

# L4Re Operating System Framework

Generated on Mon Mar 16 2026 12:35:20 for L4Re Operating System Framework by Doxygen  
1.15.0

Mon Mar 16 2026 12:35:20

<b>1 Overview</b>	<b>1</b>
<b>2 Introduction</b>	<b>3</b>
2.1 L4Re Microkernel	3
2.1.1 Communication	3
2.1.2 Kernel Objects	4
2.2 L4Re System Structure	4
2.3 L4Re Runtime Environment	6
<b>3 Programming for L4Re</b>	<b>7</b>
3.1 L4 Inter-Process Communication (IPC)	7
3.1.1 IPC mechanism	8
3.1.1.1 IPC Flags	8
3.1.1.2 Partner capability selector	9
3.1.1.3 IPC Label	9
3.1.1.4 IPC Message Tag	9
3.1.1.5 IPC Timeouts	10
3.1.1.6 User-level Thread Control Block	11
3.1.1.7 Transfer of Typed Send Items	13
3.1.2 Examples	13
3.1.2.1 User Thread to Kernel Object	14
3.1.2.2 User Thread to User Thread	14
3.1.2.3 User Thread to User Object	16
3.2 Kernel ABI	16
3.2.1 Capability selector and flags	17
3.2.2 Label	17
3.2.3 Message tag	17
3.2.4 Timeouts	18
3.2.5 User-level thread control block (UTCB)	19
3.2.5.1 Buffer descriptor register	19
3.2.6 Typed message items	20
3.2.6.1 Flexpages	20
3.2.6.2 Send items	21
3.2.6.3 Receive items	21
3.2.6.4 Return items	22
3.3 Capabilities and Naming	23
3.4 Spaces and Mappings	24
3.5 Initial Environment and Application Bootstrapping	25
3.5.1 Configuring an application before startup	26
3.5.2 Connecting clients and servers	26
3.6 Memory management - Data Spaces and the Region Map	27
3.6.1 User-level paging	27
3.6.1.1 Data spaces	27

3.6.1.2 Virtual Memory Handling	27
3.6.1.3 Memory Allocation	27
3.7 Program Input and Output	28
3.8 Initial Memory Allocator and Factory	28
3.9 Application and Server Building Blocks	28
3.9.1 Creating Additional Application Threads	28
3.9.2 Providing a Service	29
3.10 Pthread Support	29
3.11 Interface Definition Language	30
3.11.1 Parameter types for RPC	31
3.11.2 Server Side Interface	32
3.11.3 RPC Return Types	32
3.11.4 RPC Method Declaration	33
3.12 L4Re Build System	33
3.12.1 Building L4Re	34
3.12.2 Writing BID Make Files	35
3.12.3 prog.mk - Application Role	35
3.12.4 include.mk - Header File Role	38
3.12.5 test.mk - Test Application Role	39
3.13 Kernel Factory	46
3.13.1 Passing parameters for the create stream	46
<b>4 L4Re Servers</b>	<b>49</b>
4.1 Sigma0, the Root-Pager	50
4.1.1 Factory	51
4.2 Moe	51
4.2.1 Moe objects	51
4.2.1.1 Factory	51
4.3 Ned, the Init Process	56
4.3.1 Lua Bindings for L4Re	57
4.3.1.1 Tutorial	57
4.3.1.2 Capabilities in Lua	57
4.3.1.3 Access to L4Re::Env Capabilities	57
4.3.1.4 Constants	57
4.3.1.5 Application Startup Details	58
4.3.1.6 Reacting on task termination	60
4.3.1.7 Control scheduling	60
4.3.1.8 Access to the kernel debugger	60
4.3.1.9 Using the interactive ned prompt	61
4.3.2 Command Line Options	61
4.4 Io, the Io Server	61
4.5 Virtio Net P2P, a virtual network point-to-point link	67

4.6 Virtio Net Switch, a virtual network switch . . . . .	69
4.7 Uvmm, the virtual machine monitor . . . . .	72
4.7.1 RAM configuration . . . . .	81
4.8 RTC driver . . . . .	82
4.9 Mag, the GUI Multiplexer . . . . .	82
4.10 Cons, the Console Multiplexer . . . . .	85
<b>5 uvmm_dtg The device tree generator for Uvmm</b>	<b>89</b>
<b>6 Bootstrap, the L4 kernel bootstrapper</b>	<b>91</b>
<b>7 Deprecated List</b>	<b>95</b>
<b>8 Topic Index</b>	<b>97</b>
8.1 Topics . . . . .	97
<b>9 Namespace Index</b>	<b>101</b>
9.1 Namespace List . . . . .	101
<b>10 Hierarchical Index</b>	<b>103</b>
10.1 Class Hierarchy . . . . .	103
<b>11 Data Structure Index</b>	<b>117</b>
11.1 Data Structures . . . . .	117
<b>12 File Index</b>	<b>135</b>
12.1 File List . . . . .	135
<b>13 Topic Documentation</b>	<b>149</b>
13.1 Base API . . . . .	149
13.1.1 Detailed Description . . . . .	152
13.1.2 Basic Macros . . . . .	152
13.1.2.1 Detailed Description . . . . .	154
13.1.2.2 Macro Definition Documentation . . . . .	154
13.1.2.3 Function Documentation . . . . .	156
13.1.3 Fiasco extensions . . . . .	157
13.1.3.1 Detailed Description . . . . .	158
13.1.3.2 Function Documentation . . . . .	159
13.1.3.3 Kernel Debugger . . . . .	161
13.1.3.4 Kernel Information Dump . . . . .	169
13.1.3.5 Kernel Tracing . . . . .	170
13.1.4 Flexpages . . . . .	173
13.1.4.1 Detailed Description . . . . .	175
13.1.4.2 Enumeration Type Documentation . . . . .	175
13.1.4.3 Function Documentation . . . . .	179
13.1.5 C++ IPC Interface Definition . . . . .	191

13.1.5.1 Detailed Description . . . . .	191
13.1.5.2 Internal Helpers . . . . .	192
13.1.6 Cache Consistency . . . . .	192
13.1.6.1 Detailed Description . . . . .	193
13.1.6.2 Function Documentation . . . . .	193
13.1.7 Memory related . . . . .	196
13.1.7.1 Detailed Description . . . . .	197
13.1.7.2 Macro Definition Documentation . . . . .	198
13.1.7.3 Enumeration Type Documentation . . . . .	200
13.1.7.4 Function Documentation . . . . .	201
13.1.8 Error codes . . . . .	205
13.1.8.1 Detailed Description . . . . .	206
13.1.8.2 Enumeration Type Documentation . . . . .	206
13.1.9 Object Invocation . . . . .	207
13.1.9.1 Detailed Description . . . . .	209
13.1.9.2 Timeouts during IPC . . . . .	209
13.1.9.3 Macro Definition Documentation . . . . .	209
13.1.9.4 Function Documentation . . . . .	210
13.1.9.5 Message Items . . . . .	225
13.1.9.6 Timeouts . . . . .	232
13.1.9.7 Error Handling . . . . .	241
13.1.9.8 Realtime API . . . . .	247
13.1.9.9 Message Tag . . . . .	247
13.1.9.10 Virtual Registers (UTCBS) . . . . .	260
13.1.10 Kernel Objects . . . . .	273
13.1.10.1 Detailed Description . . . . .	275
13.1.10.2 IPC-Gate API . . . . .	275
13.1.10.3 DMA space . . . . .	280
13.1.10.4 L4 kernel object type information . . . . .	280
13.1.10.5 Factory . . . . .	282
13.1.10.6 Virtual Machines . . . . .	293
13.1.10.7 Interrupt controller . . . . .	314
13.1.10.8 IRQs . . . . .	331
13.1.10.9 Platform Control C API . . . . .	346
13.1.10.10 Scheduler . . . . .	352
13.1.10.11 Kernel-provided semaphore . . . . .	360
13.1.10.12 Task . . . . .	362
13.1.10.13 Thread . . . . .	374
13.1.10.14 Thread groups . . . . .	408
13.1.10.15 Virtual Console . . . . .	410
13.1.11 Kernel Interface Page . . . . .	425
13.1.11.1 Detailed Description . . . . .	427

13.1.11.2 Typedef Documentation	427
13.1.11.3 Enumeration Type Documentation	427
13.1.11.4 Function Documentation	428
13.1.11.5 Memory descriptors (C version)	432
13.1.12 Capabilities	437
13.1.12.1 Detailed Description	438
13.1.12.2 Typedef Documentation	438
13.1.12.3 Enumeration Type Documentation	439
13.1.12.4 Function Documentation	439
13.1.13 Memory Operations	441
13.1.13.1 Detailed Description	442
13.1.13.2 Enumeration Type Documentation	442
13.1.13.3 Function Documentation	443
13.1.14 Integer Types	444
13.1.14.1 Detailed Description	446
13.2 EDID parsing functionality	446
13.2.1 Detailed Description	446
13.2.2 Enumeration Type Documentation	446
13.2.2.1 Libedid_consts	446
13.2.3 Function Documentation	447
13.2.3.1 libedid_check_header()	447
13.2.3.2 libedid_checksum()	447
13.2.3.3 libedid_dump()	448
13.2.3.4 libedid_dump_standard_timings()	448
13.2.3.5 libedid_num_ext_blocks()	448
13.2.3.6 libedid_pnp_id()	449
13.2.3.7 libedid_prefered_resolution()	449
13.2.3.8 libedid_revision()	449
13.2.3.9 libedid_version()	450
13.3 IO interface	450
13.3.1 Detailed Description	451
13.3.2 Typedef Documentation	451
13.3.2.1 l4io_resource_t	451
13.3.3 Enumeration Type Documentation	451
13.3.3.1 l4io_device_types_t	451
13.3.3.2 l4io_iomem_flags_t	452
13.3.3.3 l4io_resource_types_t	452
13.3.4 Function Documentation	453
13.3.4.1 l4io_has_resource()	453
13.3.4.2 l4io_lookup_device()	453
13.3.4.3 l4io_lookup_resource()	454
13.3.4.4 l4io_release_iomem()	454

13.3.4.5 l4io_release_ioport()	455
13.3.4.6 l4io_request_iomem()	455
13.3.4.7 l4io_request_iomem_region()	456
13.3.4.8 l4io_request_ioport()	457
13.3.4.9 l4io_request_resource_iomem()	457
13.4 IPC Helpers	458
13.4.1 Detailed Description	458
13.4.2 Function Documentation	458
13.4.2.1 throw_ipc_exception() [1/2]	458
13.4.2.2 throw_ipc_exception() [2/2]	459
13.5 IRQ handling library	459
13.5.1 Detailed Description	460
13.5.2 Interface using direct functionality.	460
13.5.2.1 Detailed Description	461
13.5.2.2 Function Documentation	461
13.5.2.3 Interface using direct functionality.	465
13.5.3 Interface for asynchronous ISR handlers.	467
13.5.3.1 Detailed Description	468
13.5.3.2 Function Documentation	468
13.5.3.3 Interface for asynchronous ISR handlers with a given IRQ capability.	469
13.6 L4 IPC Opcodes	470
13.6.1 Detailed Description	471
13.6.2 Enumeration Type Documentation	471
13.6.2.1 L4_icu_opcode	471
13.6.2.2 L4_ipc_gate_ops	472
13.6.2.3 L4_platform_ctl_ops	473
13.6.2.4 L4_task_ops	473
13.6.2.5 L4_thread_ops	473
13.6.2.6 L4_vcon_ops	474
13.7 L4 VIRTIO Interface	475
13.7.1 Detailed Description	475
13.7.2 L4 VIRTIO Transport Layer	475
13.7.2.1 Detailed Description	477
13.7.2.2 Typedef Documentation	477
13.7.2.3 Enumeration Type Documentation	478
13.7.2.4 Function Documentation	480
13.7.3 L4 VIRTIO Block Device	484
13.7.3.1 Detailed Description	485
13.7.3.2 Enumeration Type Documentation	485
13.7.4 L4 VIRTIO Input Device	486
13.7.4.1 Detailed Description	486
13.7.5 L4 VIRTIO Network Device	486

13.7.5.1 Detailed Description . . . . .	487
13.8 L4 Vbus functions . . . . .	487
13.8.1 Detailed Description . . . . .	488
13.8.2 Enumeration Type Documentation . . . . .	489
13.8.2.1 L4vbus_dma_domain_assign_flags . . . . .	489
13.8.3 Function Documentation . . . . .	489
13.8.3.1 l4vbus_assign_dma_domain() . . . . .	489
13.8.3.2 l4vbus_get_adr() . . . . .	490
13.8.3.3 l4vbus_get_device() . . . . .	490
13.8.3.4 l4vbus_get_device_by_hid() . . . . .	491
13.8.3.5 l4vbus_get_hid() . . . . .	492
13.8.3.6 l4vbus_get_next_device() . . . . .	493
13.8.3.7 l4vbus_get_resource() . . . . .	494
13.8.3.8 l4vbus_is_compatible() . . . . .	494
13.8.3.9 l4vbus_release_ioport() . . . . .	495
13.8.3.10 l4vbus_request_ioport() . . . . .	496
13.8.3.11 l4vbus_vicu_get_cap() . . . . .	497
13.8.4 L4vbus GPIO functions . . . . .	497
13.8.4.1 Detailed Description . . . . .	498
13.8.4.2 Enumeration Type Documentation . . . . .	498
13.8.4.3 Function Documentation . . . . .	499
13.8.5 L4vbus PCI functions . . . . .	508
13.8.5.1 Detailed Description . . . . .	508
13.8.5.2 Function Documentation . . . . .	508
13.8.6 L4vbus power management functions . . . . .	514
13.8.6.1 Detailed Description . . . . .	514
13.8.6.2 Function Documentation . . . . .	514
13.9 L4Re C Interface . . . . .	516
13.9.1 Detailed Description . . . . .	517
13.9.2 L4Re Util C Interface . . . . .	518
13.9.3 Dataspace interface . . . . .	518
13.9.3.1 Detailed Description . . . . .	519
13.9.3.2 Enumeration Type Documentation . . . . .	519
13.9.3.3 Function Documentation . . . . .	520
13.9.4 Debug interface . . . . .	524
13.9.4.1 Detailed Description . . . . .	524
13.9.4.2 Function Documentation . . . . .	524
13.9.5 DMA Space Interface . . . . .	525
13.9.5.1 Detailed Description . . . . .	525
13.9.5.2 Typedef Documentation . . . . .	526
13.9.5.3 Function Documentation . . . . .	526
13.9.6 Event interface . . . . .	529

13.9.6.1 Detailed Description . . . . .	529
13.9.6.2 Function Documentation . . . . .	530
13.9.7 Log interface . . . . .	532
13.9.7.1 Detailed Description . . . . .	533
13.9.7.2 Function Documentation . . . . .	533
13.9.8 Memory allocator . . . . .	535
13.9.8.1 Detailed Description . . . . .	536
13.9.8.2 Enumeration Type Documentation . . . . .	536
13.9.8.3 Function Documentation . . . . .	536
13.9.9 Namespace interface . . . . .	540
13.9.9.1 Detailed Description . . . . .	541
13.9.9.2 Enumeration Type Documentation . . . . .	541
13.9.9.3 Function Documentation . . . . .	541
13.9.10 Parent interface . . . . .	544
13.9.11 Region map interface . . . . .	544
13.9.11.1 Detailed Description . . . . .	545
13.9.11.2 Enumeration Type Documentation . . . . .	545
13.9.11.3 Function Documentation . . . . .	546
13.9.12 Capability allocator . . . . .	559
13.9.12.1 Detailed Description . . . . .	560
13.9.12.2 Function Documentation . . . . .	560
13.9.13 Kumem allocator utility . . . . .	560
13.9.14 Video API . . . . .	561
13.9.14.1 Detailed Description . . . . .	562
13.9.14.2 Typedef Documentation . . . . .	562
13.9.14.3 Enumeration Type Documentation . . . . .	563
13.9.14.4 Function Documentation . . . . .	563
13.9.15 Initial Environment . . . . .	569
13.9.15.1 Detailed Description . . . . .	570
13.9.15.2 Function Documentation . . . . .	570
13.10 L4Re C++ Interface . . . . .	574
13.10.1 Detailed Description . . . . .	576
13.10.2 L4Re Util C++ Interface . . . . .	576
13.10.2.1 Detailed Description . . . . .	577
13.10.2.2 L4Re Capability API . . . . .	577
13.10.2.3 Kumem utilities . . . . .	579
13.10.3 Console API . . . . .	581
13.10.3.1 Detailed Description . . . . .	581
13.10.4 Debugging API . . . . .	581
13.10.4.1 Detailed Description . . . . .	582
13.10.5 L4Re ELF Auxiliary Information . . . . .	582
13.10.5.1 Detailed Description . . . . .	583

13.10.5.2 Macro Definition Documentation . . . . .	583
13.10.5.3 Enumeration Type Documentation . . . . .	584
13.10.6 Event API . . . . .	584
13.10.6.1 Detailed Description . . . . .	585
13.10.7 Auxiliary data . . . . .	585
13.10.7.1 Detailed Description . . . . .	586
13.10.8 Logging interface . . . . .	586
13.10.8.1 Detailed Description . . . . .	586
13.10.9 Name-space API . . . . .	586
13.10.9.1 Detailed Description . . . . .	587
13.10.10 Parent API . . . . .	587
13.10.10.1 Detailed Description . . . . .	587
13.10.11 L4Re Protocol identifiers . . . . .	588
13.10.11.1 Detailed Description . . . . .	588
13.10.11.2 Enumeration Type Documentation . . . . .	589
13.10.12 Region map API . . . . .	589
13.10.12.1 Detailed Description . . . . .	590
13.10.13 Video API . . . . .	590
13.10.13.1 Detailed Description . . . . .	591
13.10.14 C++ Exceptions . . . . .	591
13.10.14.1 Detailed Description . . . . .	592
13.10.15 Vbus API . . . . .	592
13.10.15.1 Detailed Description . . . . .	593
13.11 L4SHM-based ring buffer implementation . . . . .	593
13.11.1 Detailed Description . . . . .	594
13.11.2 Sender . . . . .	594
13.11.3 Receiver . . . . .	594
13.11.4 Internal . . . . .	594
13.11.4.1 Detailed Description . . . . .	595
13.11.4.2 Macro Definition Documentation . . . . .	595
13.12 Shared Memory Library . . . . .	596
13.12.1 Detailed Description . . . . .	597
13.12.2 Function Documentation . . . . .	598
13.12.2.1 l4shmc_area_overhead() . . . . .	598
13.12.2.2 l4shmc_area_size() . . . . .	598
13.12.2.3 l4shmc_area_size_free() . . . . .	598
13.12.2.4 l4shmc_attach() . . . . .	599
13.12.2.5 l4shmc_chunk_overhead() . . . . .	599
13.12.2.6 l4shmc_connect_chunk_signal() . . . . .	600
13.12.2.7 l4shmc_create() . . . . .	600
13.12.2.8 l4shmc_get_client_nr() . . . . .	601
13.12.2.9 l4shmc_get_initialized_clients() . . . . .	601

13.12.2.10 l4shmc_mark_client_initialized()	602
13.12.3 Chunks	602
13.12.3.1 Detailed Description	603
13.12.3.2 Function Documentation	603
13.12.3.3 Producer	607
13.12.3.4 Consumer	610
13.12.4 Signals	615
13.12.4.1 Detailed Description	615
13.12.4.2 Function Documentation	615
13.12.4.3 Producer	618
13.12.4.4 Consumer	619
13.13 Sigma0 API	623
13.13.1 Detailed Description	624
13.13.2 Enumeration Type Documentation	624
13.13.2.1 l4sigma0_return_flags_t	624
13.13.3 Function Documentation	625
13.13.3.1 l4sigma0_debug_dump()	625
13.13.3.2 l4sigma0_map_anypage()	625
13.13.3.3 l4sigma0_map_errstr()	626
13.13.3.4 l4sigma0_map_iomem()	626
13.13.3.5 l4sigma0_map_kip()	627
13.13.3.6 l4sigma0_map_mem()	627
13.13.4 Internal constants	628
13.13.4.1 Detailed Description	629
13.14 Small C++ Template Library	629
13.14.1 Detailed Description	630
13.14.2 Function Documentation	630
13.14.2.1 clamp()	630

# Chapter 1

## Overview

Welcome to the documentation of the L4Re Operating System Framework, or L4Re for short. There are two parts to this documentation: a user manual, which provides a birds eye view of L4Re and its environment, and a reference section which documents the complete programming API.

### User Manual

1. [Introduction](#) shortly explains the concept of microkernels and introduces the basic terminology.
2. [Programming for L4Re](#) explains in detail the most important programming concepts.
3. [L4Re Servers](#) provides a quick overview over standard services running on the L4Re operating system.

### Reference

The second part provides the complete reference of all classes and functions of the L4Re Operating System Framework as well as a list of example code.

# Chapter 2

## Introduction

The intention of this section is to provide a short overview about the [L4Re](#) Operating System Framework.

The general structure of a microkernel-based system will be introduced and the principal functionality of the servers in the basic environment outlined.

### 2.1 L4Re Microkernel

The [L4Re](#) Microkernel is the lowest-level component of software running in an L4Re-based system. The microkernel is the only component that runs in privileged processor mode. It does not include complex services such as program loading, device drivers, or file systems; those are implemented in user-level programs on top of it (a basic set of these services and abstractions is provided by the [L4](#) Runtime Environment).

Microkernel services are implemented in kernel objects. Tasks hold references to kernel objects in their respective *"object space"*, which is a kernel-protected table. These references are called *capabilities*. System calls to the microkernel are function invocations on kernel objects through the corresponding capabilities. These can be thought of as function invocations on object references in an object-oriented programming environment. Furthermore, if a task owns a capability, it may grant other tasks the same (or fewer) rights on this object by passing the capability from its own to the other task's object space.

From a design perspective, capabilities are a concept that enables flexibility in the system structure. A thread that invokes an object through a capability does not need to care about where this object is implemented. In fact, it is possible to implement all objects either in the kernel or in a user-level server and replace one implementation with the other transparently for clients.

#### 2.1.1 Communication

The basic communication mechanism in L4-based systems is called *"Inter Process Communication (IPC)"*. It is always synchronous, i.e. both communication partners need to actively rendezvous for IPC. In addition to transmitting arbitrary data between threads, IPC is also used to resolve hardware exceptions, faults and for virtual memory management.

### 2.1.2 Kernel Objects

The following list gives a short overview of the kernel objects provided by the [L4Re](#) Microkernel:

- **Task** A task comprises a memory address space (represented by the task's page table), an object space (holding the kernel protected capabilities), and on x86 an IO-port address space.
- **Thread** A thread is bound to a task and executes code. Multiple threads can coexist in one task and are scheduled by the microkernel's scheduler.
- **Factory** A factory is used by applications to create new kernel objects. Access to a factory is required to create any new kernel object. Factories can control and restrict object creation.
- **IPC Gate** An IPC gate is used to create a secure communication channel between different tasks. It embeds a label (kernel protected payload) that securely identifies the gate through which a message is received. The gate label is not visible to and cannot be altered by the sender.
- **IRQ** IRQ objects provide access to hardware interrupts. Additionally, programs can create new virtual interrupt objects and trigger them. This allows to implement a signaling mechanism. The receiver cannot decide whether the interrupt is a physical or virtual one.
- **Vcon** Provides access to the in-kernel debugging console (input and output). There is only one such object in the kernel and it is only available, if the kernel is built with debugging enabled. This object is typically interposed through a user-level service or without debugging in the kernel can be completely based on user-level services.
- **Scheduler** Implements scheduling policy and assignment of threads to CPUs, including CPU statistics.

## 2.2 L4Re System Structure

The system has a multi-tier architecture consisting of the following layers depicted in the figure below:

- **Microkernel** The microkernel is the component at the lowest level of the software stack. It is the only piece of software that is running in the privileged mode of the processor.
- **Tasks** Tasks are the basic containers (address spaces) in which system services and applications are executed. They run in the processor's deprivileged user mode.

Figure 2.1 Basic Structure of an L4Re based system

In terms of functionality, the system is structured as follows:

- Microkernel** The kernel provides primitives to execute programs in tasks, to enforce isolation among them, and to provide means of secure communication in order to let them cooperate. As the kernel is the most privileged, security-critical software component in the system, it is a general design goal to make it as small as possible in order to reduce its attack surface. It provides only a minimal set of mechanisms that are necessary to support applications.
- Runtime Environment** The small kernel offers a concise set of interfaces, but these are not necessarily suited for building applications directly on top of it. The [L4Re](#) Runtime Environment aims at providing more convenient abstractions for application development. It comprises low-level software components that interface directly with the microkernel. The root pager *sigma0* and the root task *Moe* are the most basic components of the [L4Re](#) Runtime Environment. Other services (e.g., for device enumeration) use interfaces provided by them.
- Applications** Applications run on top of the system and use services provided by the runtime environment – or by other applications. There may be several types of applications in the system and even virtual machine monitors and device drivers are considered applications in the terminology used in this document. They are running alongside other applications on the system.

Lending terminology from the distributed systems area, applications offering services to other applications are usually called *servers*, whereas applications using those services are named *clients*. Being in both roles is also common, for instance, a file system server may be viewed as a server with respect to clients using the file system, while the server itself may also act as a client of a hard disk driver.

## 2.3 L4Re Runtime Environment

The [L4Re](#) Runtime Environment provides a basic set of services and abstractions, which are useful to implement and run user-level applications on top of the [L4Re](#) Microkernel. They form the [L4Re](#) Operating System Framework.

The [L4Re](#) Operating System Framework consists of a set of libraries and servers. [L4Re](#) follows an object-oriented design. Server interfaces are object-oriented, and the implementation is also object-oriented.

A minimal L4Re-based application needs 3 components to be booted beforehand: the [L4Re](#) Microkernel, the root pager (Sigma0), and the root task (Moe). The Sigma0 root pager initially owns all system resources, but is usually used only to resolve page faults for the Moe root task. Moe provides the essential services to normal user applications such as an initial program loader, a region-map service for virtual memory management, and a memory (data space) allocator.

## Chapter 3

# Programming for L4Re

This part of the documentation discusses the concept of microkernel-based programming in more detail.

You should already have a basic understanding of the [L4Re](https://l4re.org/) programming environment from the tutorials available on [l4re.org](https://l4re.org/)(<https://l4re.org/>).

- [L4 Inter-Process Communication \(IPC\)](#)
- [Kernel ABI](#)
- [Capabilities and Naming](#)
- [Spaces and Mappings](#)
- [Initial Environment and Application Bootstrapping](#)

- [Application and Server Building Blocks](#)
- [Pthread Support](#)
- tasks and threads
- communication channels
- server loops
- [Interface Definition Language](#)
- hardware access
- [L4Re Build System](#)
- [Kernel Factory](#)

### 3.1 L4 Inter-Process Communication (IPC)

Inter-process communication (IPC) is the fundamental communication mechanism in the [L4Re](#) Microkernel.

Basically IPC invokes a subroutine in a different context using input and output parameters. It is used to communicate between userland threads and, as a special case, to communicate between a userland thread and a kernel object. IPC provides the only (non-debugging) way of doing system calls.

### 3.1.1 IPC mechanism

When using this API, an IPC operation can be conducted using the `l4_ipc()` function (or one of its related [helpers](#)). In general it causes a method to be invoked on the called kernel object. An IPC operation consists of a send and receive phase, but either of them can be skipped, that is, an IPC operation can consist of only either a send or a receive phase. IPC is always synchronous and blocking and can be given a timeout. Timeouts can be specified separately for each phase. Invoking the IPC syscall without any phase is deprecated.

On the lowest abstraction level, IPC operations need the following arguments:

- [flags](#) describing the IPC mode,
- the [capability selector](#) of the communication partner,
- a [label](#),
- a [message tag](#), and
- a pair of [timeout](#) values.

During an IPC operation the kernel accesses the UTCB of the current thread to read parameters which are not passed as direct arguments.

As result of an IPC operation the kernel returns a message tag and a label and the kernel also changes UTCB content. For the detailed call signature, refer to `l4_ipc()`. Furthermore, depending on the IPC parameters, the kernel might have transferred the FPU state and capabilities (memory, I/O ports, and/or object capabilities) from the sender to the receiving thread.

The transition between the IPC send phase and the IPC receive phase is atomic, that is, as soon as the send phase has finished, the thread receive phase starts. A relative receive timeout does not start before the send phase has finished (see also below) and a thread which received an IPC call from another thread can assume that the other thread is ready to receive the reply message and the replying thread can therefore reply with a timeout of zero, see [IPC Timeouts](#).

For performance optimization and under certain conditions, the kernel may perform a context switch from the IPC sender to the IPC receiver without consulting the scheduler after the send phase finished. For instance, a client performing an IPC call to a server has to wait for the server anyway. Hence, after the client request was sent to the server, the kernel switches directly to the server thread. This behavior can be disabled by setting the `L4_MSGTAG_SCHEDULE` flag in the sender message tag (see below).

#### 3.1.1.1 IPC Flags

The capability selector *flags* (`L4_SYSF_SEND`, `L4_SYSF_RECV`, `L4_SYSF_OPEN_WAIT`, `L4_SYSF_REPLY`) are used by the invoking thread to define the intended IPC operation. The variants of `l4_ipc()` (see [Object Invocation](#)) use the flags

- to request the IPC phases (send-only IPC, receive-only IPC, IPC with send and receive phase), and
- to decide, if the reply capability (see [below](#)) should be used instead of the capability of a dedicated kernel object as target for the send phase (*reply*), and
- to decide, if receiving should wait for an incoming message from any possible sender (*open wait*) instead of a message from a dedicated sender (*closed wait*).

### 3.1.1.2 Partner capability selector

The *partner capability selector* defines a kernel object as partner of the IPC operation. Some kernel objects forward IPC to a userland thread.

Basically an object capability is represented by `l4_cap_idx_t` where the bits starting from `L4_CAP_SHIFT` are used as index into the local capability table of the current address space.

Specifying `L4_INVALID_CAP` as target for an IPC operation is equivalent to specifying a thread capability of the current thread with full permissions. As a result, the userland thread either communicates with its corresponding kernel thread object (if `L4_PROTO_THREAD` is specified as protocol value, see the description of the message tag below) or the IPC target is the current userland thread. In the latter case, no IPC will be performed and the send phase and the receive phase will block until the corresponding timeout has expired, see below.

A special partner is defined by the *reply capability*. Since it would be impractical (and a security flaw) to always pass an explicit object capability to reply to for each IPC, the kernel generates an implicit one that can be used for just that purpose if the IPC contains an **open wait** phase. The reply capability is valid after a receive phase and points to the kernel object that sent the IPC just received. It can be used only once. The reply capability is selected by setting the `L4_SYSF_REPLY` flag, see above.

### 3.1.1.3 IPC Label

The IPC label is a machine word which is transferred unchanged from the IPC sender to the IPC receiver when directly sending to a userland thread. However, the primary purpose of the label is to create a relationship between an `L4::Rcv_endpoint` (`L4::lpc_gate` or `L4::lrq`) and the bound thread.

During `L4::Rcv_endpoint::bind_thread()`, a label is specified. If the thread receives an IPC message through the endpoint, that label is delivered to the receiving thread as output parameter of `l4_ipc()` instead of the label specified during the corresponding IPC send operation (see the detailed description of `L4::lpc_gate` for more details on the label with IPC gates). The label is usually used by the receiving thread to invoke the object which is responsible for handling the IPC request of the corresponding endpoint. This mechanism is used by the `L4::Epiface` mechanism for server loops.

### 3.1.1.4 IPC Message Tag

The *message tag* (`l4_msgtag_t`) describes the payload of the IPC and can also be used to enable certain features. It contains:

- a *protocol value* (cf. `l4_msgtag_t::label()`, also called the tag's *label*),
- the number of items in *UTCB message registers* to transfer (cg. `l4_msgtag_t::words()` and `l4_msgtag_t::items()`), and
- flags (cf. `l4_msgtag_t::flags()` and `L4_msgtag_flags`, may be 0).

The information from the message tag is required by the kernel to transfer the message. The IPC system call returns a message tag as result of the IPC operation. On success, a copy of the message tag specified by the sender is returned if there is a receive phase. Without receive phase, a successful IPC syscall returns the message tag specified as input parameter.

Failures during IPC are signalled using the `L4_MSGTAG_ERROR` flag in the message tag. If this bit is set by the kernel, the content of the returned message tag apart from that bit is undefined and the kernel wrote the actual error code into the `l4_thread_regs_t::error` register of the UTCB (see also *IPC Thread Control Registers*). When an IPC error occurs after the rendezvous of the IPC partners, both partners observe the same error information. If, for

instance, the IPC was aborted using `L4::Thread::ex_regs()`, the sender gets an `L4_IPC_SECANCELED` error while the receiver gets an `L4_IPC_RECANCELED` error. The function `L4Re::chkipc()` can be used to verify that an IPC operation finished successfully: It throws an error if the IPC failed.

The *protocol value* is usually used to distinguish between different protocols of the same interface. Certain protocol IDs are pre-defined when talking to kernel objects, see `L4_msgtag_protocol`. From IPC point of view, the protocol value is just payload that is transferred from sender to receiver and hence doesn't have a dedicated meaning.

By convention, during IPC calls, the protocol value is used for return values, where negative values signify errors. See the [section](#) about L4 RPC return types for further information. The function `L4Re::chksys()` can be used to verify that an RPC call using IPC was successful: It throws an error if the IPC failed or if the returned protocol value is negative.

### 3.1.1.5 IPC Timeouts

As written above, IPC *timeouts* are specified separately for the send phase (IPC send timeout) and the receive phase (IPC receive timeout). The timeout of one phase is encapsulated by `l4_timeout_s`. Both timeouts are combined into a single `l4_timeout_t` parameter. Timeouts are either relative to the current time of the invoking thread or absolute. In the latter case, the absolute time of the deadline of the respective phase is written into a UTCB buffer register (see `l4_timeout_abs()`). The relative timeout of the receive phase starts immediately after the send phase has finished.

Two specific timeout values are sufficient for most IPC operations:

- `L4_IPC_TIMEOUT_NEVER` is used if the IPC partner might not yet be ready. Usually a client trusting a server will perform an IPC call with an infinite timeout for both phases. The send phase will take some time if the IPC receiver is currently not ready. The receive phase will take some time as the server needs time to serve the request. Also, a server will usually wait with an infinite receive timeout for the next request (see below for a possible exception).
- `L4_IPC_TIMEOUT_0` is used when it is either certain that the IPC receiver is currently ready or if the IPC sender doesn't want to wait if the IPC receiver is not ready. The former case applies to a thread which was called with an IPC call, for example a server got a client request. The reply to the IPC call should use a timeout of zero to ensure that a client doesn't block a server (server could not deliver the result of the request). See also `L4::ipc_srv::Default_timeout`. Another case is an IPC send operation for waking up another thread from an IPC receive operation. If the other thread is not ready to receive, then it might be already woken up and it does not make sense to wait any longer. Also triggering an IRQ is usually done with a send timeout of 0, see `L4::Triggerable::trigger()`.

In certain cases it also makes sense to specify an IPC timeout different from "never" or "zero":

- A server might leave the server loop after some time to perform idle work (see `L4::ipc_srv::Server_iface::add_timeout()`).
- A thread does not want to wait for an infinite time if the partner is not ready. This could be also some safety measure.
- A thread wants to block for a certain amount of time without consuming CPU time. The `l4_ipc_sleep()` function specifies the `L4_INVALID_CAP` as target for an IPC receive operation and specifies the intended relative waiting period as IPC timeout. Waiting for an absolute timeout would be possible with similar code.

#### Note

The kernel IPC path is optimized for the two special cases using `L4_IPC_TIMEOUT_NEVER` and `L4_IPC_TIMEOUT_0`. Specifying a different timeout causes more maintenance effort for the kernel.

Special care is required if a finite timeout for the receive phase of an IPC call is specified: The IPC receive operation could abort before the partner was able to send the reply message. Under certain circumstances the partner may still have the temporary reply capability to the calling thread and may use this capability to reply to the caller at a later, unexpected time specifying an arbitrary IPC label. This case is relevant for servers which call another, possibly untrusted, server while serving a client request.

### 3.1.1.6 User-level Thread Control Block

The **UTCB** is located on a power-of-2-sized and power-of-2-aligned memory area shared between userland and the kernel (`L4::Task::add_ku_mem()`). The UTCB is bound to a thread during the `L4::Thread::control()` operation with the `L4::Thread::Attr` parameters set up using `L4::Thread::Attr::bind()`. The UTCB is used for IPC-related data exchange and is set up before invoking `l4_ipc()`. To access certain parts of the UTCB, the corresponding functions have to be used (there is no data type `L4_utcb` or similar). The UTCB consists of:

- the **message registers** `MR[0], MR[1], ..., MR[n-1]` with  $n = \text{L4\_UTCB\_GENERIC\_DATA\_SIZE}$  (access using `l4_utcb_mr()`),
- the **buffer descriptor register** `BDR` (access using `l4_utcb_br()`, see `l4_buf_regs_t::bdr`),
- the **buffer registers** `BR[0], BR[1], ..., BR[m-1]` with  $m = \text{L4\_UTCB\_GENERIC\_BUFFERS\_SIZE}$  (access using `l4_utcb_br()`),
- the **thread control registers** (access using `l4_utcb_tcr()`, includes the IPC error code), and
- in case of an exception IPC, the register state of the thread which triggered the exception (access using `l4_utcb_exc()`).

IPC to a kernel object requires the setup of the UTCB of the corresponding userlevel thread. IPC between userlevel threads requires the setup of UTCBs of both partners.

The kernel changes only the following UTCB content:

- The message registers of the UTCB of the receiver of an IPC, and
- the IPC error field of the thread invoking `l4_ipc()` if there was an error during IPC.

#### 3.1.1.6.1 IPC Message registers

The *message registers* contain *untyped items* and *typed items*. The sender's typed items are interpreted by the kernel in conjunction with the receiver's *receive items*. Each typed send item occupies two message registers. The untyped items, on the other hand, are free to be used by the communication partners to exchange data: The content of all message registers used for untyped items (`l4_msgtag_t::words()`) is copied from the UTCB of the IPC sender to the UTCB of the IPC receiver.

A typed send item consists of a *flexpage* (see `l4_fpage()`, `l4_obj_fpage()`, and `l4_iofpage()`) of the to be transferred capabilities (*flexpage word*) and a *message word*. There are two types of send items: *map items* and *void items*. For a void item, the message word is all zero. For a map item, the message word contains:

- the *compound bit* allowing to use the same receive buffer for the subsequent typed send item (scatter-gather behavior, see `L4_ITEM_CONT` of `l4_msg_item_consts_t`),
- the *type bit* defining this typed send item as a *map item*,
- the *grant flag* for delegating the access to the flexpage from the sender to the receiver and atomically removing the rights from the sender (see `l4_msg_item_consts_t`),
- *attributes* with semantics depending on the item type; for memory mappings, they contain cacheability information (see `l4_fpage_cacheability_opt_t`); for objects, they contain additional rights (see [Attributes and additional permissions for object send items](#)),
- the *send base* (also called *hot spot*) defining what is actually mapped when send and receive flexpages have a different size.

A typed send item can be created using `l4_sndfpage_add()`. This function sets the compound bit unconditionally. Alternatively, the functions `l4_map_control()` and `l4_map_obj_control()` can be used to set up the message word of a map item for a memory flexpage respective for objects.

See [below](#) for a description how typed items are transferred.

### 3.1.1.6.2 IPC Buffer Registers

The *buffer registers* and *buffer descriptor register* are interpreted by the kernel during the receive phase (if any). [Buffer](#) registers define *receive items* which are required to receive typed send items (memory, I/O ports or object capabilities). To specify a receive item, up to three buffer registers are required:

- A *small receive item* ([L4::ipc::Small\\_buf](#)) occupying one buffer register is sufficient to receive one object capability.
- A *receive item* ([L4::ipc::Rcv\\_fpage](#)) occupying two or three buffer registers (*message word*, a *flexpage*, and an optional destination task capability index) is required to receive memory flexpages, I/O ports, or multiple object capabilities.

### 3.1.1.6.3 IPC Buffer Descriptor Register

The buffer descriptor register defines indices of buffer registers used to receive dedicated types of send items and also contains a flag:

- 5 bits starting at [L4\\_BDR\\_MEM\\_SHIFT](#) define the index of the first receive item used for memory flexpages.
- 5 bits starting at [L4\\_BDR\\_IO\\_SHIFT](#) define the index of the first receive item used for I/O flexpages.
- 5 bits starting at [L4\\_BDR\\_OBJ\\_SHIFT](#) define the index of the first receive item used for object flexpages.
- The [L4\\_UTCB\\_INHERIT\\_FPU](#) can be set using [l4\\_utcb\\_inherit\\_fpu\(\)](#) and allows to receive the FPU state from the IPC sender. This is only relevant if the sender set [L4\\_MSGTAG\\_TRANSFER\\_FPU](#) in the message tag.

For most use cases, a BDR value of zero is sufficient. In that case, if `BR[0]` contains a void item, no capabilities are received. Otherwise, only one type of capabilities (memory, I/O ports or objects) can be received even if there are several receive items. For more complex setups that require receiving different types of capabilities in one receive operation, other BDR values are necessary.

The BDR of the receiving thread is only used by the kernel if at least one typed item is transferred during the IPC or if [L4\\_MSGTAG\\_TRANSFER\\_FPU](#) is set in the UTCB of the sending thread.

### 3.1.1.6.4 IPC Thread Control Registers

The [l4\\_thread\\_regs\\_t::error](#) register contains the IPC error code in case the [L4\\_MSGTAG\\_ERROR](#) flag is set in the message tag returned by an IPC syscall. Otherwise this register is not touched by the kernel. See [l4\\_ipc\\_tcr\\_error\\_t](#) for a detailed enumeration of all possible error codes during an IPC operation.

The [l4\\_thread\\_regs\\_t::free\\_marker](#) is set by the kernel to zero immediately before a thread is destroyed. This value indicates that the kernel does not longer use the UTCB and it can be re-used by other threads.

The other members of [l4\\_thread\\_regs\\_t](#) are never touched by the kernel.

### 3.1.1.7 Transfer of Typed Send Items

The kernel interprets all typed items in the sender UTCB ([l4\\_msgtag\\_t::items\(\)](#)) and performs the following operations while modifying the corresponding typed items in the receiver UTCB:

- If the message item of the sender is void, this item is ignored and the message word of the corresponding typed item in the receiver UTCB is set to zero (making it a void item). The flexpage word of this item is not changed.
- Otherwise, if the type bit of the message item of the sender is not set, the IPC is aborted with [L4\\_IPC\\_SEMSGCUT](#) / [L4\\_IPC\\_REMSGCUT](#).
- Otherwise, if there is a receive item corresponding to the flexpage type of the send item available (see [IPC Buffer Descriptor Register](#)), information described by the flexpage is transferred to the receiver.

In the last case, the message word of the typed item in the receiver UTCB is modified to contain the send base, the type and the size of the transferred flexpage, as well as a copy of the compound bit and the type bit of the send item. If the receiver ordered a local ID in the corresponding receive item, the kernel attempts to apply special rules, see [L4\\_RCV\\_ITEM\\_LOCAL\\_ID](#). Otherwise, regular mappings as described by the flexpage of the send item are created in the receiver space.

A receive item forms a *receive window* of a specific address and size in the receiver space. Each typed send item that is a map item requires a corresponding receive item. By default, there is a one-to-one mapping (one receive item per typed send item) but it is also possible to use one receive item to receive several typed send items: The compound bit (see [l4\\_msg\\_item\\_consts\\_t](#)) of a send item defines if the following typed send item shall use the same receive item as the current one for receiving the flexpage. If the compound bit is set, proper values of the send base shall be used to prevent overlapping of addresses in the receiver space.

The send base is relevant when the size of the receive flexpage differs from the size of the transferred resource. As a typical example, triggering a memory page fault opens a receive window covering the entire memory address space of the faulting thread. The pager will usually reply a memory flexpage smaller than the entire address space of the faulting thread. Hence, the pager has to specify a proper base which is used as offset of the sent object in the receive flexpage in the *receiver space*. If the sender flexpage is bigger than the receive window, a flexpage of the size of the receive window starting at the send base in the *sender space* is transferred to the receiver.

The kernel will stop transmission of typed items before [l4\\_msgtag\\_t::items\(\)](#) is reached either if it finds a void item as receive buffer or if the flexpage type of the send item does not match the flexpage type of the corresponding receive item. Under both conditions, the IPC is aborted with [L4\\_IPC\\_SEMSGCUT](#) / [L4\\_IPC\\_REMSGCUT](#).

#### Note

The kernel ignores the flexpage access rights of the receive items. The actual rights for a transferred resource in the target address space are defined by the access rights to that resource of the IPC sender address space and the flexpage access rights in the typed send item. Additionally, when transferring object capabilities, the transferred rights also depend on the sender's rights on the capability invoked for IPC.

