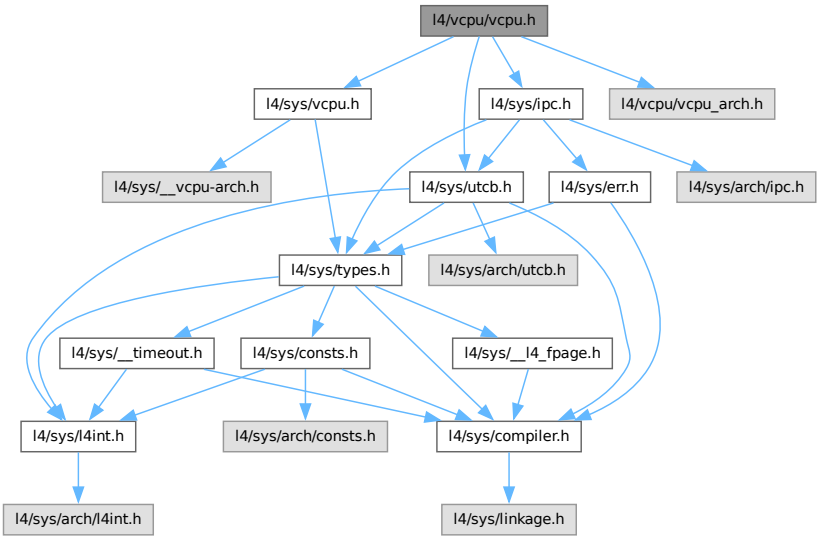
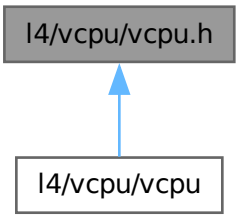
#include <l4/vcpu/vcpu_arch.h>
```

Include dependency graph for vcpu.h:



This graph shows which files directly or indirectly include this file:



Functions

- void l4vcpu_irq_disable (l4_vcpu_state_t *vcpu) L4_NOTHROW

  Disable a vCPU for event delivery.
- unsigned l4vcpu_irq_disable_save (l4_vcpu_state_t *vcpu) L4_NOTHROW

  Disable a vCPU for event delivery and return previous state.
- void l4vcpu_irq_enable (l4_vcpu_state_t *vcpu, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work_cb, l4vcpu_setup_ipc_t setup_ipc) L4_NOTHROW

  Enable a vCPU for event delivery.
- void l4vcpu_irq_restore (l4_vcpu_state_t *vcpu, unsigned s, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_↩ event_work_cb, l4vcpu_setup_ipc_t setup_ipc) L4_NOTHROW

  Restore a previously saved IRQ/event state.
- void l4vcpu_wait_for_event (l4_vcpu_state_t *vcpu, l4_utcb_t *utcb, l4vcpu_event_hndl_t do_event_work↩ _cb, l4vcpu_setup_ipc_t setup_ipc) L4_NOTHROW

  Wait for event.
- void l4vcpu_print_state (const l4_vcpu_state_t *vcpu, const char *prefix) L4_NOTHROW

Print the state of a vCPU.

- int l4vcpu_is_irq_entry (l4_vcpu_state_t const *vcpu) L4_NOTHROW

  Return whether the entry reason was an IRQ/IPC message.

- int l4vcpu_is_page_fault_entry (l4_vcpu_state_t const *vcpu) L4_NOTHROW

  Return whether the entry reason was a page fault.

- int l4vcpu_ext_alloc (l4_vcpu_state_t **vcpu, l4_addr_t *ext_state, l4_cap_idx_t task, l4_cap_idx_t regmgr) L4_NOTHROW

  Allocate state area for an extended vCPU.