The kernel does not unmap capabilities in the receive window when there is no capability present at the corresponding index at the sender. Further, the receiver cannot reliably detect at which capability indices it received capabilities in its receive windows. Therefore, before receiving from an untrusted source, all receive windows should be cleared. Otherwise the receiver may erroneously associate a capability in one of its receive windows with his last IPC partner although it was actually received in an earlier IPC.

However, the kernel indicates if at least one object capability was received or not, see [L4::lpc::Snd\\_fpage::cap\\_received\(\)](#).

## 3.1.2 Examples

A number of examples show the interplay of the concepts introduced so far.

### 3.1.2.1 User Thread to Kernel Object

The `L4::Scheduler` kernel object has a method `L4::Scheduler.idle_time()`. It takes a set of CPUs to query, represented by two machine words.

In user space, the function `L4::Cap<L4::Scheduler>->idle_time()` is called, which does the following:

- Fill `MR[0]` with a constant identifying the method being called (`L4_SCHEDULER_IDLE_TIME_OP`).
- Fill `MR[1]` and `MR[2]` with the two words making up the CPU set.
- Set up the message tag with the protocol value (`L4_PROTO_SCHEDULER`), the number of untyped and typed items (3 and 0), and some flags.
- Call `l4_ipc()` with the partner capability ID, the tag, the pointer to the filled UTCB, infinite timeouts, and with flags indicating a send and receive phase. (The label does not matter in this case.)

This function traps into kernel space using standard platform specific mechanisms. The kernel reads the protocol value on the message tag, checks that the partner capability ID refers to a valid object that speaks that protocol, and dispatches the message to the appropriate handler. The handler fills the first 64 bits of the message registers with the computed time value. This will cover `MR[0]` on 64-bit architectures and `MR[0]` and `MR[1]` on 32-bit architectures. It then sets up the return message tag:

- The number of untyped items is 1 or 2.
- The number of typed items is 0.
- The protocol value contains the return value and is set to 0.
- An error would be signalled as a negative protocol value. Under certain conditions (e.g. wrong kernel object capability specified), the error is signalled as IPC error (see `L4_MSGTAG_ERROR` in the description of the `IPC Message Tag`).
- (The return label is as irrelevant in this case as the send label.)

This reply is received by the receive phase of the original `l4_ipc()` call from userland. Finally the `l4_ipc()` function copies the time value out of the message registers and forwards it with a possible error from the message tag flags to its caller.

### 3.1.2.2 User Thread to User Thread

When the target kernel object is of type `L4::Thread` (or `L4::ipc_gate`, but we will cover this in the example [below](#)) and the message tag's protocol value is not `L4_PROTO_THREAD`, the kernel will forward the IPC message to the userland thread represented by the kernel object. There it can be received by a call to `l4_ipc()`. The restriction of the protocol number is necessary because one also wants to invoke `L4::Thread`'s control methods such as `L4::Thread.switch_to()` or `L4::Thread.ex_regs()`. Besides this restriction, the interpretation of all the IPC parameters and the untyped items of the UTCB is up to the communication partners.

### 3.1.2.2.1 Simple Messages

A simple example is a client calling a server to have a computation performed on a value: Similar to IPC from a userland thread to a kernel object, the client writes the value to `MR[0]`. It sets up the message tag with some agreed upon protocol value (which, as explained above, must be different from `L4_PROTO_THREAD`), number of untyped items to 1, typed items to 0, and no flags set. The client may want to pass a label that identifies itself, as many clients can use the server. In this context, the identifier might also be passed via the message registers, but the label is the proper place for this, as it gets a special treatment by the kernel for IPC gates (covered by the example below). The client then calls `l4_ipc()` with the tag, label and flags indicating it wants a send phase and a receive phase (as it wants a result back). The target is the capability index referring to a capability for the `L4::Thread` kernel object of the server.

To be able to receive an IPC message, the server has set up a UTCB of its own and called `l4_ipc()` with flags indicating it only wants to enter a receive phase and it accepts IPCs from any partner. This is called an **open wait**. (The alternative would be to specify a capability index referring to a `L4::Thread` capability to exclusively receive from.)

Both system calls (the send IPC initiated by the client and the receive IPC initiated by the server) may be seen by the kernel in any order but the IPC will not start before sender and receiver are ready. In that case the kernel will copy the relevant message registers the client specified in the message tag from the client's UTCB to the server's UTCB, in the current example just `MR[0]`. It will then switch the client to the receive phase of its call (which cannot yet be executed) and return the server's call with the message tag and label.

The server inspects the tag for the correct protocol value and number of untyped items passed, inspect the label to decide whether it maybe wants special treatment of this particular client, performs the computation on `MR[0]` and writes the result back to `MR[0]` (or to more words, depending on what exactly it computes). It sets up the tag in the usual way, but probably needs to pass no label, as the client knows who it is talking to.

For the reply, the server makes use the reply capability (see above). Since the client sent the last IPC to the server, the reply capability will point to it. So when the server calls `l4_ipc()` with the computed result in the message registers and using the reply capability as target, the kernel knows to forward this to the client's thread. The kernel copies the message registers from the server's UTCB to the client's UTCB, and the client's `l4_ipc()` system call, which is still stuck in the receive phase, is returned with the tag.

The client looks at the tag and then the message registers for its wanted result and the example is concluded.

### 3.1.2.2.2 Send Items

IPC between userland threads is also used to transfer typed items: Memory, I/O ports, and objects, all represented as flexpages. Typed items and untyped items can be part of the same IPC. As general rule, the sender specifies what he wants to send, the receiver where and how much it wants to receive, and the kernel checks the required permissions before doing the actual transfer. As written before, this mechanism is synchronous and the receiver cannot be transferred items against its will.

See also

[Flexpages](#)

Suppose a client wants a server to have read only access to a page of its memory. The client sets up a flexpage covering the page and with only the `L4_FPAGE_RO` right set. The server sets up a flexpage of a memory region where it will receive the mapping. This may be larger than one page, suppose for our case four pages, in which case the exact position of the mapping will be resolved by the send base provided by the sender. The client combines the hot spot and some flags into a machine word and writes it to `MR[0]` (see also `l4_map_control()`). At `MR[1]` follows the flexpage it wants to send (see also `l4_fpage()`). The server does almost the same but writes the words to `BR[0]` and `BR[1]`. (The server could also specify a hot spot, but it is currently ignored by the kernel.) The

client specifies 1 typed and 0 untyped items in the message tag. The server writes 0 to `BDR` to specify that the first receive item starts at the first buffer register.

Both client and server initiate their IPC, the client with only a send phase to the server, and the server with an open wait receive phase. The kernel checks the compatibility of the send items and the receive buffers (e.g. that no object capability flexpage is sent to a receive buffer describing a memory mapping flexpage) and updates its internal structures to reflect the change. In our case, the sender's hot spot indicates to which of the four pages that make up the receive buffer the sent page should be mapped. The kernel also translates the typed send item to the server's address space and stores it in the server's UTCB at `MR[0]` and `MR[1]`.

Once the server returns from its syscall, it will have read access to the client's shared page.

### 3.1.2.3 User Thread to User Object

A common use case for thread to thread communication is when a server implements a number of object interfaces and a client wants to invoke methods on them. For security reasons, the server does not want to hand out its thread capability to everyone it nonetheless wants to serve. It also may not want to allow every client access to everyone of its interfaces. For this purpose, IPC gates implemented by the kernel object `L4::ipc_gate` can be used. An IPC gate can be bound to a thread and forwards IPC to it. In doing so it applies two transformations

1. It sets the label to a predefined value.
2. It changes the rights of transferred items (see `L4_CAP_FPAGE_S`).

For each object of every interface the server implements, it creates an IPC gate and binds it to itself (see `L4::ipc_gate::bind_thread()`). It sets the gate's label to a unique value identifying the object. Then it hands the gate out to clients. Several clients can be handed the same gate and will all end up invoking methods on the same object.

Instead of setting the target as the server's thread kernel object, the client uses the IPC gate's instead. The label the client sends is irrelevant, as the gate will overwrite it with the value the server has set during the bind operation. The server executes an open wait, and the kernel performs the same operation as in the above [example](#) with the transformed IPC finally ending up in the server's thread.

The server checks that the received label refers to one of its objects. It then checks if the protocol value in the message tag matches the interface the object implements. Then it invokes the method specified in `MR[0]` with the rest of the arguments. Finally it returns the results via UTCB and message tag to the reply capability and waits for the next IPC.

## 3.2 Kernel ABI

This section details the binary representation of the IPC interface of the kernel.

It accompanies the [L4 Inter-Process Communication \(IPC\)](#) section. The details presented here are usually not relevant when developing L4Re applications and can therefore be skipped by many readers.

### Note

The kernel ABI is subject to change. Please use the API instead of relying on particular binary representations.

The following notation is used to indicate how particular data fields are used:

- `[in]`: The kernel reads and interprets this field.
- `[out]`: The kernel writes this field with information provided by the kernel.
- `[cpy]`: The kernel copies this field from sender to receiver (without interpretation if `[in]` is not listed as well).

The above indications may be combined.

### 3.2.1 Capability selector and flags

See [partner capability selector](#) and [IPC flags](#).

The kernel reads and interprets all the fields ([in]).

- Bits 0...3 [in]: These bits correspond to the capability selector flags. The individual bits correspond to [L4\\_SYSF\\_REPLY](#), [L4\\_SYSF\\_OPEN\\_WAIT](#), [L4\\_SYSF\\_RECV](#), [L4\\_SYSF\\_SEND](#). Note that not all combinations of those bits are valid; see [L4\\_SYSF\\_NONE](#) for an overview.
- Bits 4...10 [in] SBZ: should be zero
- Bit 11 [in] special: Set when using [L4\\_INVALID\\_CAP](#), otherwise unset.
- Bits 12...MSB [in]: Capability index if special is unset, otherwise all those bits should be one (see [L4\\_INVALID\\_CAP](#), [partner capability selector](#) and [l4\\_cap\\_idx\\_t](#)).

### 3.2.2 Label

See [IPC label](#).

When IPC is sent via a thread capability, the label is copied to the receiver unchanged ([cpy]).

When IPC is sent via an IPC gate, the sent label is ignored and the kernel provides the bitwise OR (|) of the IPC gate label and the sender's write and special permissions (see [L4\\_CAP\\_FPAGE\\_W](#) and [L4\\_CAP\\_FPAGE\\_S](#)) of the used capability ([out]):

### 3.2.3 Message tag

See [IPC message tag](#). Note that, for a message tag returned by the kernel, if the error flag is set, all other contents of the message tag is undefined.

- Bits 0...5 [in,cpy] `words`: Number of (untyped) message words in the UTCB's message registers. See [l4\\_msgtag\\_words\(\)](#) and [l4\\_msgtag\\_t::words\(\)](#).
- Bits 6...11 [in,cpy] `items`: Number of typed message items in the UTCB's message registers. See [l4\\_msgtag\\_items\(\)](#) and [l4\\_msgtag\\_t::items\(\)](#).
- Bit 12 [in,cpy] `transfer` FPU flag: See [L4\\_MSGTAG\\_TRANSFER\\_FPU](#).
- Bit 13 [in,cpy] `schedule` flag: See [L4\\_MSGTAG\\_SCHEDULE](#).
- Bit 14 SBZ: should be zero
- Bit 15 [out] `error`: See [L4\\_MSGTAG\\_ERROR](#), [l4\\_msgtag\\_has\\_error\(\)](#) and [l4\\_msgtag\\_t::has\\_error\(\)](#).
- Bits 16...MSB [cpy] `payload`: Transferred to receiver unchanged; not interpreted by kernel (unless it is the communication partner). For IPC calls or send-only IPC, this is usually the protocol. For replies, this is usually used for return values and server error signaling. See [l4\\_msgtag\\_label\(\)](#) and [l4\\_msgtag\\_t::label\(\)](#).

### 3.2.4 Timeouts

See [IPC timeouts](#) and [l4\\_timeout\\_t](#).

The kernel reads and interprets all the fields ([in]).

```

31      [16]      16 15      [16]      0  bits
|-----|-----|
|      [in]      |      [in]      |
| send timeout  | receive timeout |
|-----|-----|

```

A timeout has the following format. There are two special timeout values:

- *Zero timeout*: Only bit 10 is set. See [L4\\_IPC\\_TIMEOUT\\_0](#).

```

15  [5]  11  10   9      [10]      0  bits
|-----|-----|-----|
|      0      |  1  |      0      |
|-----|-----|-----|

```

- *Infinite timeout*: All bits are unset. See [L4\\_IPC\\_TIMEOUT\\_NEVER](#).

```

15      [16]      0  bits
|-----|
|      0      |
|-----|

```

Otherwise, the timeout is either relative or absolute, which is specified by bit 15.

- *Relative timeout*: If bit 15 is unset, the timeout is `mantissa * 2 ^ exponent` micro seconds relative to the current time. The `mantissa` must not be zero:

```

15  14  [5]  10  9      [10]      0  bits
|----|-----|-----|
|  0  | exponent | mantissa ≠ 0  |
|----|-----|-----|

```

- *Absolute timeout*: If bit 15 is set, an absolute timeout is specified in the UTCB's buffer registers starting at `buf reg idx` (the particular number of registers depends on the architecture; see [l4\\_timeout\\_s](#)):

```

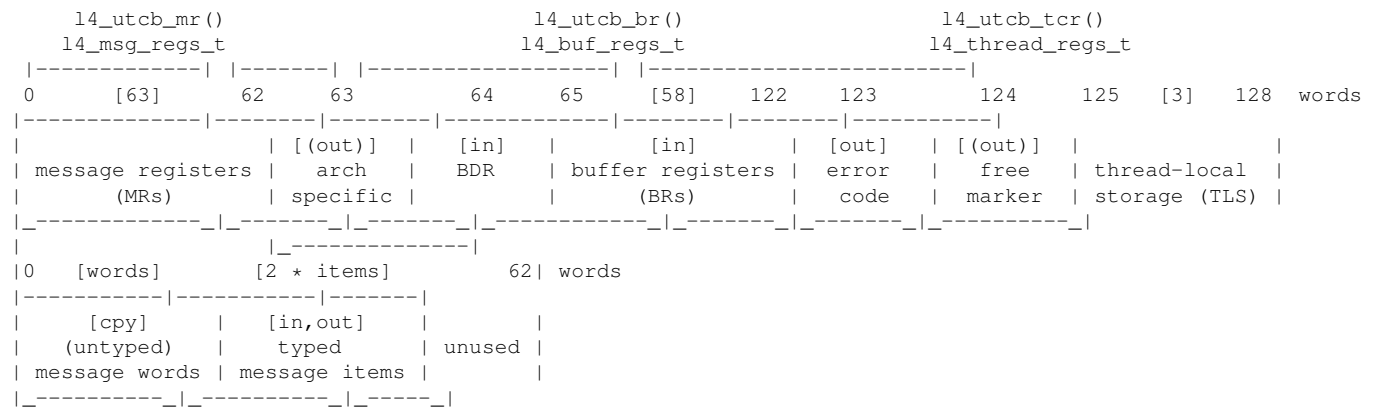

15  14      [9]      6 5      [6]      0  bits
|----|-----|-----|
|  1  |      SBZ      | buf reg idx |
|----|-----|-----|

```

### 3.2.5 User-level thread control block (UTCB)

See [User-level thread control block \(UTCB\)](#).

- Words 0...62 MRs: See [IPC Message registers](#) and [l4\\_utcb\\_mr\(\)](#). The number of message registers is defined by [L4\\_UTCB\\_GENERIC\\_DATA\\_SIZE](#). The actually used message registers are defined by `words` and `items` in the [message tag](#). The layout of a typed message item varies depending on being an input or output value, see [typed message items](#).
- Word 63 [(out)]: Depending on the architecture, this word may be used by the kernel to signify the position of a thread's UTCB in memory. See architecture-specific implementation of [l4\\_utcb\(\)](#). If at all, the kernel writes this word when kernel-user memory is set up as UTCB while binding a thread to a task; see [l4\\_thread\\_control\\_bind\(\)](#), [L4::Thread::Attr::bind\(\)](#).
- Word 64 [in] BDR: See [buffer descriptor register](#).
- Words 65...122 [in] BRs: See [IPC Buffer Registers](#), [receive items](#) and [l4\\_utcb\\_br\(\)->br](#). The number of buffer registers is defined by [L4\\_UTCB\\_GENERIC\\_BUFFERS\\_SIZE](#).
- Word 123 [out] `error code`: See [IPC Thread Control Registers](#) and [l4\\_utcb\\_tcr\(\)->error](#).
- Word 124 [(out)] `free marker`: Written by the kernel, but not necessarily during IPC. See [IPC Thread Control Registers](#) and [l4\\_utcb\\_tcr\(\)->free\\_marker](#).
- Word 125...128 TLS: Ignored and left untouched by the kernel. See [IPC Thread Control Registers](#) and [l4\\_utcb\\_tcr\(\)->user](#).

#### 3.2.5.1 Buffer descriptor register

See [IPC Buffer Descriptor Register](#) and [l4\\_utcb\\_br\(\)->bdr](#).

### 3.2.6 Typed message items

The number of words in a typed message item varies depending on the particular kind of item. However, for the first word, the following properties are shared:

- *Void item*: If all bits of the first word of a typed message item are zero, then it is a void item.
- *Non-void item*: The first word of a non-void typed message item has the following binary layout:

Bit 3 ( $t$ ) is the type bit. If  $t$  is set, the item is a map item. Currently, map item is the only supported type. Hence, this bit must be set for all items except for void items.

There are three sub-types of typed message items: *send items*, *receive items*, and *return items*; see [Message Items](#).

Many typed items make use of flexpages, therefore, these are described before the various kinds of typed items. Note that flexpages are also used outside of typed message items, e.g., for [L4::Task::unmap\(\)](#).

#### 3.2.6.1 Flexpages

A flexpage consists of a single word and, except for some special values, describes a range in an address space, see [flex pages](#).

The general layout is defined as follows:

- Bits 4...5 type: See [l4\\_fpage\\_type\(\)](#) and [L4\\_fpage\\_type](#).

The type [L4\\_FPAGE\\_SPECIAL](#) only supports some selected values, which are only supported for selected interfaces; see [L4\\_FPAGE\\_SPECIAL](#).

The other types share the same layout:

- Bits 0...3 permissions: See [l4\\_fpage\\_rights\(\)](#), [L4\\_fpage\\_rights](#) (memory space) and [L4\\_cap\\_fpage\\_rights](#) (object space). Should be zero for I/O port space.
- Bits 6...11 order: The  $\log_2$  size of the flexpage. See [l4\\_fpage\\_size](#).
- Bits 12...MSB start: The starting page number / I/O port number / capability index of the flexpage. Must be aligned to the flexpage size. See [l4\\_fpage\\_page\(\)](#), [l4\\_fpage\\_memaddr\(\)](#), [l4\\_fpage\\_ioport\(\)](#) and [l4\\_fpage\\_obj\(\)](#).

Also see [l4\\_fpage\(\)](#) (memory space), [l4\\_iofpage\(\)](#) (I/O port space) and [l4\\_fpage\\_obj\(\)](#) (object space).

### 3.2.6.2 Send items

A send item consists of two words. The second word of a non-void send item is a [flexpage](#). The type of the flexpage determines the interpretation of the `attr` bits in the first word (see below).

If not void, the layout of the first word is defined as follows:

SBZ means “should be zero”.

- Bit 0 (compound): Compound bit. See [L4\\_ITEM\\_CONT](#) and [L4::ipc::Snd\\_fpage::is\\_compound\(\)](#).
- Bit 1 (grant): Grant flag. See [L4\\_ITEM\\_MAP](#), [L4\\_MAP\\_ITEM\\_GRANT](#) and [L4::ipc::Snd\\_fpage::Map\\_type](#).
- Bits 7..4 (attr): Attributes. See [Attributes and additional permissions for object send items](#) and [l4\\_fpage\\_cacheability\\_opt\\_t](#), [L4::ipc::Snd\\_fpage::Cacheopt](#).
- Bits MSB..12 (hot\_spot): Send base (also called hot spot). See [L4::ipc::Snd\\_fpage::snd\\_base\(\)](#).

For details, see [IPC Message registers](#).

### 3.2.6.3 Receive items

A non-void receive item consists of up to three words.

If not void, the general layout of the first word is defined as follows:

The `small` and `fwd` bits determine the details of the layout of the whole message item.

If `small` is unset, then also `rcv_id` must be unset, and the most significant bits should be zero:

If `small` is set, the most significant bits are layouted as follows:

```

|-----|-----|-----|---|-----|---|-----|
| hot_spot | order | type | 1 | 01 | c | | undefined |
|_-----|_-----|_-----|_--|_-----|_--|_-----|

```

10: Used if the receive item's `rcv_id` bit was set and the conditions for transferring an IPC gate label were fulfilled. In that case, no mapping is done for this item and the payload consists of the bitwise OR (|) of the IPC gate label and the write and special permissions (see [L4\\_CAP\\_FPAGE\\_W](#) and [L4\\_CAP\\_FPAGE\\_S](#)) that would have been mapped (also see [L4::lpc::Snd\\_fpage::id\\_received\(\)](#)):

```

                                     2 1      0 bits
|-----|-----|-----|---|-----|---|-----|
| hot_spot | order | type | 1 | 10 | c | | label | rights |
|_-----|_-----|_-----|_--|_-----|_--|_-----|

```

11: Used if the receive item's `rcv_id` bit was set and the conditions for transferring the sender's flexpage word were fulfilled. In that case, no mapping is done for this item and the payload is a copy of the sender's flexpage word (also see [L4::lpc::Snd\\_fpage::local\\_id\\_received\(\)](#)):

```

|-----|-----|-----|---|-----|---|-----|
| hot_spot | order | type | 1 | 11 | c | | send flexpage |
|_-----|_-----|_-----|_--|_-----|_--|_-----|

```

### 3.3 Capabilities and Naming

The [L4Re](#) system is a capability based system which uses and offers capabilities to implement fine-grained access control.

Generally, owning a capability means to be allowed to communicate with the object the capability points to. All user-visible kernel objects, such as tasks, threads, and IRQs, can only be accessed through a capability. Please refer to the [Kernel Objects](#) documentation for details. Capabilities are stored in per-task capability tables (the object space) and are referenced by capability selectors or object flexpages. In a simplified view, a capability selector is a natural number indexing into the capability table of the current task.

As a matter of fact, a system designed solely based on capabilities uses so-called 'local names' because each task can only access those objects made available to this task. Other objects are not visible to and accessible by the task.

**Figure 3.1 Capabilities and Local Naming in L4**

So how does an application get access to a service? In general all applications are started with an initial set of available objects. This set of objects is predetermined by the creator of a new application process and granted directly to the new task before starting the first application thread. The application can then use these initial objects to request access to further objects or to transfer capabilities to its own objects to other applications. A central L4Re object for exchanging capabilities at runtime is the name-space object, implementing a store of named capabilities.

From a security perspective, the set of initial capabilities (access rights to objects) completely define the execution environment of an application. Mandatory security policies can be defined by well known properties of the initial objects and carefully handled access rights to them.

### 3.4 Spaces and Mappings

Each task in the L4Re system has access to two resource spaces (three on IA32) which are maintained by the kernel.

These are the

1. object space,
2. memory space, and
3. IO-port space (only on IA32).

The entities addressed in each space are capabilities to objects, virtual memory pages, and IO ports. The addresses are unsigned integers and the largest valid address depends on which space is referenced, the hardware, and the configuration of the kernel. Although a program can access memory at byte granularity, from the kernel's point of view the address granularity in the memory space is not bytes but pages, as determined by the hardware. The address of a capability is also called its "capability slot".

Flexpages describe a range in any of the spaces that has a power-of-two length and is also aligned to this length. They additionally hold access rights information and further space specific information.

When a resource is present at some address in a task's corresponding resource space, then we say that resource is mapped to that task. For example, a capability to the task's main thread may be mapped to capability slot 5, or the first page of the code segment a thread executes is mapped to virtual memory page 12345. However, there need not be any resource mapped to an address.

Tasks can exchange resources through a process called "mapping" during IPC and using the [L4::Task::map\(\)](#) method. The sending task specifies a send flexpage and the receiving task a receive flexpage. The resources mapped to the send flexpage will then be mapped to the receive flexpage by the kernel.

Memory mappings and IO port mappings are hierarchical: If a resource of such a type is subject of a map operation, the received mapping is a child mapping of the corresponding mapping in the sending task (parent mapping). The kernel usually respects the relationship between these two mappings (granting is an exception; see below): If rights of a parent mapping are revoked using [L4::Task::unmap\(\)](#), these rights are also removed from its child mappings. Also, if a mapping is completely removed (via [L4::Task::unmap\(\)](#) or by mapping something else at its place), then also all child mappings are removed. In contrast, revoking rights of a child mapping leaves the rights of its parent mapping untouched.

The mapping of a resource can be performed as *grant* operation (see [L4\\_MAP\\_ITEM\\_GRANT](#)): Such an operation includes the removal of all involved mappings from the send flexpage (basically a move operation). While with a map operation without grant the mapping in the send flexpage remains the parent of all child mappings (including the new child mapping in the receive flexpage), a grant operation moves the mappings covered by the send flexpage to the corresponding addresses from the receive flexpage while leaving the parent/child relationship of the moved mappings with other mappings untouched.

During a map operation at most the access rights of the source mapping(s) can be transferred but no additional rights can be added. So only rights that are present in the source mapping and that are specified in the send item/flexpage are transferred. This also holds for grant mappings, however, rights revocation is *not* guaranteed to be applied to descendant mappings in case of grant.

There are cases where a grant operation is not or cannot be performed as requested; see [L4\\_MAP\\_ITEM\\_GRANT](#) for details.

Object capabilities are not hierarchical – they have no children. The result of the map operation on an object capability is a copy of that capability in the object space of the destination task.

## 3.5 Initial Environment and Application Bootstrapping

New applications that are started by a loader conforming to [L4Re](#) get provided an [Initial Environment](#).

This environment comprises a set of capabilities to initial [L4Re](#) objects that are required to bootstrap and run this application. These capabilities include:

- A capability to an initial memory allocator for obtaining memory in the form of data spaces
- A capability to a factory which can be used to create additional kernel objects
- A capability to a Vcon object for debugging output and maybe input

- A set of named capabilities to application specific objects

During the bootstrapping of the application, the loader establishes data spaces for each individual region in the ELF binary. These include data spaces for the code and data sections, and a data space backed with RAM for the stack of the program's first thread.

One loader implementation is the `moe` root task. Moe usually starts an *init* process that is responsible for coordinating the further boot process. The default *init* process is `ned`, which implements a script-based configuration and startup of other processes. Ned uses Lua (<https://www.lua.org>) as its scripting language, see [Ned Script example](#) for more details.

### 3.5.1 Configuring an application before startup

The default L4Re init process (Ned) provides a Lua script based configuration of initial capabilities and application startup. Ned itself also has a set of initial objects available that can be used to create the environment for an application. The most important object is a kernel object factory that allows creation of kernel objects such as IPC gates (communication channels), tasks, threads, etc. Ned uses Lua tables (associative arrays) to represent sets of capabilities that shall be granted to application processes.

```
local caps = {
    name = some_capability
}
```

The L4 Lua package in Ned also has support functions to create application tasks, region-map objects, etc. to start an ELF binary in a new task. The package also contains Lua bindings for basic L4Re objects, for example, to generic factory objects, which are used to create kernel objects and also user-level objects provided by user-level servers.

```
L4.default_loader:start({ caps = { some_service = service } }, "rom/program --arg");
```

### 3.5.2 Connecting clients and servers

In general, a connection between a client and a server is represented by a communication channel (IPC gate) that is available to both of them. You can see the simplest connection between a client and a server in the following example.

```
local loader = L4.default_loader; -- which is Moe
local svc = loader:new_channel(); -- create an IPC gate
loader:start({ caps = { service = svc:svr() } }, "rom/my_server");
loader:start({ caps = { service = svc:m("rw") } }, "rom/my_client");
```

As you can see in the snippet, the first action is to create a new channel (IPC gate) using `loader:new_channel()`. The capability to the gate is stored in the variable `svc`. Then the binary `my_server` is started in a new task, and full (`:svr()`) access to the IPC gate is granted to the server as initial object. The gate is accessible to the server application as "service" in the set of its initial capabilities. Virtually in parallel a second task, running the client application, is started and also given access to the IPC gate with less rights (`:m("rw")`), note, this is essential). The server can now receive messages via the IPC gate and provide some service and the client can call operations on the IPC gate to communicate with the server.

Services that keep client specific state need to implement per-client server objects. Usually it is the responsibility of some authority (e.g., Ned) to request such an object from the service via a generic factory object that the service provides initially.

```
local loader = L4.default_loader; -- which is Moe
local svc = loader:new_channel():m("rws"); -- create an IPC gate with rws rights
loader:start({ caps = { service = svc:svr() } }, "rom/my-service");
loader:start({ caps = { foo_service = svc:create(object_to_create, "param") } }, "rom/client");
```

This example is quite similar to the first one, however, the difference is that Ned itself calls the `create` method on the factory object provided by the server and passes the returned capability of that request as "foo\_service" to the client process.

#### Note

The `svc:create(...)` call blocks on the server. This means the script execution blocks until the my-service application handles the create request.

## 3.6 Memory management - Data Spaces and the Region Map

### 3.6.1 User-level paging

Memory management in L4-based systems is done by user-level applications, the role is usually called *pager*. Tasks can give other tasks full or restricted access rights to parts of their own memory. The kernel offers means to give access to memory in a secure way, often referred to as *memory mapping*.

The mapping mechanism allows one task to resolve page faults of another: A thread usually has a pager assigned to it. When the thread causes a page fault, the kernel sends an IPC message to the pager with information about the page fault. The pager answers this IPC by either providing a backing page, or with an error. The kernel will map the backing page into the address space of the faulting thread's task.

These mechanisms can be used to construct a memory and paging hierarchy among tasks. The root of the hierarchy is `sigma0`, which initially gets all system resources and hands them out once on a first-come-first-served basis. Memory resources can be mapped between tasks at a page-size granularity. This size is predetermined by the CPU's memory management unit and is commonly set to 4 kB.

#### 3.6.1.1 Data spaces

A data space is the [L4Re](#) abstraction for objects which may be accessed in a memory mapped fashion (i.e., using normal memory read and write instructions). Examples include the sections of a binary which the loader attaches to the application's address space, files in the ROM or on disk provided by a file server, the registers of memory-mapped devices and anonymous memory such as the heap or the stack.

Anonymous memory data spaces in particular (but in general all data spaces except memory mapped IO) can either be constructed entirely from a portion of the RAM or the current working set may be multiplexed on some portion of the RAM. In the first case it is possible to eagerly insert all pages (more precisely page-frame capabilities) into the application's address space such that no further page faults occur when this data space is accessed. In general, however, only the pages for some portion are provided and further pages are inserted by the pager as a result of page faults.

#### 3.6.1.2 Virtual Memory Handling

The virtual memory of each task is constructed from data spaces backing virtual memory regions (VMRs). The management of the VMRs is provided by an object called *region map*. A dedicated region-map object is associated with each task; it allows attaching and detaching data spaces to an address space as well as reserving areas of virtual memory. Since the region-map object possesses all knowledge about the virtual memory layout of a task, it also serves as an application's default pager.

#### 3.6.1.3 Memory Allocation

Operating systems commonly use anonymous memory for implementing dynamic memory allocation (e.g., using `malloc` or `new`). In an L4Re-based system, each task gets assigned a memory allocator providing anonymous memory using data spaces.

See also

[L4Re::Dataspace](#) and [L4Re::Rm](#).

## 3.7 Program Input and Output

The initial environment provides a Vcon capability used as the standard input/output stream.

Output is usually connected to the parent of the program and displayed as debugging output. The standard output is also used as a back end to the C-style printf functions and the C++ streams.

Vcon services are implemented in Moe and the loader as well as by the [L4Re](#) Microkernel and connected either to the serial line or to the screen if available.

See also

[Virtual Console](#)

## 3.8 Initial Memory Allocator and Factory

The purpose of the memory allocator and of the factory is to provide the application with the means to allocate memory (in the form of data spaces) and kernel objects respectively.

An initial memory allocator and an initial factory are accessible via the initial [L4Re](#) environment.

See also

[L4Re::Mem\\_alloc](#)

The factory is a kernel object that provides the ability to create new kernel objects dynamically. A factory imposes a resource limit for kernel memory, and is thus a means to prevent denial of service attacks on kernel resources. A factory can also be used to create new factory objects.

See also

[Factory](#)

## 3.9 Application and Server Building Blocks

So far we have discussed the environment of applications in which a single thread runs and which may invoke services provided through their initial objects.

In the following we describe some building blocks to extend the application in various dimensions and to eventually implement a server which implements user-level objects that may in turn be accessed by other applications and servers.

### 3.9.1 Creating Additional Application Threads

To create application threads, one must allocate a stack on which this thread may execute, create a thread kernel object and setup the information required at startup time (instruction pointer, stack pointer, etc.). In [L4Re](#) this functionality is encapsulated in the pthread library.

### 3.9.2 Providing a Service

In capability systems, services are typically provided by transferring a capability to those applications that are authorised to access the object to which the capability refers to.

Let us discuss an example to illustrate how two parties can communicate with each other: Assume a simple file server, which implements an interface for accessing individual files: `read(pos, buf, length)` and `write(pos, data, length)`.

L4Re provides support for building servers based on the class `L4::Server_object`. `L4::Server_object` provides an abstract interface to be used with the `L4::Server` class. Specific server objects such as, in our case, files inherit from `L4::Server_object`. Let us call this class `File_object`. When invoked upon receiving a message, the `L4::Server` will automatically identify the corresponding server object based on the capability that has been provided to its clients and invoke this object's `dispatch` function with the incoming message as a parameter. Based on this message, the server must then decide which of the protocols it implements was invoked (if any). Usually, it will evaluate a protocol specific opcode that clients are required to transmit as one of the first words in the message. For example, assume our server assigns the following opcodes: `Read = 0` and `Write = 1`. The `dispatch` function calls the corresponding server function (i.e., `File_object::read()` or `File_object::write()`), which will in turn parse additional parameters given to the function. In our case, this would be the position and the amount of data to be read or written. In case the write function was called the server will now update the contents of the file with the data supplied. In case of a read it will store the requested part of the file in the message buffer. A reply to the client finishes the client request.

## 3.10 Pthread Support

L4Re supports the standard pthread library functionality.

Therefore L4Re itself does not contain any documentation for pthreads itself. Please refer to the standard pthread documentation instead.

The L4Re specific parts will be described herein.

- Include pthread-l4.h header file:

```
#include <pthread-l4.h>
```

- Return the local thread capability of a pthread thread:

Use `pthread_l4_cap(pthread_t t)` to get the capability index of the pthread `t`.

For example:

```
pthread_l4_cap(pthread_self());
```

- Setting the L4 priority of an L4 thread works with a special scheduling policy (other policies do not affect the L4 thread priority):

```
pthread_t t;
pthread_attr_t a;
struct sched_param sp;

pthread_attr_init(&a);
sp.sched_priority = l4_priority;
pthread_attr_setschedpolicy(&a, SCHED_L4);
pthread_attr_setschedparam(&a, &sp);
pthread_attr_setinheritsched(&a, PTHREAD_EXPLICIT_SCHED);

if (pthread_create(&t, &a, pthread_func, NULL))
    // failure...

pthread_attr_destroy(&a);
```

- You can prevent your pthread from running immediately after the call to `pthread_create(..)` by adding `PTHREAD_L4_ATTR_NO_START` to the `create_flags` of the pthread attributes. To finally start the thread you need to call `scheduler()->run_thread()` passing the capability of the pthread and scheduling parameters.

```
pthread_t t;
pthread_attr_t attr;

pthread_attr_init(&attr);
attr.create_flags |= PTHREAD_L4_ATTR_NO_START;

if (pthread_create(&t, &attr, pthread_func, nullptr))
    // failure...

pthread_attr_destroy(&attr);

// do stuff

auto ret = L4Re::Env::env()->scheduler()->run_thread(pthread_l4_cap(t),
                                                    l4_sched_param(2));
if (l4_error(ret))
    // failure...
```

### Constraints on pthread\_t, user-land capability slot, and kernel thread-object

- `pthread_l4_cap()` is guaranteed to return the valid capability slot of the pthread (A) until `pthread_join()` or `pthread_detach()` is invoked on (A)'s `pthread_t`.
- `pthread_l4_cap()` exposes internal state of the pthread management, take the necessary precautions as you would for any shared data in concurrent environments. If you use `pthread_l4_cap()` guarding against concurrency issues is your duty.
- There is no guarantee that a valid capability slot points to a present capability.

#### • Example

It is possible to obtain a valid thread capability slot and for `l4_task_cap_valid()` to return the capability as not present. The following example showcases a possible sequence of events.

```
// Assume: void some_func(void *)
pthread_t pthread = nullptr;
pthread_create(&pthread, nullptr, some_func, nullptr);

// pthread running some_func()
l4_cap_idx_t cap_idx = pthread_l4_cap(pthread);
l4_is_valid_cap(cap_idx); // --> true

long valid = l4_task_cap_valid(L4RE_THIS_TASK_CAP, cap_idx).label();
// valid == 1 --> capability object is present (refers to a kernel object).

// some_func() exits

cap_idx = pthread_l4_cap(pthread);
l4_is_valid_cap(cap_idx); // --> true

valid = l4_task_cap_valid(L4RE_THIS_TASK_CAP, cap_idx).label();
// valid == 0 --> capability object is not present (refers to no kernel object).

pthread_join(pthread, nullptr); // invalidates the cap slot and frees
                                // the pthread's data structures

// using cap_idx here is undefined behavior.
```

## 3.11 Interface Definition Language

An interface definition in L4Re is normally declared as a class derived from `L4::Kobject_t`.

For example, the [simple calculator example](#) declares its interface like that:

```
struct Calc : L4::Kobject_t<Calc, L4::Kobject>
{
```

```

L4_INLINE_RPC(long, sub, (l4_uint32_t a, l4_uint32_t b, l4_uint32_t *res));
L4_INLINE_RPC(long, neg, (l4_uint32_t a, l4_uint32_t *res));

typedef L4::Typeid::Rpc<sub_t, neg_t> Rpc;
};

```

The signature of each function is first declared using one of the RPC macros (see below) and then all the functions need to be listed in the `Rpcs` type.

Clients invoke these functions with the name given to the RPC macros, `sub` and `neg` above. Servers implement them by defining functions with an `op_` prepended, `op_sub` and `op_neg`. The types of the parameters in the macro definition, on the server side, and on the client side are not the same. The following section describes how they are related to each other.

### 3.11.1 Parameter types for RPC

Generally all value parameters, const reference parameters, and const pointer parameters to an RPC interface are considered as input parameters for the RPC and are transmitted from the client to the server.

#### Note

This means that `char const *` is treated as an input `char` and not as a zero terminated string value, for strings see `L4::lpc::String<>`.

Parameters that are non-const references or non-const pointers are treated as output parameters going from the server to the client.

There are special data types that appear on only one side (client or server) when used, see the following table for details.

```
L4_RPC(l4_ret_t, test, (int arg1, char const *arg2, unsigned *ret1));
```

The example shows the declaration of a method called `test` with `l4_ret_t` as return type, `arg1` is an `int` input, `arg2` a `char` input, and `ret1` an unsigned output parameter.

Type	Direction	Client-Type	Server-Type
T	Input	T	T
T const &	Input	T const &	T const &
T const *	Input	T const *	T const &
T &	Output	T &	T &
T *	Output	T *	T &
<a href="#">L4::Ipc::In_out&lt;T &amp;&gt;</a>	In/Out	T &	T &
<a href="#">L4::Ipc::In_out&lt;T *&gt;</a>	In/Out	T *	T &
<a href="#">L4::Ipc::Cap&lt;T&gt;</a>	Input	<a href="#">L4::Ipc::Cap&lt;T&gt;</a>	<a href="#">L4::Ipc::Snd_fpage</a>
<a href="#">L4::Ipc::Out&lt;L4::Cap&lt;T&gt;&gt;</a>	Output	<a href="#">L4::Cap&lt;T&gt;</a>	<a href="#">L4::Ipc::Cap&lt;T&gt; &amp;</a>
<a href="#">L4::Ipc::Rcv_fpage</a>	Input	<a href="#">L4::Ipc::Rcv_fpage</a>	void
<a href="#">L4::Ipc::Small_buf</a>	Input	<a href="#">L4::Ipc::Small_buf</a>	void

Array types can be used to transmit arrays of variable length. They can either be stored in a client-provided buffer ([L4::lpc::Array](#)), copied into a server-provided buffer ([L4::lpc::Array\\_in\\_buf](#)) or directly read and written into the UTCB ([L4::lpc::Array\\_ref](#)).

Constraints on [L4::lpc::Array\\_ref](#):

- the start position of this array type needs to be known in advance.
- it must be the last parameter of a message.
- the size of the array type is not transmitted to the server, only the client side knows the intended size of the input array. The server assumes the rest of the UTCB as the actual array. Different sever-side behavior must be steered otherwise, e.g. through another parameter.

Type	Direction	Client-Type	Server-Type
<code>L4::Ipc::Array&lt;const T&gt;</code>	Input	<code>L4::Ipc::Array&lt;const T&gt;</code>	<code>L4::Ipc::Array_ref&lt;const T&gt;</code>
<code>L4::Ipc::Array&lt;const T&gt;</code>	Input	<code>L4::Ipc::Array&lt;const T&gt;</code>	<code>L4::Ipc::Array_in_buf&lt;const T&gt;</code>
<code>L4::Ipc::Array&lt;T&gt; &amp;</code>	Output	<code>L4::Ipc::Array&lt;T&gt; &amp;</code>	<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>
<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>	Output	<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>	<code>L4::Ipc::Array_ref&lt;T&gt; &amp;</code>

Finally, there are some optional types where the sender can choose if the parameter should be included in the message. These types are for the implementation of some legacy message formats and should generally not be needed for the definition of ordinary interfaces.

Type	Direction	Client-Type	Server-Type
<code>L4::Ipc::Opt&lt;T&gt;</code>	Input	<code>L4::Ipc::Opt&lt;T&gt;</code>	<code>T</code>
<code>L4::Ipc::Opt&lt;const T*&gt;</code>	Input	<code>L4::Ipc::Opt&lt;const T*&gt;</code>	<code>T</code>
<code>L4::Ipc::Opt&lt;T &amp;&gt;</code>	Output	<code>T &amp;</code>	<code>L4::Ipc::Opt&lt;T&gt; &amp;</code>
<code>L4::Ipc::Opt&lt;T *&gt;</code>	Output	<code>T *</code>	<code>L4::Ipc::Opt&lt;T&gt; &amp;</code>
<code>L4::Ipc::Opt&lt;Array↔_ref&lt;T&gt; &amp;&gt;</code>	Output	<code>Array_ref&lt;T&gt; &amp;</code>	<code>L4::Ipc::Opt&lt;Array↔_ref&lt;T&gt;&gt; &amp;</code>

### 3.11.2 Server Side Interface

The server side function signature for the Calc example above is

```
long op_sub(Calc::Rights, 14_uint32_t a, 14_uint32_t b, 14_uint32_t &res);
```

The first rights parameter is a bitfield encoding the rights the client has on the used capability in the lower two bits. Currently, the W-right and S-right are supported. The rest of the Rights-bitfield is reserved.

The second and third arguments are input parameters as can be deduced from the tables above. The fourth parameter is an output parameter, delivered to the client with the return value of type long.

### 3.11.3 RPC Return Types

On the server side, the return type of an RPC handling function is always `14_ret_t`. The return value is transmitted via the label field in `14_msgtag_t` and is therefore restricted to its length. Per convention, a negative return value is interpreted as an error condition. If the return value is negative, output parameters are not transmitted back to the client.

**Attention**

The client must never rely on the content of output parameters when the return value is negative.

On the client-side, the return value of the RPC is set as defined in the RPC macro. If `l4_msgtag_t` is given, then the client has access to the full message tag, otherwise the return type should be `l4_ret_t`. Note that the client might not only receive the server return value in response but also an IPC error code.

**3.11.4 RPC Method Declaration**

RPC member functions can be declared using one of the following C++ macros.

For inline RPC stubs, where the RPC stub code itself is `inline`:

- `L4_INLINE_RPC(res, name, (args...), flags)`  
Define an inline RPC call (type and callable).
- `L4_INLINE_RPC_OP(op, res, name, (args...), flags)`  
Define an inline RPC call with specific opcode (type and callable).
- `L4_INLINE_RPC_NF(res, name, (args...), flags)`  
Define an inline RPC call type (the type only, no callable).
- `L4_INLINE_RPC_NF_OP(opcode, Ret_type, func_name, (args...), flags)`  
Define an inline RPC call type with specific opcode (the type only, no callable).

For external RPC stubs, where the RPC stub code must be defined in a separate compile unit (usually a `.cc` file):

- `L4_RPC(Ret_type, func_name, (args...), flags)`  
Define an RPC call (type and callable).
- `L4_RPC_OP(opcode, Ret_type, func_name, (args...), flags)`  
Define an RPC call with specific opcode (type and callable).
- `L4_RPC_NF(Ret_type, func_name, (args...), flags)`  
Define an RPC call type (the type only, no callable).
- `L4_RPC_NF_OP(opcode, Ret_type, func_name, (args...), flags)`  
Define an RPC call type with specific opcode (the type only, no callable).

To generate the implementation of an external RPC stub:

- `L4_RPC_DEF(class_name::func_name)`  
Generate the definition of an RPC stub.

The NF versions of the macro generally do not generate a callable member function named `<name>` but do only generate the type `<name>_t`. This data type can be used to call the RPC stub explicitly using `<name>_t::call(L4::Cap<Iface_class> cap, args...)`.

**3.12 L4Re Build System**

L4Re uses a custom make-based build system, often simply referred to as *BID*.

This section explains how to use BID when writing applications and libraries for L4Re.

### 3.12.1 Building L4Re

#### Setting up the Build Directory

L4Re must be built out-of-source. Therefore the first mandatory step is creating and populating a build directory. From the root of the L4Re source tree run

```
make B=<builddir>
```

Other targets that can be executed in the source directory are

#### update

Update the source directory from svn. Only makes sense when you have downloaded L4Re from the official subversion repository.

#### help

Show a short help with the most important targets.

#### Invoking Make

Once the build directory is set up, BID make can be invoked in one of two ways:

1. Go to the build directory and invoke make without special options.
2. Go to a source directory with a BID make file and invoke `make O=<builddir> . . .`

The default target builds the source (as you would expect), other targets that are available in build mode are

#### cleanfast

Quickly cleans the build directory by removing all subdirectories that contain generated files. The configuration will remain untouched.

#### clean

Remove generated files. Slower than `make cleanfast` but can be used on selected packages. Use `S= . . .` to select the target package.

In addition to these targets, there are a number of targets to generate images which are explained elsewhere.

### 3.12.2 Writing BID Make Files

The BID build system exports different roles that define what should be done in the subdirectory. So a BID make file essentially consists of defining the role and a number of role-dependent make variables. The basic layout should look like this:

```
PKGDIR  ?= <path to package's root directory> # e.g., '.' or '..'
L4DIR   ?= <path to L4Re source directory>    # e.g. '$(PKGDIR)/../..'

<various definitions>

include $(L4DIR)/mk/<role>.mk
```

PKGDIR in the first line defines the root directory of the current package. L4DIR in the next line must be pointed to the root of the [L4Re](#) source tree the package should be built against. After this custom variable definitions for the role follow. In the final line of the file, the make file with the role-specific rules must be sourced.

The following roles are currently defined:

- project.mk - Sub-project Role
- subdir.mk - Directory Role
- [prog.mk - Application Role](#)
- lib.mk - Library Role
- [include.mk - Header File Role](#)
- doc.mk - Documentation Role
- [test.mk - Test Application Role](#)
- idl.mk - IDL File Role (currently unused)
- runux.mk - Tests in FiascoUX Role

#### BID-global Variables

This section lists variables that configure how the BID build system behaves. They are applicable for all roles.

Variable	Description
CC	C compiler for target
CXX	C++ compiler for target
HOST_CC	C compiler for host
HOST_CXX	C++ compiler for host

### 3.12.3 prog.mk - Application Role

The prog role is used to build executable programs.

## General Configuration Variables

The following variables can only be set globally for the Makefile:

MODE

Kind of target to build for. The following values are possible:

- `static` - build a statically linked binary (default)
- `shared` - build a dynamically linked binary
- `l4linux` - build a binary for running on L4Linux on the target platform
- `host` - build for host system
- `targetsys` - build a binary for the target platform with the compiler's default settings

SYSTEMS

List of architectures the target can be built for. The entries must be space-separated entries either naming an architecture (e.g. `amd64`) or an architecture and ABI (e.g. `arm-l4f`). When not defined, the target will be built for all possible platforms.

TARGET

Name or names of the binaries to compile. This variable may also be postfixed with a specific architecture.

## Target-specific Configuration Variables

The following variables may either be used with or without a description suffix. Without suffix they will be used for all operations. With a specific description their use is restricted to a subset. These specifications include a target file and the architecture, both optional but in this order, separated by underscores. The specific variables will be used in addition to the more general ones.

`SRC_C / SRC_CC / SRC_F / SRC_S`

`.c, .cc, .f90, .S` source files.

`REQUIRES_LIBS`

List of libraries the binary depends on. This works only with libraries that export a `pkg_config` configuration file. Automatically adds any required include and link options.

DEPENDS\_PKGS

List of packages this binary depends on. If one these packages is missing then building of the binary will be skipped.

CPPFLAGS / CFLAGS / CXXFLAGS / FFLAGS / ASFLAGS

Options for the C preprocessor, C compiler, C++ compiler, Fortran compiler and assembler. When used with suffix, the referred element is the source file, not the target file.

LDFLAGS

Options for the linker ld.

LIBS

Additional libraries to link against (with -l).

PRIVATE\_LIBDIR

Additional directories to search for libraries.

CRT0 / CRTN

(expert use only) Files containing custom startup and finish code.

LDSCRIPT

(expert use only) Custom link script to use.

### 3.12.4 include.mk - Header File Role

The header file role is responsible for installing header file at the appropriate location.

The following variables can be used for customizing the process:

`INCSRC_DIR`

Source directory where the headers can be found. Default is the directory where the Makefile resides.

`TARGET`

List of header files to install. If left undefined, then `INCSRC_DIR` will be scanned for files with suffix `.h` or `.i`.

Supports the specification of special filenames to allow for different source and target filenames to be installed. The syntax is `TARGET<SRC`, where a filename including the path of `SRC` is installed as `TARGET`. An example is

```
libfoo.h<contrib/libfoo_linux.h
```

which installs the header from the `contrib` directory under the name without that `contrib` directory and without the platform specific suffix.

`EXTRA_TARGET`

When `TARGET` is undefined, then add these files to the headers found by scanning the source directory. Has no effect if `TARGET` has been defined.

The filenames specified allow for the same rule specifications as supported by `TARGET`.

`CONTRIB_HEADERS`

When set, the headers will be installed in `${BUILDDIR}/include/contrib/${PKGNAME}` rather than `${BUILDDIR}/include/l4/${PKGNAME}`.

`INSTALL_INC_PREFIX`

Base directory where to install the headers. Overwrites `CONTRIB_HEADERS`. The headers will then be found under `${BUILDDIR}/include/${INSTALL_INC_PREFIX}`.

`PC_FILENAME`

When set, a `pkg_config` configuration file is created with the given name.

### 3.12.5 test.mk - Test Application Role

The test role is very similar to the application role, it also builds an executable binary.

The difference is that it also builds for each target a test script that executes the test target either on the host (MODE=host) or a target platform (currently only qemu).

The role accepts all make variables that are accepted by the application role. The only difference is that the `TARGET` variable is not required. If it is missing, the source directory will be scanned for source files that fit the pattern `test_*.c[c]` and create one target for each of them.

#### Note

It is possible to still use `SRC_C[C]` when targets are determined automatically. In that case the specified sources will be used in addition\* to the main `test_*.c[c]` source.

In addition to the variables above, there are a number of variables that control how the test is executed. All these variables may be used as a global variable that applies to all test or, if the target name is added as a suffix, set for a specific target only.

#### TEST\_TARGET

Name of binary containing the test (default: same as `TARGET`).

#### TARGET\_\$ (ARCH)

When `TARGET` is undefined, these targets are added to the list of targets for the specified architecture. For all targets `SRC_C[C]` files must be defined separately.

#### TEST\_KERNEL\_ARGS

Arguments to append to the kernel command line. These are also appended when specifying custom ones via a `.t`-file's `-f` parameter or when using `-d`.

#### TEST\_EXPECTED

File containing expected output. By default the variable is empty, which means the test binary is expected to produce TAP test output, that can be directly processed. When the `TEST_TAP_PLUGINS` variable is given, `TEST_EXPECTED` is ignored.

#### TEST\_EXPECTED\_REPEAT

Number of times the expected output should be repeated, by default 1. When set to 0 then output is expected to repeat forever. This is particularly useful to make sure that stress tests that are meant to run in an endless loop are still alive. Note that such endless tests can only be run by directly executing the test script. They will be skipped when run in a test harness like `prove`.

`TEST_TAP_PLUGINS`

Specify the plugins that are used to process the output of the test run. The syntax is of the values is:

`plugin1:arg1=a,arg2=b plugin2:arg=foo`

Multiple plugins separated by a space are loaded in order. Spaces are not allowed inside a plugin specification. One or more arguments are optionally passed to the plugin separated by commas and delimited by a colon.

If the variable is not specified the plugins for `TAPOutput` and `OutputMatching` (depending on the `TEST_EXPECTED` variable) are automatically loaded.

For the supported plugins and their options please refer to their in-line documentation in `tool/lib/L4/TapWrapper/Plugin/`. The plugin name corresponds to the file stem name in that directory.

`TEST_TIMEOUT`

Non-standard timeout after which the test run is aborted (useful for tests involving sleep).

`NED_CFG`

LUA configuration file for startup to give to Ned

`REQUIRED_MODULES`

Additional modules needed to run the test. By adding `[opts]` to the name of a module you can add module options that are reflected in the generated `modules.list`.

`BOOTSTRAP_ARGS`

Additional parameters to supply to bootstrap.

`QEMU_ARGS`

Additional parameters to supply to QEMU.

`MOE_ARGS`

Additional parameters to supply to moe.

`TEST_ARGS`

Additional arguments for the `TEST_STARTER` (tapper-wrapper per default).

`TEST_ROOT_TASK`

Alternative root task to be used during a test instead of moe.

`TEST_ROOT_TASK_ARGS`

Arguments passed to `TEST_ROOT_TASK` if `TEST_ROOT_TASK` is different from moe.

`KERNEL_CONF`

Features the [L4Re](#) Microkernel must have been compiled with. A space-separated list of config options as used by Kconfig. `run_test` looks for a `globalconfig.out` file in the same directory as the kernel and checks that all options are enabled. If not, the test is skipped. Has only an effect if the `globalconfig.out` file is present.

`L4RE_CONF`

Features the [L4Re](#) userland must have been compiled with. A space-separated list of config options as used by Kconfig. `run_test` will look for these in the `.kconfig` file in the [L4Re](#) build directory.

`L4LINUX_CONF`

Features the L4Linux kernel must have been compiled with. Similar to `KERNEL_CONF` but checks for a `.config` file in the directory of the L4Linux kernel.

`TEST_SETUP`

Command to execute before the test is run. The test will only be executed if the command returns 0. If the exit code is 69, the test is marked as skipped with the reason provided in the final line of stdout.

`TEST_LOGFILE`

Append output of test execution to the given file unless `TEST_WORKDIR` is given.

`TEST_WORKDIR`

Create logs, temp and other files below the given directory. That directory is taken as base dir for more automatically created subdir levels using the current test path, in order to guarantee conflict-free usage when running many different tests with a common workdir. When `TEST_WORKDIR` is provided then `TEST_LOGFILE` is ignored as it is organized below workdir.

`TEST_TAGS`

List of conditions for tags provided during execution of a test. A tag can be set to 1, set to 0 or be unspecified via `TEST_RUN_TAGS` during execution. Therefore there are 4 possible conditions for a tag that can be specified in `TEST_TAGS`: `tag`, `!tag`, `+tag` and `-tag`. The following table shows the conditions they represent.

<code>TEST_RUN_TAGS \ TEST_TAGS</code>	<code>tag</code>	<code>!tag</code>	<code>+tag</code>	<code>-tag</code>
<code>tag</code> or <code>tag=1</code>	y		y	
unspecified		y	y	
<code>tag=0</code>		y		y

*Example usage:*

The tag `long-running` is used by tests which take a long time and should be skipped by default. These tests are marked with the tag `long-running` unprefixd.

The tag `hardware` is set to 1 at runtime when the tests will run on real hardware. Tests that must not run on real hardware are marked with `!hardware`.

The tag `+impl-def` is used by tests that test implementation details. Due to the nature of this flag we require the "+" prefix to be used, so they are run by default but can be excluded from execution by setting `TEST_RUN_TAGS` to `impl-def=0` at runtime.

If you want to specify multiple tag conditions they need to be separated with a comma.

**TEST\_PLATFORM\_ALLOW and TEST\_PLATFORM\_DENY**

Deny and allow lists of platforms a test is banned from or limited to. If you list platforms in the TEST\_PLATFORM\_ALLOW variable the test will only be run on these listed platforms and will be skipped on any other platform. If you list platforms in the TEST\_PLATFORM\_DENY variable the test will be skipped on the listed platforms and will be run on any other platform. You can only use one of these variables per test, not both. See mk/platforms/ for the various identifiers.

*Example usage:*

```
# Do not run this test on the Raspberry Pi platform
TEST_PLATFORM_DENY_test_xyz := rpi

# Only run this test on this test on the RCar3 platform.
TEST_PLATFORM_ALLOW_test_abc := rcar3
```

**TAPARCHIVE**

Filename for an archive file to store the resulting TAP output.

In addition to compiled tests, it is also possible to create tests where the test binary or script comes from a different source. These tests must be listed in EXTRA\_TARGET and for each target a custom TEST\_TARGET must be provided.

**Running Tests**

The make role creates a test script which can be found in <builddir>/test/t/<arch>/<api>. It is possible to organise the tests further in subdirectories below by specifying a TEST\_GROUP.

To be able to execute the test, a minimal test environment needs to be set up by exporting the following environment variables:

KERNEL\_<arch>, KERNEL

**L4Re** Microkernel binary to use. The test runner is able to check if the kernel has all features necessary for the test and skip tests accordingly. In order for this to work, the globalconfig.out config file from the build directory needs to be available in the same directory as the kernel.

L4LX\_KERNEL\_<arch>, L4LX\_KERNEL

L4Linux binary to use. This is only required to run tests in mode=l4linux. If no L4Linux kernel is set then these tests will simply be skipped. The test runner is also able to check if the kernel has all features compiled in that are required to run the test successfully (see make variable L4LINUX\_CONF above). For this to work, the .config configuration file from the build directory needs to be available in the same directory as the kernel.

LINUX\_RAMDISK\_<arch>, LINUX\_RAMDISK

Ramdisk to mount as root in L4Linux. This is only required to run tests in mode=l4linux. If not supplied, L4Linux tests will be skipped. The ramdisk must be set up to start the test directly after the initial startup is finished. The name of the test binary is supplied via the kernel command line option l4re\_testprog. The tool/test directory contains an example script launch-l4linux-test. which can be copied onto the ramdisk and started by the init script.

## TEST\_HWCONFIG and TEST\_FIASCOCONFIG

Some userland tests rely on external information about the underlying platform and the configuration of the [L4Re](#) Microkernel to decide whether or not to test specific features or to determine which and how much resources are available. Some examples for this are whether or not virtualization is supported by the platform, how many cores the platform has, how many cores the kernel supports or how much memory the platform provides. To convey this information to these tests you can set the two environment variables `TEST_HWCONFIG` and `TEST_FIASCOCONFIG`.

Using `TEST_HWCONFIG` requires a plain text document containing key-value pairs separated by a `=` symbol. On top of that comment lines starting with `#` are supported. Simply create a plain text file such as the following and set `TEST_HWCONFIG` to its absolute path.

```
VIRTUALIZATION=y
MP=y
NUM_CORES=4
MEMORY=2048
```

Using `TEST_FIASCOCONFIG` is easier since it only needs to contain the absolute path of the `globalconfig.out` file in the [L4Re](#) Microkernel's build directory. The build system will then extract the information when a test is started.

When starting a test the build system will read both files and provide their content as a lua table to the test. A lua script can then make decisions based on them. To simplify some decisions the build system merges some information by itself, e.g. virtualization is only available if both the platform and the [L4Re](#) Microkernel support this feature. More details can be obtained from the perl module in `tool/lib/L4/TestEnvLua.pm`.

In addition to these variables, the following BID variables can be overwritten at runtime: `PT` (for the platform type) and `TEST_TIMEOUT`. You may also supply `QEMU_ARGS` and `MOE_ARGS` which will be appended to the parameters specified in the BID test make file.

Once the environment is set up, the tests can be run either by simply executing all of them from the build directory with

```
make test
```

or executing them directly, like

```
test/t/amd64_amdfam10/14f/14re-core/moe/test_namespace.t
```

or running one or more tests through the test harness `prove`, like

```
prove test/t/amd64_amdfam10/14f/14re-core/moe/test_namespace.t
prove -r test/t/amd64_amdfam10/14f/14re-core/
prove -rv test/t/amd64_amdfam10/14f/14re-core/
```

`TEST_TAGS` allow for a way to include or exclude whole groups of tests during execution, primarily with `prove`. You can specify which tests to run at runtime using one of the following ways:

```
$ test/t/amd64_amdfam10/14f/14re-core/test_one.t --run-tags slow,gtest-shuffle=0
$ test/t/amd64_amdfam10/14f/14re-core/test_one.t -T slow,gtest-shuffle=0
$ prove -r test/t/amd64_amdfam10/14f/14re-core/ : -T slow,gtest-shuffle=0
$ TEST_RUN_TAGS=slow,gtest-shuffle=0 prove -r test/t/amd64_amdfam10/14f/14re-core/
```

For each test tag requirements defined in the corresponding `TEST_TAGS` Makefile variable are tested. If the requirements for tags do not match the test is skipped. The `SKIP` message will provide insight why the test was skipped:

```
$ make test
...
test/t/amd64_amdfam10/test_one.t .... ok
test/t/amd64_amdfam10/test_two.t .... skipped: Running this test requires tag slow to be set to 1.
test/t/amd64_amdfam10/test_three.t .. ok
```

When tags are provided, the tests requiring those tags are now also executed while the tests that forbid them are skipped:

```
$ TEST_RUN_TAGS=slow,gtest-shuffle
$ make test
...
test/t/amd64_amdfam10/test_one.t .... ok
test/t/amd64_amdfam10/test_two.t .... ok
test/t/amd64_amdfam10/test_three.t .. skipped: Running this test requires tag gtest-shuffle to be set to 0 or
```

For further details on how values in `TEST_TAGS` and `TEST_RUN_TAGS` interact, see the help text for `TEST_TAGS`.

## Running Tests in External Programs

You can hand-over test execution to an external program by setting the environment variable `EXTERNAL_TEST_STARTER` to the full path of that program:

```
export EXTERNAL_TEST_STARTER=/path/to/external/test-starter
make test
```

`EXTERNAL_TEST_STARTER`

This variable is evaluated by `tool/bin/run_test` (the backend behind `make test`) and contains the full path to the tool which actually starts the test instead of the test itself.

The `EXTERNAL_TEST_STARTER` can be any program instead of the default execution via `make qemu E=make test`. Its output is taken by `run_test` as the test output.

Usually it is just a bridge to prepare the test execution, e.g., it could create the test as image and start that image via a simulator.

## Running Tests in a Simulator

Based on above mechanism there is a dedicated external test starter `tool/bin/teststarter-image-telnet.pl` shipped in BID which assumes an image to be started with another program which provides test execution output on a network port.

This can be used to execute tests in a simulator, like this:

```
export EXTERNAL_TEST_STARTER=$L4RE_SRC/tool/bin/teststarter-image-telnet.pl
export SIMULATOR_START=/path/to/configured/simulator-exe
make test
```

After building the image and starting the simulator it contacts the simulator via a network port (sometimes called "telnet" port) to pass-through its execution output as its own output so it gets captured by `run_test` as usual.

The following variables control `teststarter-image-telnet.pl`:

#### SIMULATOR\_START

This points to the full path of the program that actually starts the prepared test image. Most often this is the frontend script of your simulator environment which is pre-configured so that it actually works in the way that `teststarter-image-telnet.pl` expects from the following settings.

#### SIMULATOR\_IMAGETYPE

The image type to be generated via `make $SIMULATOR_IMAGETYPE E=maketest`. Default is `elfimage`.

#### SIMULATOR\_HOST

The simulator will be contacted via socket on that host to read its output. Default is `localhost`.

#### SIMULATOR\_PORT

The simulator will be contacted via socket on that port to read its output. Default is `11111`.

#### SIMULATOR\_START\_SLEEPTIME

After starting the simulator it waits that many seconds before reading from the port. Default is `1` (second).

### Running tests without tapper-wrapper

In case you want to replace the `tapper-wrapper` test starter, you can replace the default one by setting the environment variable `TEST_STARTER` to the path of your test starter. Then your test starter can use the same environment which is normally set up for the default starter, which includes environment variables provided by the build system as well as the test itself. Among these are `SEARCHPATH`, `MODE`, `ARCH`, `MOE_CFG`, `MOE_ARGS`, `TEST_TIMEOUT`, `TEST_TARGET`, `TEST_EXPECTED`, `QEMU_ARGS` and many more.

### Debugging Tests

The test script is only a thin wrapper that sets up the test environment as it was defined in the make file and then executes two scripts: `tapper-wrapper` and `run_test`.

The main work horse of the two is `tool/bin/run_test`. It collects the necessary files and starts `qemu` to execute the test. This script is always required.

There is then a second script wrapped around the test runner: `tool/bin/tapper-wrapper`. This tool inspects the output of the test runner and reformats it, so that it can be read by tools like `prove`. If the test produces tap output, then the script scans for this output and filters away all the debug output. If `TEST_EXPECTED` was defined, then the script scans the output for the expected lines and prints a suitable TAP message with success or failure. It also makes sure that `qemu` is killed as soon as the test is finished.

There are a number of command-line parameters that allow to quickly change test parameters for debugging purposes. Run the test with `'-help'` for more information about available parameters.

### 3.13 Kernel Factory

The kernel factory is a kernel object that provides the ability to create new kernel objects dynamically.

The kernel factory enforces a memory quota. This quota defines the maximum amount of kernel memory the factory service can use to construct the requested objects. When the quota is depleted, the factory refuses the creation of new objects.

The quota may be higher than the amount of available kernel memory; ultimately, the amount of available kernel memory is the strict limit for the factory to remain operational.

The kernel factory creates the following kinds of objects:

- [DMA space](#)
- [L4::Factory](#)
- [L4::lpc\\_gate](#) ([L4\\_PROTO\\_NONE](#), [L4\\_PROTO\\_KOBJECT](#))
- [L4::Irq](#) ([L4\\_PROTO\\_IRQ\\_SENDER](#))
- [L4::Semaphore](#)
- [L4::Task](#)
- [L4::Thread](#)
- [L4::Vm](#)
- [L4::Vcpu\\_context](#)

The protocol IDs for objects in this list are given in [L4\\_msgtag\\_protocol](#). Kernel objects whose protocol ID is not immediately clear from the documentation of [L4\\_msgtag\\_protocol](#) have their protocol IDs stated within parenthesis. As an exception, [L4::lpc\\_gate](#) can be identified by more than one protocol IDs. The protocol ID shall be used as the second argument for [L4::Factory.create](#)([Cap<void>](#), long, [l4\\_utcb\\_t \\*](#)).

For the C++ interface see [L4::Factory](#), for the C interface see [Factory](#).

#### 3.13.1 Passing parameters for the create stream

[L4::Factory.create\(\)](#) returns a [create stream](#) that allows arguments to be forwarded to the constructor of the object to be created.

Objects that support additional parameters on their creation are presented with a non-empty list of parameters. The parameters are listed in the order they should be provided to a create stream returned by [L4::Factory.create\(\)](#).

- [Dmar\\_space\(\)](#)
- [L4::Factory\(l4\\_umword\\_t\)](#)
  - Argument: factory quota (in bytes).
  - See [L4::Factory.create\\_factory\(\)](#) for details.
- [L4::lpc\\_gate\(\)](#)
  - Creates an unbound IPC gate.
  - Alternatively, an IPC gate can be immediately bound to a thread upon creation using [L4::Factory.create\\_gate\(\)](#).

- [L4::Irq\(\)](#)
- [L4::Semaphore\(\)](#)
- [L4::Task\(l4\\_fpage\\_t\)](#)
  - Argument: utcb\_area
  - See [L4::Factory.create\\_task\(\)](#) for details.
- [L4::Thread\(\)](#)
- [L4::Vm\(\)](#)
- [L4::Vcpu\\_context\(\)](#)

# Chapter 4

## L4Re Servers

Here you shall find a quick overview over the standard services running on the [L4Re](#) Microkernel.

### Sigma0, the Root Pager

Sigma0 is a special server running on [L4](#) because it is responsible of resolving page faults for the root task, the first useful task on [L4Re](#). Sigma0 can be seen as part of the kernel, however it runs in unprivileged mode. To run something useful on the [L4Re](#) Microkernel you usually need to run Sigma0, nevertheless it is possible to replace Sigma0 by a different implementation.

For more details see [Sigma0, the Root-Pager](#)

### Moe, the Root Task

Moe is our implementation of the [L4](#) root task that is responsible for bootstrapping the system, and to provide basic resource management services to the applications on top. Therefore Moe provides [L4Re](#) resource management and multiplexing services:

- **Memory** in the form of memory allocators ([L4Re::Mem\\_alloc](#), [L4::Factory](#)) and data spaces ([L4Re::Dataspace](#))
- **Cpu** in the form of basic scheduler objects ([L4::Scheduler](#))
- **Vcon** multiplexing for debug output (output only)
- **Virtual memory management** for applications, [L4Re::Rm](#)

Moe further provides an implementation of [L4Re](#) name spaces ([L4Re::Namespace](#)), which are for example used to provide a read only directory of all multi-boot modules. In the case of a boot loader, like grub that enables a VESA frame buffer, there is also a single instance of an [L4Re](#) graphics session ([L4Re::Goos](#)).

To start the system Moe starts a single ELF program, the init process. The init process (usually Ned, see the next section) gets access to all resources managed by Moe and to the Sigma0 root pager interface.

For more details see [Moe, the Root-Task](#).

## Ned, the Default Init Process

To keep the root task free from complicated scripting engines and to avoid circular dependencies in application startup (that could lead to dead locks) the configuration and startup of the real system is managed by an extra task, the init process.

Ned is such an init process that allows system configuration via Lua scripts.

For more information see [Ned](#).

## Io, the Platform and Device Resource Manager

Because all peripheral management in [L4Re](#) is done in user-level applications, there is the need to have a centralized management of the resources belonging to the platform and to peripheral devices.

This is the job of Io. Io provides portable abstractions for iterating and accessing devices and their resources (IRQ's, IO Memory...), as well as delegating access to those resources to other applications (e.g., device drivers).

For more details see [Io, the Io Server](#).

## Other Servers

The following additional server package are available on top of the core [L4Re](#) environment.

- [Rtc, the Real-Time Clock Server](#)  
is a simple multiplexer for real-time clock hardware on your platform.
- [fb-drv, the Low-Level Graphics Driver](#)  
provides low-level access and initialization of various graphics hardware. It has support for running VESA BIOS calls on Intel x86 platforms, as well as support for various ARM display controllers. `fb-drv` provides a single instance of the `L4Re::Goos` interface and can serve as a back end for the Mag server, in particular, if there is no graphics support in the boot loader.
- [Virtio Net P2P, a virtual network point-to-point link](#)
- [Virtio Net Switch, a virtual network switch](#)
- [Uvmm, the virtual machine monitor](#)
- [RTC driver](#)
- [Mag, the GUI Multiplexer](#)
- [Sigma0, the Root-Pager](#)
- [Cons, the Console Multiplexer](#)

### 4.1 Sigma0, the Root-Pager

Sigma0 is a special [L4](#) server that serves as the origin for mapping memory.

It is started by Fiasco.OC on the system boot and gets full access to all userland RAM and device memory. It functions as the pager (main memory provider) for Moe and as the provider for device memory for Io. Moe and Io are trusted and usually the only applications besides Ned that get a capability for Sigma0. Memory can be requested from Sigma0 directly via an IPC, or indirectly by causing page faults and having them resolved by Sigma0.

### 4.1.1 Factory

There is only one instance of Sigma0 in an [L4Re](#) system, which is made accessible to Moe via an IPC gate capability. Using this capability, Moe can request Sigma0 to create new communication channels to itself by creating additional IPC gate capabilities. This request is done using the [L4::Factory](#) interface. This is the only kind of object that can be created by the factory in Sigma0.

List of objects that the Sigma0 Factory can create:

- Sigma0 ()
  - Use protocol id [L4\\_PROTO\\_SIGMA0](#) for creation
  - No arguments supported

See also

[Sigma0 API](#)

## 4.2 Moe

Moe is the default root-task implementation for L4Re-based systems.

*Moe* is the first task which is usually started in L4Re-based systems. The microkernel starts *Moe* as the Root-Task.

### 4.2.1 Moe objects

Moe provides a default implementation for the basic [L4Re](#) abstractions, such as data spaces ([L4Re::Dataspace](#)), region maps ([L4Re::Rm](#)), memory allocators ([L4::Factory](#), [L4Re::Mem\\_alloc](#)), name spaces ([L4Re::Namespace](#)) and so on (see [L4Re Interface](#)). These are described in the following subsections.

#### 4.2.1.1 Factory

The factory in Moe is responsible for all kinds of dynamic object allocation.

Moe's factory allows allocation of the following objects:

- [L4Re::Namespace](#)
- [L4Re::Dataspace](#), RAM allocation
- [L4Re::Dma\\_space](#), memory management for DMA-capable devices
- [L4Re::Rm](#), virtual memory management for application tasks
- [L4::Vcon](#) (output only)
- [L4::Scheduler](#), to provide a restricted priority / CPU range for clients
- [L4::Factory](#), to provide a quota limited allocation for clients

Note

[L4::Scheduler](#) objects can be only created through the user factory provided by Moe to the initial application. Other factory instances cannot create this object.

#### 4.2.1.1.1 Passing parameters to the create stream

`L4::Factory.create()` returns a [create stream](#) that allows arguments to be forwarded to the object creation in Moe.

### Namespace

Moe provides a name space conforming to the [L4Re::Namespace](#) interface (see [Namespace](#)). Per default Moe creates a single name space for the [Boot FS](#). That is available as `rom` in the initial objects of the init process.

#### 4.2.1.1.2 Boot FS

The Boot FS subsystem provides access to the files loaded during the platform boot (or available in ROM). These files are either linked into the boot image or loaded via a flexible boot loader, such as GRUB.

The subsystem provides an [L4Re::Namespace](#) object as directory and an [L4Re::Dataspace](#) object for each file.

By default all files are read only and visible in the namespace `rom`. As an option, files can be supplied with the argument `:rw` to mark them as writable modules. Moe will allow read and write access to these dataspace and make them visible in a different namespace called `rwfs`.

An example entry in 'modules.list' would look like this:

```
module somemodule :rw
```

### Note

In order for a client to receive write permissions to the dataspace, the corresponding cap also needs write permissions.

### Capabilities

- `svr`  
Server Capability of application. Endpoint for IPC calls  
Mandatory capability.

### Command Line Options

- `--debug=<flags>`  
This option enables debug messages from Moe itself.  
Multiple Flags in one string separated through '|', '+' or ','.  
Possible values for `<flags>` are
  - info
  - warn
  - boot
  - server
  - exceptions
  - loader
  - ns

- all
- `--init=<init_process>`

This options allows to set the init process binary.

String value.

Default: `rom/ned`
- `--l4re-dbg=<flags>`

This option allows to set the debug options for the [L4Re](#) runtime environment of the init process.

Multiple Flags in one string separated through '|', '+' or ','.

Possible values for `<flags>` are

  - info
  - warn
  - boot
  - server
  - exceptions
  - loader
  - ns
  - all
- `--ldr-flags=<flags>`

This option allows setting some loader options for the [L4Re](#) runtime environment.

Multiple Flags in one string separated through '|', '+' or ','.

Possible values for `<flags>` are

  - pre\_alloc
  - all\_segs\_cow
  - pinned\_segs
- `--brk=<address>`

This option is only present on systems without MMU. It restricts dynamic allocations to addresses equal or higher than `<address>`. Use it to prevent moe from allocating memory in regions that shall later be used by other applications or virtual machines.

Hexadecimal number without '0x' prefix.
- `-- <init_options>`

All command-line parameters after the special `--` option are passed directly to the init process.

## Namespace

Call: `create (L4.Proto.Namespace)`

## Dataspace

Dataspaces can be allocated with an arbitrary size. The granularity for memory allocation however is the machine page size ([L4\\_PAGESIZE](#)). A dataspace user must be aware that, as a result of this page-size granularity, there may be padding memory at the end of a dataspace which is accessible to each client. Moe currently allows most dataspace operations on this padding area. Nonetheless, the client must not make any assumptions about the size or content of the padding area, as this behaviour might change in the future.

The provided data spaces can have different characteristics:

- Physically contiguous and pre-allocated
- Non contiguous and on-demand allocated with possible copy on write (COW)

Dataspaces allocated via the Moe's factory allow mappings with any combination of the read-write-execute (RWX) rights, subject to a possible restriction of the writable right for client capabilities lacking the 'W' right.

Call: `create(L4.Proto.Dataspace, size [, flags, align])`

- `size`  
Size in bytes.  
Numerical value.
- `flags`  
Special dataspace properties  
Bitmap of length 4 with the single bits holding the following meaning:
  - 0x01: Continuous Allocate physically contiguous memory.
  - 0x02: Pinned Deprecated, use [L4Re::Dma\\_space](#) instead.
  - 0x04: Super pages Allocate super pages.
  - 0x08: Fixed physical Address Allocate at fixed physical address. Only honored on no-MMU systems. Will fail on MMU systems.
- `align`  
Log2 alignment of dataspace if supported by allocator  
Numerical value.

## DMA space

Call: `create(L4.Proto.Dma_space)`

## Region Map

Call: `create(L4.Proto.Rm)`

## Virtual console

The logging facility of Moe provides per application tagged and synchronized log output.

Call: `create(L4.Proto.Log [, label, "color=(string|int)"])`

- `label`

Label used as prefix for the console output.

String value.

- `"color=(string|int) "`

Color of client's output

The Value for this parameter can be one of the following:

- `string`

Define the color by the first character of the given string

Possible values are

- \* `n`: gray
- \* `r`: red
- \* `g`: green
- \* `y`: yellow
- \* `b`: blue
- \* `m`: magenta
- \* `c`: cyan
- \* `w`: white
- \* `N`: black
- \* `R`: light red
- \* `G`: light green
- \* `Y`: light yellow
- \* `B`: light blue
- \* `M`: light magenta
- \* `C`: light cyan
- \* `W`: bright white

- `int`

Define the color by integer.

Possible values are

- \* `0`: gray
- \* `1`: red
- \* `2`: green
- \* `3`: yellow
- \* `4`: blue
- \* `5`: magenta
- \* `6`: cyan
- \* `7`: white
- \* `8`: black
- \* `9`: light red
- \* `10`: light green
- \* `11`: light yellow
- \* `12`: light blue
- \* `13`: light magenta
- \* `14`: light cyan
- \* `15`: bright white

Default: `white`

## Scheduler

The scheduler subsystem provides a simple scheduler proxy for scheduling policy enforcement.

The priority offset provided on the creation of a scheduler proxy defines the minimum priority assigned to threads which are scheduled by that instance of the scheduler proxy. The offset is implicitly added to priorities provided to `L4::Scheduler.run_thread()`.

Call: `create(L4.Proto.Scheduler, limit, offset [, bitmap])`

- `limit`  
Maximum priority.  
Numerical value.
- `offset`  
Priority offset.  
Numerical value.
- `bitmap`  
Bitmap of CPUs - can be repeated to address higher order CPUs  
Numerical value.

## Factory

Call: `create(L4.Proto.Factory [, quota])`

- `quota`  
Limit in bytes. The limit is deducted from the limit of the factory that creates the new factory.  
Numerical value.
  - Must not be zero.

## 4.3 Ned, the Init Process

Ned's job is to bootstrap the system running on [L4Re](#).

The main thing to do here is to coordinate the startup of services and applications as well as to provide the communication channels for them. The central facility in Ned is the Lua (<http://www.lua.org>) script interpreter with the [L4Re](#) and ELF-loader bindings.

The boot process is based on the execution of one or more Lua scripts that create communication channels (IPC gates), instantiate other [L4Re](#) objects, organize capabilities to these objects in sets, and start application processes with access to those objects (or based on those objects).

For starting applications, Ned depends on the services of [Moe](#) or another *loader*, which must provide data spaces and region maps. Ned also uses the 'rom' capability as source for Lua scripts and at least the 'l4re' binary (the runtime environment core) running in each application.

Each application Ned starts is equipped with an [L4Re::Env](#) environment that provides information about all the initial objects made accessible to this application.

### 4.3.1 Lua Bindings for L4Re

Ned provides various bindings for [L4Re](#) abstractions. These bindings are located in the 'L4' package (`require "L4"`).

#### 4.3.1.1 Tutorial

For a verbose example using the Ned Lua bindings, see [tutorial.lua](#).

#### 4.3.1.2 Capabilities in Lua

Capabilities are handled as normal values in Lua. They can be stored in normal variables or Lua compound structures (tables). A capability in Lua possesses additional information about the access rights that shall be transferred to other tasks when the capability is transferred. To support implementation of the Principle of Least Privilege, minimal rights are assigned by default. Extended rights can be added using the method `mode("...")` (short `m("...")`) that returns a new reference to the capability with the given rights.

#### Note

It is generally impossible to elevate the real access rights to an object. This means that if Ned has only restricted rights to an object it is not possible to upgrade the access rights with the `mode` method.

The capabilities in Lua also carry dynamic type information about the referenced objects. They thereby provide type-specific operations on the objects, such as the `create` operation on a generic factory or the `query` and `register` operations on a name space.

#### 4.3.1.3 Access to L4Re::Env Capabilities

The initial objects provided to Ned itself are accessible via the table `L4.Env`. The default (usually unnamed) capabilities are accessible as `factory`, `log`, `mem_alloc`, `parent`, `rm`, and `scheduler` in the `L4.Env` table.

#### 4.3.1.4 Constants

#### Protocols

The protocol constants are defined by default in the [L4](#) package's table `L4.Proto`. The definition is not complete and only covers what is usually needed to configure and start applications. The protocols are for example used as first argument to the `Factory:create` method.

```
Proto = {
  Dataspace = 0x4000,
  Namespace = 0x4001,
  Goos      = 0x4003,
  Mem_alloc = 0x4004,
  Rm        = 0x4005,
  Event     = 0x4006,
  Inhibitor = 0x4007,
  Sigma0    = -6,
  Log       = -13,
  Scheduler = -14,
  Factory   = -15,
  Vm        = -16,
  Dma_space = -17,
  Irq_sender = -18,
  Semaphore = -20,
```

```

Iommu      = -22,
Ipc_gate   = 0,
}

```

## Rights

The rights of a Lua capability can be defined in two ways via the `:mode()` interface. Either via a string representation of the rights or via an integer value. An example for the former is `:mode("rsnc")` while the latter equivalent is `:mode(L4.Rights.r | L4.Rights.s | L4.Rights.n | L4.Rights.c)`. The following listing shows the integer constants. The constant names can be used in the string parameter to `:mode()`.

```

Rights = {
  s = 2,
  w = 1,
  r = 4,
  d = 8,
  n = 16,
  c = 32,
  ro = 4,
  rw = 5,
  rws = 7,
}

```

## Debugging Flags

Debugging flags used for the applications [L4Re](#) core:

```

Dbg = {
  Info      = 1,
  Warn      = 2,
  Boot      = 4,
  Server     = 0x10,
  Exceptions = 0x20,
  Cmd_line  = 0x40,
  Loader     = 0x80,
  Name_space = 0x400,
  All       = 0xffffffff,
}

```

## Loader Flags

Flags for configuring the loading process of an application.

```

Ldr_flags = {
  eager_map    = 0x1, -- L4RE_AUX_LDR_FLAG_EAGER_MAP
  all_segs_cow = 0x2, -- L4RE_AUX_LDR_FLAG_ALL_SEGS_COW
  pinned_segs  = 0x4, -- L4RE_AUX_LDR_FLAG_PINNED_SEGS
}

```

### 4.3.1.5 Application Startup Details

The central facility for starting a new task with Ned is the class `L4.Loader`. This class provides interfaces for conveniently configuring and starting programs. It provides three operations:

- `new_channel()` Returns a new IPC gate that can be used to connect two applications
- `start()` and `startv()` Start a new application process and return a process object

The `new_channel()` call is used to provide a service application with a communication channel to bind its initial service to. The concrete behavior of the object and the number of IPC gates required by a server depends on the server implementation. The channel can be passed to client applications as well or can be used for operations within the script itself.

`start()` and `startv()` always require at least two arguments. The first one is a table that contains information about the initial objects an application shall get. The second argument is a string, which for `start()` is the program name plus a white-space-separated list of program arguments (`argv`). For `startv()` the second argument is just the program binary name – which may contain spaces –, and the program arguments are provided as separate string arguments following the binary name (allowing spaces in arguments, too). The last optional argument is a table containing the POSIX environment variables for the program.

The Loader class uses reasonable defaults for most of the initial objects. However, you can override any initial object with some user-defined values. The main elements of the initial object table are:

- `factory` The factory used by the new process to create new kernel objects, such as threads etc. This must be a capability to an object implementing the [L4Re::Factory](#) protocol and defaults to the factory object provided to Ned.
- `mem` The memory allocator provided to the application and used by Ned allocates data spaces for the process. This defaults to Ned's memory allocator object (see [L4Re::Mem\\_alloc](#)).
- `rm_fab` The generic factory object used to allocate the region-map object for the process. (defaults to Ned's memory allocator).
- `log_fab` The generic factory to create the [L4Re::Log](#) object for the application's output (defaults to Ned's memory allocator). The `create` method of the `log_fab` object is called with `log_tag` and `log_color`, from this table, as arguments.
- `log` A table with parameters passed to the `log_fab`:
  - The first item is a short string defining the tag used for tagging log output of this process (defaults to the program name).
  - The second item is a string defining the color used for the log tag and the log string (defaults to "white").
  - Further parameters might be evaluated by certain implementations of the [L4Re::Log](#) interface.
- `scheduler` The scheduler object used for the process' threads (defaults to Ned's own scheduler).
- `caps` The table with application-specific named capabilities (default is an empty table). If the table does not contain a capability with the name 'rom', the 'rom' capability from Ned's initial caps is inserted into the table.

Less frequently used parameters:

- `l4re_dbg` An integer value overriding the debug level of the ITAS used for this application. Default is 2 (Warn). See *Debugging Flags* above.
- `ldr_flags` An integer value for setting additional flags for attaching regions, see *Loader Flags* above.

The `start()` and `startv()` calls return a task object that supports a number of operations.

- `state()` returns a string with the current task state: "running" or "zombie" if the task has terminated. If the task was already reaped (`wait()` returned) or if `kill()` was called, then the function will return `nil`.
- `exit_code()` returns the exit code if the task has terminated or `nil` if it was either killed or has been reaped.
- `kill()` forcefully terminates the task. Returns "killed" if the task was terminated or the exit code if the task was already gone. Returns `nil` if the task was already reaped.
- `exit_handler(function)` registers a Lua function that is invoked when the task terminates. If the task has already terminated, the function is called immediately. Returns `true` if the callback is pending, otherwise `false`. The callback function gets the exit code (`nil` if killed) of the task as its only parameter. The return value of the function is ignored. Only one callback can be registered.
- `wait()` suspends execution until the task has terminated. It's better to use `exit_handler()` instead. While the Lua code executes `wait()`, no `exit_handler()` will be dispatched.

#### 4.3.1.6 Reacting on task termination

Ned can react on the termination of child tasks. The preferred mechanism is to register an `exit_handler()` for a task:

```
task = L4.default_loader:start(...)
task:exit_handler(function(exit_code)
  if exit_code == nil then
    print("Task was killed")
  else
    print("Task has terminated w/ code [" .. exit_code .. "]")
  end
end)
```

If the task did already terminate then the callback is invoked immediately. It is also possible to suspend execution of the Ned script until a task has terminated:

```
task = L4.default_loader:start(...)
task:wait()
```

This method should be used with caution, though. The Ned script will wait until the child task has terminated. Neither will any of the registered `exit_handler()` will be called during this time, nor will the [remote command interface](#) be able to execute commands either.

#### 4.3.1.7 Control scheduling

Scheduling of L4Re applications is controlled by creating scheduler proxies. The proxy restricts the threads of an application to run on a subset of the available CPUs and to set their minimum and maximum priority. Use the loader factory function to create the proxy and pass it to the application:

```
sched_proxy = L4.default_loader:create_sched_proxy{ cpus=L4.Cpu_set:new("0-3") }
L4.default_loader:start({ scheduler = sched_proxy }, ...)
```

The `create_sched_proxy` function takes the following table arguments. All arguments are optional:

`cpus`: Set of allowed CPUs. Default: all CPUs. `prio_offset`: Base priority of all threads. Default: 0. `prio_limit`: Maximum priority of all threads. Default: `prio_offset + 10`. `fab`: Scheduler proxy factory capability. Default: `loader sched_fab`.

The `Cpu_set` constructor takes any number of CPU numbers or ranges:

```
Cpu_set:new()           -- all CPUs (because no argument was passed)
Cpu_set:new{}           -- empty CPU set (because an empty table was passed)
Cpu_set:new(42)          -- single CPU: 42
Cpu_set:new("0-3")       -- 4 CPUs: 0..3
Cpu_set:new("0-3", 42)   -- 5 CPUs: 0..3, 42
```

A limited number of operations are defined on CPU sets. To compute the union of two sets (all CPUs of both sets), use the `|` operator. To compute the intersection of two sets (all CPUs common to both sets), use the `&` operator.

#### 4.3.1.8 Access to the kernel debugger

Applications can enrich the kernel debugger with information using the API defined in [l4/sys/debugger](#). In order to do so, the developer has to assign access to the kernel debugger kernel object to the application. This can be done like this:

```
L4.default_loader:start({ caps = { jdb = L4.Env.jdb; }}, "rom/example")
```

### 4.3.1.9 Using the interactive ned prompt

Ned can be used in interactive mode by connecting the small ned-prompt helper tool to the command capability. Add the following code snippet at the end of your ned script:

```
local L4 = require("L4");
local l = L4.default_loader;

cmd = l:new_channel()

l:start({ log = L4.Env.log, caps = { svr = cmd } }, "rom/ned-prompt")

L4.server_loop(cmd)
```

The script hands in ned's own log capability to ned-prompt. This ensures that input and output of ned and the prompt appear on the same console.

ned-prompt needs to be added to your modules list.

## 4.3.2 Command Line Options

Ned's command line syntax is:

```
[--exit|--wait-and-exit] [--disable-backtracer-autoload] [--execute|-e STATEMENT] <lua script> [options passed]
```

Ned interprets the first non-option argument `<lua script>` as the Lua script which it should load and run. All arguments following the first non-option argument are passed as arguments to the Lua script via Lua's global `arg` table.

- Exit Options: **exit**, **wait-and-exit** (must be first if used)
  - **exit**: terminates the application after the script has run through even if there are still tasks running. `wait` for tasks at the end of the script to ensure they do not die forcefully.
  - **exit-and-wait**: terminates the application after the script has run through and all tasks started by ned have signaled their exit.
- Execute Statement Option: **execute**, **e**  
Execute the Lua statement `STATEMENT`.
- **disable-backtracer-autoload**: Do not load the backtracer automatically.

## 4.4 Io, the Io Server

The Io server handles all platform devices and resources such as I/O memory, ports (on x86) and interrupts, and grants access to those to clients.

Upon startup Io discovers all platform devices using available means on the system, e.g. on x86 the PCI bus is scanned and the ACPI subsystem initialised. Available I/O resource can also be configured via configuration scripts.

Io's configuration consists of two parts:

- the description of the real hardware
- the description of virtual buses

Both descriptions represent a hierarchical (tree) structure of device nodes. Where each device has a set of resources attached to it. And a device that has child devices can be considered a bus.

## Hardware Description

The hardware description represents the devices that are available on the particular platform including their resource descriptions, such as MMIO regions, IO-Port regions, IRQs, bus numbers etc.

The root of the hardware devices is formed by a system bus device (accessible in the configuration via `lo.system↔_bus()`). As mentioned before, platforms that support methods for device discovery may populate the hardware description automatically, for example from ACPI. On platforms that do not have support for such methods you have to specify the hardware description by hand. A simple example for this is `x86-legacy.devs`.

## Virtual Bus Description

Each lo server client is provided with its own virtual bus which it can iterate to find devices. A virtual PCI bus may be a part of this virtual bus.

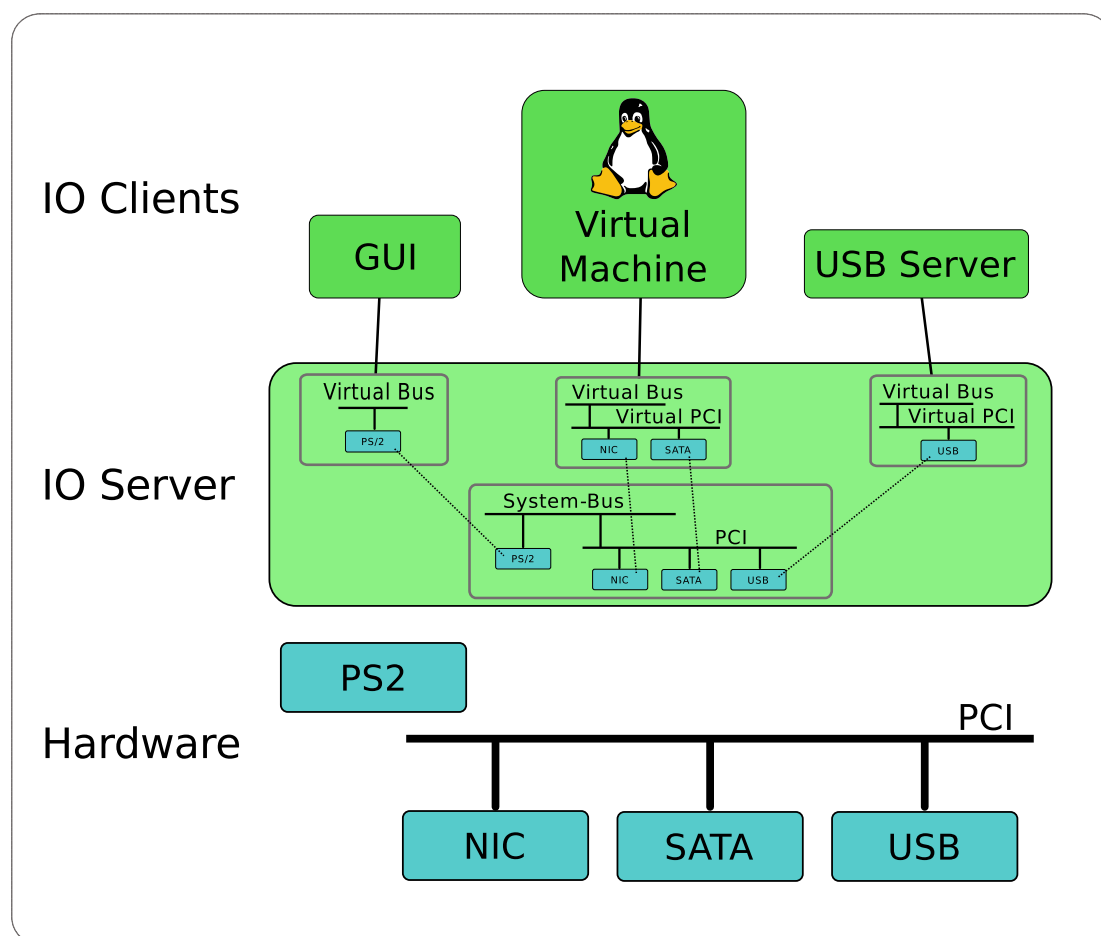

Figure 4.1 IO Service Architecture Overview

The lo server must be configured to create virtual buses for its clients.

This is done with at least one configuration file specifying static resources as well as virtual buses for clients. The configuration may be split across several configuration files passed to lo through the command line.

To allow clients access to available devices, a virtual system bus needs to be created that lists the devices and their resources that should be available to that client. The names of the buses correspond to the capabilities given to lo in its launch configuration.

A very simple configuration for Io could look like this:

```
-- vim:ft=lua
-- Example configuration for io

-- Configure two platform devices to be known to io
Io.Dt.add_children(Io.system_bus(), function()

    -- create a new hardware device called "FOODEVICE"
    FOODEVICE = Io.Hw.Device(function()
        -- set the compatibility IDs for this device
        -- a client tries to match against these IDs and configures
        -- itself accordingly
        -- the list should be sorted from specific to less specific IDs
        compatible = {"dev-foo,mmio", "dev-foo"};

        -- set the 'hid' property of the device, the hid can also be used
        -- as a compatible ID when matching clients
        Property.hid = "dev-foo,Example";

        -- note: names for resources are truncated to 4 letters and a client
        -- can determine the name from the ID field of a l4vbus_resource_t
        -- add two resources 'irq0' and 'reg0' to the device
        Resource.irq0 = Io.Res.irq(17);
        Resource.reg0 = Io.Res.mmio(0x6f000000, 0x6f007fff);
    end);

    -- create a new hardware device called "BARDEVICE"
    BARDEVICE = Io.Hw.Device(function()
        -- set the compatibility IDs for this device
        -- a client tries to match against these IDs and configures
        -- itself accordingly
        -- the list should be sorted from specific to less specific IDs
        compatible = {"dev-bar,mmio", "dev-bar"};

        -- set the 'hid' property of the device, the hid can also be used
        -- as a compatible ID when matching clients
        Property.hid = "dev-bar,Example";

        -- Specify that this device is able to use direct memory access (DMA).
        -- This is needed to allow clients to gain access to DMA addresses
        -- used by this device to directly access memory.
        Property.flags = Io.Hw_device_DF_dma_supported;

        -- note: names for resources are truncated to 4 letters and a client
        -- can determine the name from the ID field of a l4vbus_resource_t
        -- add three resources 'irq0', 'irq1', and 'reg0' to the device
        Resource.irq0 = Io.Res.irq(19);
        Resource.irq1 = Io.Res.irq(20);
        Resource.reg0 = Io.Res.mmio(0x6f100000, 0x6f100fff);
    end);
end);

Io.add_vbusses
{
    -- Create a virtual bus for a client and give access to FOODEVICE
    client1 = Io.Vi.System_bus(function ()
        dev = wrap(Io.system_bus():match("dev-foo,mmio"));
    end);

    -- Create a virtual bus for another client and give it access to BARDEVICE
    client2 = Io.Vi.System_bus(function ()
        dev = wrap(Io.system_bus():match("dev-bar,Example"));
    end);
}
```

Each device supports a 'compatible' property. It is a list of compatibility strings. A client matches itself against one (or multiple) compatibility IDs and configures itself accordingly. All other device members are handled according to their type. If the type is a resource (Io.Res) it is added as a named resource. Note that resource names are truncated to 4 letters and are stored in the ID field of a [l4vbus\\_resource\\_t](#). If the type is a device it is added as a child device to the current one. All other types are treated as a device property which can be used to configure a device driver. Right now, device properties are internal to Io only.

## Matching and Assigning PCI Devices

Assigning clients PCI devices could look like this:

```
-- This is a configuration snippet for PCI device selection

local hw = Io.system_bus();

Io.add_vbusses
{
  pciclient = Io.Vi.System_bus(function ()
    PCI = Io.Vi.PCI_bus(function ()
      pci_mm      = wrap(hw:match("PCI/CC_04"));
      pci_net     = wrap(hw:match("PCI/CC_02"));
      pci_storage = wrap(hw:match("PCI/CC_01"));
    end)
  end)
}
```

The "PCI/" is followed by a bus-specific ID string. The format of the PCI ID string may be one of the following:

- PCI/CC\_cc
- PCI/CC\_ccss
- PCI/CC\_ccssp
- PCI/VEN\_vvvv
- PCI/DEV\_dddd
- PCI/SUBSYS\_sssssss
- PCI/REV\_rr
- PCI/ADR\_xxxx:xx:xx.x

Where:

- `cc` is the hexadecimal representation of the class code byte
- `ss` is the hexadecimal representation of the subclass code byte
- `pp` is the hexadecimal representation of the programming interface byte
- `vvvv` is the hexadecimal representation of the vendor ID
- `dddd` is the hexadecimal representation of the device ID
- `ssssssss` is the hexadecimal representation of the subsystem ID
- `rr` is the hexadecimal representation of the revision byte
- `xxxx:xx:xx.x` is the bus address in PCI nomenclature

As a special extension Io supports replacing the ID string with a human-readable common PCI class name. The following table gives an overview of the names known to Io and their respective PCI class and subclass.

Common Name	Description	PCI ID string
storage	Mass storage controller	CC_01
scsi	SCSI storage controller	CC_0100
ide	IDE interface	CC_0101
floppy	Floppy disk controller	CC_0102
raid	RAID bus controller	CC_0104
ata	ATA controller	CC_0105

Common Name	Description	PCI ID string
sata	SATA controller	CC_0106
sas	Serial attached SCSI controller	CC_0107
nvm	Non-volatile memory controller	CC_0108
-	-	-
network	Network controller	CC_02
ethernet	Ethernet controller	CC_0200
token_ring	Token ring network controller	CC_0201
fddi	FDDI network controller	CC_0202
atm	ATM network controller	CC_0203
isdn	ISDN controller	CC_0204
picmg	PICMG controller	CC_0206
net_infiniband	Infiniband controller	CC_0207
fabric	Fabric controller	CC_0208
network_nw	Network controller e.g. Wifi	CC_0280
-	-	-
display	Display controller	CC_03
vga	VGA compatible controller	CC_0300
xga	XGA compatible controller	CC_0301
-	-	-
media	Multimedia controller	CC_04
mm_video	Multimedia video controller	CC_0400
mm_audio	Multimedia audio controller	CC_0401
telephony	Computer telephony device	CC_0402
audio	Audio device	CC_0403
-	-	-
bridge	Bridge	CC_06
br_host	Host bridge	CC_0600
br_isa	ISA bridge	CC_0601
br_eisa	EISA bridge	CC_0602
br_microchannel	MicroChannel bridge	CC_0603
br_pci	PCI bridge	CC_0604
br_pcmcia	PCMCIA bridge	CC_0605
br_nubus	NuBus bridge	CC_0606
br_cardbus	CardBus bridge	CC_0607
br_raceway	RACEway bridge	CC_0608
br_semi_pci	Semi-transparent PCI-to-PCI bridge	CC_0609
br_infiniband_to_pci	InfiniBand to PCI host bridge	CC_060a
-	-	-
com	Communication controller	CC_07
com_serial	Serial controller	CC_0700
com_parallel	Parallel controller	CC_0701

Common Name	Description	PCI ID string
com_multiport_ser	Multiport serial controller	CC_0702
com_modem	Modem	CC_0703
com_gpib	GPiB controller	CC_0704
com_smart_card	Smart card controller	CC_0705
-	-	-
serial_bus	Serial bus controller	CC_0c
firewire	FireWire (IEEE 1394)	CC_0c00
access_bus	ACCESS bus	CC_0c01
ssa	SSA	CC_0c02
usb	USB controller	CC_0c03
fibre_channel	Fibre channel	CC_0c04
smbus	SMBus	CC_0c05
bus_infiniband	InfiniBand	CC_0c06
ipmi_smic	IPMI SMIC interface	CC_0c07
sercos	SERCOS interface	CC_0c08
canbus	CAN bus	CC_0c09
-	-	-
wireless	Wireless controller	CC_0d
bluetooth	Bluetooth	CC_0d11
w_8021a	802.1a controller	CC_0d20
w_8021b	802.1b controller	CC_0d21

### Strong Matching of PCI Devices

If more specific matching of PCI devices is required it is possible to concatenate multiple ID strings using &. An example where a specific device from a specific vendor at a fixed bus address is matched would use the string `PCI/VEN_vvvv&DEV_dddd&ADR_xxxx:xx:xx.x`.

### Isolation of PCIe devices

PCIe encodes device communication with a network-like protocol with destination headers and packet fragmentation allowing a devices to talk directly to other devices. This potentially works against security boundaries for a system. E.g. two network cards could exchange packets and thereby leak information from one security domain to the other without involvement of the OS.

PCIe introduced an optional capability named PCI Access Control Services (PCI/ACS) to control communication between PCIe devices.

With PCI/ACS it is possible to restrict inter-device communication between PCIe devices.

PCI/ACS is optional and for Intel chipsets, it is usually only implemented on high-end PCI platform controller hubs (PCHs), and is missing on low-end and mobile PCHs. On some Intel-PCHs there exist facilities that allow for similar isolation.

If IO encounters a supported PCH, it will enable those facilities in order to enforce device isolation.

## Command Line Options

The lo Server supports the following optional parameters:

```
[--verbose|v] [--transparent-msi] [--trace <trace_mask>] [--acpi-debug-level <debug_level>] [config_files]
```

- **verbose|v**

By default, error debug messages are enabled. This option increments the verbosity level, and can be applied multiple times to reach the desired debug level. The available debug levels are ordered as: `DBG_ERR` (default, level 1), `DBG_WARN`, `DBG_INFO`, `DBG_DEBUG`, `DBG_DEBUG2` and `DBG_ALL` (level 6).

- **transparent-msi**

Enable MSI on PCI devices which support this feature. This is transparent to clients, as there are no changes in the API used to interact with PCI device via interrupts.

- **acpi-debug-level <level\_mask>**

Set the ACPI debug level. The `<level_mask>` is a mask that selects components of interest for debugging. It can be constructed from the ACPI debug constants defined in the linux kernel, see [ACPI Debug Output](#) for details. By default, the ACPI debug level is set to `ACPI_LV_INIT | ACPI_LV_TABLES | ACPI_LV_VERBOSE_INFO`.

- **trace <trace\_mask>**

Enable tracing of events matching `trace_mask`. The only supported trace mask is 1 and this matches ACPI events.

- **config\_files**

Space separated list of Lua configuration files specifying real hardware and virtual buses. See example on [Virtual Bus Description](#).

## 4.5 Virtio Net P2P, a virtual network point-to-point link

The virtual network point-to-point server (p2p) connects two clients with a virtual network connection. It uses virtio as the transport mechanism. Each virtual network p2p endpoint implements the device-side of a virtio network device. Each client can access its endpoint using the driver-side semantics of a virtio network device.

## Capabilities

- **dataspace**

Trusted dataspaces

Multiple capability names can be provided by the `--register-ds` command line parameter.

- **svr**

Server Capability of application. Endpoint for IPC calls

Mandatory capability.

## Command Line Options

The following command line options are supported:

- `-p <num_usec>, --poll <num_usec>`  
 Enable polling mode and set the poll interval. IRQ notification is disabled for queues while in polling mode.  
 Numerical value.
  - Must be a positive integer specified in microseconds.
- `-s <num>, --size <num>`  
 Set the maximum queue size for the device-side virtio queues.  
 Numerical value.
  - Must be a power of 2 in the range of 1 to 32768 inclusive.
 Default: 256
- `-d <cap_name>, --register-ds <cap_name>`  
 Register a trusted dataspace capability. If this option is used, it is not possible to communicate with the server via dataspaces other than the registered ones.  
 Can be used multiple times.  
 Name of a provided capability that adheres to the dataspace protocol.

## Building and Configuration

The virtual network p2p server can be built using the [L4Re](#) build system by placing this project into the `pkg` directory.

## Starting the service

The virtual network p2p server can be started with Lua like this:

```
local p2p = L4.default_loader:new_channel();
L4.default_loader:start(
{
  caps = {
    svr = p2p:svr(),
  },
},
"rom/l4vio_net_p2p [<options>]");
```

First an IPC gate (`p2p`) is created which is used between the virtual network p2p server and a client to create new virtual ports. The server-side is assigned to the mandatory `svr` capability of the virtual network p2p server. See the section below on how to create a new virtual port and connect a client to it.

## Virtual p2p port

Prior to connecting a client to a virtual network p2p server port it has to be created using the following Lua function. It has to be called on the client side of the IPC gate capability whose server side is bound to the virtual network p2p server.

The "key=value" pairs passed to create() can be omitted and their order is not important.

Call: `create(0 [, "ds-max=<max>", "mac=<addr>"])`

- "ds-max=<max>"

Specifies the upper limit of the number of dataspace the client is allowed to register with the server for virtio DMA.

Numerical value.

- Must be in the range of 1 to 80 inclusive.

Default: 2

- "mac=<addr>"

Specify the MAC address of the endpoint where <mac\_address> is of the form xx:xx:xx:xx:xx:xx.

String value.

- Must be in the form xx:xx:xx:xx:xx:xx.

If the `create()` call is successful a new capability which references a virtual network p2p server port is returned. A client uses this capability to talk to the virtual network p2p server using the virtio network protocol.

## Examples

A couple of examples on how to create ports with different properties are listed below.

```
-- two normal ports with at most 4 data spaces
net0 = p2p:create(0, "ds-max=4")
net1 = p2p:create(0, "ds-max=4")
-- normal port with 4 data spaces and MAC address
net0 = p2p:create(0, "ds-max=4", "mac=11:22:33:44:55:66")
```

## 4.6 Virtio Net Switch, a virtual network switch

The virtual network switch connects multiple clients with a virtual network connection. It uses Virtio as the transport mechanism. Each virtual switch port implements the host-side of a Virtio network device (virtio-net).

### Capabilities

- `dataspace`

Trusted dataspace

Multiple capability names can be provided by the `--register-ds` command line parameter.

- `svr`

Server Capability of application. Endpoint for IPC calls

Mandatory capability.

## Command Line Options

In the example above the virtual network switch is started in its default configuration with a maximum of 5 virtual ports. To customize the configuration the virtual network switch accepts the following command line options:

- `-D <component=level>, --debug <component=level>`  
 Configure individual debug levels per component. Verbosity increases from `quiet` up to `trace`.  
 Can be used multiple times.  
 Possible values for component are | `core, virtio, port, request, queue, packet`.  
 Possible values for level are | `quiet, warn, info, debug, trace`.
- `-m, --mac`  
 Ignored. Provided for compatibility with older switch versions.  
 Flag. True if provided.
- `-M`  
 Do not assign a random MAC address to ports by default. It is always possible to set an explicit MAC address by passing the `mac=` to the factory call, regardless of this option. If `-M` is passed and no `mac=` address was given, it is the responsibility of the Virtio driver to choose an appropriate address.  
 Flag. True if provided.
- `-p <num>, --ports <num>`  
 Set the maximum number of virtual ports.  
 Numerical value.  
 Default: 256
- `-q, --quiet`  
 Silence all output except for error messages.  
 Flag. True if provided.
- `-s <num>, --size <num>`  
 Set the maximum queue size for the device-side Virtio queues.  
 Numerical value.
  - Must be a power of 2 in the range of 1 to 32768 inclusive.
 Default: 256
- `-v, --verbose`  
 Increase the global verbosity level. Individual levels per component can be set using the `-D` option.  
 Can be used up to 3 times.  
 Flag. True if provided.
- `-d <cap_name>, --register-ds <cap_name>`  
 Register a trusted dataspace capability. If this option gets used, it is not possible to communicate with the server via dataspace other than the registered ones. Can be used multiple times for multiple dataspace.  
 The option's parameter is the name of a dataspace capability.  
 Can be used multiple times.  
 Name of a provided capability that adheres to the dataspace protocol.

The virtual network switch can be setup to feature exactly one monitor port. All traffic passing through the switch is mirrored to the monitor port. The monitor port is read-only, and has no TX capability. An optional packet filter can be configured and implemented to filter data sent to the monitor port.

## Configuration

Certain features of the virtual network switch are configurable at compile-time. Configuration is done through the build-time configuration of the [L4Re](#) build tree.

## Starting the service

The virtual network switch can be started in Ned like this:

```
local switch = L4.default_loader:new_channel();
L4.default_loader:start(
{
  caps = {
    svr = switch:svr(),
  },
},
"rom/l4vio_switch");
```

First a communication channel (`switch`) is created which is used to create virtual network ports. It is connected to the switch component via its mandatory `svr` capability. See the section below on how to create a new virtual port and connect a client to it.

## Hardware devices

To plug hardware devices into the switch, provide a `Vbus` capability with the name `vbus` when starting the switch. To use this feature, you have to enable the `VNS_IXL` config option.

## Virtual switch port

First, a virtual network port has to be created using the following Ned-Lua function. It has to be called on the communication channel called `switch`, which has been created earlier.

```
Call: create(0 [, "ds-max=<max>", "name=<name>", "type=<port type>", "vlan=(access=<vlan id>|trunk=<vlan id>[,<vlan id>]*)", "mac=<addr>"])
```

- "ds-max=<max>"

Specifies the upper limit of the number of dataspace the client is allowed to register with the virtual network switch for Virtio DMA.

Numerical value.

- In the range of 1 to 80 inclusive

- "name=<name>"

Sets the name of port in debug messages to `<name>`. A name may consist of at most 19 characters, all other characters are dropped. If there is enough space left, the name will get a postfix of "`[<port number>]`", e.g. "name=foo" -> foo[1].

String value.

- "type=<port type>"

Optionally specify the port type.

Possible values for `<port type>` are

- monitor: Monitor Port
- normal: Normal Port

Default: normal

- "vlan=(access=<vlan id>|trunk=<vlan id>[,<vlan id>]\*)"

Configure the port to participate in an IEEE 802.1Q compatible VLAN. Fundamentally there are two types of ports: access ports and trunk ports.

The Value for this parameter can be one of the following:

- "access=<vlan id>"

Configures the port as access port for VLAN <vlan id> where the id must be a decimal number greater than 0 and less than 4095 in accordance to the standard. Packets on an access port belong to the configured VLAN and are only forwarded to ports that belong to the same VLAN or trunk ports that participate in the particular VLAN. The packets on this port will not have a VLAN tag attached to them so that a guest connected to this port does not see that the port is part of a VLAN.

An optional monitor port will see packets from an access port as VLAN tagged packets with the <vlan id> given for the port.

Numerical value.

- \* In the range of 0 to 4095 exclusive

- "trunk=<vlan id>[, <vlan id>]\*"

Configures the port as trunk port. It participates either in all VLANs, if specified by the keyword 'all', or in the list of VLANs given as comma separated list. There must be no whitespace in the list. Each id must be a decimal number greater than 0 and less than 4095 in accordance to the standard. Outgoing packets on this port will be tagged with an IEEE 802.1Q compatible tag. Incoming packets must be tagged with a VLAN tag from the given list. Packets that have no tag or a tag not in the vlan id list are dropped silently. They are not forwarded to the monitor port either. Currently there is no support for IEEE 802.1p. The PCP and DEI sub-fields in the TCI field will be set to zero on outgoing packets and are ignored for incoming packets.

Numerical value.

- "mac=<addr>"

Explicitly sets the MAC address of the port. It will be checked that no other port on the switch has the same address. It is the responsibility of the user to ensure the validity of the address and its global uniqueness, though.

String value.

- In form xx:xx:xx:xx:xx:xx

If the `create()` call is successful a new capability which references a virtual switch port is returned. A client uses this capability to talk to the virtual network switch using the Virtio network protocol.

## Examples

Here are couple of examples on how to create ports with different properties:

```
-- normal port with at most 4 data spaces
net0 = switch:create(0, "ds-max=4")
-- like the previous but with name foo
net0 = switch:create(0, "ds-max=4", "name=foo")
-- like the previous but the port is a monitor port
net0 = switch:create(0, "ds-max=4", "name=foo", "type=monitor")
-- normal port with 4 data spaces as access port to VLAN 1
net0 = switch:create(0, "ds-max=4", "name=v11", "vlan=access=1")
-- normal port with 4 data spaces as trunk port participating in VLAN 1 & 2
net0 = switch:create(0, "ds-max=4", "name=v11", "vlan=trunk=1,2")
```

## 4.7 Uvmm, the virtual machine monitor

Uvmm provides a virtual machine for running an unmodified guest in non- privileged mode.

## Capabilities

- `ram`

The memory for the guest provided via a simple dataspace.

- `pfc`

Uvmm can be instructed to inform a PM manager of PM events through the [L4::Platform\\_control](#) interface. To that end, uvmm may be equipped with a `pfc` cap. On suspend, uvmm will call [l4\\_platform\\_ctl\\_system\\_suspend\(\)](#).

The `pfc` cap can also be implemented by IO. In that case the guest can start a machine suspend/shutdown/reboot.

## Command Line Options

- `--mon <option>`

Control the handling of guest reads/writes to non-existing memory.

Possible values for `<option>` are

- `true`: The monitor interface is enabled but no server implementing the client side of the monitor interface is started. The monitor interface can still be utilized via cons but no readline functionality will be available.
- `some_binary`: If a string is passed as the value of `mon`, the monitor interface is enabled and the string is interpreted as the name of a server binary which implements the client side of the monitor interface. This server is automatically started and has access to a `vcon` capability named `mon` at startup through which it can make use of the monitor interface. Unless you have written your own server you should specify `'uvmm_cli'` which is a server implementing a simple readline interface.
- `false`: The monitor interface is disabled at runtime.

Default: `true`

- `-c <guest command line>,--cmdline <guest command line>`

Command line that is passed to the guest on boot.

String value.

- `-k <kernel image name>,--kernel <kernel image name>`

The name of the guest-kernel image file present in the ROM namespace.

File path in ROM namespace.

- `-d <DTB overlay>,--dtb <DTB overlay>`

The name of the device tree file present in the ROM namespace. The device tree will be placed in the upmost region of guest memory. Optionally, a user may use an additional parameter in the form of "`<DTB overlay>:limit=0xffffffff`" to set an upper limit for the device tree location.

This option can be issued multiple times. uvmm will merge all provided device tree overlays.

File path in ROM namespace.

- `-r <RAM disk name>,--ramdisk <RAM disk name>`

The name of the RAM disk file present in the ROM namespace

File path in ROM namespace.

- `-b <Base address of the guest RAM>,--rambase <Base address of the guest RAM>`

Physical start address for the guest RAM. This value is platform specific.

Numerical value.

- `-D <component=level>, --debug <component=level>`

Control the verbosity level of the uvmm.

Using the `component` prefix, the verbosity level of each uvmm component is configurable.

For example, the following command line sets the verbosity of all uvmm components to `info` except for IRQ handling, which is set to `trace`:

```
uvmm -D info -D irq=trace
```

Can be used multiple times.

Possible values for `component` are | `core, cpu, mmio, irq, dev, pm, vbus_event`.

Possible values for `level` are | `quiet, warn, info, trace`.

Options `-q, --quiet, -v, --verbose` and `-D, --debug` cancel each other out.

- `-f, --fault-mode`

Control the handling of guest reads/writes to non-existing memory.

Possible values are

- `ignore`: Invalid writes are ignored. Invalid reads either return 0 or are skipped. The guest may experience undefined behaviour.
- `halt`: Halt the VM on the first invalid memory access.
- `inject`: Try to forward the invalid access to the guest. This is not supported on all architectures. Falls back to `halt` if the error could not be forwarded to the guest.

Default: `ignore`

- `-q, --quiet`

Silence all uvmm output.

Flag. True if provided.

Options `-q, --quiet, -v, --verbose` and `-D, --debug` cancel each other out.

- `-v, --verbose`

Increase the verbosity of the uvmm. Repeating the option increases the verbosity by another level.

Can be used multiple times.

Flag. True if provided.

Options `-q, --quiet, -v, --verbose` and `-D, --debug` cancel each other out.

- `-W, --wakeup-on-system-resume`

When set, the uvmm resumes when the host system resumes after a suspend call.

Flag. True if provided.

- `-i, --ram-identity-mapping`

When set, the option forces the guest RAM to be mapped to its corresponding host-physical addresses.

Flag. True if provided.

## Setting up guest memory

In the most simple setup, memory for the guest can be provided via a simple dataspace. In your ned script, create a new dataspace of the required size and hand it into uvmm as the `ram` capability:

```
local ramds = L4.Env.user_factory:create(L4.Proto.Dataspace, 0x4000000)

L4.default_loader::startv({caps = {ram = ramds:m("rw")}}, "rom/uvmm")
```

The memory will be mapped to the most appropriate place and a memory node added to the device tree, so that the guest can find the memory.

For a more complex setup, the memory can be configured via the device tree. uvmm scans for memory nodes and tries to set up the memory from them. A memory device node should look like this:

```
memory@0 {
    device_type = "memory";
    reg = <0x00000000 0x00100000
          0x00200000 0xffffffff>;
    l4vmm,dscap = "memcap";
    dma-ranges = <>;
};
```

The `device_type` property is mandatory and needs to be set to `memory`.

`l4vmm,dscap` contains the name of the capability containing the dataspace to be used for the RAM. `reg` describe the memory regions to use for the memory. The regions will be filled up to the size of the supplied dataspace. If they are larger, then the remaining area will be cut.

If the optional `dma-ranges` property is given, the host-physical address ranges for the memory regions will be added here. Note that the property is not cleared first, so it should be left empty.

For more details see [RAM configuration](#).

## Memory layout

uvmm populates the RAM with the following data:

- kernel binary
- (optional) ramdisk
- (optional) device tree

The kernel binary is put at the predefined address. For ELF binaries, this is an absolute physical address. If the binary supports relative addressing, the binary is put to the requested offset relative to beginning of the first 'memory' region defined in the device tree.

The ramdisk and device tree are placed as far as possible to the end of the regions defined in the first 'memory' node.

If there is a part of RAM that must remain empty, then define an extra memory node for it in the device tree. uvmm only writes to memory in the first memory node it finds.

Warning: uvmm does not touch any unpopulated memory. In particular, it does not ensure that the memory is cleared. It is the responsibility of the provider of the RAM dataspace to make sure that no data leakage can happen. Normally this is not an issue because dataspaces are guaranteed to be cleaned when they are newly created but users should be careful when reusing memory or dataspaces, for example, when restarting the uvmm.

## Forwarding hardware resources to the guest

Hardware resources must be specified in two places: the device tree contains the description of all hardware devices the guest could see and the Vbus describes which resources are actually available to the uvmm.

The vbus allows the uvmm access to hardware resources in the same way as any other [L4](#) application. uvmm expects a capability named 'vbus' where it can access its hardware resources. It is possible to leave out the capability for purely virtual guests (Note that this is not actually practical on some architectures. On ARM, for example, the guest needs hardware access to the interrupt controller. Without a 'vbus' capability, interrupts will not work.) For information on how to configure a vbus, see the [IO documentation](#).

The device tree needs to contain the hardware description the guest should see. For hardware devices this usually means to use a device tree that would also be used when running the guest directly on hardware.

On startup, uvmm scans the device tree for any devices that require memory or interrupt resources and compares the required resources with the ones available from its vbus. When all resources are available, it sets up the appropriate forwarding, so that the guest now has direct access to the hardware. If the resources are not available, the device will be marked as 'disabled'. This mechanism allows to work with a standard device tree for all guests in the system while handling the actual resource allocation in a flexible manner via the vbus configuration.

The default mechanism assigns all resources 1:1, i.e. with the same memory address and interrupt number as on hardware. It is also possible to map a hardware device to a different location. In this case, the assignment between vbus device and device tree device must be known in advance and marked in the device tree using the `l4vmm, vbus-dev` property.

The following device will for example be bound with the vbus device with the HID 'l4-test,dev':

```
test@e0000000 {
    compatible = "memdev,bar";
    reg = <0 0xe0000000 0 0x50000>,
        <0 0xe1000000 0 0x50000>;
    l4vmm,vbus-dev = "l4-test,dev";
    interrupts-extended = <&gic 0 139 4>;
};
```

Resources are then matched by name. Memory resources in the vbus must be named `reg0` to `reg9` to match against the address ranges in the device tree `reg` property. Interrupts must be called `irq0` to `irq9` and will be matched against `interrupts` or `interrupts-extended` entries in the device tree. The vbus must expose resources for all resources defined in the device tree entry or the initialisation will fail.

An appropriate IO entry for the above device would thus be:

```
MEM = Io.Hw.Device(function()
    Property.hid = "l4-test,dev"
    Resource.reg0 = Io.Res.mmio(0x41000000, 0x4104ffff)
    Resource.reg1 = Io.Res.mmio(0x42000000, 0x4204ffff)
    Resource.irq0 = Io.Res.irq(134);
end)
```

Please note that HIDs on the vbus are not necessarily unique. If multiple devices with the HID given in `l4vmm, vbus-dev` are available on the vbus, then one device is chosen at random.

If no vbus device with the given HID is available, the device is disabled.

## How to enable guest suspend/resume

### Note

Currently only supported on ARM. It should work fine with Linux version 4.4 or newer.

Uvmm (partially) implements the power state coordination interface (PSCI), which is the standard ARM power management interface. To make use of this interface, you have to announce its availability to the guest operating system via the device tree like so:

```
psci {
    compatible = "arm,psci-0.2";
    method = "hvc";
};
```

The Linux guest must be configured with at least these options:

```
CONFIG_SUSPEND=y
CONFIG_ARM_PSCI=y
```

## How to communicate power management (PM) events

Uvmm can be instructed to inform a PM manager of PM events through the [L4::Platform\\_control](#) interface. To that end, uvmm may be equipped with a `pf_c` cap. On suspend, uvmm will call `l4_platform_ctl_system_suspend()`.

The `pf_c` cap can also be implemented by IO. In that case the guest can start a machine suspend/shutdown/reboot.

## Ram block device support

The example ramdisk works by loading a file system into RAM, which needs RAM block device support to work. In the Linux kernel configuration add: `CONFIG_BLK_DEV_RAM=y`

## Framebuffer support for uvmm/amd64 guests

Uvmm can be instructed to pass along a framebuffer to the Linux guest. To enable this three things need to be done:

1. Configure Linux to support a simple framebuffer by enabling

```
CONFIG_FB_SIMPLE=y
CONFIG_X86_SYSFB=y
```

2. Configure a simple framebuffer device in the device tree (currently only read by uvmm, linearer framebuffer at [0xf0000000 - 0xf1000000])

```
simplefb {
    compatible = "simple-framebuffer";
    reg = <0x0 0xf0000000 0x0 0x1000000>;
    l4vmm,fbcap = "fb";
};
```

3. Start a framebuffer instance and connect it to uvmm e.g.

```
-- Start fb-drv (but only if we need to)
local fbdrv_fb = L4.Env.vesa;
if (not fbdrv_fb) then
    fbdrv_fb = l:new_channel();
    l:start({
        caps = {
            vbus = io_busses.fbdrv,
            fb   = fbdrv_fb:svr(),
        },
        log = { "fbdrv", "r" },
    },
    "rom/fb-drv");
end
vmm.start_vm{
    ext_caps = { fb = fbdrv_fb },
    -- ...
```

## Requirements on the Fiasco.OC configuration on amd64

The kernel configuration must feature `CONFIG_SYNC_TSC=y` in order for the emulated timers to reach a sufficiently high resolution.

## Recommended Linux configuration options for uvmm/amd64 guests

The following options are recommended in addition to the amd64 defaults provided by a `make defconfig`:

Virtio support is required to access virtual devices provided by uvmm:

```
CONFIG_VIRTIO=y
CONFIG_VIRTIO_PCI=y
CONFIG_VIRTIO_BLK=y
CONFIG_BLK_MQ_VIRTIO=y
CONFIG_VIRTIO_CONSOLE=y
CONFIG_VIRTIO_INPUT=y
CONFIG_VIRTIO_NET=y
```

It is highly recommended to use the X2APIC, which needs virtualization awareness to work under uvmm:

```
CONFIG_X86_X2APIC=y
CONFIG_PARAVIRT=y
CONFIG_PARAVIRT_SPINLOCKS=y
```

## KVM clock for uvmm/amd64 guests

When executing [L4Re](#) + uvmm on QEMU, the PIT as clock source is not reliable. The paravirtualized KVM clock provides the guest with a stable clock source.

A KVM clock device is available to the guest, if the device tree contains the corresponding entry:

```
kvm_clock {
    compatible = "kvm-clock";
    reg = <0x0 0x0 0x0 0x0>;
};
```

To make use of this clock, the Linux guest must be built with the following configuration options:

```
CONFIG_HYPERVISOR_GUEST=y
CONFIG_KVM_GUEST=y
CONFIG_PTP_1588_CLOCK_KVM is not set
```

### Note

KVM calls besides the KVM clock are unhandled and lead to failure in the uvmm, e.g. `vmcall 0x9` for the `PTP_1588_CLOCK_KVM`.

This is considered a development feature. The KVM clock is not required when running on physical hardware as TSC calibration via the PIT works as expected.

## Development notes for amd64

When you are developing on Linux using QEMU please note that nested virtualization support is necessary on your host system to run uvmm guests. Your host Linux version should be 4.12 or greater, **excluding 4.20**.

Check if your KVM module has nested virtualization enabled via:

```
cat /sys/module/kvm_intel/parameters/nested
Y
```

In case it shows N instead of Y enable nested virtualization support via:

```
modprobe kvm_intel nested=1
```

On AMD platforms the module name is `kvm_amd`.

## QEMU network setup for a uvmm guest on amd64

```
qemu-system-x86_64 -M q35 -cpu host -enable-kvm -device intel-iommu
                  -device e1000e,netdev=net0 -netdev bridge,id=net0,br=virbr0
```

where 'virbr0' is the name of the host's bridge device. The line 'allow virbr0' needs to be present in /etc/qemu/bridge.conf. The bridge can either be created via the network manager or via the command line:

```
brctl addbr virbr0
ip addr add 192.168.124.1/24 dev virbr0
ip link set up dev virbr0
```

In the guest linux with eth0 as network device:

```
ip a a 192.168.124.5/24 dev eth0
ip li se up dev eth0
```

Now the host and guest can ping each other using their respective IPs.

Of course, uvmm needs to be connected to io and io needs a vbus configuration for the uvmm client like this:

```
Io.add_vbusses
{
    vm_pci = Io.Vi.System_bus(function ()
        Property.num_msis = 6
        PCI = Io.Vi.PCI_bus(function ()
            pci_net = wrap(Io.system_bus():match("PCI/CC_0200"))
        end)
    end)
}
```

## QEMU emulated VirtIO devices and IO-MMU on amd64

QEMU does not route VirtIO devices through the IO-MMU per default. To use QEMU emulated VirtIO devices add the `disable-legacy=on,disable-modern=off,iommu_platform=on` flags to the option list of the device. The e1000e card in the network example above can be replaced with an virtio-net-pci card like this:

```
-device virtio-net-pci,disable-legacy=on,disable-modern=off,
      iommu_platform=on,netdev=net0
```

For more information on VirtIO devices and their options see <https://wiki.qemu.org/Features/VT-d>.

## Using the uvmm monitor interface

Uvmm implements an interface with which parts of the guest's state can be queried and manipulated at runtime. This monitor interface needs to be enabled during compilation as well as during startup of uvmm. This is described in detail below.

### Compiling uvmm with monitor interface support

To compile uvmm with monitor interface support pass the `CONFIG_MONITOR=y`, option during the `make` step (or set in in the Makefile.config). This option is available on all architectures but note that the set of available monitor interface features may vary significantly between them. Also note that the monitor interface will always be disabled in release mode, i.e. if `CONFIG_RELEASE_MODE=y`.

## Enabling the monitor interface at runtime

When starting a uvmm instance from inside a `ned` script using the `uvmm.start_vm` function, the `mon` argument controls whether the monitor interface is enabled at runtime. There are three cases to distinguish:

- `mon=true` (default): The monitor interface is enabled but no server implementing the client side of the monitor interface is started. The monitor interface can still be utilized via `cons` but no readline functionality will be available.
- `mon='some_binary'`: If a string is passed as the value of `mon`, the monitor interface is enabled and the string is interpreted as the name of a server binary which implements the client side of the monitor interface. This server is automatically started and has access to a `vcon` capability named `mon` at startup through which it can make use of the monitor interface. Unless you have written your own server you should specify `'uvmm_cli'` which is a server implementing a simple readline interface.
- `mon=false`: The monitor interface is disabled at runtime.

## Using the monitor interface

If the monitor interface was enabled you can connect to it via `cons` under the name `mon<n>` where `<n>` is a unique integer for every uvmm instance that is started with the monitor interface enabled (numbered starting from one in order of corresponding `uvmm.start_vm` calls). If `mon='uvmm_cli'` was specified, readline functionality such as command completion and history will be available. Enter a command followed by enter to run that command. To obtain a list of all available commands issue the `help` command, to obtain usage information for a specific command `foo` issue `help foo`.

### Note

Some commands will modify the guests state. Since it should be obvious to which ones this applies this is usually not specifically highlighted. Exercise reasonable caution.

## Using the guest debugger

The guest debugger provides monitoring functionality akin to a very bare-bone GDB interface, e.g. guest RAM and page table dumping, breakpointing and single stepping. Additional functionality might be added in the future.

### Note

The guest debugger is currently still under development. The guest debugger may also not be available on all architectures. To check whether the guest debugger is available check if `help dbg` returns usage information.

If the guest debugger is available, you have to manually load it at runtime using the monitor interface. This saves resources if the guest debugger is not used. To enable the guest debugger, issue the `dbg on` monitor command. Once enabled, the guest debugger can not be disabled again.

To list available guest debugger subcommands, issue `dbg help` after `dbg on`.

### Note

When using SMP, most guest debugger subcommands require you to explicitly specify a guest vcpu using an index starting from zero.

### 4.7.1 RAM configuration

#### RAM configuration for uvmm

##### Without a memory node in the device tree

- setup default RAM for guest VM.
- RAM starts either
  - at base-address which defaults to 0x0 or the base address value set via the -b cmdline option or
  - in case of identity mapping at the host-physical address of the dataspace allocated for the RAM

##### With a memory node in the device tree

The memory node needs at least the properties `device_type` and `l4vmm,dscap`:

```
memory@0 {  
    device_type = "memory";  
    l4vmm,dscap = "ram";  
}
```

Where the given `l4vmm,dscap` name is accessible in the capability namespace of the uvmm. If the capability is invalid, the memory node is disabled.

If memory nodes are given, but none provides valid RAM the configuration is invalid and uvmm refuses to boot.

Additional properties of the memory node are `reg` and `dma-ranges`.

The `reg` property describes the location in the guest's address space that should be backed by RAM.

The `dma-ranges` property describes the offset between guest-physical and host-physical addresses. The guest can evaluate this non-standard property to derive the correct DMA addresses to program into passed-through devices. Usage of this property **requires** modification of guest code.

##### Without `reg` and `dma-ranges` properties

The `reg` property is optional only in case the uvmm maps the guest's RAM into the VM under the host-physical addresses of the backing memory (`l4vmm,dscap`).

This case can be forced via the cmdline parameter `-i` and is the default for platforms without IOMMU, but with DMA capable devices on the configured vBus.

##### Without a `reg` property, but with a `dma-ranges` property

If the `-i` cmdline parameter is given, identity mapping is forced and the behavior is the same as in the case above. Additionally, the `dma-ranges` property is written

In case no `-i` cmdline parameter is given, the configuration is invalid and uvmm refuses to boot.

### With a reg property

uvmm parses the reg property of the memory node and maps the memory into the VM to the given range(s).

If the -i cmdline parameter is set, the reg property is ignored and the memory is mapped into the VM under the corresponding host-physical addresses of the backing memory (l4vmm,dscap)

### With a reg and dma-ranges property

uvmm parses the reg property of the memory node and maps the memory into the VM to the given range(s).

The dma-ranges property is filled with the corresponding host-physical addresses of the backing memory (l4vmm,dscap).

## 4.8 RTC driver

The RTC driver can drive various real-time clocks and provides an interface for other components, e.g., uvmm, to read and write the time.

It needs access to the hardware, depending on the clock, either via a vbus or via an I2C device.

### Command Line Options

There are no command line options.

### Environment

Several capabilities can be used to interact with the environment:

- 'rtc' (server)  
The capability with which clients talk to the service. Note that writing to the RTC is only possible when having the rtc capability with write rights, read-only clients must have the capability with read rights only.
- 'vbus'  
The vbus used to access hardware for port-based clock on X86 and pl031 on arm.  
The vbus is also needed for receiving the inhibitor signal from IO.
- 'ds3231' (optional)  
The capability that provides access to an I2C DS3231 device. The capability needs to be created with type 1 (i2c-device).

## 4.9 Mag, the GUI Multiplexer

Mag is the default multiplexer for graphics hardware. Mag is a Nitpicker derivate that allows secure multiplexing of the graphics and input hardware among multiple applications and multiple complete windowing environments. It is not, and does not attempt to be, a fully-fledged window manager.

## Capabilities

None.

## Command Line Options

The following command line options are supported:

```
<$FILE.lua | libmag-$LIBNAME.so>
```

As Mag's only command line option it supports loading additional plugins via the application's command line.

Can be used multiple times.

File path in ROM namespace.

- Plugins must be either a Lua file or a shared library. Shared libraries must be named libmag-\$LIBNAME.so.

## Session Factory

As a simple nitpicker clone Mag supports the so-called Xray mode. This mode displays all session labels and draws a colored frame around them. The session that currently has the input focus is highlighted. The Xray mode is activated via the special keys Scroll or NEXTSONG.

Call: `create(0 [, "label|l=<LABEL>", "col=(string|hex)"])`

- "label|l=<LABEL>"

Set the session's text label to LABEL.

String value.

- The label is restricted to a length of 256 characters.

- "col=(string|hex) "

Set the session's color which is used in Xray mode to tint the session's screen area and the border drawn around it. The argument can be either one of the following letters or a hexadecimal representation of the RGB values.

The Value for this parameter can be one of the following:

- string

Define the color by the given character

Possible values are

- \* r, R: Red color
- \* g, G: Green color
- \* b, B: Blue color
- \* w, W: White color
- \* y, Y: Yellow color
- \* v, V: Magenta color

- hex

Define the color by its RGB values in hexadecimal representation.

Hexadecimal number without '0x' prefix.

## Mag Client Session

A client with a mag client session gets access to the whole screen. The client has to allocate and manage its own buffers and has to position them on the screen on its own.

Call: `create(L4.Proto.Goos [, "default-background|dfl-bg"])`

- "default-background|dfl-bg"  
Marks this session as the default background.  
Flag. True if provided.

## Mag Client Framebuffer Session

For a client framebuffer session mag allocates a view of the requested size and displays it at the requested coordinates on the screen.

Call: `create(L4.Proto.Goos [, "geometry|g=<GEOMETRY>", "focus", "shaded", "fixed", "barheight=<X>"])`

- "geometry|g=<GEOMETRY>"  
Set the session's geometry and position on the screen. GEOMETRY is provided in an X11-style format: WIDTHxHEIGHT+X\_OFFSET+Y\_OFFSET.  
String value.
- "focus"  
Set the focus to this session.  
Flag. True if provided.
- "shaded"  
The window is collapsed and only the title bar is visible. The window can be expanded by clicking into the title bar with the middle mouse button. Collapsing and expanding works also independently of this option.  
Flag. True if provided.
- "fixed"  
The window cannot be moved on the screen.  
Flag. True if provided.
- "barheight=<X>"  
Set the height of the title bar in pixels.  
Numerical value.

## Examples

### Creating a session

```
-- set label to "Linux" and use a light blue color
fb = mag_client:create(L4.Proto.Goos, "l=Linux", "col=98d9ff");
```

**Requesting a framebuffer via a client framebuffer session**

```
-- create a window of 640x480 pixels at position (100,100) on the screen.
fb = mag_fb:create(L4.Proto.Goos, "g=640x480+100+100");
```

## 4.10 Cons, the Console Multiplexer

`cons` is an interactive multiplexer for console input and output. It buffers the output from different L4 clients and allows to switch between them to redirect input.

### Multiplexers and Frontends

`cons` is able to connect multiple clients to multiple console I/O servers. All clients are connected to all configured multiplexers

Multiplexers and frontends come in pairs where the actual I/O is handled by the frontend. From the point-of-view of `cons`, a frontend consists of an IPC channel to a server that speaks an appropriate server protocol. By default the `L4.Env.log` capability is used. Only frontends that speak the `L4::Vcon` protocol are supported.

A multiplexer handles and routes the I/O of each client to and from its respective frontend.

Each client's console settings (e.g. color, visibility) apply to all multiplexers and cannot be changed individually. A user can connect to all clients through all multiplexers. It is not possible to assign individual clients to distinct multiplexers.

### Client sessions

For clients `cons` implements the `L4::Vcon` and the Virtio console interface. A client session can be requested through a `create` call to `cons`'s factory. `cons` binds its factory capability to the `cons` capability. See the example below on how this can be set up.

### Starting the service

The `cons` server can be started with Lua like this:

```
local log_server = L4.default_loader:new_channel()
L4.default_loader:start({
  caps = {
    cons = log_server:svr(),
  },
  log = L4.Env.log,
},
"rom/cons")
```

First an IPC gate (`log_server`) is created which is used between the `cons` server and a client to request a new session. The server side is assigned to the mandatory `cons` capability of `cons`. This example explicitly assigns the kernel's log capability (`L4.Env.log`) to `cons`'s `log` capability in order to allow `cons` to provide input and output for its clients. The default log factory (usually provided by `moe`) doesn't provide input capabilities.

## Command Line Options

cons accepts the following command line switches:

- `-a, --show-all`  
Initially show output from all clients.
- `-B <size>, --defaultbufsize <size>`  
Default buffer size per client in bytes. Default: 40960
- `-c <client>, --autoconnect <client>`  
Automatically connect to the client with the given name. That means that output of this client will be visible and input will be routed to it.
- `-f <cap>, --frontend <cap>`  
Set the frontend for the current multiplexer. Output for the multiplexer is then sent to the capability with the given name `<cap>`. The server connected to the capability needs to understand the [L4::Vcon](#) protocol.
- `-V <cap>, --virtio-device-frontend <cap>`  
Set a virtio-console frontend for the current multiplexer. This behaves identical to the `--frontend` option except that this frontend implements a virtio-console device that –for example– can be connected to a virtio proxy in uvmm.

Example lua:

```
-- use 'cons_svr' to create client sessions
local cons_svr = loader:new_channel()
-- connect 'virtio_device' with a virtio driver (e.g. Uvmm)
local virtio_device = loader:new_channel()
loader:start(
{
  caps = {
    virtio = virtio_device,
    cons = cons_svr:svr(),
  },
  log = {"cons", "blue"},
}, "cons -m guests -V virtio")
```

- `-k, --keep`  
Keep the console buffer when a client disconnects.
- `-l, --no-line-buffering`  
By default, merge the client output to entire lines. If the client writes characters without a final newline, the following client output is merged with the current line content. Specifying this switch disables the line buffered mode by default.
- `--line-buffering-ms <timeout>`  
Timeout in milliseconds before buffered client output is written even without a newline. Default value is 50.
- `-m <prompt name>, --mux <prompt name>`  
Add a new multiplexer named `<prompt name>`. This is necessary if output should be sent to different frontends. This option must be used in conjunction with the `-f` frontend option
- `-n, --defaultname`  
Default name for the multiplexer prompt. Default: `cons`.
- `-t, --timestamp`  
Prefix the output with timestamps.

## Connecting a client

```
create(backend_type, ["client_name"], ["color"], ["option"] [, "option"] ...)
```

- `backend_type`

The type of backend that should be created for the client. The type is a positive integer and currently the following types are supported:

- `L4.Proto.Log: L4::Vcon` client
- `1`: Virtio console client

`cons` accepts the following per-client options:

- `bufsz=n`

Use a buffer of `n` bytes for this client, deviating from the default buffer size.

- `keep / no-keep`

The console buffer is kept / thrown away when the client disconnects.

- `key=<key>`

Assign `<key>` as keyboard shortcut to this client.

- `line-buffering / no-linux-buffering`

Line buffering is enabled / disabled for this client.

- `show / hide`

Output from this client is initially shown / hidden.

- `timestamp / no-timestamp`

Do / do not prefix the output of this client with timestamps.

## Chapter 5

# uvmm\_dtg The device tree generator for Uvmm

A virtual machine in Uvmm is configured with a device tree that contains information about the VMs resources, memory layout, virtual CPUs and peripheral devices.

Uvmm\_dtg is a tool to generate such a device tree at runtime according to its command line.

### Capabilities

- dt

The dataspace that the device tree is put into.

### Command Line Options

`<file | -->`

-- prints to stdout. On [L4Re](#), the string given as `<file>` is interpreted as a named capability which needs to be backed by a sufficiently large Dataspace. On Linux, a file with the given name is created. In both cases, uvmm\_dtg will output into the named file.

String value.

- -h, --help

Show help.

Flag. True if provided.

- --arch `<target architecture>`

Select the target architecture.

Possible values for `<target architecture>` are x86, x86\_64, arm32, arm64, mips32, mips64

- --format `<format>`

Select the output format.

Possible values for `<format>` are

- txt: The device tree will be printed as plain text (dts).
- bin: The device tree will be output as binary (dtb).
- --mem-base <membase>  
Configure the start of the memory distribution. membase can be defined in both decimal and hex notations. uvmm\_dtg rounds the given base up to the platforms page size.  
This value can be overridden by memory devices with fixed addresses.  
Numerical value.
- --device <devicename:[Option1,Option2=value,Option3=value,...]>  
This configures a device.  
To get a list of supported devices, use --device help.  
To get help for a specific device, use --device devicename:help.  
String value.

## Examples

### Usage in L4Re

Example lua script for Ned:

```
-- Create DS holding device tree
local dt = L4.Env.user_factory:create(L4.Proto.Dataspace, 4 * 1024):m("rw");

-- Start the generator
L4.default_loader:start(
{
  caps = { dt = dt },
}, "rom/uvmm_dtg dt"):wait();

-- Start uvmm
vmm.start_vm
{
  ...
  ext_caps = { dt = dt },
  fdt = "dt",
  ...
}
```

Please notice the :wait() when starting uvmm\_dtg. This makes Ned pause until uvmm\_dtg has exited and put the device tree into the dataspace such that Uvmm can commence.

## Chapter 6

# Bootstrap, the L4 kernel bootstrapper

### Bootstrap Command Line Options

`bootstrap` and the kernel can be configured through command line switches. `bootstrap` is responsible for parsing both command lines: `bootstrap` options are the ones directly given to `bootstrap`, whereas kernel options are those directly given to the kernel, respectively.

When using Multiboot boot, the first module directly after `bootstrap` is considered the kernel: An example using GRUB2 might look like this:

```
multiboot /path/to/bootstrap bootstrap -bs-boolean-opt -bs-opt-with-argument=foo
module /path/to/fiasco fiasco -kernel-opt-with-argument=bar -kernel-boolean-opt
```

#### Note

The exact way to provide the command line to `bootstrap` is platform-dependent. On platforms supporting booting via Multiboot Specification the command line can be specified in the boot configuration (currently x86/amd64 only, e.g. using GRUB) whereas other platforms need the command line to be compiled into the `bootstrap` binary.

Platforms utilising flattened device trees usually also allow specifying a command line through the DT. This mechanism is **not** currently supported in `bootstrap`!

#### Note

`bootstrap` will ignore options it does not understand. For most cases, this also holds true if an option's arguments cannot be understood.

## bootstrap options

Command line options directly understood by `bootstrap` itself are as follows (passed via `bootstrap` command line):

- `-comirq=<irqno>` (x86/amd64 only)

If serial logging is enabled (default on), `<irqno>` defines which IRQ to use for serial port communication. This option is ignored if `-noserial` is also specified (see below).

- `-comport=<portspec>` (x86/amd64 only)

If serial logging is enabled (default on), `<portspec>` defines which serial port to use, being one of:

- `<number>`  
Use legacy port `<number>`, e.g. use `-comport=1` for the port commonly known as *COM1*, or
- `pci:<card>:<port>`  
Use serial port number `<port>` at PCI card number `<card>`, e.g. use `-comport=pci:0:1` for the second port on the first PCI card.
- `pci:probe`  
Use this to have `bootstrap` autodiscover all PCI serial lines. On each discovered line a message will be displayed, telling the correct `<portspec>` to be given to use the respective line.

### Note

`bootstrap` does not support specifying the serial port's baudrate and always uses 115200 bps.

- `-noserial`

Disable serial logging.

- `-wait`

Wait for key press at early startup.

### Note

This is not to be confused with the kernel's `-wait` option, see below.

- `-maxmem=<mbytes>`

Limit the available memory to at most `<mbytes>` MiB.

- `-mem=<size>@<offset>`

Add a region of memory of `<size>` at `<offset>` to the system's memory map. Both `<size>` and `<offset>` may be suffixed by either G, M, or K/k to denote GiB, MiB, or KiB, respectively.

This option may be specified multiple times. If the option is not given, a platform-specific method for determining the memory layout will be used, if available.

- `-presetmem=<intval>`

Initialise memory regions with `<intval>` before starting the kernel.

- `-modaddr=<paddr>`

Relocate modules to the physical address `<paddr>`. Use this when utilising a version of GRUB that lacks support for the `modaddr` command.

## Kernel Options

Command line options for the kernel (passed on kernel command line, i.e. to first module) `bootstrap` understands are as follows.

### Note

Availability of individual options might depend on used platform and/or actual kernel configuration.

- `-wait`  
Enter debugger directly after startup, prior to executing any task.
- `-serial_esc`  
Enable entering the debugger over serial line by pressing `Esc`. This option also activates `-serial_input`.
- `-serial_input`  
Allow the kernel to read from the serial line either triggered by the UART receive interrupt or (if that is not possible) by polling the UART receive register from the kernel timer interrupt handler. This is required for Vlog clients to receive input.
- `-noserial`  
Disable serial logging.

### Note

If this is given as kernel command line argument, it does not affect `bootstrap` but only the kernel.

- `-noscreen`  
Disable VGA console.
- `-esc`  
Enable entering the debugger by pressing `Esc` on attached keyboard.
- `-nojdb`  
Disable the kernel debugger.
- `-nohlt`  
Enable quirk for broken HLT instruction.
- `-apic`  
Use Advanced Programmable Interrupt Controller (APIC) if available and known to be well-behaving.
- `-loadcnt`  
Use load counter for performance counting.
- `-watchdog`  
Enable watchdog timer.
- `-irq0`  
Allow IRQ 0 to be used by userland. This enables some sanity checks to ensure IRQ 0 is not used by the kernel, e.g. for profiling or scheduling purposes. This only has an effect on x86.
- `-nosfn`  
Disable SFN (special fully nested) mode of interrupt controller. This only has an effect on x86 with PIC8259 interrupt controller.
- `-jdb_never_stop`  
Prevent system from stopping to enter JDB. This only has an effect on x86.

- `-kmemsize=<KB>`  
Reserve `<KB>` KiB of memory for the kernel.
- `-tbuf_entries=<number>`  
Specify the `<number>` of trace buffer entries.
- `-out_buf=<length>`  
Specify length of console buffer to be `<length>` bytes.
- `-jdb_cmd=<ctrlseq>`  
Execute JDB command sequence `<ctrlseq>` right after start-up. If `-wait` is also given, `<ctrlseq>` is executed right before entering JDB.

## Module options

Bootstrap supports module attributes for `sigma0` and the `roottask`. They need to be specified in `modules.list`, e.g.:

```
sigma0[attr:nodes=4-7] ...
```

Attributes are not supported when using multi-boot on platforms that support it. The following attributes are supported:

- `nodes`

This is a colon separated list of AMP node ranges. A range can also be a single number. Examples:

- `nodes=1` – Only node 1
- `nodes=1-3` – Nodes 1 to 3 (inclusive)
- `nodes=0:2-3` – Nodes 0, 2 and 3

If not present, the `sigma0/roottask` module is applicable to all AMP nodes.

- `reloc`

Normally the `sigma0` or `roottask` images are loaded at the preferred load address if the RAM is available at the desired location. If this is not possible, they will be relocated to some free RAM region. Setting the "reloc" module attribute to a non-empty string will always request the dynamic relocation.

This attribute can be used on no-MMU systems to maximize the size of contiguous free RAM regions.

# Chapter 7

## Deprecated List

Global `L4::Rcv_endpoint::bind_thread (Ipc::Cap< Thread > t, I4_umword_t label)`

Use `bind_snd_destination()` instead.

Global `L4_CAP_SIZE`

Superseded by `L4_CAP_OFFSET`.

Global `I4_kip_clock_lw (I4_kernel_info_t const *kip) L4_NOTHROW`

Use `I4_kip_clock()` instead.

Global `L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server (I4_utcb_t *, L4::Cap< L4::Thread > server, L4::Cap< L4::Factory > factory)`

Note that this variant of the constructor is deprecated, please do not supply the UTCB pointer, it's not used.

Global `I4util_kip_for_each_feature (s)`

Use `I4_kip_for_each_feature()`.

Global `I4util_kip_kernel_has_feature (I4_kernel_info_t const *k, char const *str)`

Use `I4_kip_kernel_has_feature()`.

Global `I4util_micros2I4to (I4_uint64_t us) L4_NOTHROW`

Use `I4_timeout_from_us()`.

Global `start_virtio_switch (ports, prio, cpus, switch_type, ext_caps)`

This function exists for backwards compatibility reasons and calls `start_virtio_switch_tbl` with an appropriate `options` table

## Chapter 10

# Hierarchical Index

### 10.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

cxx::arith::Ld< V > . . . . .	787
cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc > . . . . .	808
cxx::Base_slab< sizeof(Type), L4_PAGESIZE, 2, New_allocator > . . . . .	808
cxx::Slab< Type, Slab_size, Max_free, Alloc > . . . . .	937
cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc > . . . . .	813
cxx::Base_slab_static< sizeof(Type), L4_PAGESIZE, 2, New_allocator > . . . . .	813
cxx::Slab_static< Type, Slab_size, Max_free, Alloc > . . . . .	942
cxx::Bitfield< T, LSB, MSB > . . . . .	818
cxx::Bitfield< T, LSB, MSB >Value_base< TT > . . . . .	827
cxx::Bitfield< T, LSB, MSB >Value< Base_type & > . . . . .	826
cxx::Bitfield< T, LSB, MSB >Value< Base_type volatile & > . . . . .	826
cxx::Bitfield< T, LSB, MSB >Value< Base_type const > . . . . .	826
cxx::Bitfield< T, LSB, MSB >Value_unshifted< Base_type & > . . . . .	828
cxx::Bitfield< T, LSB, MSB >Value_unshifted< Base_type volatile & > . . . . .	828
cxx::Bitfield< T, LSB, MSB >Value_unshifted< Base_type const > . . . . .	828
cxx::Bitfield< T, LSB, MSB >Value< TT > . . . . .	826
cxx::Bitfield< T, LSB, MSB >Value_unshifted< TT > . . . . .	828
cxx::Bitmap_base . . . . .	834
cxx::Bitmap< BITS > . . . . .	830
cxx::Bitmap_base::Bit . . . . .	847
cxx::Bitmap_base::Char< BITS > . . . . .	847
cxx::Bitmap_base::Word< BITS > . . . . .	848
cxx::Bits::Avl_map_get_key< KEY_TYPE > . . . . .	849
cxx::Bits::Avl_set_get_key< KEY_TYPE > . . . . .	850
cxx::Bits::Avl_set_iter< Node, Key, Node_op > . . . . .	850
cxx::Bits::Avl_set_iter< _Node, Const_item_type, Fwd > . . . . .	850
cxx::Bits::Avl_set_iter< _Node, Const_item_type, Rev > . . . . .	850
cxx::Bits::Avl_set_iter< _Node, Item_type, Fwd > . . . . .	850
cxx::Bits::Avl_set_iter< _Node, Item_type, Rev > . . . . .	850
cxx::Bits::Avl_set_iter< Node, Non_const_key, Node_op > . . . . .	850
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > . . . . .	854
cxx::Avl_map< Region, Hdlr, cxx::Lt_functor, Alloc > . . . . .	788
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >Node . . . . .	864

cxx::Bits::Base_avl_set< ITEM_TYPE, Lt_funcutor< ITEM_TYPE >, New_allocator, Bits::Avl_set_get_↵ key< ITEM_TYPE > > . . . . .	854
cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC > . . . . .	794
cxx::Bits::Base_avl_set< Pair< KEY_TYPE, DATA_TYPE >, Lt_funcutor< KEY_TYPE >, New_allocator, Bits::Avl_map_get_key< KEY_TYPE > > . . . . .	854
cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC > . . . . .	788
cxx::Bits::Basic_list< POLICY > . . . . .	866
cxx::H_list< Timeout > . . . . .	892
cxx::H_list< Observer > . . . . .	892
cxx::H_list< cxx::Base_slab::Slab_i > . . . . .	892
cxx::S_list< T, POLICY > . . . . .	934
cxx::H_list< T, POLICY > . . . . .	892
cxx::Bits::Basic_list< Bits::Basic_list_policy< T, H_list_item_t< T > > > . . . . .	866
cxx::H_list< T, Bits::Basic_list_policy< T, H_list_item_t< T > > > . . . . .	892
cxx::H_list_t< T > . . . . .	902
cxx::Bits::Basic_list< Bits::Basic_list_policy< T, S_list_item > > . . . . .	866
cxx::S_list< T, Bits::Basic_list_policy< T, S_list_item > > . . . . .	934
cxx::S_list< T, POLICY > . . . . .	934
cxx::Bits::Basic_list< Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > > > . . . . .	866
cxx::H_list< Weak_ref_base, Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_↵ base > > > . . . . .	892
cxx::H_list_t< Weak_ref_base > . . . . .	902
cxx::Weak_ref_base::List . . . . .	960
cxx::Bits::Bst< Node, Get_key, Compare > . . . . .	869
cxx::Avl_tree< Entry, Names_get_key > . . . . .	798
cxx::Avl_tree< _Node, GET_KEY, COMPARE > . . . . .	798
cxx::Avl_tree< Node, Get_key, Compare > . . . . .	798
cxx::Bits::Bst< _Node, Bits::Avl_map_get_key< KEY_TYPE >, Lt_funcutor< KEY_TYPE > > . . . . .	869
cxx::Avl_tree< _Node, Bits::Avl_map_get_key< KEY_TYPE >, Lt_funcutor< KEY_TYPE > > . . . . .	798
cxx::Bits::Bst< _Node, Bits::Avl_set_get_key< ITEM_TYPE >, Lt_funcutor< ITEM_TYPE > > . . . . .	869
cxx::Avl_tree< _Node, Bits::Avl_set_get_key< ITEM_TYPE >, Lt_funcutor< ITEM_TYPE > > . . . . .	798
cxx::Bits::Bst_node . . . . .	882
cxx::Avl_tree_node . . . . .	806
cxx::Bits::Direction . . . . .	884
cxx::Bits::Smart_ptr_list< ITEM > . . . . .	886
cxx::Bits::Smart_ptr_list_item< T, STORE_T > . . . . .	889
cxx::Bits::Smart_ptr_list_item< T, cxx::Ref_ptr< T > > . . . . .	889
cxx::Ref_obj_list_item< T > . . . . .	927
cxx::Elide_dtor< T > . . . . .	891
cxx::H_list_item_t< ELEM_TYPE > . . . . .	899
cxx::H_list_item_t< void > . . . . .	899
L4::lpc_svr::Timeout . . . . .	1240
cxx::H_list_item_t< Weak_ref_base > . . . . .	899
cxx::Weak_ref_base . . . . .	957
cxx::Weak_ref< T > . . . . .	955
cxx::List< D, Alloc > . . . . .	906
cxx::List< D, Alloc >Iter . . . . .	908
cxx::List_alloc . . . . .	909

# Chapter 11

## Data Structure Index

### 11.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">Buffer</a>	
Data buffer used to transfer packets	785
<a href="#">cxx::arith::Ld&lt; V &gt;</a>	
Computes the binary logarithm of the given number at compile time	787
<a href="#">cxx::Avl_map&lt; KEY_TYPE, DATA_TYPE, COMPARE, ALLOC &gt;</a>	
AVL tree based associative container	788
<a href="#">cxx::Avl_set&lt; ITEM_TYPE, COMPARE, ALLOC &gt;</a>	
AVL set for simple comparable items	794
<a href="#">cxx::Avl_tree&lt; Node, Get_key, Compare &gt;</a>	
A generic AVL tree	798
<a href="#">cxx::Avl_tree_node</a>	
Node of an AVL tree	806
<a href="#">cxx::Base_slab&lt; Obj_size, Slab_size, Max_free, Alloc &gt;</a>	
Basic slab allocator	808
<a href="#">cxx::Base_slab&lt; Obj_size, Slab_size, Max_free, Alloc &gt;::Slab_i</a>	
Type of a slab	812
<a href="#">cxx::Base_slab_static&lt; Obj_size, Slab_size, Max_free, Alloc &gt;</a>	
Merged slab allocator (allocators for objects of the same size are merged together)	813
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;</a>	
Definition for a member (part) of a bit field	818
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;::Value&lt; TT &gt;</a>	
Internal helper type	826
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;::Value_base&lt; TT &gt;</a>	
Internal helper type	827
<a href="#">cxx::Bitfield&lt; T, LSB, MSB &gt;::Value_unshifted&lt; TT &gt;</a>	
Internal helper type	828
<a href="#">cxx::Bitmap&lt; BITS &gt;</a>	
A static bitmap	830
<a href="#">cxx::Bitmap_base</a>	
Basic bitmap abstraction	834
<a href="#">cxx::Bitmap_base::Bit</a>	
A writable bit in a bitmap	847
<a href="#">cxx::Bitmap_base::Char&lt; BITS &gt;</a>	
Helper abstraction for a byte contained in the bitmap	847
<a href="#">cxx::Bitmap_base::Word&lt; BITS &gt;</a>	
Helper abstraction for a word contained in the bitmap	848

<a href="#">cxx::Bits::Avl_map_get_key&lt; KEY_TYPE &gt;</a>	
Key-getter for <a href="#">Avl_map</a>	849
<a href="#">cxx::Bits::Avl_set_get_key&lt; KEY_TYPE &gt;</a>	
Internal, key-getter for <a href="#">Avl_set</a> nodes	850
<a href="#">cxx::Bits::Avl_set_iter&lt; Node, Key, Node_op &gt;</a>	
Generic iterator for the AVL-tree based set	850
<a href="#">cxx::Bits::Base_avl_set&lt; ITEM_TYPE, COMPARE, ALLOC, GET_KEY &gt;</a>	
AVL set with internally managed nodes	854
<a href="#">cxx::Bits::Base_avl_set&lt; ITEM_TYPE, COMPARE, ALLOC, GET_KEY &gt;::Node</a>	
A smart pointer to a tree item	864
<a href="#">cxx::Bits::Basic_list&lt; POLICY &gt;</a>	
Internal: Common functions for all head-based list implementations	866
<a href="#">cxx::Bits::Bst&lt; Node, Get_key, Compare &gt;</a>	
Basic binary search tree (BST)	869
<a href="#">cxx::Bits::Bst_node</a>	
Basic type of a node in a binary search tree (BST)	882
<a href="#">cxx::Bits::Direction</a>	
The direction to go in a binary search tree	884
<a href="#">cxx::Bits::Smart_ptr_list&lt; ITEM &gt;</a>	
List of smart-pointer-managed objects	886
<a href="#">cxx::Bits::Smart_ptr_list_item&lt; T, STORE_T &gt;</a>	
List item for an arbitrary item in a <a href="#">Smart_ptr_list</a>	889
<a href="#">cxx::Elide_dtor&lt; T &gt;</a>	
Wrapper class to remove destructor calls	891
<a href="#">cxx::H_list&lt; T, POLICY &gt;</a>	
General double-linked list of unspecified <a href="#">cxx::H_list_item</a> elements	892
<a href="#">cxx::H_list_item_t&lt; ELEM_TYPE &gt;</a>	
Basic element type for a double-linked <a href="#">H_list</a>	899
<a href="#">cxx::H_list_t&lt; T &gt;</a>	
Double-linked list of typed <a href="#">H_list_item_t</a> elements	902
<a href="#">cxx::List&lt; D, Alloc &gt;</a>	
Doubly linked list, with internal allocation	906
<a href="#">cxx::List&lt; D, Alloc &gt;::Iter</a>	
Iterator	908
<a href="#">cxx::List_alloc</a>	
Standard list-based allocator	909
<a href="#">cxx::List_item</a>	
Basic list item	913
<a href="#">cxx::List_item::Iter</a>	
Iterator for a list of <a href="#">ListItem</a> -s	916
<a href="#">cxx::List_item::T_iter&lt; T, Poly &gt;</a>	
Iterator for derived classes from <a href="#">ListItem</a>	918
<a href="#">cxx::Lt_functor&lt; Obj &gt;</a>	
Generic comparator class that defaults to the less-than operator	920
<a href="#">cxx::New_allocator&lt; _Type &gt;</a>	
Standard allocator based on <code>operator new ()</code>	920
<a href="#">cxx::Nothrow</a>	
Helper type to distinguish the <code>operator new</code> version that does not throw exceptions	922
<a href="#">cxx::Pair&lt; First, Second &gt;</a>	
Pair of two values	922
<a href="#">cxx::Pair_first_compare&lt; Cmp, Typ &gt;</a>	
Comparison functor for <a href="#">Pair</a>	925
<a href="#">cxx::Ref_obj_list_item&lt; T &gt;</a>	
Item for list linked via <a href="#">cxx::Ref_ptr</a> with default reference counting	927
<a href="#">cxx::Ref_ptr&lt; T, CNT &gt;</a>	
A reference-counting pointer with automatic cleanup	929
<a href="#">cxx::S_list&lt; T, POLICY &gt;</a>	
Simple single-linked list	934

<a href="#">cxx::Slab&lt; Type, Slab_size, Max_free, Alloc &gt;</a>	
Slab allocator for object of type <code>Type</code>	937
<a href="#">cxx::Slab_static&lt; Type, Slab_size, Max_free, Alloc &gt;</a>	
Merged slab allocator (allocators for objects of the same size are merged together)	942
<a href="#">cxx::static_vector&lt; T, IDX &gt;</a>	
Simple encapsulation for a dynamically allocated array	946
<a href="#">cxx::String</a>	
Allocation free string class with explicit length field	947
<a href="#">cxx::Weak_ref&lt; T &gt;</a>	
Typed weak reference to an object of type <code>T</code>	955
<a href="#">cxx::Weak_ref_base</a>	
Generic (base) weak reference to some object	957
<a href="#">cxx::Weak_ref_base::List</a>	
The list type for keeping all weak references to an object	960
<a href="#">Elf32_Auxv</a>	
Auxiliary vector (32-bit)	964
<a href="#">Elf32_Dyn</a>	
ELF32 dynamic entry	965
<a href="#">Elf32_Ehdr</a>	
ELF32 header	966
<a href="#">Elf32_Phdr</a>	
ELF32 program header	969
<a href="#">Elf32_Rel</a>	
ELF32 relocation entry w/o addend	970
<a href="#">Elf32_Rela</a>	
ELF32 relocation entry w/ addend	971
<a href="#">Elf32_Shdr</a>	
ELF32 section header	972
<a href="#">Elf32_Sym</a>	
ELF32 symbol table entry	974
<a href="#">Elf64_Auxv</a>	
Auxiliary vector (64-bit)	975
<a href="#">Elf64_Dyn</a>	
ELF64 dynamic entry	976
<a href="#">Elf64_Ehdr</a>	
ELF64 header	977
<a href="#">Elf64_Phdr</a>	
ELF64 program header	979
<a href="#">Elf64_Rel</a>	
ELF64 relocation entry w/o addend	981
<a href="#">Elf64_Rela</a>	
ELF64 relocation entry w/ addend	981
<a href="#">Elf64_Shdr</a>	
ELF64 section header	982
<a href="#">Elf64_Sym</a>	
ELF64 symbol table entry	984
<a href="#">Enum_bitops::Enable&lt; T &gt;</a>	
Check whether the given enum type opts in for the bitwise operators	985
<a href="#">Enum_bitops::Has_marker&lt; typename, typename &gt;</a>	
Marker for the opt-in ADL function	986
<a href="#">Enum_bitops::Has_marker&lt; T, Void&lt; decltype(enum_bitops_enable(declval&lt; T &gt;()))&gt; &gt;</a>	
Marker for the opt-in ADL function	989
<a href="#">L4::Alloc_list</a>	
A simple list-based allocator	991
<a href="#">L4::Arm_smccc</a>	
Wrapper for function calls that follow the ARM SMC/HVC calling convention	992
<a href="#">L4::Base_exception</a>	
Base class for all exceptions, thrown by the <a href="#">L4Re</a> framework	994

<a href="#">L4::Basic_registry</a>	
This registry returns the corresponding server object based on the label of an <a href="#">lpc_gate</a>	996
<a href="#">L4::Bounds_error</a>	
Access out of bounds	999
<a href="#">L4::Cap&lt; T &gt;</a>	
C++ interface for capabilities	1002
<a href="#">L4::Cap_base</a>	
Base class for all kinds of capabilities	1008
<a href="#">L4::Com_error</a>	
Error conditions during IPC	1021
<a href="#">L4::Debugger</a>	
C++ kernel debugger API	1024
<a href="#">L4::Element_already_exists</a>	
Exception for duplicate element insertions	1034
<a href="#">L4::Element_not_found</a>	
Exception for a failed lookup (element not found)	1038
<a href="#">L4::Epiface</a>	
Base class for interface implementations	1041
<a href="#">L4::Epiface_t&lt; Derived, IFACE, BASE, bool &gt;</a>	
Epiface implementation for Kobject-based interface implementations	1046
<a href="#">L4::Epiface_t0&lt; RPC_IFACE, BASE &gt;</a>	
Epiface mixin for generic Kobject-based interfaces	1049
<a href="#">L4::Exception</a>	
Exception interface	1052
<a href="#">L4::Exception_tracer</a>	
Back-trace support for exceptions	1054
<a href="#">L4::Factory</a>	
C++ Factory interface, see <a href="#">Factory</a> for the C interface	1055
<a href="#">L4::Factory::Lstr</a>	
Special type to add a pascal string into the factory create stream	1066
<a href="#">L4::Factory::Nil</a>	
Special type to add a void argument into the factory create stream	1068
<a href="#">L4::Factory::S</a>	
Stream class for the <a href="#">create()</a> argument stream	1068
<a href="#">L4::lcu</a>	
C++ lcu interface, see <a href="#">Interrupt controller</a> for the C interface	1075
<a href="#">L4::lcu::Info</a>	
This class encapsulates information about an ICU	1085
<a href="#">L4::Invalid_capability</a>	
Indicates that an invalid object was invoked	1087
<a href="#">L4::lo_pager</a>	
lo_pager interface	1090
<a href="#">L4::lommu</a>	
Interface for IO-MMUs used for DMA remapping	1093
<a href="#">L4::IOModifier</a>	
Modifier class for the IO stream	1098
<a href="#">L4::lpc::Array&lt; ELEM_TYPE, LEN_TYPE &gt;</a>	
Array data type for dynamically sized arrays in RPCs	1098
<a href="#">L4::lpc::Array_in_buf&lt; ELEM_TYPE, LEN_TYPE, MAX &gt;</a>	
Server-side copy in buffer for Array	1101
<a href="#">L4::lpc::Array_ref&lt; ELEM_TYPE, LEN_TYPE &gt;</a>	
Array reference data type for arrays located in the message	1104
<a href="#">L4::lpc::As_value&lt; T &gt;</a>	
Pass the argument as plain data value	1105
<a href="#">L4::lpc::Call</a>	
RPC attribute for a standard RPC call	1106
<a href="#">L4::lpc::Call_t&lt; RIGHTS &gt;</a>	
RPC attribute for an RPC call with required rights	1107

<a href="#">L4::lpc::Call_zero_send_timeout</a>	RPC attribute for an RPC call, with zero send timeout . . . . .	1108
<a href="#">L4::lpc::Cap&lt; T &gt;</a>	Capability type for RPC interfaces (see <a href="#">L4::Cap&lt;T&gt;</a> ) . . . . .	1109
<a href="#">L4::lpc::Gen_fpage</a>	Generic RPC base for typed message items . . . . .	1113
<a href="#">L4::lpc::In_out&lt; T &gt;</a>	Mark an argument as in-out argument . . . . .	1116
<a href="#">L4::lpc::Iostream</a>	Input/Output stream for IPC [un]marshalling . . . . .	1117
<a href="#">L4::lpc::Istream</a>	Input stream for IPC unmarshalling . . . . .	1127
<a href="#">L4::lpc::Msg::CInt_val_ops&lt; MTYPE, DIR, CLASS &gt;</a>	Defines client-side handling of 'MTYPE' as RPC argument . . . . .	1138
<a href="#">L4::lpc::Msg::Cls_buffer</a>	Marker type for receive buffer values . . . . .	1139
<a href="#">L4::lpc::Msg::Cls_data</a>	Marker type for data values . . . . .	1141
<a href="#">L4::lpc::Msg::Cls_item</a>	Marker type for item values . . . . .	1142
<a href="#">L4::lpc::Msg::Dir_in</a>	Marker type for input values . . . . .	1143
<a href="#">L4::lpc::Msg::Dir_out</a>	Marker type for output values . . . . .	1144
<a href="#">L4::lpc::Msg::Do_in_data</a>	Marker for Input data . . . . .	1145
<a href="#">L4::lpc::Msg::Do_in_items</a>	Marker for Input items . . . . .	1146
<a href="#">L4::lpc::Msg::Do_out_data</a>	Marker for Output data . . . . .	1147
<a href="#">L4::lpc::Msg::Do_out_items</a>	Marker for Output items . . . . .	1148
<a href="#">L4::lpc::Msg::Do_rcv_buffers</a>	Marker for receive buffers . . . . .	1150
<a href="#">L4::lpc::Msg::Elem&lt; Array&lt; A, LEN &gt; &amp; &gt;</a>	Array as output argument . . . . .	1151
<a href="#">L4::lpc::Msg::Elem&lt; Array&lt; A, LEN &gt; &gt;</a>	Array as input arguments . . . . .	1152
<a href="#">L4::lpc::Msg::Elem&lt; Array_ref&lt; A, LEN &gt; &amp; &gt;</a>	Array_ref as output argument . . . . .	1153
<a href="#">L4::lpc::Msg::False</a>	False meta value . . . . .	1154
<a href="#">L4::lpc::Msg::Is_valid_rpc_type&lt; T &gt;</a>	Type trait defining a valid RPC parameter type . . . . .	1156
<a href="#">L4::lpc::Msg::Svr_arg_pack&lt; IPC_TYPE &gt;</a>	Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function . . . . .	1158
<a href="#">L4::lpc::Msg::Svr_val_ops&lt; MTYPE, DIR, CLASS &gt;</a>	Defines server-side handling for MTYPE server arguments . . . . .	1158
<a href="#">L4::lpc::Msg::True</a>	True meta value . . . . .	1159
<a href="#">L4::lpc::Msg_ptr&lt; T &gt;</a>	Pointer to an element of type T in an <a href="#">lpc::Istream</a> . . . . .	1162
<a href="#">L4::lpc::Opt&lt; T &gt;</a>	Attribute for defining an optional RPC argument . . . . .	1163
<a href="#">L4::lpc::Ostream</a>	Output stream for IPC marshalling . . . . .	1165

<a href="#">L4::lpc::Out&lt; T &gt;</a>	Mark an argument as a output value in an RPC signature . . . . .	1171
<a href="#">L4::lpc::Rcv_fpage</a>	Non-small receive item . . . . .	1172
<a href="#">L4::lpc::Ret_array&lt; T &gt;</a>	Dynamically sized output array of type T . . . . .	1179
<a href="#">L4::lpc::Send_only</a>	RPC attribute for a send-only RPC . . . . .	1180
<a href="#">L4::lpc::Small_buf</a>	A receive item for receiving a single object capability . . . . .	1181
<a href="#">L4::lpc::Snd_fpage</a>	Send item or return item . . . . .	1183
<a href="#">L4::lpc::Str_cp_in&lt; T &gt;</a>	Abstraction for extracting a zero-terminated string from an <a href="#">lpc::Istream</a> . . . . .	1193
<a href="#">L4::lpc::Varg</a>	Variably sized RPC argument . . . . .	1194
<a href="#">L4::lpc::Varg_list&lt; MAX &gt;</a>	Self-contained list of variable-sized RPC parameters . . . . .	1200
<a href="#">L4::lpc::Varg_list_ref</a>	List of variable-sized RPC parameters as received by the server . . . . .	1203
<a href="#">L4::lpc::Varg_list_ref::Iterator</a>	Iterator for Valists . . . . .	1205
<a href="#">L4::lpc_gate</a>	The C++ IPC gate interface, see <a href="#">IPC-Gate API</a> for the C interface . . . . .	1207
<a href="#">L4::lpc_svr::Br_manager_no_buffers</a>	Empty implementation of <a href="#">Server_iface</a> . . . . .	1212
<a href="#">L4::lpc_svr::Compound_reply</a>	Mix in for LOOP_HOOKS to always use compound reply and wait . . . . .	1216
<a href="#">L4::lpc_svr::Dbg_dispatch&lt; R, Exc, Printer &gt;</a>	Dispatch helper that, in addition to what <a href="#">Exc_dispatch</a> does, prints exception messages . . . . .	1218
<a href="#">L4::lpc_svr::Default_loop_hooks</a>	Default LOOP_HOOKS . . . . .	1220
<a href="#">L4::lpc_svr::Default_setup_wait</a>	Mix in for LOOP_HOOKS for setup_wait no op . . . . .	1223
<a href="#">L4::lpc_svr::Default_timeout</a>	Mix in for LOOP_HOOKS to use a 0 send and a infinite receive timeout . . . . .	1224
<a href="#">L4::lpc_svr::Direct_dispatch&lt; R &gt;</a>	Direct dispatch helper, for forwarding dispatch calls to a registry <i>R</i> . . . . .	1226
<a href="#">L4::lpc_svr::Direct_dispatch&lt; R * &gt;</a>	Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry <i>R</i> . . . . .	1228
<a href="#">L4::lpc_svr::Exc_dispatch&lt; R, Exc &gt;</a>	Dispatch helper wrapping try {} catch {} around the dispatch call . . . . .	1230
<a href="#">L4::lpc_svr::Ignore_errors</a>	Mix in for LOOP_HOOKS to ignore IPC errors . . . . .	1232
<a href="#">L4::lpc_svr::Server_iface</a>	Interface for server-loop related functions . . . . .	1233
<a href="#">L4::lpc_svr::Timeout</a>	Callback interface for <a href="#">Timeout_queue</a> . . . . .	1240
<a href="#">L4::lpc_svr::Timeout_queue</a>	Timeout queue to be used in l4re server loop . . . . .	1244
<a href="#">L4::lpc_svr::Timeout_queue_hooks&lt; HOOKS, BR_MAN &gt;</a>	Loop hooks mixin for integrating a timeout queue into the server loop . . . . .	1247
<a href="#">L4::Irq</a>	C++ <a href="#">Irq</a> interface, see <a href="#">IRQs</a> for the C interface . . . . .	1252
<a href="#">L4::Irq_eoi</a>	Interface for sending an unmask message to an object . . . . .	1262
<a href="#">L4::Irq_handler_object</a>	Server object base class for handling IRQ messages . . . . .	1265

<a href="#">L4::lrqep_t&lt; Derived, BASE, bool &gt;</a>	
Epiface implementation for interrupt handlers	1269
<a href="#">L4::Kip::Mem_desc</a>	
Memory descriptors stored in the kernel interface page	1273
<a href="#">L4::Kobject</a>	
Base class for all kinds of kernel objects and remote objects, referenced by capabilities	1284
<a href="#">L4::Kobject_2t&lt; Derived, Base1, Base2, PROTO, S_DEMAND &gt;</a>	
Helper class to create an <a href="#">L4Re</a> interface class that is derived from two base classes (see <a href="#">L4::Kobject_t</a> )	1288
<a href="#">L4::Kobject_3t&lt; Derived, Base1, Base2, Base3, PROTO, S_DEMAND &gt;</a>	
Helper class to create an <a href="#">L4Re</a> interface class that is derived from three base classes (see <a href="#">L4::Kobject_t</a> )	1292
<a href="#">L4::Kobject_demand&lt; T &gt;</a>	
Get the combined server-side resource requirements for all type T..	1295
<a href="#">L4::Kobject_t&lt; Derived, Base, PROTO, S_DEMAND &gt;</a>	
Helper class to create an <a href="#">L4Re</a> interface class that is derived from a single base class	1296
<a href="#">L4::Kobject_typeid&lt; T &gt;</a>	
Meta object for handling access to type information of Kobjects	1298
<a href="#">L4::Kobject_typeid&lt; void &gt;</a>	
Minimalistic ID for void interface	1302
<a href="#">L4::Kobject_x&lt; Derived, ARGS &gt;</a>	
Generic <a href="#">Kobject</a> inheritance template	1305
<a href="#">L4::Lock_guard</a>	
Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code	1306
<a href="#">L4::Meta</a>	
Meta interface that shall be implemented by each <a href="#">L4Re</a> object and gives access to the dynamic type information for <a href="#">L4Re</a> objects	1309
<a href="#">L4::Out_of_memory</a>	
Exception signalling insufficient memory	1315
<a href="#">L4::Pager</a>	
Pager interface including the <a href="#">lo_pager</a> interface	1319
<a href="#">L4::Platform_control</a>	
L4 C++ interface for controlling platform-wide properties, see <a href="#">Platform Control C API</a> for the C interface	1322
<a href="#">L4::Poll_timeout_counter</a>	
Evaluate an expression for a maximum number of times	1330
<a href="#">L4::Poll_timeout_kipclock</a>	
A polling timeout based on the <a href="#">L4Re</a> clock	1333
<a href="#">L4::Proto_t&lt; P &gt;</a>	
Data type for defining protocol numbers	1337
<a href="#">L4::Rcv_endpoint</a>	
Interface for kernel objects that allow to receive IPC from them	1337
<a href="#">L4::Registry_iface</a>	
Abstract interface for object registries	1343
<a href="#">L4::Runtime_error</a>	
Exception for an abstract runtime error	1348
<a href="#">L4::Scheduler</a>	
C++ interface of the <a href="#">Scheduler</a> kernel object, see <a href="#">Scheduler</a> for the C interface	1352
<a href="#">L4::Semaphore</a>	
C++ Kernel-provided semaphore interface, see <a href="#">Kernel-provided semaphore</a> for the C interface	1361
<a href="#">L4::Server&lt; LOOP_HOOKS &gt;</a>	
Basic server loop for handling client requests	1366
<a href="#">L4::Server_object</a>	
Abstract server object to be used with <a href="#">L4::Server</a> and <a href="#">L4::Basic_registry</a>	1372
<a href="#">L4::Server_object_t&lt; IFACE, BASE &gt;</a>	
Base class (template) for server implementing server objects	1377

<a href="#">L4::Server_object_x&lt; Derived, IFACE, BASE &gt;</a>	
Helper class to implement p_dispatch based server objects	1382
<a href="#">L4::Smart_cap&lt; T, SMART &gt;</a>	
Smart capability class	1386
<a href="#">L4::String</a>	
A null-terminated string container class	1390
<a href="#">L4::Task</a>	
C++ interface of the <a href="#">Task</a> kernel object, see <a href="#">Task</a> for the C interface	1391
<a href="#">L4::Thread</a>	
C++ <a href="#">L4</a> kernel thread interface, see <a href="#">Thread</a> for the C interface	1404
<a href="#">L4::Thread::Attr</a>	
<a href="#">Thread</a> attributes used for <a href="#">control()</a>	1419
<a href="#">L4::Thread::Modify_senders</a>	
Class wrapping a list of rules which modify the sender label of IPC messages inbound to this thread	1425
<a href="#">L4::Thread_group</a>	
C++ <a href="#">L4</a> kernel thread group interface, see <a href="#">Thread groups</a> for the C interface	1427
<a href="#">L4::Triggerable</a>	
Interface that allows an object to be triggered by some source	1431
<a href="#">L4::Type_info</a>	
Dynamic Type Information for <a href="#">L4Re</a> Interfaces	1435
<a href="#">L4::Type_info::Demand</a>	
Data type for expressing the needed receive buffers at the server-side of an interface	1436
<a href="#">L4::Type_info::Demand_t&lt; CAPS, FLAGS, MEM, PORTS &gt;</a>	
Template type statically describing demand of receive buffers	1440
<a href="#">L4::Type_info::Demand_union_t&lt; D1, D2 &gt;</a>	
Template type statically describing the combination of two <a href="#">Demand</a> object	1443
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, X &gt;</a>	
Empty list of RPCs	1447
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, Default_op&lt; R &gt; &gt;::Rpc&lt; Y &gt;</a>	
Find the given RPC in the list	1448
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, R, X... &gt;</a>	
Non-empty list of RPCs	1448
<a href="#">L4::Typeid::Detail::_Rpc&lt; OPCODE, O, R, X... &gt;::Rpc&lt; Y &gt;</a>	
Find the given RPC in the list	1451
<a href="#">L4::Typeid::Detail::Rpc_end</a>	
Internal end-of-list marker	1452
<a href="#">L4::Typeid::P_dispatch&lt; LIST &gt;</a>	
Use for protocol based dispatch stage	1452
<a href="#">L4::Typeid::Raw_ipc&lt; CLASS &gt;</a>	
RPCs list for passing raw incoming IPC to the server object	1453
<a href="#">L4::Typeid::Rpc_nocode&lt; OPERATION &gt;</a>	
List of RPCs of an interface using a single operation without an opcode	1455
<a href="#">L4::Typeid::Rpc&lt; RPCS &gt;</a>	
Standard list of RPCs of an interface	1457
<a href="#">L4::Typeid::Rpc_code&lt; OPCODE_TYPE &gt;</a>	
List of RPCs of an interface using a special opcode type	1459
<a href="#">L4::Typeid::Rpc_code&lt; OPCODE_TYPE &gt;::F&lt; RPCS &gt;</a>	
	1460
<a href="#">L4::Typeid::Rpc_sys&lt; ARG &gt;</a>	
List of RPCs typically used for kernel interfaces	1463
<a href="#">L4::Types::__Add_rvalue_reference_helper&lt; T, typename &gt;</a>	
Helper template for <a href="#">Add_rvalue_reference</a>	1465
<a href="#">L4::Types::__Add_rvalue_reference_helper&lt; T, Void&lt; T &amp;&amp; &gt; &gt;</a>	
Helper template for <a href="#">Add_rvalue_reference</a>	1466
<a href="#">L4::Types::__Underlying_type_helper&lt; T, bool &gt;</a>	
Helper template for <a href="#">Underlying_type</a>	1468
<a href="#">L4::Types::__Underlying_type_helper&lt; T, false &gt;</a>	
Helper template for <a href="#">Underlying_type</a>	1469

<a href="#">L4::Types::Add_rvalue_reference&lt; T &gt;</a>	1471
Create an rvalue reference of the given type . . . . .	
<a href="#">L4::Types::Bool&lt; V &gt;</a>	1472
Boolean meta type . . . . .	
<a href="#">L4::Types::False</a>	1473
False meta value . . . . .	
<a href="#">L4::Types::Flags&lt; BITS_ENUM, UNDERLYING &gt;</a>	1476
Template for defining typical <a href="#">Flags</a> bitmaps . . . . .	
<a href="#">L4::Types::Flags_ops_t&lt; DT &gt;</a>	1480
Mixin class to define a set of friend bitwise operators on DT . . . . .	
<a href="#">L4::Types::Flags_t&lt; DT, T &gt;</a>	1483
Template type to define a flags type with bitwise operations . . . . .	
<a href="#">L4::Types::Int_for_size&lt; SIZE, bool &gt;</a>	1487
Metafunction to get an unsigned integral type for the given size . . . . .	
<a href="#">L4::Types::Int_for_type&lt; T &gt;</a>	1488
Metafunction to get an integral type of the same size as T . . . . .	
<a href="#">L4::Types::Integral_constant&lt; T, Value &gt;</a>	1489
Wrapper for a static constant of the given type . . . . .	
<a href="#">L4::Types::Is_enum&lt; T &gt;</a>	1490
Check whether the given type is an enumeration type . . . . .	
<a href="#">L4::Types::Same&lt; A, B &gt;</a>	1492
Compare two data types for equality . . . . .	
<a href="#">L4::Types::True</a>	1494
True meta value . . . . .	
<a href="#">L4::Types::Underlying_type&lt; T &gt;</a>	1497
Get an underlying type of an enumeration type . . . . .	
<a href="#">L4::Uart</a>	1498
Uart driver abstraction . . . . .	
<a href="#">L4::Uart_apb</a>	1505
Driver for the Advanced Peripheral Bus (APB) UART from the Cortex-M System Design Kit (CMSDK) . . . . .	
<a href="#">L4::Unknown_error</a>	1510
Exception for an unknown condition . . . . .	
<a href="#">L4::Vcon</a>	1513
C++ <a href="#">L4 Vcon</a> interface, see <a href="#">Virtual Console</a> for the C interface . . . . .	
<a href="#">L4::Vm</a>	1523
Virtual machine host address space . . . . .	
<a href="#">l4_buf_regs_t</a>	1527
Encapsulation of the buffer-registers block in the UTCB . . . . .	
<a href="#">l4_exc_regs_t</a>	1528
UTCB structure for exceptions . . . . .	
<a href="#">l4_fpage_t</a>	1531
L4 flexpage type . . . . .	
<a href="#">l4_icu_info_t</a>	1532
Info structure for an ICU . . . . .	
<a href="#">l4_icu_msi_info_t</a>	1533
Info to use for a specific MSI . . . . .	
<a href="#">l4_kernel_info_mem_desc_t</a>	1534
Memory descriptor data structure . . . . .	
<a href="#">l4_kernel_info_t</a>	1535
L4 Kernel Interface Page . . . . .	
<a href="#">l4_msg_regs_t</a>	1536
Encapsulation of the message-register block in the UTCB . . . . .	
<a href="#">l4_msgtag_t</a>	1537
Message tag data structure . . . . .	
<a href="#">l4_sched_cpu_set_t</a>	1540
CPU sets . . . . .	

<a href="#">l4_sched_param_t</a>	Scheduler parameter set . . . . .	1544
<a href="#">l4_snd_fpage_t</a>	Send-flexpage types . . . . .	1545
<a href="#">l4_thread_regs_t</a>	Encapsulation of the thread-control-register block of the UTCB . . . . .	1546
<a href="#">l4_timeout_s</a>	Basic timeout specification . . . . .	1547
<a href="#">l4_timeout_t</a>	Timeout pair . . . . .	1548
<a href="#">l4_vcon_attr_t</a>	Vcon attribute structure . . . . .	1549
<a href="#">l4_vcpu_arch_state_t</a>	Architecture-specific vCPU state . . . . .	1551
<a href="#">l4_vcpu_ipc_regs_t</a>	vCPU message registers . . . . .	1551
<a href="#">l4_vcpu_regs_t</a>	vCPU registers . . . . .	1553
<a href="#">l4_vcpu_state_t</a>	State of a vCPU . . . . .	1556
<a href="#">l4_vm_svm_vmcb_control_area</a>	VMCB structure for SVM VMs . . . . .	1560
<a href="#">l4_vm_svm_vmcb_state_save_area</a>	State save area structure for SVM VMs . . . . .	1560
<a href="#">l4_vm_svm_vmcb_state_save_area_seg</a>	State save area segment selector struct . . . . .	1562
<a href="#">l4_vm_svm_vmcb_t</a>	Control structure for SVM VMs . . . . .	1562
<a href="#">l4_vm_tz_state</a>	State structure for TrustZone VMs . . . . .	1564
<a href="#">l4_vm_vmx_vcpu_infos_t</a>	VMX information members . . . . .	1564
<a href="#">l4_vm_vmx_vcpu_state_t</a>	VMX vCPU state . . . . .	1565
<a href="#">l4_vm_vmx_vcpu_vmcs_t</a>	VMX software VMCS . . . . .	1567
<a href="#">l4_vmx_offset_table_t</a>	Software VMCS field offset table . . . . .	1568
<a href="#">L4drivers::Mmio_register_block&lt; MAX_BITS &gt;</a>	An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order . . . . .	1570
<a href="#">L4drivers::Register_block&lt; MAX_BITS, BLOCK &gt;</a>	Handles a reference to a register block of the given maximum access width . . . . .	1572
<a href="#">L4drivers::Register_block_base&lt; MAX_BITS &gt;</a>	Abstract register block interface . . . . .	1576
<a href="#">L4drivers::Register_block_impl&lt; BASE, MAX_BITS &gt;</a>	Implementation helper for register blocks . . . . .	1577
<a href="#">L4drivers::Register_block_tmpl&lt; BLOCK &gt;</a>	Helper template that translates to the <a href="#">Register_block_base</a> interface . . . . .	1579
<a href="#">L4drivers::Register_tmpl&lt; BITS, BLOCK &gt;</a>	Single hardware register inside a <a href="#">Register_block_base</a> interface . . . . .	1580
<a href="#">L4drivers::Ro_register_block&lt; MAX_BITS, BLOCK &gt;</a>	Handles a reference to a read only register block of the given maximum access width . . . . .	1586
<a href="#">L4drivers::Ro_register_tmpl&lt; BITS, BLOCK &gt;</a>	Single read only register inside a <a href="#">Register_block_base</a> interface . . . . .	1588
<a href="#">L4Re::Cap_alloc</a>	Capability allocator interface . . . . .	1591
<a href="#">L4Re::Console</a>	<a href="#">Console</a> class . . . . .	1594

<a href="#">L4Re::Core::Ref_ptr&lt; T, CNT &gt;</a>	
A reference-counting pointer with automatic cleanup	1597
<a href="#">L4Re::Dataspace</a>	
Interface for memory-like objects	1602
<a href="#">L4Re::Dataspace::F</a>	
<a href="#">Dataspace</a> flags definitions	1615
<a href="#">L4Re::Dataspace::Stats</a>	
Information about the dataspace	1616
<a href="#">L4Re::Debug_obj</a>	
Debug interface	1617
<a href="#">L4Re::Default_event_payload</a>	
Default event stream payload	1621
<a href="#">L4Re::Dma_space</a>	
Managed DMA Address Space	1622
<a href="#">L4Re::Env</a>	
C++ interface of the initial environment that is provided to an <a href="#">L4</a> task	1629
<a href="#">L4Re::Event</a>	
<a href="#">Event</a> class	1644
<a href="#">L4Re::Event_buffer_t&lt; PAYLOAD &gt;</a>	
<a href="#">Event</a> buffer class	1654
<a href="#">L4Re::Event_buffer_t&lt; PAYLOAD &gt;::Event</a>	
<a href="#">Event</a> structure used in buffer	1658
<a href="#">L4Re::Inhibitor</a>	
Set of inhibitor locks, which inhibit specific actions when held	1659
<a href="#">L4Re::Itas</a>	
Interface to the ITAS	1665
<a href="#">L4Re::Log</a>	
<a href="#">Log</a> interface class	1675
<a href="#">L4Re::Mem_alloc</a>	
Memory allocation interface	1681
<a href="#">L4Re::Mem_alloc::Stats</a>	
Statistics about memory-allocator	1687
<a href="#">L4Re::Mmio_space</a>	
Interface for memory-like address space accessible via IPC	1690
<a href="#">L4Re::Namespace</a>	
Name-space interface	1695
<a href="#">L4Re::Ned::Cmd_control</a>	
Direct control interface for Ned	1705
<a href="#">L4Re::Parent</a>	
<a href="#">Parent</a> interface	1707
<a href="#">L4Re::Random</a>	
Low-bandwidth interface for random number generators	1712
<a href="#">L4Re::Rm</a>	
<a href="#">Region</a> map	1716
<a href="#">L4Re::Rm::Area</a>	
An area is a range of virtual addresses which is reserved, see <a href="#">L4Re::Rm::reserve_area()</a>	1737
<a href="#">L4Re::Rm::F</a>	
<a href="#">Rm</a> flags definitions	1737
<a href="#">L4Re::Rm::Region</a>	
A region is a range of virtual addresses which is backed by content	1739
<a href="#">L4Re::Rm::Unique_region&lt; T &gt;</a>	
Unique region	1740
<a href="#">L4Re::Smart_cap_auto&lt; Unmap_flags &gt;</a>	
Helper for <a href="#">Unique_cap</a> and <a href="#">Unique_del_cap</a>	1746
<a href="#">L4Re::Smart_count_cap&lt; Unmap_flags &gt;</a>	
Helper for <a href="#">Ref_cap</a> and <a href="#">Ref_del_cap</a>	1746
<a href="#">L4Re::Util::Cap_alloc</a>	
Adapter to expose the cap allocator implementation as <a href="#">L4Re::Cap_alloc</a> compatible class	1748

<a href="#">L4Re::Util::Bitmap&lt; BITS &gt;</a>	
A static bitmap	1751
<a href="#">L4Re::Util::Bitmap_base</a>	
Basic bitmap abstraction	1756
<a href="#">L4Re::Util::Bitmap_base::Bit</a>	
A writable bit in a bitmap	1764
<a href="#">L4Re::Util::Bitmap_base::Char&lt; BITS &gt;</a>	
Helper abstraction for a byte contained in the bitmap	1764
<a href="#">L4Re::Util::Bitmap_base::Word&lt; BITS &gt;</a>	
Helper abstraction for a word contained in the bitmap	1765
<a href="#">L4Re::Util::Br_manager</a>	
Buffer-register (BR) manager for <a href="#">L4::Server</a>	1766
<a href="#">L4Re::Util::Br_manager_hooks</a>	
Predefined server-loop hooks for a server loop using the <a href="#">Br_manager</a>	1772
<a href="#">L4Re::Util::Br_manager_timeout_hooks</a>	
Predefined server-loop hooks for a server with using the <a href="#">Br_manager</a> and a timeout queue	1774
<a href="#">L4Re::Util::Cap_alloc_base</a>	
Capability allocator	1778
<a href="#">L4Re::Util::Counter&lt; COUNTER &gt;</a>	
Counter for <a href="#">Counting_cap_alloc</a> with variable data width	1779
<a href="#">L4Re::Util::Counter_atomic&lt; COUNTER &gt;</a>	
Thread safe version of counter for <a href="#">Counting_cap_alloc</a>	1780
<a href="#">L4Re::Util::Counting_cap_alloc&lt; COUNTERTYPE, Dbg &gt;</a>	
Internal reference-counting cap allocator	1782
<a href="#">L4Re::Util::Dataspace_svr</a>	
Dataspace server class	1788
<a href="#">L4Re::Util::Event_buffer_consumer_t&lt; PAYLOAD &gt;</a>	
An event buffer consumer	1795
<a href="#">L4Re::Util::Event_buffer_t&lt; PAYLOAD &gt;</a>	
Event_buffer utility class	1798
<a href="#">L4Re::Util::Event_svr&lt; SVR &gt;</a>	
Convenience wrapper for implementing an event server	1802
<a href="#">L4Re::Util::Event_t&lt; PAYLOAD &gt;</a>	
Convenience wrapper for getting access to an event object	1804
<a href="#">L4Re::Util::Item_alloc_base</a>	
Item allocator	1808
<a href="#">L4Re::Util::Names::Name</a>	
Name class	1809
<a href="#">L4Re::Util::Names::Name_space</a>	
Abstract server-side implementation of the <a href="#">L4::Namespace</a> interface	1812
<a href="#">L4Re::Util::Object_registry</a>	
A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread	1817
<a href="#">L4Re::Util::Ref_cap&lt; T &gt;</a>	
Automatic capability that implements automatic free and unmap of the capability selector	1824
<a href="#">L4Re::Util::Ref_del_cap&lt; T &gt;</a>	
Automatic capability that implements automatic free and unmap+delete of the capability selector	1826
<a href="#">L4Re::Util::Registry_server&lt; LOOP_HOOKS &gt;</a>	
A server loop object which has a <a href="#">Object_registry</a> included	1827
<a href="#">L4Re::Util::Smart_cap_auto&lt; Unmap_flags &gt;</a>	
Helper for <a href="#">Unique_cap</a> and <a href="#">Unique_del_cap</a>	1833
<a href="#">L4Re::Util::Smart_count_cap&lt; Unmap_flags &gt;</a>	
Helper for <a href="#">Ref_cap</a> and <a href="#">Ref_del_cap</a>	1834
<a href="#">L4Re::Util::Vcon_svr&lt; SVR &gt;</a>	
Console server template class	1835
<a href="#">L4Re::Util::Video::Goos_svr</a>	
Goos server class	1836

<a href="#">L4Re::Vfs::Be_file</a>	Boiler plate class for implementing an open file for <a href="#">L4Re::Vfs</a>	1840
<a href="#">L4Re::Vfs::Be_file_system</a>	Boilerplate class for implementing a <a href="#">L4Re::Vfs::File_system</a>	1845
<a href="#">L4Re::Vfs::Directory</a>	Interface for a POSIX file that is a directory	1848
<a href="#">L4Re::Vfs::File</a>	The basic interface for an open POSIX file	1853
<a href="#">L4Re::Vfs::File_system</a>	Basic interface for an <a href="#">L4Re::Vfs</a> file system	1857
<a href="#">L4Re::Vfs::Fs</a>	POSIX File-system related functionality	1859
<a href="#">L4Re::Vfs::Generic_file</a>	The common interface for an open POSIX file	1864
<a href="#">L4Re::Vfs::Mman</a>	Interface for POSIX memory management	1873
<a href="#">L4Re::Vfs::Ops</a>	Interface for the POSIX backends of an application	1874
<a href="#">L4Re::Vfs::Regular_file</a>	Interface for a POSIX file that provides regular file semantics	1877
<a href="#">L4Re::Vfs::Special_file</a>	Interface for a POSIX file that provides special file semantics	1887
<a href="#">L4Re::Video::Color_component</a>	A color component	1890
<a href="#">L4Re::Video::Goos</a>	Class that abstracts framebuffers	1895
<a href="#">L4Re::Video::Goos::Info</a>	Information structure of a <a href="#">Goos</a>	1905
<a href="#">L4Re::Video::Pixel_info</a>	Pixel information	1907
<a href="#">L4Re::Video::View</a>	View of a framebuffer	1918
<a href="#">L4Re::Video::View::Info</a>	Information structure of a view	1925
<a href="#">l4re_aux_t</a>	Auxiliary descriptor	1927
<a href="#">l4re_ds_stats_t</a>	Information about the data space	1928
<a href="#">l4re_elf_aux_mword_t</a>	Auxiliary vector element for a single unsigned data word	1928
<a href="#">l4re_elf_aux_t</a>	Generic header for each auxiliary vector element	1929
<a href="#">l4re_elf_aux_vma_t</a>	Auxiliary vector element for a reserved virtual memory area	1930
<a href="#">l4re_env_cap_entry_t</a>	Entry in the <a href="#">L4Re</a> environment array for the named initial objects	1930
<a href="#">l4re_env_t</a>	Initial environment data structure	1932
<a href="#">l4re_event_t</a>	Event structure used in buffer	1935
<a href="#">l4re_video_color_component_t</a>	Color component structure	1936
<a href="#">l4re_video_goos_info_t</a>	Goos information structure	1936
<a href="#">l4re_video_pixel_info_t</a>	Pixel_info structure	1938
<a href="#">l4re_video_view_info_t</a>	View information structure	1939

<a href="#">l4re_video_view_t</a>	
C representation of a goos view	1941
<a href="#">l4shmc_ringbuf_head_t</a>	
Head field of a ring buffer	1942
<a href="#">l4shmc_ringbuf_t</a>	
Ring buffer	1943
<a href="#">l4util_l4mod_info</a>	
Base module structure	1944
<a href="#">l4util_l4mod_mod</a>	
A single module	1946
<a href="#">l4util_mb_addr_range_t</a>	
INT-15, AX=E820 style "AddressRangeDescriptor" ...with a "size" parameter on the front which is the structure size - 4, pointing to the next one, up until the full buffer length of the memory map has been reached	1947
<a href="#">l4util_mb_apm_t</a>	
APM BIOS info	1948
<a href="#">l4util_mb_drive_t</a>	
Drive Info structure	1948
<a href="#">l4util_mb_info_t</a>	
MultiBoot Info description	1949
<a href="#">l4util_mb_mod_t</a>	
The structure type "mod_list" is used by the <a href="#">multiboot_info</a> structure	1951
<a href="#">l4util_mb_vbe_ctrl_t</a>	
VBE controller information	1952
<a href="#">l4util_mb_vbe_mode_t</a>	
VBE mode information	1952
<a href="#">L4vbus::Device</a>	
Device on a <a href="#">L4vbus::Vbus</a>	1956
<a href="#">L4vbus::Gpio_module</a>	
A <a href="#">Gpio_module</a> groups multiple GPIO pins together	1966
<a href="#">L4vbus::Gpio_module::Pin_slice</a>	
A slice of the pins provided by this module	1973
<a href="#">L4vbus::Gpio_pin</a>	
A GPIO pin	1973
<a href="#">L4vbus::Icu</a>	
Vbus Interrupt controller API	1982
<a href="#">L4vbus::Pci_dev</a>	
A PCI device	1986
<a href="#">L4vbus::Pci_host_bridge</a>	
A Pci host bridge	1992
<a href="#">L4vbus::Pm&lt; DEC &gt;</a>	
Power-management API mixin	1998
<a href="#">L4vbus::Vbus</a>	
The virtual bus ( <a href="#">Vbus</a> ) interface	2001
<a href="#">l4vbus_device_t</a>	
Detailed information about a vbus device	2012
<a href="#">l4vbus_resource_t</a>	
Description of a single vbus resource	2013
<a href="#">L4vcpu::State</a>	
C++ implementation of state word in the vCPU area	2014
<a href="#">L4vcpu::Vcpu</a>	
C++ implementation of the vCPU save state area	2016
<a href="#">L4virtio::Device</a>	
IPC interface for virtio over <a href="#">L4 IPC</a>	2029
<a href="#">L4virtio::Driver::Block_device</a>	
Simple class for accessing a virtio block device synchronously	2039
<a href="#">L4virtio::Driver::Block_device::Handle</a>	
Handle to an ongoing request	2047

<a href="#">L4virtio::Driver::Device</a>	Client-side implementation for a general virtio device . . . . .	2047
<a href="#">L4virtio::Driver::Virtio_net_device</a>	Simple class for accessing a virtio net device . . . . .	2060
<a href="#">L4virtio::Driver::Virtio_net_device::Packet</a>	Structure for a network packet (header including data) with maximum size, assuming that no extra features have been negotiated . . . . .	2069
<a href="#">L4virtio::Driver::Virtqueue</a>	Driver-side implementation of a <a href="#">Virtqueue</a> . . . . .	2070
<a href="#">L4virtio::Ptr&lt; T &gt;</a>	Pointer used in virtio descriptors . . . . .	2079
<a href="#">L4virtio::Svr::Bad_descriptor</a>	Exception used by Queue to indicate descriptor errors . . . . .	2082
<a href="#">L4virtio::Svr::Block_dev_base&lt; Ds_data &gt;</a>	Base class for virtio block devices . . . . .	2084
<a href="#">L4virtio::Svr::Block_request&lt; Ds_data &gt;</a>	A request to read or write data . . . . .	2093
<a href="#">L4virtio::Svr::Console::Control_message</a>	Virtio console control message . . . . .	2095
<a href="#">L4virtio::Svr::Console::Control_request</a>	Specialised <a href="#">Virtqueue::Request</a> providing access to control message payload . . . . .	2097
<a href="#">L4virtio::Svr::Console::Device</a>	Base class implementing a virtio console device with L4Re-based notification handling . . . . .	2098
<a href="#">L4virtio::Svr::Console::Device_port</a>	A console port with associated read/write state . . . . .	2112
<a href="#">L4virtio::Svr::Console::Features</a>	Virtio console specific feature bits . . . . .	2116
<a href="#">L4virtio::Svr::Console::Port</a>	Representation of a Virtio console port . . . . .	2121
<a href="#">L4virtio::Svr::Console::Port::Transition</a>	State transition from last report state to current state . . . . .	2125
<a href="#">L4virtio::Svr::Console::Virtio_con</a>	Base class implementing a virtio console functionality . . . . .	2126
<a href="#">L4virtio::Svr::Data_buffer</a>	Abstract data buffer . . . . .	2143
<a href="#">L4virtio::Svr::Dev_config</a>	Abstraction for L4-Virtio device config memory . . . . .	2147
<a href="#">L4virtio::Svr::Dev_features</a>	Type for device feature bitmap . . . . .	2159
<a href="#">L4virtio::Svr::Dev_status</a>	Type of the device status register . . . . .	2162
<a href="#">L4virtio::Svr::Device_t&lt; DATA &gt;</a>	Server-side L4-VIRTIO device stub . . . . .	2165
<a href="#">L4virtio::Svr::Driver_mem_list_t&lt; DATA &gt;</a>	List of driver memory regions assigned to a single L4-VIRTIO transport instance . . . . .	2172
<a href="#">L4virtio::Svr::Driver_mem_region_t&lt; DATA &gt;</a>	Region of driver memory, that shall be managed locally . . . . .	2178
<a href="#">L4virtio::Svr::Request_processor</a>	Encapsulate the state for processing a VIRTIO request . . . . .	2185
<a href="#">L4virtio::Svr::Scmi::Base_attr_t</a>	SCMI base protocol attributes . . . . .	2192
<a href="#">L4virtio::Svr::Scmi::Base_proto</a>	Base class for the SCMI base protocol . . . . .	2193
<a href="#">L4virtio::Svr::Scmi::Perf_proto</a>	Base class for the SCMI performance protocol . . . . .	2195
<a href="#">L4virtio::Svr::Scmi::Performance_attr_t</a>	SCMI performance protocol attributes . . . . .	2198

<a href="#">L4virtio::Svr::Scmi::Performance_describe_level_t</a>	
SCMI performance describe level	2199
<a href="#">L4virtio::Svr::Scmi::Performance_describe_levels_n_t</a>	
SCMI performance describe levels numbers	2199
<a href="#">L4virtio::Svr::Scmi::Performance_domain_attr_t</a>	
SCMI performance domain protocol attributes	2201
<a href="#">L4virtio::Svr::Scmi::Proto&lt; OBSERV &gt;</a>	
Base class for all protocols	2203
<a href="#">L4virtio::Svr::Scmi::Scmi_dev</a>	
A server implementation of the virtio-scmi protocol	2204
<a href="#">L4virtio::Svr::Scmi::Scmi_hdr_t</a>	
SCMI header	2208
<a href="#">L4virtio::Svr::Virtio_gpio&lt; Request_handler, Epiface &gt;</a>	
A server implementation of the virtio-gpio protocol	2210
<a href="#">L4virtio::Svr::Virtio_gpio&lt; Request_handler, Epiface &gt;::Host_irq</a>	
Handler for the host irq	2214
<a href="#">L4virtio::Svr::Virtio_gpio&lt; Request_handler, Epiface &gt;::Irq_handler</a>	
Handler for an gpio pin irq	2218
<a href="#">L4virtio::Svr::Virtio_gpio&lt; Request_handler, Epiface &gt;::Request_processor</a>	
Generic handler for the Virtio requests	2219
<a href="#">L4virtio::Svr::Virtio_i2c&lt; Request_handler, Epiface &gt;</a>	
A server implementation of the virtio-i2c protocol	2222
<a href="#">L4virtio::Svr::Virtio_i2c&lt; Request_handler, Epiface &gt;::Host_irq</a>	
Handler for the host irq	2226
<a href="#">L4virtio::Svr::Virtio_i2c&lt; Request_handler, Epiface &gt;::Request_processor</a>	
Handler for the Virtio requests	2230
<a href="#">L4virtio::Svr::Virtio_rng&lt; Rnd_state, Epiface &gt;</a>	
A server implementation of the virtio-rng protocol	2233
<a href="#">L4virtio::Svr::Virtio_rng&lt; Rnd_state, Epiface &gt;::Host_irq</a>	
Handler for the host irq	2237
<a href="#">L4virtio::Svr::Virtio_rng&lt; Rnd_state, Epiface &gt;::Request_processor</a>	
Handler for the Virtio requests	2241
<a href="#">L4virtio::Svr::Virtio_spi&lt; Spi_request_handler, Epiface &gt;</a>	
A server implementation of the virtio-spi protocol	2243
<a href="#">L4virtio::Svr::Virtio_spi&lt; Spi_request_handler, Epiface &gt;::Host_irq</a>	
Handler for the host IRQ	2248
<a href="#">L4virtio::Svr::Virtio_spi&lt; Spi_request_handler, Epiface &gt;::Request_processor</a>	
Handler for the Virtio requests	2252
<a href="#">L4virtio::Svr::Virtqueue</a>	
Virtqueue implementation for the device	2255
<a href="#">L4virtio::Svr::Virtqueue::Head_desc</a>	
VIRTIO request, essentially a descriptor from the available ring	2267
<a href="#">L4virtio::Virtqueue</a>	
Low-level Virtqueue	2270
<a href="#">L4virtio::Virtqueue::Avail</a>	
Type of available ring, this is read-only for the host	2287
<a href="#">L4virtio::Virtqueue::Avail::Flags</a>	
Flags of the available ring	2288
<a href="#">L4virtio::Virtqueue::Desc</a>	
Descriptor in the descriptor table	2289
<a href="#">L4virtio::Virtqueue::Desc::Flags</a>	
Type for descriptor flags	2291
<a href="#">L4virtio::Virtqueue::Used</a>	
Used ring	2293
<a href="#">L4virtio::Virtqueue::Used::Flags</a>	
Flags for the used ring	2294
<a href="#">L4virtio::Virtqueue::Used_elem</a>	
Type of an element of the used ring	2296

<a href="#">l4virtio_block_config_t</a>	Device configuration for block devices . . . . .	2297
<a href="#">l4virtio_block_discard_t</a>	Structure used for the write zeroes and discard commands . . . . .	2298
<a href="#">l4virtio_block_header_t</a>	Header structure of a request for a block device . . . . .	2299
<a href="#">l4virtio_config_hdr_t</a>	L4-VIRTIO config header, provided in shared data space . . . . .	2300
<a href="#">l4virtio_config_queue_t</a>	Queue configuration entry . . . . .	2301
<a href="#">l4virtio_input_absinfo_t</a>	Information about the absolute axis in the underlying evdev implementation . . . . .	2302
<a href="#">l4virtio_input_config_t</a>	Device configuration for input devices . . . . .	2303
<a href="#">l4virtio_input_devids_t</a>	Device ID information for the device . . . . .	2303
<a href="#">l4virtio_input_event_t</a>	Single event in event or status queue . . . . .	2304
<a href="#">l4virtio_net_config_t</a>	Device configuration for network devices . . . . .	2305
<a href="#">l4virtio_net_header_t</a>	Header structure of a request for a network device . . . . .	2305
<a href="#">L4virtio_port</a>	A Port on the Virtio Net Switch . . . . .	2306
<a href="#">Mac_addr</a>	A wrapper class around the value of a MAC address . . . . .	2312
<a href="#">Mac_table&lt; Size &gt;</a>	<a href="#">Mac_table</a> manages a 1:n association between ports and MAC addresses . . . . .	2312
<a href="#">Net_transfer</a>	A network request to only a single destination . . . . .	2315
<a href="#">Rm</a>	<a href="#">Region</a> map . . . . .	2318
<a href="#">Rm::Area</a>	An area is a range of virtual addresses which is reserved, see <a href="#">L4Re::Rm::reserve_area()</a> . . . . .	2332
<a href="#">Rm::F</a>	<a href="#">Rm</a> flags definitions . . . . .	2333
<a href="#">Rm::Region</a>	A region is a range of virtual addresses which is backed by content . . . . .	2335
<a href="#">Rm::Unique_region&lt; T &gt;</a>	Unique region . . . . .	2336
<a href="#">Switch_factory</a>	The IPC interface for creating ports . . . . .	2341
<a href="#">Virtio_net</a>	The Base class of a Port . . . . .	2345
<a href="#">Virtio_net_request</a>	Abstraction for a network request . . . . .	2350
<a href="#">Virtio_switch</a>	The Virtio switch contains all ports and processes network requests . . . . .	2353
<a href="#">Virtio_vlan_mangle</a>	Class for VLAN packet rewriting . . . . .	2358

# Chapter 12

## File Index

### 12.1 File List

Here is a list of all documented files with brief descriptions:

pkg/drivers-frst/include/asm_access_gen.h . . . . .	2368
pkg/drivers-frst/include/hw_mmio_register_block . . . . .	2369
pkg/drivers-frst/include/hw_register_block . . . . .	2370
pkg/drivers-frst/include/io_regblock.h . . . . .	2373
pkg/drivers-frst/include/io_regblock_port.h . . . . .	2375
pkg/drivers-frst/include/Makefile . . . . .	2419
pkg/drivers-frst/include/poll_timeout_counter.h . . . . .	2376
pkg/drivers-frst/include/ARCH-amd64/asm_access.h . . . . .	2363
pkg/drivers-frst/include/ARCH-arm/asm_access.h . . . . .	2364
pkg/drivers-frst/include/ARCH-arm64/asm_access.h . . . . .	2365
pkg/drivers-frst/include/ARCH-mips/asm_access.h . . . . .	2366
pkg/drivers-frst/include/ARCH-ppc32/asm_access.h . . . . .	2366
pkg/drivers-frst/include/ARCH-riscv/asm_access.h . . . . .	2366
pkg/drivers-frst/include/ARCH-sparc/asm_access.h . . . . .	2367
pkg/drivers-frst/include/ARCH-x86/asm_access.h . . . . .	2368
pkg/drivers-frst/uart/include/device.h . . . . .	2377
pkg/drivers-frst/uart/include/Makefile . . . . .	2419
pkg/drivers-frst/uart/include/uart_16550.h . . . . .	2378
pkg/drivers-frst/uart/include/uart_16550_dw.h . . . . .	2379
pkg/drivers-frst/uart/include/uart_apb.h . . . . .	2380
pkg/drivers-frst/uart/include/uart_base.h . . . . .	2380
pkg/drivers-frst/uart/include/uart_cadence.h . . . . .	2382
pkg/drivers-frst/uart/include/uart_dcc-v6.h . . . . .	2382
pkg/drivers-frst/uart/include/uart_dm.h . . . . .	2383
pkg/drivers-frst/uart/include/uart_dummy.h . . . . .	2383
pkg/drivers-frst/uart/include/uart_geni.h . . . . .	2384
pkg/drivers-frst/uart/include/uart_imx.h . . . . .	2384
pkg/drivers-frst/uart/include/uart_leon3.h . . . . .	2385
pkg/drivers-frst/uart/include/uart_linfex.h . . . . .	2386
pkg/drivers-frst/uart/include/uart_lpuart.h . . . . .	2386
pkg/drivers-frst/uart/include/uart_mvebu.h . . . . .	2387
pkg/drivers-frst/uart/include/uart_of.h . . . . .	2387
pkg/drivers-frst/uart/include/uart_omap35x.h . . . . .	2388
pkg/drivers-frst/uart/include/uart_pl011.h . . . . .	2388
pkg/drivers-frst/uart/include/uart_s3c2410.h . . . . .	2389

pkg/drivers-frst/uart/include/uart_sa1000.h	2390
pkg/drivers-frst/uart/include/uart_sbi.h	2391
pkg/drivers-frst/uart/include/uart_sh.h	2391
pkg/drivers-frst/uart/include/uart_sifive.h	2392
pkg/drivers-frst/uart/include/uart_tegra-tcu.h	2392
pkg/l4re-core/ned/doc/tutorial.lua	2393
pkg/l4re-core/ned/lib/include/cmd_control	2395
pkg/l4re-core/ned/lib/include/Makefile	2419
pkg/uvmm/configs/vmm.lua	2396
pkg/virtio-net-switch/server/switch/debug.h	2404

pkg/virtio-net-switch/server/switch/switch.cc	2437
pkg/virtio-net-switch/server/switch/switch.h	2440
pkg/virtio-net-switch/server/switch/virtio_net.h	2441
pkg/virtio-net-switch/server/switch/virtio_net_buffer.h	2445
pkg/virtio-net-switch/server/switch/vlan.h	2446
amd64/l4/sys/__kip-arch.h	2487
amd64/l4/sys/__vcpu-arch.h	
AMD64-specific vCPU interface	2488
amd64/l4/sys/ktrace_events.h	2500
amd64/l4/sys/linkage.h	
Linkage	2512
amd64/l4/sys/segment.h	
Segment handling (AMD64)	2447
amd64/l4/sys/vm.h	2518
amd64/l4/sys/arch/cache.h	
Cache functions	3037
amd64/l4/sys/arch/consts.h	
Common L4 constants, AMD64 version	3053
amd64/l4/sys/arch/ipc.h	3160
amd64/l4/sys/arch/kip.h	3342
amd64/l4/sys/arch/l4int.h	
Fixed sized integer types, AMD64 version	3205
amd64/l4/sys/arch/platform_control.h	3223
amd64/l4/sys/arch/task.h	3253
amd64/l4/sys/arch/thread.h	2524
amd64/l4/sys/arch/utcb.h	
UTCB definitions for AMD64	3274
amd64/l4/util/bitops_arch.h	
Amd64 bit manipulation functions	2538
amd64/l4/util/cpu.h	
CPU related functions	2546
amd64/l4/util/irq.h	
Some PIC and hardware interrupt related functions	2683

amd64/l4/util/ <a href="#">mbi_argv.h</a>	
Command line handling . . . . .	2551
amd64/l4/util/ <a href="#">perform.h</a>	
Performance Monitoring using P5/P6 Measurement Counters . . . . .	2456
amd64/l4/util/ <a href="#">port_io.h</a>	
X86 port I/O . . . . .	2468
amd64/l4/util/ <a href="#">rdtsc.h</a>	
Timestamp counter related functions . . . . .	2476
amd64/l4/util/ <a href="#">spin.h</a>	
Spinning for amd64 . . . . .	2485
amd64/l4/util/arch/ <a href="#">l4_macros.h</a>	
Main function . . . . .	2521
amd64/l4/util/arch/ <a href="#">thread.h</a>	2524
arm/l4/sys/ <a href="#">__kip-arch.h</a>	2487
arm/l4/sys/ <a href="#">__vcpu-arch.h</a>	
ARM-specific vCPU interface . . . . .	2491
arm/l4/sys/ <a href="#">atomic.h</a>	3304
arm/l4/sys/ <a href="#">ktrace_events.h</a>	2503
arm/l4/sys/ <a href="#">linkage.h</a>	
Linkage . . . . .	2513
arm/l4/sys/ <a href="#">mem_op.h</a>	
Memory access functions (ARM specific) . . . . .	2515
arm/l4/sys/ <a href="#">syscall_defs.h</a>	
Syscall entry definitions . . . . .	2517
arm/l4/sys/ <a href="#">vm.h</a>	
ARM virtualization interface . . . . .	2518
arm/l4/sys/arch/ <a href="#">cache.h</a>	
Cache functions . . . . .	3038
arm/l4/sys/arch/ <a href="#">consts.h</a>	
Common L4 constants, arm version . . . . .	3054
arm/l4/sys/arch/ <a href="#">ipc.h</a>	3161
arm/l4/sys/arch/ <a href="#">kip.h</a>	3343
arm/l4/sys/arch/ <a href="#">l4int.h</a>	
Fixed sized integer types, arm version . . . . .	3206

l4/re/c/log.h	
Log C interface	2823
l4/re/c/mem_alloc.h	
Memory allocator C interface	2824
l4/re/c/namespace.h	
Namespace functions, C interface	2826
l4/re/c/parent.h	
Parent C interface	2827
l4/re/c/rm.h	
Region map interface, C interface	2829
l4/re/c/util/cap_alloc.h	
Capability allocator C interface	2833
l4/re/c/util/kumem_alloc.h	
Kumem allocator utility C interface	2835
l4/re/c/util/video/goos_fb.h	
Framebuffer utility functionality	2837
l4/re/c/video/colors.h	2838
l4/re/c/video/goos.h	2840
l4/re/c/video/view.h	2843
l4/re/impl/dataspace_impl.h	
Dataspace client stub implementation	2870
l4/re/impl/mem_alloc_impl.h	
Memory allocator client stub implementation	2873
l4/re/impl/namespace_impl.h	
Namespace client stub implementation	2874
l4/re/impl/rm_impl.h	
Region map client stub implementation	2877
l4/re/util/bitmap_cap_alloc	
Bitmap capability allocator	2905
l4/re/util/br_manager	2907

l4/re/util/cap	
Capability utility functions	2909
l4/re/util/cap_alloc	
Capability allocator	2914
l4/re/util/cap_alloc_impl.h	
Capability allocator implementation	2917
l4/re/util/counting_cap_alloc	
Reference-counting capability allocator	2919
l4/re/util/dataspace_svr	2924
l4/re/util/debug	2929
l4/re/util/env_ns	2931
l4/re/util/event	2934
l4/re/util/event_buffer	2937
l4/re/util/event_svr	2938
l4/re/util/icu_svr	2939
l4/re/util/item_alloc	
Item allocator	2941
l4/re/util/kumem_alloc	
Kumem allocator helper	2944
l4/re/util/meta	3213
l4/re/util/name_space_svr	2945
l4/re/util/object_registry	2951
l4/re/util/poll_timeout_kipclock	2953
l4/re/util/region_mapping	
Region handling	2954
l4/re/util/region_mapping_svr	2961
l4/re/util/shared_cap	
Shared_cap / Shared_del_cap	2966
l4/re/util/unique_cap	
Unique_cap / Unique_del_cap	2971
l4/re/util/vcon_svr	2973
l4/re/util/video/goos_fb	2974
l4/re/util/video/goos_svr	2976
l4/re/video/colors	2977
l4/re/video/goos	2979
l4/re/video/goos-sys.h	
Goos protocol definition	2982
l4/re/video/view	2983
l4/shmc/ringbuf.h	2983
l4/shmc/shmc.h	
Shared memory library header file	2992
l4/sigma0/sigma0.h	
Sigma0 interface	2997
l4/sys/_kernel_object_impl.h	3001
l4/sys/_ktrace-impl.h	
L4 kernel event tracing	3001
l4/sys/_l4_fpage.h	3003
l4/sys/_platform_control-arm.h	3007

### 13.1.1 Detailed Description

Interfaces for all kinds of base functionality.

Some notes on Inter Process Communication (IPC)

IPC in L4 is always synchronous and unbuffered: a message is transferred from the sender to the recipient if and only if the recipient has invoked a corresponding IPC operation. The sender blocks until this happens or a timeout specified by the sender elapsed without the destination becoming ready to receive.

### 13.1.2 Basic Macros

L4 standard macros for header files, function definitions, and public APIs etc.

Collaboration diagram for Basic Macros:

## Macros

- **#define L4\_INLINE**  
*L4 Inline function attribute.*
- **#define L4\_ALWAYS\_INLINE**  
*Always inline a function.*
- **#define L4\_BEGIN\_DECLS**  
*Start section with C types and functions.*
- **#define L4\_END\_DECLS**  
*End section with C types and functions.*
- **#define L4\_NOTHROW**  
*Mark a function declaration and definition as never throwing an exception.*
- **#define L4\_EXPORT**  
*Attribute to mark functions, variables, and data types as being exported from a library.*
- **#define L4\_HIDDEN**  
*Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.*
- **#define L4\_CONSTEXPR**  
*Constexpr function attribute.*
- **#define L4\_NORETURN**  
*Noreturn function attribute.*
- **#define L4\_NOINSTRUMENT**  
*No instrumentation function attribute.*
- **#define L4\_LIKELY(x)**  
*Expression is likely to execute.*
- **#define L4\_UNLIKELY(x)**  
*Expression is unlikely to execute.*
- **#define L4\_STICKY(x)**  
*Mark symbol sticky (even not there).*
- **#define L4\_DEPRECATED(s)**  
*Mark symbol deprecated.*
- **#define L4\_stringify\_helper(x)**  
*stringify helper.*
- **#define L4\_stringify(x)**  
*stringify.*
- **#define L4\_CV**  
*Define calling convention.*
- **#define L4\_CV**  
*Define calling convention.*
- **#define L4\_CV**  
*Define calling convention.*
- **#define L4\_CV**  
*Define calling convention.*

## Functions

- unsigned long [l4\\_align\\_stack\\_for\\_direct\\_fncall](#) (unsigned long stack)  
*Specify the desired alignment of the stack pointer.*
- void [l4\\_barrier](#) (void)  
*Memory barrier.*
- void [l4\\_mb](#) (void)  
*Memory barrier.*
- void [l4\\_wmb](#) (void)  
*Write memory barrier.*
- [L4\\_NORETURN](#) void [l4\\_infinite\\_loop](#) (void)  
*Infinite loop.*

### 13.1.2.1 Detailed Description

[L4](#) standard macros for header files, function definitions, and public APIs etc.

#### Include File

```
#include <l4/sys/compiler.h>
```

### 13.1.2.2 Macro Definition Documentation

#### 13.1.2.2.1 L4\_EXPORT

```
#define L4_EXPORT
```

Attribute to mark functions, variables, and data types as being exported from a library.

All data types, functions, and global variables that shall be exported from a library shall be marked with this attribute. The default may become to hide everything that is not marked as `L4_EXPORT` from the users of a library and provide the possibility for aggressive optimization of all those internal functionality of a library.

#### Usage:

```
class L4_EXPORT My_class
{
    ...
};

int L4_EXPORT function(void);

int L4_EXPORT global_data; // global data is not recommended
```

Definition at line 214 of file [compiler.h](#).

Referenced by [l4io\\_iterate\\_devices\(\)](#), [l4io\\_lookup\\_device\(\)](#), [l4io\\_lookup\\_resource\(\)](#), [l4io\\_release\\_iomem\(\)](#), [l4io\\_release\\_ioport\(\)](#), [l4io\\_request\\_all\\_ioports\(\)](#), [l4io\\_request\\_icu\(\)](#), [l4io\\_request\\_iomem\(\)](#), [l4io\\_request\\_iomem\\_region\(\)](#), [l4io\\_request\\_ioport\(\)](#), [l4io\\_request\\_resource\\_iomem\(\)](#), [l4re\\_inhibitor\\_acquire\(\)](#), and [l4re\\_inhibitor\\_release\(\)](#).

### 13.1.2.2.2 L4\_HIDDEN

```
#define L4_HIDDEN
```

Attribute to mark functions, variables, and data types as being explicitly hidden from users of a library.

This attribute is intended for functions, data, and data types that shall never be visible outside of a library. In particular, for shared libraries this may result in much faster code within the library and short linking times.

```
class L4_HIDDEN My_class
{
    ...
};

int L4_HIDDEN function(void);

int L4_HIDDEN global_data; // global data is not recommended
```

Definition at line 211 of file [compiler.h](#).

### 13.1.2.2.3 L4\_NOTHROW

```
#define L4_NOTHROW
```

Mark a function declaration and definition as never throwing an exception.

(Also for C code).

This macro shall be used to mark C and C++ functions that never throw any exception. Note that also C functions may throw exceptions according to the compilers ABI and shall be marked with L4\_NOTHROW if they never do. In C++ this is equivalent to `throw()`.

```
int foo() L4_NOTHROW;
...
int foo() L4_NOTHROW
{
    ...
    return result;
}
```

Definition at line 161 of file [compiler.h](#).

### 13.1.2.3 Function Documentation

#### 13.1.2.3.1 l4\_align\_stack\_for\_direct\_fncall()

```
unsigned long l4_align_stack_for_direct_fncall (
    unsigned long stack) [inline]
```

Specify the desired alignment of the stack pointer.

**BIGGEST\_ALIGNMENT** provides the largest alignment ever used for any data type on the target machine. This is normally identical to desired stack alignment. Align stack pointer for directly invoked functions.

The stack needs to be aligned to `L4_STACK_ALIGN` for being able to access certain data on the stack. On x86/AMD64, a function call is performed using the 'call' instruction decrementing the stack pointer and writing the return address onto the stack. The called function considers this when adapting the stack pointer after function entry. If the called function was not invoked by a 'call' instruction, the stack pointer is actually off by a machine word leading to stack alignment issues when executing SSE instructions.

This function fixes the stack pointer for directly invoked functions. For architectures not automatically pushing the stack pointer during a function call, just enforce the `L4_STACK_ALIGN` alignment.

Definition at line 278 of file [compiler.h](#).

References [L4\\_INLINE](#).

### 13.1.2.3.2 l4\_infinite\_loop()

```
L4_NORETURN void l4_infinite_loop (
    void ) [inline]
```

Infinite loop.

Will never return. Use [l4\\_sleep\\_forever\(\)](#) if at all possible.

Definition at line 352 of file [compiler.h](#).

References [l4\\_barrier\(\)](#), [L4\\_INLINE](#), and [L4\\_NORETURN](#).

Here is the call graph for this function:

### 13.1.3 Fiasco extensions

Extensions of the Fiasco [L4](#) implementation.

*Return the offset of the entry in the GDT.*

### 13.1.3.1 Detailed Description

Extensions of the Fiasco [L4](#) implementation.

### 13.1.3.2 Function Documentation

#### 13.1.3.2.1 fiasco\_gdt\_get\_entry\_offset()

```
unsigned fiasco_gdt_get_entry_offset (
    l4_cap_idx_t thread,
    l4_utcb_t * utcb) [inline]
```

Return the offset of the entry in the GDT.

##### Parameters

<i>thread</i>	Thread to get info from.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

Definition at line 166 of file [segment.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_THREAD](#), and [L4\\_THREAD\\_X86\\_GDT\\_OP](#).

Here is the call graph for this function:

#### 13.1.3.2.2 fiasco\_gdt\_set()

```
long fiasco_gdt_set (
    l4_cap_idx_t thread,
    void * desc,
    unsigned int size,
    unsigned int entry_number_start,
    l4_utcb_t * utcb) [inline]
```

Set GDT segment descriptors.

Fiasco supports 4 consecutive entries, starting at the value returned by [fiasco\\_gdt\\_get\\_entry\\_offset\(\)](#).

##### Parameters

<i>thread</i>	Thread to set the GDT entry for.
<i>desc</i>	Pointer to GDT descriptors.

<i>size</i>	Size of the descriptors in bytes (multiple of 8).
<i>entry_number_start</i>	Entry number to start (valid values: 0-3).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

### Return values

<i>&lt;0</i>	At least one provided GDT descriptor is considered unsafe by the kernel, and not all selected GDT descriptors have been updated.
<i>L4_EOK</i>	Success.

Definition at line 220 of file [segment.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_THREAD](#), and [L4\\_THREAD\\_X86\\_GDT\\_OP](#).

Here is the call graph for this function:

### 13.1.3.2.3 fiasco\_ldt\_set()

```

long fiasco_ldt_set (
    l4_cap_idx_t task,
    void * ldt,
    unsigned int num_desc,
    unsigned int entry_number_start,
    l4_utcb_t * utcb) [inline]

```

Set LDT segments descriptors.

### Parameters

<i>task</i>	Task to set the segment for.
<i>ldt</i>	Pointer to LDT hardware descriptors.
<i>num_desc</i>	Number of descriptors.
<i>entry_number_start</i>	Entry number to start.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Return values**

<code>-L4_ENOSYS</code>	The kernel configuration doesn't support this feature.
<code>-L4_EINVAL</code>	Invalid descriptor or invalid entry number.
<code>L4_EOK</code>	Success.

**Note**

This feature is not available if the kernel is configured with page table isolation.

Definition at line 153 of file [segment.h](#).

References [L4\\_EINVAL](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_TASK](#), [L4\\_TASK\\_LDT\\_SET\\_X86\\_OP](#), [L4\\_TASK\\_LDT\\_X86\\_ENTRY\\_SIZE](#), and [L4\\_TASK\\_LDT\\_X86\\_MAX\\_ENTRIES](#).

Here is the call graph for this function:

**13.1.3.3 Kernel Debugger**

Kernel debugger related functionality.

Collaboration diagram for Kernel Debugger:

**Files**

*Add loaded image information for a task.*

### 13.1.3.3.1 Detailed Description

Kernel debugger related functionality.

#### Attention

This API is subject to change!

This is a debugging facility, any call to any function might be invalid. Do not rely on it in any real code.

#### Include File

```
#include <l4/sys/debugger.h>
```

### 13.1.3.3.2 Function Documentation

#### 13.1.3.3.2.1 l4\_debugger\_add\_image\_info()

```
l4_msgtag_t l4_debugger_add_image_info (
    l4_cap_idx_t cap,
    l4_addr_t base,
    const char * name) [inline]
```

Add loaded image information for a task.

**Parameters**

<i>cap</i>	Capability which refers to the task object.
<i>base</i>	Load base address of image.
<i>name</i>	Image base name.

This is a debugging facility, the call might be invalid.

Definition at line 472 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.3.3.2.2 l4\_debugger\_get\_object\_name()**

```

l4_msgtag_t l4_debugger_get_object_name (
    l4_cap_idx_t cap,
    char * name,
    unsigned size) [inline]
  
```

Get name of a kernel object.

**Parameters**

	<i>cap</i>	Capability which refers to the kernel object.
out	<i>name</i>	<a href="#">Buffer</a> to copy the name into. The buffer must be allocated by the caller.
	<i>size</i>	Length of the <i>name</i> buffer.

**Returns**

Syscall return tag

Definition at line 465 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.3.3.2.3 l4\_debugger\_global\_id()

```
unsigned long l4_debugger_global_id (
    l4_cap_idx_t cap) [inline]
```

Get the globally unique ID of the object behind a capability.

##### Parameters

<i>cap</i>	Capability
------------	------------

##### Return values

<i>~0UL</i>	Capability is not valid.
<i>otherwise</i>	Global debugger id.

This is a debugging facility, the call might be invalid.

Definition at line 423 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.3.3.2.4 l4\_debugger\_kobj\_to\_id()

```
unsigned long l4_debugger_kobj_to_id (  
    l4_cap_idx_t cap,  
    l4_addr_t kobjp) [inline]
```

Get the globally unique ID of the object behind the kobject pointer.

##### Parameters

<i>cap</i>	Capability
<i>kobjp</i>	Kobject pointer

##### Return values

<i>~0UL</i>	The capability or the kobject pointer are invalid.
<i>otherwise</i>	The globally unique id.

This is a debugging facility, the call might be invalid.

Definition at line 429 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.3.3.2.5 l4\_debugger\_query\_log\_name()

```
l4_ret_t l4_debugger_query_log_name (  
    l4_cap_idx_t cap,  
    unsigned idx,  
    char * name,  
    unsigned namelen,  
    char * shortname,  
    unsigned shortnamelen) [inline]
```

Query the name of a log type given the ID.

**Parameters**

<i>cap</i>	Debugger capability.
<i>idx</i>	ID to query.
<i>name</i>	<a href="#">Buffer</a> to copy name to.
<i>namelen</i>	<a href="#">Buffer</a> length of name.
<i>shortname</i>	<a href="#">Buffer</a> to copy <code>shortname</code> to.
<i>shortnamelen</i>	<a href="#">Buffer</a> length of <code>shortname</code> .

**Return values**

<i>0</i>	Success
<i>&lt;0</i>	Error

This is a debugging facility, the call might be invalid.

Definition at line 442 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.3.3.2.6 l4\_debugger\_query\_log\_typeid()**

```

l4_ret_t l4_debugger_query_log_typeid (
    l4_cap_idx_t cap,
    const char * name,
    unsigned idx) [inline]
  
```

Query the log-id for a log type.

**Parameters**

<i>cap</i>	Debugger capability
<i>name</i>	Name to query for.
<i>idx</i>	Idx to start searching, start with 0

**Returns**

positive ID, or negative error code

This is a debugging facility, the call might be invalid.

Definition at line 435 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

**13.1.3.3.2.7 l4\_debugger\_query\_object\_name()**

```

l4_msgtag_t l4_debugger_query_object_name (
    l4_cap_idx_t cap,
    unsigned id,
    char * name,
    unsigned size) [inline]
  
```

Get name of the kernel object with Id *id*.

**Parameters**

	<i>cap</i>	Capability of the debugger object.
	<i>id</i>	Global id of the object whose name is asked.
out	<i>name</i>	<a href="#">Buffer</a> to copy the name into. The buffer must be allocated by the caller.
	<i>size</i>	Length of the <i>name</i> buffer.

**Returns**

Syscall return tag

Definition at line 458 of file [debugger.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

#### 13.1.3.4 Kernel Information Dump

Kernel information dumping related functionality.

Collaboration diagram for Kernel Information Dump:

Kernel information dumping related functionality.

Functions that dump various kernel internal information to the console. Probably only present in kernel debug builds.

##### Include File

```
#include <l4/sys/kdump.h>
```

### 13.1.3.5 Kernel Tracing

Kernel tracing related functionality.

Collaboration diagram for Kernel Tracing:

#### Functions

- `l4_umword_t fiasco_tbuf_log` (const char \*text)  
*Create new trace-buffer entry with describing <text>.*
- `l4_umword_t fiasco_tbuf_log_3val` (const char \*text, `l4_umword_t` v1, `l4_umword_t` v2, `l4_umword_t` v3)  
*Create new trace-buffer entry with describing <text> and three additional values.*
- `l4_umword_t fiasco_tbuf_log_binary` (const unsigned char \*data)  
*Create new trace-buffer entry with binary data.*
- void `fiasco_tbuf_clear` (void)  
*Clear trace-buffer.*
- void `fiasco_tbuf_dump` (void)  
*Dump trace-buffer to kernel console.*

#### 13.1.3.5.1 Detailed Description

Kernel tracing related functionality.

##### Attention

This API is subject to change!

This is a tracing facility for the Fiasco kernel trace buffer. Any call to any function might be invalid. Do not rely on it in any real code.

##### Include File

```
#include <l4/sys/ktrace.h>
```

### 13.1.3.5.2 Function Documentation

#### 13.1.3.5.2.1 fiasco\_tbuf\_log()

```
l4_umword_t fiasco_tbuf_log (
    const char * text) [inline]
```

Create new trace-buffer entry with describing <text>.

##### Parameters

<i>text</i>	Logging text
-------------	--------------

##### Returns

Pointer to trace-buffer entry

Definition at line 24 of file [\\_\\_ktrace-impl.h](#).

References [\\_\\_l4\\_kdebug\\_text\(\)](#), and [l4\\_error\(\)](#).

#### 13.1.3.5.2.2 fiasco\_tbuf\_log\_3val()

```
l4_umword_t fiasco_tbuf_log_3val (
    const char * text,
    l4_umword_t v1,
    l4_umword_t v2,
    l4_umword_t v3) [inline]
```

Create new trace-buffer entry with describing <text> and three additional values.

##### Parameters

<i>text</i>	Logging text
-------------	--------------

<i>v1</i>	first value
<i>v2</i>	second value
<i>v3</i>	third value

**Returns**

Pointer to trace-buffer entry

Definition at line 31 of file [\\_\\_ktrace-impl.h](#).

References [\\_\\_l4\\_kdebug\\_3\\_text\(\)](#), and [l4\\_error\(\)](#).

Here is the call graph for this function:

**13.1.3.5.2.3 fiasco\_tbuf\_log\_binary()**

```
l4_umword_t fiasco_tbuf_log_binary (
    const unsigned char * data) [inline]
```

Create new trace-buffer entry with binary data.

**Parameters**

<i>data</i>	binary data
-------------	-------------

**Returns**

Pointer to trace-buffer entry

Definition at line 54 of file [\\_\\_ktrace-impl.h](#).

References [\\_\\_l4\\_kdebug\\_text\(\)](#), and [l4\\_error\(\)](#).

*Test whether a given range is completely within an fpage.*

- unsigned char [l4\\_fpage\\_max\\_order](#) (unsigned char order, [l4\\_addr\\_t](#) addr, [l4\\_addr\\_t](#) min\_addr, [l4\\_addr\\_t](#) max\_addr, [l4\\_addr\\_t](#) hotspot=0)

*Determine maximum flexpage size of a region.*

- int [l4\\_is\\_fpage\\_valid](#) ([l4\\_fpage\\_t](#) fp) [L4\\_NOTHROW](#)

*Test if the flexpage is valid.*

#### 13.1.4.1 Detailed Description

Flexpage-related API.

A flexpage is a page with a variable size, that can describe memory, IO-Ports (IA32 only), and sets of kernel objects.

A flexpage describes an always size aligned region of an address space. The size is given in a log2 scale. This means the size in elements (bytes for memory, ports for IO-Ports, and capabilities for kernel objects) is always a power of two.

A flexpage also carries type and access right information for the described region. The type information selects the address space in which the flexpage is valid. Access rights have a meaning depending on the specific address space (type).

There exists a special type for defining *receive windows* or for the [l4\\_task\\_unmap\(\)](#) method, that can be used to describe all address spaces (all types) with a single flexpage.

##### Include File

```
#include <l4/sys/types.h>
```

#### 13.1.4.2 Enumeration Type Documentation

##### 13.1.4.2.1 anonymous enum

anonymous enum

Constants for flexpages.

##### Enumerator

<a href="#">L4_WHOLE_ADDRESS_SPACE</a>	Whole address space size. This value does not only specify the log2 size of the biggest possible memory flexpage. It can be also used as size for a special flexpage to define a flexpage which completely covers all spaces.
--	---

Definition at line 84 of file [\\_\\_l4\\_fpage.h](#).

### 13.1.4.2.2 anonymous enum

`anonymous enum`

Special constants for IO flexpages.

#### Enumerator

L4_WHOLE_IOADDRESS_SPACE	Whole I/O address space size. In contrast to <a href="#">L4_WHOLE_ADDRESS_SPACE</a> , this value forms the log2 size of the biggest possible I/O flexpage.
L4_IOPORT_MAX	Maximum I/O port address plus 1.

Definition at line 326 of file [\\_\\_l4\\_fpage.h](#).

### 13.1.4.2.3 L4\_cap\_fpage\_rights

`enum L4_cap_fpage_rights`

Object flexpage rights.

Capabilities are modified or transferred with map and unmap operations. For that, capabilities are wrapped into flexpage objects. The flexpage carries a set of rights the sender wants to hand over to the receiver along with the capability.

For the user only the 'S' and the 'W' right are visible. Other rights such as the 'D' right are internal to the corresponding kernel object and cannot be evaluated by the receiver.

Note that additional object attributes and permissions can be specified in a send item, see [Attributes and additional permissions for objects](#).

#### Note

A thread can also map a capability from its task's capability table with a reduced set of rights into another slot of its own capability table.

#### Enumerator

L4_CAP_FPAGE_W	Interface specific 'W' right for capability flexpages. The semantics of the 'W' right is defined by the protocol. For example in case of a dataspace cap, the 'W' right is needed to get a writable dataspace.
L4_CAP_FPAGE_S	Interface specific 'S' right for capability flexpages. The semantics of the 'S' right is defined by the interface. When transferring object capabilities via IPC, the kernel masks this right with the 'S' right of the capability used to address the IPC partner. Thus, the 'S' right of sent capabilities is only transferred if both the flexpage and the IPC gate or thread capability specifying the IPC partner have the 'S' right. For <a href="#">L4::Task::map()</a> , the 'S' right is only transferred if the flexpage, the source and destination task capabilities have the 'S' right.
L4_CAP_FPAGE_R	Read right for capability flexpages. This is always required, otherwise no capability is mapped.
L4_CAP_FPAGE_RO	Read right for capability flexpages. This is always required, otherwise no capability is mapped.

L4_CAP_FPAGE_D	Delete right for capability flexpages. This allows the receiver to delete the corresponding kernel object using <code>unmap()</code> regardless of other tasks still holding a capability to the kernel object. Such capabilities are set to an empty capability if the object is deleted.
L4_CAP_FPAGE_RW	Read and interface specific 'W' right for capability flexpages. The semantics of the 'W' right is defined by the interface.  See also <a href="#">L4_CAP_FPAGE_W</a>
L4_CAP_FPAGE_RS	Read and interface specific 'S' right for capability flexpages. The semantics of the 'S' right is defined by the interface.  See also <a href="#">L4_CAP_FPAGE_S</a>
L4_CAP_FPAGE_RWS	Read, interface specific 'W', and 'S' rights for capability flexpages. The semantics of the 'W' and 'S' right are defined by the interface.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_W</a> , and <a href="#">L4_CAP_FPAGE_S</a>
L4_CAP_FPAGE_RWSD	Full rights for capability flexpages.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_W</a> , <a href="#">L4_CAP_FPAGE_S</a> , and <a href="#">L4_CAP_FPAGE_D</a>
L4_CAP_FPAGE_RWD	Read, write, and delete right for capability flexpages.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_W</a> , and <a href="#">L4_CAP_FPAGE_D</a>
L4_CAP_FPAGE_RSD	Read, 'S', and delete right for capability flexpages.  See also <a href="#">L4_CAP_FPAGE_R</a> , <a href="#">L4_CAP_FPAGE_S</a> , and <a href="#">L4_CAP_FPAGE_D</a>

Definition at line 148 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.4.2.4 L4\_fpage\_consts

enum [L4\\_fpage\\_consts](#)

[L4](#) flexpage structure.

##### Enumerator

L4_FPAGE_RIGHTS_SHIFT	Access permissions shift.
L4_FPAGE_TYPE_SHIFT	Flexpage type shift (memory, IO port, obj...).

L4_FPAGE_SIZE_SHIFT	Flexpage size shift (log2-based).
L4_FPAGE_ADDR_SHIFT	Page address shift.
L4_FPAGE_RIGHTS_BITS	Access permissions size.
L4_FPAGE_TYPE_BITS	Flexpage type size (memory, IO port, obj...).
L4_FPAGE_SIZE_BITS	Flexpage size size (log2-based).
L4_FPAGE_ADDR_BITS	Page address size.
L4_FPAGE_RIGHTS_MASK	Mask to get the flexpage rights.
L4_FPAGE_RIGHTS_ALL	Specify as flexpage rights during grant.

Definition at line 48 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.4.2.5 L4\_fpage\_control

```
enum L4_fpage_control
```

Flexpage map control flags.

##### Enumerator

L4_FPAGE_CONTROL_OFFSET_SHIFT	Number of bits an index must be shifted or an address must be aligned to in the control word.
L4_FPAGE_CONTROL_MASK	Mask for truncating the lower bits of the send base or the index of the control word.

Definition at line 243 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.4.2.6 L4\_fpage\_rights

```
enum L4_fpage_rights
```

Memory and IO port flexpage rights.

For IO flexpages, bit 1 and bit 2 are a combined read/write right. In a map operation, the receiver receives the IO port capability when the sender possesses it and at least one of these bits is present. For an unmap operation, the absence of one of those bits is sufficient to unmap the IO port capability.

Note that more memory attributes can be specified in a send item, see [l4\\_fpage\\_cacheability\\_opt\\_t](#).

##### Enumerator

L4_FPAGE_X	Executable flexpage.
L4_FPAGE_W	Writable flexpage.
L4_FPAGE_RO	Read-only flexpage.
L4_FPAGE_RW	Read-write flexpage.

L4_FPAGE_RX	Read-execute flexpage.
L4_FPAGE_RWX	Read-write-execute flexpage.

Definition at line 118 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.4.2.7 L4\_fpage\_type

enum [L4\\_fpage\\_type](#)

Flexpage type.

##### Enumerator

L4_FPAGE_SPECIAL	Special flexpage, either <a href="#">l4_fpage_invalid()</a> or <a href="#">l4_fpage_all()</a> ; only supported by selected interfaces.
L4_FPAGE_MEMORY	Flexpage for memory spaces.
L4_FPAGE_IO	Flexpage for I/O port spaces.
L4_FPAGE_OBJ	Flexpage for object spaces.

Definition at line 230 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.4.3 Function Documentation

##### 13.1.4.3.1 l4\_fpage()

```
l4_fpage_t l4_fpage (
    l4_addr_t address,
    unsigned int order,
    unsigned char rights) [inline]
```

Create a memory flexpage.

##### Parameters

<i>address</i>	Flexpage start address
<i>order</i>	Flexpage size (log2), <a href="#">L4_WHOLE_ADDRESS_SPACE</a> to specify the whole address space (with address 0). The minimum log2 size of a memory flexpage is defined by <a href="#">L4_LOG2_PAGESIZE</a> according to the size of the smallest virtual page supported by the MMU.
<i>rights</i>	Access rights, see <a href="#">L4_fpage_rights</a>

**Returns**

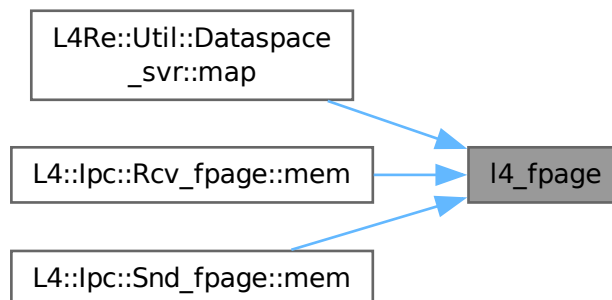

Memory flexpage

Definition at line 715 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_MEMORY](#), and [L4\\_NOTHROW](#).

Referenced by [L4Re::Util::Dataspace\\_svr::map\(\)](#), [L4::lpc::Rcv\\_fpage::mem\(\)](#), and [L4::lpc::Snd\\_fpage::mem\(\)](#).

Here is the caller graph for this function:

**13.1.4.3.2 l4\_fpage\_all()**

```
l4_fpage_t l4_fpage_all (
    void ) [inline]
```

Get a flexpage, describing all address spaces at once.

**Returns**

Special *all-spaces* flexpage.

**Note**

This flexpage can be used to define a receive window where the sender can send objects of any type, or for an unmap item completely covering all spaces of the target task. It does not make sense to use this flexpage as send item.

Definition at line 735 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_SPECIAL](#), [L4\\_NOTHROW](#), and [L4\\_WHOLE\\_ADDRESS\\_SPACE](#).

#### 13.1.4.3.3 l4\_fpage\_contains()

```
int l4_fpage_contains (
    l4_fpage_t fpage,
    l4_addr_t addr,
    unsigned order) [inline]
```

Test whether a given range is completely within an fpage.

##### Parameters

<i>fpage</i>	Flexpage
<i>addr</i>	Address
<i>order</i>	Size of range in log2.

##### Return values

<code>==0</code>	The range is not completely in the fpage.
<code>!=0</code>	The range is within the fpage.

Definition at line 767 of file [\\_\\_l4\\_fpage.h](#).

References [l4\\_fpage\\_memaddr\(\)](#), [l4\\_fpage\\_size\(\)](#), and [L4\\_NOTHROW](#).

Here is the call graph for this function:

#### 13.1.4.3.4 l4\_fpage\_invalid()

```
l4_fpage_t l4_fpage_invalid (
    void ) [inline]
```

Get an invalid flexpage.

##### Returns

Special *invalid* flexpage.

Definition at line 741 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_SPECIAL](#), and [L4\\_NOTHROW](#).

#### 13.1.4.3.5 l4\_fpage\_ioport()

```
unsigned long l4_fpage_ioport (
    l4_fpage_t f) [inline]
```

Return the IO port number from the IO flexpage.

##### Parameters

<i>f</i>	Flexpage
----------	----------

##### Returns

IO port number from the given IO flexpage.

##### Precondition

*f* must be an IO flexpage (`l4_fpage_type(f) == L4_FPAGE_IO`) and

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.

Definition at line 671 of file `__l4_fpage.h`.

References `L4_FPAGE_ADDR_SHIFT`, and `L4_NOTHROW`.

#### 13.1.4.3.6 l4\_fpage\_max\_order()

```
unsigned char l4_fpage_max_order (
    unsigned char order,
    l4_addr_t addr,
    l4_addr_t min_addr,
    l4_addr_t max_addr,
    l4_addr_t hotspot = 0) [inline]
```

Determine maximum flexpage size of a region.

##### Parameters

<i>order</i>	Order value to start with (e.g. for memory <code>L4_LOG2_PAGESIZE</code> would be used)
<i>addr</i>	Address to be covered by the flexpage.
<i>min_addr</i>	Start of region / minimal address (including).
<i>max_addr</i>	End of region / maximal address (excluding).
<i>hotspot</i>	(Optional) hot spot.

##### Returns

Maximum order (log2-size) possible.

**Note**

The start address of the flexpage can be determined with `l4_trunc_size(addr, returnvalue)`

Definition at line 775 of file `__l4_fpage.h`.

References `l4_trunc_size()`.

Here is the call graph for this function:

**13.1.4.3.7 l4\_fpage\_memaddr()**

```
l4_addr_t l4_fpage_memaddr (
    l4_fpage_t f) [inline]
```

Return the memory address from the memory flexpage.

**Parameters**

<i>f</i>	Flexpage
----------	----------

**Returns**

Page address from the given memory flexpage.

**Precondition**

*f* must be a memory flexpage (`l4_fpage_type(f) == L4_FPAGE_MEMORY`).

The function does not enforce size alignment of the read memory address. The caller must ensure the input *fpage* is correct.

Definition at line 677 of file `__l4_fpage.h`.

References `L4_NOTHROW`.

Referenced by `l4_fpage_contains()`.

Here is the caller graph for this function:

#### 13.1.4.3.8 l4\_fpage\_obj()

```
l4_cap_idx_t l4_fpage_obj (
    l4_fpage_t f) [inline]
```

Return the capability index from the object flexpage.

##### Parameters

<i>f</i>	Flexpage
----------	----------

##### Returns

Capability index from the given object flexpage.

##### Precondition

*f* must be an object flexpage (`l4_fpage_type(f) == L4_FPAGE_OBJ`)

The function does not enforce size alignment of the read memory address. The caller must ensure the input fpage is correct.

Definition at line 683 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.4.3.9 l4\_fpage\_page()

```
unsigned long l4_fpage_page (
    l4_fpage_t f) [inline]
```

Return the page part from a flexpage.

##### Parameters

<i>f</i>	Flexpage
----------	----------

##### Returns

Page part of the given flexpage.

##### Note

The meaning of the page part depends on the flexpage type.

Definition at line 665 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_ADDR\\_SHIFT](#), and [L4\\_NOTHROW](#).

#### 13.1.4.3.10 l4\_fpage\_rights()

```
unsigned l4_fpage_rights (  
    l4_fpage_t f) [inline]
```

Return rights from a flexpage.

##### Parameters

<i>f</i>	Flexpage
----------	----------

##### Returns

Size part of the given flexpage.

Definition at line 647 of file `__l4_fpage.h`.

References `L4_FPAGE_RIGHTS_MASK`, `L4_FPAGE_RIGHTS_SHIFT`, and `L4_NOTHROW`.

Referenced by `l4_is_fpage_writable()`.

Here is the caller graph for this function:

#### 13.1.4.3.11 l4\_fpage\_set\_rights()

```
l4_fpage_t l4_fpage_set_rights (  
    l4_fpage_t src,  
    unsigned char new_rights) [inline]
```

Set new right in a flexpage.

##### Parameters

<i>src</i>	Flexpage
<i>new_rights</i>	New rights

**Returns**

Modified flexpage with new rights.

Definition at line 706 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_RIGHTS\\_MASK](#), [L4\\_FPAGE\\_RIGHTS\\_SHIFT](#), [L4\\_NOTHROW](#), and [l4\\_fpage\\_t::raw](#).

Referenced by [L4::lpc::Snd\\_fpage::io\(\)](#).

Here is the caller graph for this function:

**13.1.4.3.12 l4\_fpage\_size()**

```
unsigned l4_fpage_size (
    l4_fpage_t f) [inline]
```

Return size (log2) from a flexpage.

**Parameters**

<i>f</i>	Flexpage
----------	----------

**Returns**

Size part of the given flexpage.

**See also**

[l4\\_fpage\\_memaddr\(\)](#), [l4\\_fpage\\_obj\(\)](#), [l4\\_fpage\\_ioport\(\)](#)

Definition at line 659 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_SIZE\\_SHIFT](#), and [L4\\_NOTHROW](#).

Referenced by [l4\\_fpage\\_contains\(\)](#), and [l4\\_is\\_fpage\\_valid\(\)](#).

Here is the caller graph for this function:

#### 13.1.4.3.13 `l4_fpage_type()`

```
unsigned l4_fpage_type (
    l4_fpage_t f) [inline]
```

Return type from a flexpage.

##### Parameters

<i>f</i>	Flexpage
----------	----------

##### Returns

Type part of the given flexpage.

Definition at line 653 of file `__l4_fpage.h`.

References `L4_FPAGE_TYPE_SHIFT`, and `L4_NOTHROW`.

Referenced by `l4_is_fpage_valid()`.

Here is the caller graph for this function:

#### 13.1.4.3.14 l4\_iofpage()

```
l4_fpage_t l4_iofpage (
    unsigned long port,
    unsigned int order) [inline]
```

Create an IO-port flexpage.

##### Parameters

<i>port</i>	I/O-flexpage port base
<i>order</i>	I/O-flexpage size (log2), <a href="#">L4_WHOLE_IOADDRESS_SPACE</a> to specify the whole I/O address space (with <code>port 0</code> )

##### Returns

I/O flexpage

Definition at line 721 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_ADDR\\_SHIFT](#), [L4\\_FPAGE\\_IO](#), [L4\\_FPAGE\\_RW](#), and [L4\\_NOTHROW](#).

Referenced by [L4::lpc::Rcv\\_fpage::io\(\)](#), [L4::lpc::Snd\\_fpage::io\(\)](#), and [l4util\\_ioport\\_map\(\)](#).

Here is the caller graph for this function:

#### 13.1.4.3.15 l4\_is\_fpage\_valid()

```
int l4_is_fpage_valid (
    l4_fpage_t fp) [inline]
```

Test if the flexpage is valid.

**Parameters**

<i>fp</i>	Flexpage.
-----------	-----------

**Return values**

<i>!=0</i>	if flexpage is valid.
<i>==0</i>	if flexpage is not valid.

Definition at line 800 of file [\\_\\_l4\\_fpage.h](#).

References [l4\\_fpage\\_size\(\)](#), [L4\\_FPAGE\\_SPECIAL](#), [l4\\_fpage\\_type\(\)](#), and [L4\\_NOTHROW](#).

Here is the call graph for this function:

**13.1.4.3.16 l4\_is\_fpage\_writable()**

```
int l4_is_fpage_writable (
    l4_fpage_t fp) [inline]
```

Test if the flexpage is writable.

**Parameters**

<i>fp</i>	Flexpage.
-----------	-----------

**Return values**

<i>!=0</i>	if flexpage is writable.
<i>==0</i>	if flexpage is not writable.

Definition at line 748 of file [\\_\\_l4\\_fpage.h](#).

References [l4\\_fpage\\_rights\(\)](#), [L4\\_FPAGE\\_W](#), and [L4\\_NOTHROW](#).

Here is the call graph for this function:

### 13.1.4.3.17 l4\_obj\_fpage()

```

l4_fpage_t l4_obj_fpage (
    l4_cap_idx_t obj,
    unsigned int order,
    unsigned char rights) [inline]
  
```

Create a kernel-object flexpage.

#### Parameters

<i>obj</i>	Base capability selector.
<i>order</i>	Log2 size (number of capabilities).
<i>rights</i>	Access rights, see <a href="#">L4_cap_fpage_rights</a>

#### Returns

Flexpage for a set of kernel objects.

#### Note

[L4\\_CAP\\_FPAGE\\_R](#) is always required, otherwise no capability is mapped.

#### Examples

[examples/sys/utcb-ipc/main.c](#).

Definition at line 727 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_CAP\\_SHIFT](#), [L4\\_FPAGE\\_ADDR\\_SHIFT](#), [L4\\_FPAGE\\_OBJ](#), and [L4\\_NOTHROW](#).

Referenced by [L4::Cap\\_base::fpage\(\)](#), [l4\\_icu\\_bind\\_u\(\)](#), [l4\\_icu\\_unbind\\_u\(\)](#), [l4\\_irq\\_bind\\_vcpu\\_u\(\)](#), [L4::lpc::Rcv\\_fpage::obj\(\)](#), and [L4::lpc::Snd\\_fpage::obj\(\)](#).

Here is the caller graph for this function:

### 13.1.5 C++ IPC Interface Definition

APIs for defining IPC interfaces using C++ as language.

Collaboration diagram for C++ IPC Interface Definition:

#### Topics

- Internal•Helpers . . . . . 192

#### Namespaces

- namespace [L4::Typeid](#)  
Definition of interface data-type helpers.

#### 13.1.5.1 Detailed Description

APIs for defining IPC interfaces using C++ as language.

### 13.1.5.2 Internal Helpers

Collaboration diagram for Internal Helpers:

## Data Structures

- struct `L4::Types::Bool< V >`  
*Boolean meta type.*
- struct `L4::Types::False`  
*False meta value.*
- struct `L4::Types::True`  
*True meta value.*
- struct `L4::Types::Same< A, B >`  
*Compare two data types for equality.*

### 13.1.5.2.1 Detailed Description

## 13.1.6 Cache Consistency

Various functions for cache consistency.

Collaboration diagram for Cache Consistency:

## Functions

- `L4_BEGIN_DECLS` `int l4_cache_clean_data` (unsigned long start, unsigned long end) `L4_NOTHROW`  
*Cache clean a range in D-cache; writes back to PoC.*
- `int l4_cache_flush_data` (unsigned long start, unsigned long end) `L4_NOTHROW`  
*Cache flush a range; writes back to PoC.*
- `int l4_cache_inv_data` (unsigned long start, unsigned long end) `L4_NOTHROW`  
*Cache invalidate a range; might write back to PoC.*
- `int l4_cache_coherent` (unsigned long start, unsigned long end) `L4_NOTHROW`  
*Make memory coherent between I-cache and D-cache; writes back to PoU.*
- `int l4_cache_dma_coherent` (unsigned long start, unsigned long end) `L4_NOTHROW`  
*Make memory coherent for use with external memory; writes back to PoC.*
- `int l4_cache_dma_coherent_full` (void) `L4_NOTHROW`  
*Make memory coherent for use with external memory; writes back to PoC.*

### 13.1.6.1 Detailed Description

Various functions for cache consistency.

These functions shall be used to ensure that

- all blocks (e.g. CPU cores, devices, DMA engines) are guaranteed to see the same copy of a memory location (Point of Coherency – PoC),
- instruction and data caches of a core are guaranteed to see the same copy of a memory location (Point of Unification – PoU).

Certain functions are NOPs on certain architectures, for example on Intel it's not necessary to explicitly make caches coherent to PoU.

### 13.1.6.2 Function Documentation

#### 13.1.6.2.1 `l4_cache_clean_data()`

```
L4_BEGIN_DECLS
int l4_cache_clean_data (
    unsigned long start,
    unsigned long end) [inline]
```

Cache clean a range in D-cache; writes back to PoC.

#### Parameters

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

#### Return values

---

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Writes back any dirty cache lines in the range but leaves them in the cache and marks the cached copies clean.

#### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#).

Definition at line 68 of file [cache.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.6.2.2 l4\_cache\_coherent()

```
int l4_cache_coherent (
    unsigned long start,
    unsigned long end) [inline]
```

Make memory coherent between I-cache and D-cache; writes back to PoU.

#### Parameters

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

#### Return values

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Definition at line 92 of file [cache.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.6.2.3 l4\_cache\_dma\_coherent()

```
int l4_cache_dma_coherent (
    unsigned long start,
    unsigned long end) [inline]
```

Make memory coherent for use with external memory; writes back to PoC.

#### Parameters

---

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

#### Return values

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Definition at line 100 of file [cache.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.6.2.4 l4\_cache\_flush\_data()

```
int l4_cache_flush_data (  
    unsigned long start,  
    unsigned long end) [inline]
```

Cache flush a range; writes back to PoC.

#### Parameters

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

#### Return values

<i>0</i>	on success
<i>-EFAULT</i>	in the case of an unresolved page fault in the given area

Writes back any dirty cache lines and invalidates all cache entries in the range.

Definition at line 76 of file [cache.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.6.2.5 l4\_cache\_inv\_data()

```
int l4_cache_inv_data (  
    unsigned long start,  
    unsigned long end) [inline]
```

Cache invalidate a range; might write back to PoC.

**Parameters**

<i>start</i>	Start of range (inclusive)
<i>end</i>	End of range (exclusive)

**Return values**

0	on success
-EFAULT	in the case of an unresolved page fault in the given area

Invalidates all cache entries in the range but does not necessarily write back dirty cache lines.

**Note**

Implementations may choose to write back dirty lines nonetheless if this is more efficient.

Definition at line 84 of file [cache.h](#).

References [L4\\_NOTHROW](#).

**13.1.7 Memory related**

Memory related constants, data types and functions.

Collaboration diagram for Memory related:

**Macros**

- **#define L4\_PAGESIZE**  
*Minimal page size (in bytes).*
- **#define L4\_PAGEMASK**  
*Mask for the page number.*
- **#define L4\_LOG2\_PAGESIZE**  
*Number of bits used for page offset.*
- **#define L4\_SUPERPAGESIZE**  
*Size of a large page.*
- **#define L4\_SUPERPAGEMASK**  
*Mask for the number of a large page.*

- `#define L4_LOG2_SUPERPAGESIZE`  
*Number of bits used as offset for a large page.*
- `#define L4_INVALID_PTR ((void *)L4_INVALID_ADDR)`  
*Invalid address as pointer type.*
- `#define L4_PAGESHIFT 12`  
*Size of a page, log2-based.*
- `#define L4_SUPERPAGESHIFT 21`  
*Size of a large page, log2-based.*
- `#define L4_PAGESHIFT 12`  
*Size of a page, log2-based.*
- `#define L4_SUPERPAGESHIFT 21`  
*Size of a large page, log2-based.*
- `#define L4_PAGESHIFT 12`  
*Size of a page, log2-based.*
- `#define L4_SUPERPAGESHIFT 21`

*Round an address down to the next lower page boundary.*
- `l4_addr_t l4_trunc_size (l4_addr_t address, unsigned char bits)` `L4_NOTHROW`  
*Round an address down to the next lower flexpage with size bits.*
- `l4_addr_t l4_round_page (l4_addr_t address)` `L4_NOTHROW`  
*Round address up to the next page.*
- `l4_addr_t l4_round_size (l4_addr_t value, unsigned char bits)` `L4_NOTHROW`  
*Round value up to the next alignment with bits size.*
- unsigned `l4_bytes_to_mwords` (unsigned size) `L4_NOTHROW`  
*Determine how many machine words (`l4_umword_t`) are required to store a buffer of 'size' bytes.*

### 13.1.7.1 Detailed Description

Memory related constants, data types and functions.

### 13.1.7.2 Macro Definition Documentation

#### 13.1.7.2.1 L4\_LOG2\_PAGESIZE

```
#define L4_LOG2_PAGESIZE
```

Number of bits used for page offset.

Size of page in log2.

Definition at line 407 of file [consts.h](#).

Referenced by [L4Re::Dataspace::map\(\)](#), [L4Re::Dataspace::map\\_region\(\)](#), and [L4Re::Util::Dataspace\\_svr::page\\_shift\(\)](#).

#### 13.1.7.2.2 L4\_LOG2\_SUPERPAGESIZE

```
#define L4_LOG2_SUPERPAGESIZE
```

Number of bits used as offset for a large page.

Size of large page in log2

Definition at line 433 of file [consts.h](#).

#### 13.1.7.2.3 L4\_PAGEMASK

```
#define L4_PAGEMASK
```

Mask for the page number.

##### Note

The most significant bits are set.

Definition at line 398 of file [consts.h](#).

Referenced by [L4virtio::Driver::Device::driver\\_connect\(\)](#), [l4\\_round\\_page\(\)](#), and [l4\\_trunc\\_page\(\)](#).

#### 13.1.7.2.4 L4\_PAGESHIFT [1/3]

```
#define L4_PAGESHIFT 12
```

Size of a page, log2-based.

Size of a page log2-based.

Definition at line 24 of file [consts.h](#).

#### 13.1.7.2.5 L4\_PAGESHIFT [2/3]

```
#define L4_PAGESHIFT 12
```

Size of a page, log2-based.

Size of a page log2-based.

##### Examples

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c/ma+rm.c](#), [examples/libs/l4re/streammap/client.cc](#),  
and [examples/libs/l4re/streammap/server.cc](#).

[L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#).

#### 13.1.7.2.6 L4\_PAGESHIFT [3/3]

```
#define L4_PAGESHIFT 12
```

Size of a page, log2-based.

Size of a page log2-based.

Definition at line 26 of file [consts.h](#).

#### 13.1.7.2.7 L4\_SUPERPAGEMASK

```
#define L4_SUPERPAGEMASK
```

Mask for the number of a large page.

##### Note

The most significant bits are set.

Definition at line 425 of file [consts.h](#).

#### 13.1.7.2.8 L4\_SUPERPAGESHIFT [1/3]

```
#define L4_SUPERPAGESHIFT 21
```

Size of a large page, log2-based.

Size of a large page log2-based.

Definition at line 30 of file [consts.h](#).

**13.1.7.2.9 L4\_SUPERPAGESHIFT** [2/3]

```
#define L4_SUPERPAGESHIFT 21
```

Size of a large page, log2-based.

Size of a large page log2-based.

**Examples**

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), and [examples/libs/l4re/c/ma+rm.c](#).

Definition at line 31 of file [consts.h](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< No\\_custom\\_data >::Driver\\_mem\\_region\\_t\(\)](#).

**13.1.7.2.10 L4\_SUPERPAGESHIFT** [3/3]

```
#define L4_SUPERPAGESHIFT 21
```

Size of a large page, log2-based.

Size of a large page log2-based.

Definition at line 31 of file [consts.h](#).

**13.1.7.2.11 L4\_SUPERPAGESIZE**

```
#define L4_SUPERPAGESIZE
```

Size of a large page.

A large page is a *super page* on IA32 or a *section* on ARM.

Definition at line 416 of file [consts.h](#).

Referenced by [L4virtio::Driver::Device::driver\\_connect\(\)](#).

**13.1.7.3 Enumeration Type Documentation****13.1.7.3.1 l4\_addr\_consts\_t**

```
enum l4_addr_consts_t
```

Address related constants.

**Enumerator**

L4_INVALID_ADDR	Invalid address.
-----------------	------------------

Definition at line 501 of file [consts.h](#).

### 13.1.7.4 Function Documentation

#### 13.1.7.4.1 l4\_bytes\_to\_mwords()

```
unsigned l4_bytes_to_mwords (
    unsigned size) [inline]
```

Determine how many machine words ([l4\\_umword\\_t](#)) are required to store a buffer of 'size' bytes.

#### Parameters

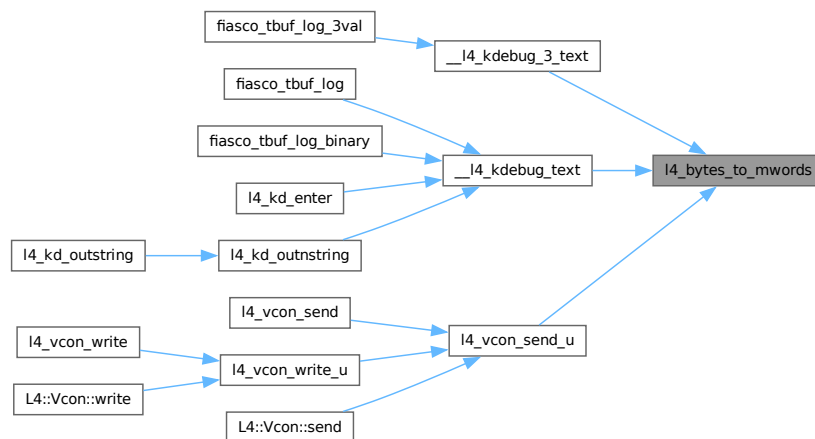

<i>size</i>	The number of bytes to be translated into machine words.
-------------	--

Definition at line 494 of file [consts.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

Referenced by [\\_\\_l4\\_kdebug\\_3\\_text\(\)](#), [\\_\\_l4\\_kdebug\\_text\(\)](#), and [l4\\_vcon\\_send\\_u\(\)](#).

Here is the caller graph for this function:

#### 13.1.7.4.2 l4\_round\_page()

```
l4_addr_t l4_round_page (
    l4_addr_t address) [inline]
```

Round address up to the next page.

The address is rounded up to the next minimal page boundary. On most architectures this is a 4k page. Check [L4\\_PAGESIZE](#) for the minimal page size.

##### Parameters

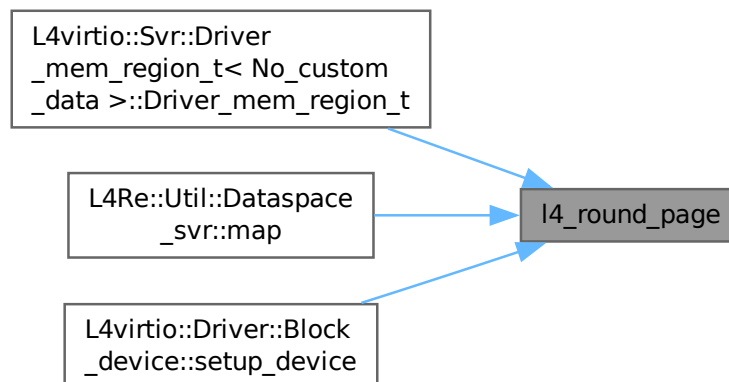

<i>address</i>	The address to round up.
----------------	--------------------------

Definition at line 471 of file [consts.h](#).

References [L4\\_INLINE](#), [L4\\_NOTHROW](#), [L4\\_PAGEMASK](#), and [L4\\_PAGESIZE](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< No\\_custom\\_data >::Driver\\_mem\\_region\\_t\(\)](#), [L4Re::Util::Dataspace\\_svr::map\(\)](#), and [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#).

Here is the caller graph for this function:

#### 13.1.7.4.3 l4\_round\_size()

```
l4_addr_t l4_round_size (
    l4_addr_t value,
    unsigned char bits) [inline]
```

Round value up to the next alignment with *bits* size.

**Parameters**

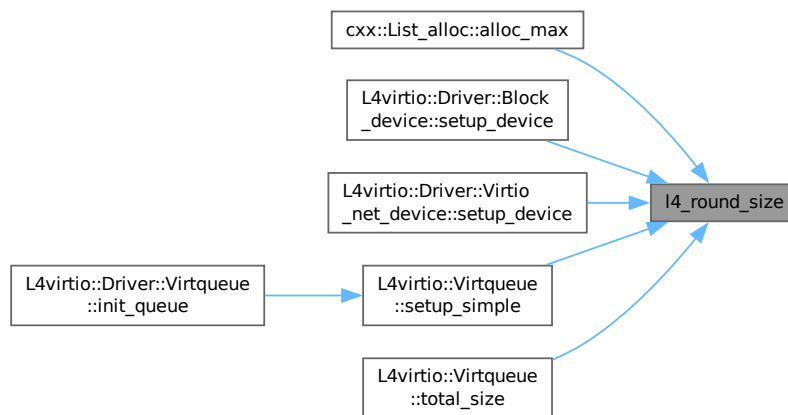

<i>value</i>	The value to round up to the next size-alignment.
<i>bits</i>	The size of the alignment (log2).

Definition at line 482 of file [consts.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

Referenced by [cxx::List\\_alloc::alloc\\_max\(\)](#), [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#), [L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#), [L4virtio::Virtqueue::setup\\_simple\(\)](#), and [L4virtio::Virtqueue::total\\_size\(\)](#).

Here is the caller graph for this function:

**13.1.7.4.4 l4\_trunc\_page()**

```
l4_addr_t l4_trunc_page (
    l4_addr_t address) [inline]
```

Round an address down to the next lower page boundary.

The address is rounded down to the next lower minimal page boundary. On most architectures this is a 4k page. Check [L4\\_PAGESIZE](#) for the minimal page size.

**Parameters**

<i>address</i>	The address to round.
----------------	-----------------------

**Examples**

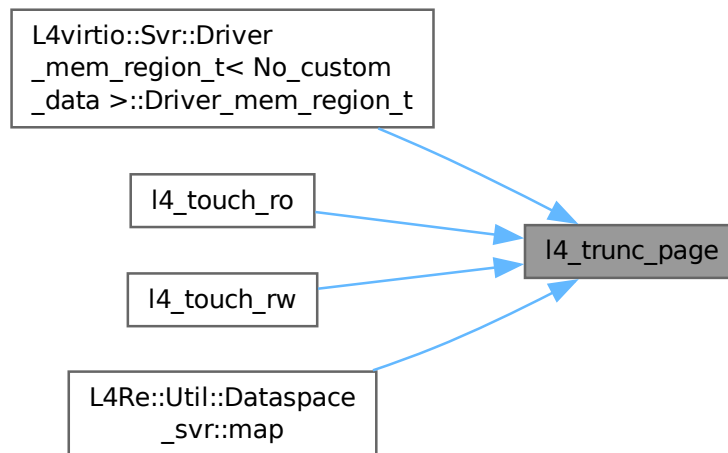

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), and [examples/libs/l4re/c/ma+rm.c](#).

Definition at line 446 of file [consts.h](#).

References [L4\\_INLINE](#), [L4\\_NOTHROW](#), and [L4\\_PAGEMASK](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< No\\_custom\\_data >::Driver\\_mem\\_region\\_t\(\)](#), [l4\\_touch\\_ro\(\)](#), [l4\\_touch\\_rw\(\)](#), and [L4Re::Util::Dataspace\\_svr::map\(\)](#).

Here is the caller graph for this function:

#### 13.1.7.4.5 l4\_trunc\_size()

```
l4_addr_t l4_trunc_size (
    l4_addr_t address,
    unsigned char bits) [inline]
```

Round an address down to the next lower flexpage with size *bits*.

##### Parameters

<i>address</i>	The address to round.
<i>bits</i>	The size of the flexpage (log2).

Definition at line 457 of file [consts.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

Referenced by [cxx::List\\_alloc::alloc\\_max\(\)](#), [l4\\_fpage\\_max\\_order\(\)](#), and [L4Re::Util::Dataspace\\_svr::map\(\)](#).

`L4_EIPC_HI` = 2000 + 0x1f }  
*L4 error codes.*

### 13.1.8.1 Detailed Description

Common error codes.

#### Include File

```
#include <l4/sys/err.h>
```

### 13.1.8.2 Enumeration Type Documentation

#### 13.1.8.2.1 l4\_error\_code\_t

```
enum l4_error_code_t
```

L4 error codes.

Those error codes are used by both the kernel and the user programs.

#### Enumerator

L4_EOK	Ok.
L4_EPERM	No permission.
L4_ENOENT	No such entity.
L4_EIO	I/O error.
L4_ENXIO	No such device or address.
L4_E2BIG	Argument value too big.
L4_EAGAIN	Try again.
L4_ENOMEM	No memory.
L4_EACCESS	Permission denied.
L4_EFAULT	Invalid memory address.
L4_EBUSY	Object currently busy, try later.
L4_EEXIST	Already exists.
L4_ENODEV	No such thing.
L4_ENOTDIR	Not a directory.
L4_EINVAL	Invalid argument.
L4_ENOSPC	No space left on device.
L4_ERANGE	Range error.
L4_ENAMETOOLONG	Name too long.
L4_ENOSYS	No sys.
L4_EBADPROTO	Unsupported protocol.
L4_EADDRNOTAVAIL	Address not available.
L4_ERRNOMAX	Maximum error value.
L4_ENOREPLY	No reply.
L4_EMMSGTOOSHORT	Message too short.

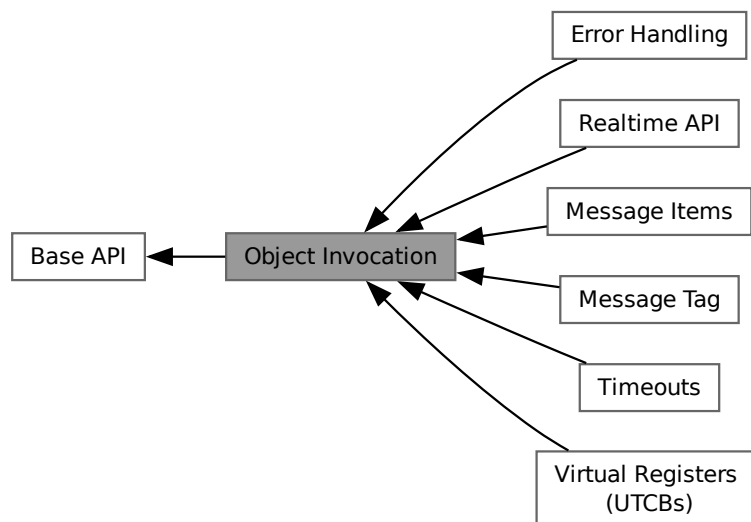

L4_MSGTOOLONG	Message too long.
L4_MSGMISSARG	Message has invalid capability.
L4_MSGERRRANGE	Error code range error.
L4_EIPC_LO	Communication error-range low.
L4_EIPC_HI	Communication error-range high.

*Add a flexpage to be sent to the UTCB.*

### 13.1.9.1 Detailed Description

API for [L4](#) object invocation.

#### Include File

```
#include <l4/sys/ipc.h>
```

General abstractions for [L4](#) object invocation. The basic principle is that all objects are denoted by a capability that is accessed via a capability selector (see [Capabilities](#)).

This set of functions is common to all kinds of objects provided by the [L4](#) micro kernel. The concrete semantics of an invocation depends on the object that shall be invoked.

Objects may be invoked in various ways, the most common way is to use a *call* operation ([l4\\_ipc\\_call\(\)](#)). However, there are a lot more flavours available that have a semantics depending on the object.

#### See also

[IPC-Gate API](#)

[L4 Inter-Process Communication \(IPC\)](#)

### 13.1.9.2 Timeouts during IPC

IPC operation between two communication partners may consist of up to two phases (send phase and receive phase). For both phases, a timeout may be specified (send timeout and receive timeout).

#### Note

When IPC communication happens across CPU cores and a timeout is specified, then the counting of the timeout only begins after the target thread has been scheduled at least once. In particular, this means that an IPC timeout, including a timeout of zero, may be delayed depending on the scheduling on the target CPU core. If a higher priority thread on the target core is executing a busy loop, that delay may even be indefinitely.

#### See also

[Timeouts](#)

### 13.1.9.3 Macro Definition Documentation

#### 13.1.9.3.1 L4\_SYSF\_NONE

```
#define L4_SYSF_NONE
```

Capability selector flags.

These flags determine the concrete operation when a kernel object is invoked.

The following combinations of flags are supported when invoking IPC (see [l4\\_ipc\(\)](#)); with other combinations, behavior is undefined:

- [L4\\_SYSF\\_SEND](#): send to specified partner
- [L4\\_SYSF\\_RECV](#): receive from specified partner
- [L4\\_SYSF\\_RECV](#) | [L4\\_SYSF\\_OPEN\\_WAIT](#): receive from any sending partner; see [L4\\_SYSF\\_WAIT](#)
- [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#): call specified partner; see [L4\\_SYSF\\_CALL](#)
- [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#) | [L4\\_SYSF\\_OPEN\\_WAIT](#): send to specified partner and receive from any sending partner; see [L4\\_SYSF\\_SEND\\_AND\\_WAIT](#)
- [L4\\_SYSF\\_REPLY](#) | [L4\\_SYSF\\_SEND](#): reply to caller
- [L4\\_SYSF\\_REPLY](#) | [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#): call the caller
- [L4\\_SYSF\\_REPLY](#) | [L4\\_SYSF\\_SEND](#) | [L4\\_SYSF\\_RECV](#) | [L4\\_SYSF\\_OPEN\\_WAIT](#): reply to caller and receive from any sending partner; see [L4\\_SYSF\\_REPLY\\_AND\\_WAIT](#) Empty set of flags.

Definition at line 55 of file [consts.h](#).

### 13.1.9.4 Function Documentation

#### 13.1.9.4.1 [l4\\_ipc\(\)](#)

```
l4_msgtag_t l4_ipc (
    l4_cap_idx_t dest,
    l4_utcb_t * utcb,
    l4_umword_t flags,
    l4_umword_t slabel,
    l4_msgtag_t tag,
    l4_umword_t * rlabel,
    l4_timeout_t timeout) [inline]
```

Generic [L4](#) object invocation.

#### Parameters

	<i>dest</i>	Destination object. <a href="#">L4_INVALID_CAP</a> denotes the current thread. An IPC to the current thread will always abort after the specified timeout and can be used for sleeping without busy waiting.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>flags</i>	Invocation flags (see <a href="#">L4_SYSF_NONE</a> ).
	<i>slabel</i>	Send label if applicable (may be seen by the receiver).
	<i>tag</i>	Sending message tag.
out	<i>rlabel</i>	Receiving label.
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ).

#### Returns

return tag

### 13.1.9.4.2 l4\_ipc\_call()

```
l4_msgtag_t l4_ipc_call (
    l4_cap_idx_t object,
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_timeout_t timeout) [inline]
```

Object call (usual invocation).

#### Parameters

<i>object</i>	Capability selector for the object to call. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread and will abort the IPC after the time specified in the <code>snd</code> part of the <code>timeout</code> parameter has expired.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
<i>tag</i>	Message tag to describe the message to be sent.
<i>timeout</i>	Timeout pair for send an receive phase (see <a href="#">l4_timeout_t</a> ).

#### Returns

result tag

A message is sent to the object and the invoker waits for a reply from the object. Messages from other sources are not accepted.

#### Note

The send-to-receive transition needs no time, the object can reply with a send timeout of zero.

If a finite receive timeout is specified, the IPC receive operation could abort before the partner was able to send the reply message. Under certain circumstances the partner may still have the temporary reply capability to the calling thread and may use this capability to reply to the caller at a later, unexpected time specifying an arbitrary IPC label. This case is relevant for servers which call another, possibly untrusted, server while serving a client request.

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.9.4.3 l4\_ipc\_receive()

```
l4_msgtag_t l4_ipc_receive (
    l4_cap_idx_t object,
    l4_utcb_t * utcb,
    l4_timeout_t timeout) [inline]
```

Wait for a message from a specific source.

### Parameters

<i>object</i>	Thread or IRQ object to receive a message from. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread. This can be used for sleeping without busy waiting for the time specified in the <code>rcv</code> part of the <code>timeout</code> parameter.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> , only the receive part matters).

### Returns

result tag.

This operation waits for a message from the specified object. Messages from other sources are not accepted by this operation. The operation does not include a send phase, this means no message is sent to the object. See [l4\\_ipc\\_wait\(\)](#) for general message receiving.

### Note

This operation is used to receive messages from a specific IRQ or thread. Receiving from IPC gates or any other objects does not work. It is not common to use the receive-only IPC operation for normal client/server communication.

### See also

[L4 Inter-Process Communication \(IPC\)](#)

### Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Referenced by [l4\\_ipc\\_sleep\(\)](#), and [l4\\_thread\\_yield\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.9.4.4 l4\_ipc\_reply\_and\_wait()

```

l4_msgtag_t l4_ipc_reply_and_wait (
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_umword_t * label,
    l4_timeout_t timeout) [inline]
  
```

Reply and wait operation (uses the *reply* capability).

##### Parameters

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>tag</i>	Describes the message to be sent as reply.
out	<i>label</i>	Label assigned to the source object of the received message.
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ).

##### Returns

result tag

A message is sent to the previous caller using the implicit reply capability. Afterwards the invoking thread waits for a message from any source.

##### Note

This is the standard server operation: it sends a reply to the actual client and waits for the next incoming request, which may come from any other client.

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

[L4 Inter-Process Communication \(IPC\)](#)

Examples

[examples/sys/ipc/ipc\\_example.c](#).

Definition at line 576 of file [ipc.h](#).

References [L4\\_INVALID\\_CAP](#), [l4\\_ipc\(\)](#), [L4\\_NOTHROW](#), and [L4\\_SYSF\\_REPLY\\_AND\\_WAIT](#).

Referenced by [L4::ipc::loststream::reply\\_and\\_wait\(\)](#), and [L4::Server< LOOP\\_HOOKS >::reply\\_n\\_wait\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.9.4.5 l4\_ipc\_send()

```

l4_msgtag_t l4_ipc_send (
    l4_cap_idx_t dest,
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_timeout_t timeout) [inline]
  
```

Send a message to an object (do **not** wait for a reply).

**Parameters**

---

<i>dest</i>	Capability selector for the destination object. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread and could be used for sleeping without busy waiting for the time specified in the <code>snd</code> part of the <code>timeout</code> parameter.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
<i>tag</i>	Descriptor for the message to be sent.
<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ) only send part is relevant.

### Returns

Syscall return tag for the send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

A message is sent to the destination object. There is no receive phase included. The invoker continues working after sending the message.

### Note

This is a special-purpose message transfer. Objects usually support only invocation via [l4\\_ipc\\_call\(\)](#) consisting of a send phase and a receive phase for returning the result of the object invocation. For example, [l4\\_icu\\_unmask\(\)](#), [l4\\_icu\\_mask\(\)](#) and [l4\\_irq\\_trigger\(\)](#) use send-only IPC operations for object invocation.

### See also

[L4 Inter-Process Communication \(IPC\)](#)

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.9.4.6 l4\_ipc\_send\_and\_wait()

```

l4_msgtag_t l4_ipc_send_and_wait (
    l4_cap_idx_t dest,
    l4_utcb_t * utcb,
    l4_msgtag_t tag,
    l4_umword_t * label,
    l4_timeout_t timeout) [inline]

```

Send a message and do an open wait.

#### Parameters

	<i>dest</i>	Object to send a message to. A value of <a href="#">L4_INVALID_CAP</a> denotes the current thread and will abort the IPC after the time specified in the <code>snd</code> part of the <code>timeout</code> parameter has expired.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>tag</i>	Describes the message that shall be sent.
out	<i>label</i>	Label assigned to the source object of the receive phase.
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> ).

#### Returns

result tag

A message is sent to the destination object and the invoking thread waits for a reply from any source.

**Note**

This is a special-purpose operation and shall not be used in general applications.

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

    l4_utcb_t * utcb,
    l4_umword_t * label,
    l4_timeout_t timeout) [inline]
  
```

Wait for an incoming message from any possible sender.

#### Parameters

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
out	<i>label</i>	Label assigned to the source object (IPC gate or IRQ).
	<i>timeout</i>	Timeout pair (see <a href="#">l4_timeout_t</a> , only the receive part is used).

**Returns**

return tag

This operation does an open wait, and therefore needs no capability to denote the possible source of a message. This means the calling thread waits for an incoming message from any possible source. There is no send phase included in this operation.

The usual usage of this function is to call that function when entering a server loop in a user-level server that implements user-level objects, see also [l4\\_ipc\\_reply\\_and\\_wait\(\)](#).

**Note**

In case of multiple senders trying to send to the thread performing this system call, the thread receives from a sender with the highest priority. In this respect, IRQ sources have the highest priority 255.

#### 13.1.9.4.11 l4\_sndfpage\_add()

```
int l4_sndfpage_add (
    l4_fpage_t const snd_fpage,
    unsigned long snd_base,
    l4_msgtag_t * tag) [inline]
```

Add a flexpage to be sent to the UTCB.

##### Parameters

	<i>snd_fpage</i>	Flexpage.
	<i>snd_base</i>	Send base.
in, out	<i>tag</i>	Tag to be updated. Only the number of items is incremented in the updated tag, all other members remain unmodified.

##### Returns

0 on success, negative error code otherwise

##### See also

`L4_RCV_ITEM_FORWARD_MAPPINGS` = 1 , `L4_RCV_ITEM_SINGLE_CAP` = `L4_ITEM_MAP` | 2 ,  
`L4_RCV_ITEM_LOCAL_ID` = 4 }
- Cacheability options for memory send items.*
- Constants for message items.*

## Functions

- `l4_umword_t l4_map_control` (`l4_umword_t` spot, unsigned char cache, unsigned grant) `L4_NOTHROW`  
*Create the first word for a map item that is a send item for the memory space.*
- `l4_umword_t l4_map_obj_control` (`l4_umword_t` spot, unsigned grant) `L4_NOTHROW`  
*Create the first word for a map item that is a send item for the object space.*

### 13.1.9.5.1 Detailed Description

Message-item-related functionality.

Message items are typed items that are used for transferring capabilities during IPC. There are three sub-types of typed message items with variations in the layout:

1. Typed message items set by the sender in its message registers (MRs) of the UTCB for specifying what shall be sent.
2. Typed message items set by the receiver in its buffer registers (BRs) of the UTCB for specifying which types of capabilities may be received at which addresses.
3. Typed message items set by the kernel in the receiver's message registers (MRs) of the UTCB for providing information about the transfer to the receiver.

They are abbreviated by *send item*, *receive item*, and *return item*, respectively.

A typed message item in the message registers (case 1 and case 3) always consists of two words (even if it is a void item). The size of a typed message item in the buffer registers (case 2) is determined by its first word. The size is up to three words (see `L4_RCV_ITEM_SINGLE_CAP` and `L4_RCV_ITEM_FORWARD_MAPPINGS`). A void item in the buffer registers consists of a single word.

## Include File

```
#include <l4/sys/types.h>
```

### 13.1.9.5.2 Enumeration Type Documentation

#### 13.1.9.5.2.1 l4\_fpage\_cacheability\_opt\_t

```
enum l4_fpage_cacheability_opt_t
```

Cacheability options for memory send items.

Only the IPC sender and the thread performing the map operation can specify the caching mode of the target mapping. By default, the caching mode of the sender is used as caching mode for the target mapping. If `L4_FPAGE_CACHE_OPT` is set in the send item, the caching mode is overridden by the respective mode from below.

#### Enumerator

<code>L4_FPAGE_CACHE_OPT</code>	Enable the cacheability option in a memory send item. Without this flag, the options are copied from the sender.
<code>L4_FPAGE_CACHEABLE</code>	Cacheability option to enable caches for the mapping. Implies <a href="#">L4_FPAGE_CACHE_OPT</a> .
<code>L4_FPAGE_BUFFERABLE</code>	Cacheability option to enable buffered writes for the mapping. Implies <a href="#">L4_FPAGE_CACHE_OPT</a> .
<code>L4_FPAGE_UNCACHEABLE</code>	Cacheability option to disable caching for the mapping. Implies <a href="#">L4_FPAGE_CACHE_OPT</a> .

Definition at line 303 of file [\\_\\_l4\\_fpage.h](#).

#### 13.1.9.5.2.2 l4\_msg\_item\_consts\_t

```
enum l4_msg_item_consts_t
```

Constants for message items.

#### Enumerator

<code>L4_ITEM_MAP</code>	Identify a message item as <i>map item</i> .
<code>L4_ITEM_CONT</code>	Denote that the following item shall be put into the same receive item as this one.

L4_MAP_ITEM_GRANT	<p>Flag as <i>grant</i> instead of <i>map</i> operation. This means, the sender delegates access to the receiver and the kernel removes the rights from the sender (basically a move operation). The mapping in the receiver gets the new parent of any child mappings of the mapping of the sender. Rights revocation via send item/flexpage is <i>not</i> guaranteed to be applied to descendant mappings in case of grant. See <a href="#">Spaces and Mappings</a> for more details on map/grant.</p> <p><b>Note</b></p> <p>The grant operation is not performed if the resulting rights of the receiver mapping would not contain the <a href="#">L4_CAP_FPAGE_R</a> bit (for object capabilities) or none of the <a href="#">L4_FPAGE_RWX</a> bits (memory and IO ports). In that case, the mapping is not created in the receiver space and not removed from the sender space.</p> <p>If the removal of the whole mapping from the sender is not possible because the size of the mapped frame at the sender exceeds the size defined by the send or receive flexpage, the grant operation is turned into a regular map operation and the mapping is <i>not</i> removed from the sender. This would happen if, for example, a smaller part of an <a href="#">L4</a> superpage mapping shall be granted.</p>
L4_MAP_ITEM_MAP	Flag as usual <i>map</i> operation.
L4_RCV_ITEM_FORWARD_MAPPINGS	<p>This flag specifies if received capabilities shall be mapped to a particular task instead of the invoking task. This flag may be used only if <a href="#">L4_RCV_ITEM_LOCAL_ID</a> is unset.</p> <p>Setting this flag increases the size of the buffer item by one word. This word is used to specify a capability index for the task that shall receive the mappings.</p>
L4_RCV_ITEM_SINGLE_CAP	<p>Mark the receive buffer to be a small receive item that describes a buffer for a single object capability. A receive item needs to specify a <i>receive window</i>. The receive window determines which kind of capabilities (object, memory, I/O ports) may be received where in the respective space. If this flag is unset, the receive window is specified in the second word of the receive item via a <a href="#">flexpage</a>. If this flag is set, the receive window consists of a single capability index in the object space and the capability index is specified in the most significant bits of the first word of the receive item (see <a href="#">L4_CAP_SHIFT</a>).</p>

L4_RCV_ITEM_LOCAL_ID	<p>The receiver requests to receive a local ID instead of a mapping whenever possible. This flag may be used only if <a href="#">L4_RCV_ITEM_SINGLE_CAP</a> is set and <a href="#">L4_RCV_ITEM_FORWARD_MAPPINGS</a> is unset.</p> <p>When this flag is set, then,</p> <ul style="list-style-type: none"> <li>• when sender and receiver are bound to the same task, then no mapping is done for this item and just the raw flexpage (<a href="#">l4_fpage_t</a>) is transferred,</li> <li>• otherwise, when the sender specified an IPC gate for transfer that is bound to a thread that is bound to the same task as the receiving thread, then no mapping is done for this item and just the bitwise OR ( ) of the label and the <a href="#">L4_CAP_FPAGE_W</a> and <a href="#">L4_CAP_FPAGE_S</a> permissions that would have been mapped is transferred,</li> <li>• otherwise a regular mapping is done for this item.</li> </ul>
----------------------	---

Definition at line 210 of file [consts.h](#).

### 13.1.9.5.3 Function Documentation

#### 13.1.9.5.3.1 l4\_map\_control()

```
l4_umword_t l4_map_control (
    l4_umword_t spot,
    unsigned char cache,
    unsigned grant) [inline]
```

Create the first word for a map item that is a send item for the memory space.

#### Parameters

<i>spot</i>	Hot spot address, used to determine what is actually mapped when send and receive flexpage have differing sizes.
<i>cache</i>	Cacheability hints for memory flexpages. See <a href="#">Cacheability options</a> .
<i>grant</i>	Indicates if it is a map or a grant item. Allowed values: <a href="#">L4_MAP_ITEM_MAP</a> , <a href="#">L4_MAP_ITEM_GRANT</a> .

#### Returns

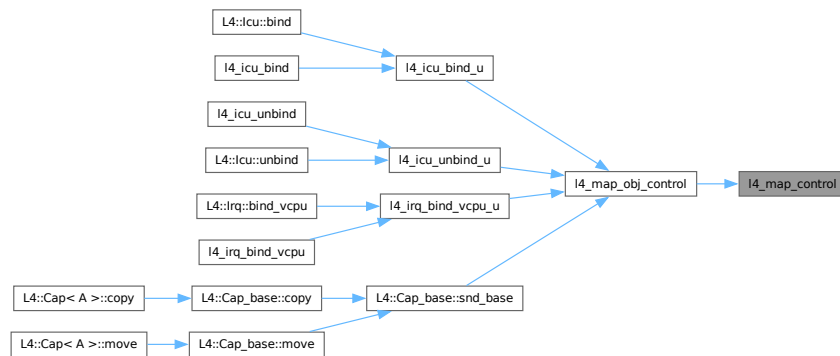

The value to be used as first word in a send item for memory.

Definition at line 754 of file [\\_\\_l4\\_fpage.h](#).

References [L4\\_FPAGE\\_CONTROL\\_MASK](#), [L4\\_ITEM\\_MAP](#), and [L4\\_NOTHROW](#).

Referenced by [l4\\_map\\_obj\\_control\(\)](#).

Here is the caller graph for this function:

### 13.1.9.5.3.2 l4\_map\_obj\_control()

```
l4_umword_t l4_map_obj_control (
    l4_umword_t spot,
    unsigned grant) [inline]
```

Create the first word for a map item that is a send item for the object space.

#### Parameters

<i>spot</i>	Hot spot address, used to determine what is actually mapped when send and receive flexpages have different size.
<i>grant</i>	Indicates if it is a map item or a grant item. Allowed values: <a href="#">L4_MAP_ITEM_MAP</a> , <a href="#">L4_MAP_ITEM_GRANT</a> .

#### Returns

The value to be used as first word in a send item for kernel objects or IO-ports.

Definition at line 761 of file [\\_\\_l4\\_fpage.h](#).

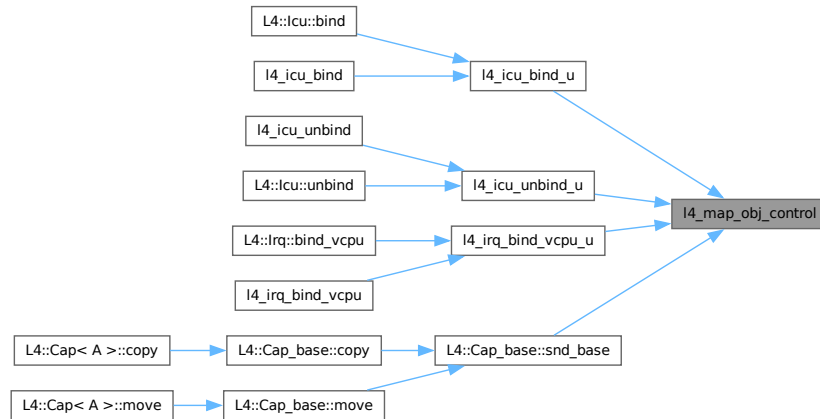

References [l4\\_map\\_control\(\)](#), and [L4\\_NOTHROW](#).

Referenced by [l4\\_icu\\_bind\\_u\(\)](#), [l4\\_icu\\_unbind\\_u\(\)](#), [l4\\_irq\\_bind\\_vcpu\\_u\(\)](#), and [L4::Cap\\_base::snd\\_base\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.9.5.4 Attributes and additional permissions for object send items

These rights need to be added to the `snd_base` when mapping and control internal behavior.

Collaboration diagram for Attributes and additional permissions for object send items:

#### Macros

- `#define L4_FPAGE_C_REF_CNT 0x00`  
*Mapping is reference-counted (default).*
- `#define L4_FPAGE_C_NO_REF_CNT 0x10`  
*Don't increase the reference counter.*
- `#define L4_FPAGE_C_OBJ_RIGHT1 0x20`  
*Object-type specific right.*
- `#define L4_FPAGE_C_OBJ_RIGHT2 0x40`  
*Object-type specific right.*
- `#define L4_FPAGE_C_OBJ_RIGHT3 0x80`  
*Object-type specific right.*
- `#define L4_FPAGE_C_OBJ_RIGHTS 0xe0`  
*All Object-type specific right bits.*
- `#define L4_FPAGE_C_IPCGATE_SVR L4_FPAGE_C_OBJ_RIGHT1`  
*The receiver may invoke IPC-gate-specific functions on the capability, for example, bind a thread to the gate and modify the label.*

#### 13.1.9.5.4.1 Detailed Description

These rights need to be added to the `snd_base` when mapping and control internal behavior.

The exact meaning depends on the type of capability (currently used only with IPC gates).

#### 13.1.9.5.4.2 Macro Definition Documentation

##### L4\_FPAGE\_C\_IPCGATE\_SVR

```
#define L4_FPAGE_C_IPCGATE_SVR L4_FPAGE_C_OBJ_RIGHT1
```

The receiver may invoke IPC-gate-specific functions on the capability, for example, bind a thread to the gate and modify the label.

Needed if the receiver implements the server side of an IPC gate.

Definition at line 288 of file `__l4_fpage.h`.

#### 13.1.9.6 Timeouts

All kinds of timeouts and time related functions.

Collaboration diagram for Timeouts:

#### Data Structures

- struct `l4_timeout_s`  
*Basic timeout specification.*
- union `l4_timeout_t`  
*Timeout pair.*

## Macros

- `#define L4_IPC_TIMEOUT_0 ((l4_timeout_s){0x0400})`  
*Timeout constants.*
- `#define L4_IPC_TIMEOUT_NEVER ((l4_timeout_s){0})`  
*never timeout*
- `#define L4_IPC_NEVER_INITIALIZER {0}`  
*never timeout, initializer*
- `#define L4_IPC_NEVER ((l4_timeout_t){0})`  
*never timeout*
- `#define L4_IPC_RECV_TIMEOUT_0 ((l4_timeout_t){0x00000400})`  
*0 receive timeout*
- `#define L4_IPC_SEND_TIMEOUT_0 ((l4_timeout_t){0x04000000})`  
*0 send timeout*
- `#define L4_IPC_BOTH_TIMEOUT_0 ((l4_timeout_t){0x04000400})`  
*0 receive and send timeout*
- `#define L4_TIMEOUT_US_NEVER (~0ULL)`  
*The waiting period in microseconds which is interpreted as "never" by l4\_timeout\_from\_us().*
- `#define L4_TIMEOUT_US_MAX ((1ULL << 41) - 1)`  
*The longest waiting period in microseconds accepted by l4\_timeout\_from\_us().*

## Typedefs

- `typedef struct l4_timeout_s l4_timeout_s`  
*Basic timeout specification.*
- `typedef union l4_timeout_t l4_timeout_t`  
*Timeout pair.*

## Functions

- `L4_CONSTEXPR l4_timeout_s l4_timeout_rel (unsigned man, unsigned exp) L4_NOTHROW`  
*Get relative timeout consisting of mantissa and exponent.*
- `L4_CONSTEXPR l4_timeout_t l4_ipc_timeout (unsigned snd_man, unsigned snd_exp, unsigned rcv_man, unsigned rcv_exp) L4_NOTHROW`  
*Convert explicit timeout values to l4\_timeout\_t type.*
- `L4_CONSTEXPR l4_timeout_t l4_timeout (l4_timeout_s snd, l4_timeout_s rcv) L4_NOTHROW`  
*Combine send and receive timeout in a timeout.*
- `L4_CONSTEXPR void l4_snd_timeout (l4_timeout_s snd, l4_timeout_t *to) L4_NOTHROW`  
*Set send timeout in given to timeout.*
- `L4_CONSTEXPR void l4_rcv_timeout (l4_timeout_s rcv, l4_timeout_t *to) L4_NOTHROW`  
*Set receive timeout in given to timeout.*
- `L4_CONSTEXPR l4_kernel_clock_t l4_timeout_rel_get (l4_timeout_s to) L4_NOTHROW`  
*Get clock value of out timeout.*
- `L4_CONSTEXPR unsigned l4_timeout_is_absolute (l4_timeout_s to) L4_NOTHROW`  
*Return whether the given timeout is absolute or not.*
- `L4_CONSTEXPR l4_kernel_clock_t l4_timeout_get (l4_kernel_clock_t cur, l4_timeout_s to) L4_NOTHROW`  
*Get clock value for a clock + a timeout.*
- `l4_timeout_s l4_timeout_abs (l4_kernel_clock_t pint, int br) L4_NOTHROW`  
*Set an absolute timeout.*
- `unsigned l4_utcb_mr64_idx (unsigned idx) L4_NOTHROW`  
*Get index into 64bit message registers alias from native-sized index.*

### 13.1.9.6.1 Detailed Description

All kinds of timeouts and time related functions.

### 13.1.9.6.2 Macro Definition Documentation

#### 13.1.9.6.2.1 L4\_IPC\_TIMEOUT\_0

```
#define L4_IPC_TIMEOUT_0 ((l4_timeout_s){0x0400})
```

Timeout constants.

0 timeout

Definition at line 73 of file [\\_\\_timeout.h](#).

Referenced by [L4::ipc\\_svr::Timeout\\_queue\\_hooks<HOOKS, BR\\_MAN>::timeout\(\)](#).

#### 13.1.9.6.2.2 L4\_TIMEOUT\_US\_MAX

```
#define L4_TIMEOUT_US_MAX ((1ULL << 41) - 1)
```

The longest waiting period in microseconds accepted by [l4\\_timeout\\_from\\_us\(\)](#).

See [l4\\_timeout\\_from\\_us\(\)](#) for an explanation.

Definition at line 91 of file [\\_\\_timeout.h](#).

### 13.1.9.6.3 Typedef Documentation

#### 13.1.9.6.3.1 l4\_timeout\_s

```
typedef struct l4_timeout_s l4_timeout_s
```

Basic timeout specification.

If bit 15 == 0, basically a floating point number with 10 bits mantissa and 5 bits exponent ( $t = m \cdot 2^e$ ).

If the mantissa is zero, the exponent encodes special values, see [L4\\_IPC\\_TIMEOUT\\_0](#) and [L4\\_IPC\\_TIMEOUT\\_NEVER](#).

If bit 15 == 1 the timeout is absolute and the lower 6 bits encode the index of the UTCB buffer register(s) holding the absolute 64-bit timeout value. On 32-bit systems, two consecutive UTCB buffer registers are used.

#### 13.1.9.6.3.2 l4\_timeout\_t

```
typedef union l4_timeout_t l4_timeout_t
```

Timeout pair.

For IPC there are usually a send and a receive timeout. So this structure contains a pair of timeouts.

#### 13.1.9.6.4 Function Documentation

##### 13.1.9.6.4.1 l4\_ipc\_timeout()

```
L4_CONSTEXPR l4_timeout_t l4_ipc_timeout (
    unsigned snd_man,
    unsigned snd_exp,
    unsigned rcv_man,
    unsigned rcv_exp) [inline]
```

Convert explicit timeout values to [l4\\_timeout\\_t](#) type.

##### Parameters

<i>snd_man</i>	Mantissa of send timeout.
<i>snd_exp</i>	Exponent of send timeout.
<i>rcv_man</i>	Mantissa of receive timeout.
<i>rcv_exp</i>	Exponent of receive timeout.

Definition at line 207 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#), and [l4\\_timeout\(\)](#).

Here is the call graph for this function:

##### 13.1.9.6.4.2 l4\_rcv\_timeout()

```
L4_CONSTEXPR void l4_rcv_timeout (
    l4_timeout_s rcv,
    l4_timeout_t * to) [inline]
```

Set receive timeout in given to timeout.

##### Parameters

	<i>rcv</i>	Receive timeout
<i>out</i>	<i>to</i>	<a href="#">L4 timeout</a>

Definition at line 231 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.9.6.4.3 l4\_snd\_timeout()

```
L4_CONSTEXPR void l4_snd_timeout (
    l4_timeout_s snd,
    l4_timeout_t * to) [inline]
```

Set send timeout in given to timeout.

##### Parameters

	<i>snd</i>	Send timeout
out	<i>to</i>	L4 timeout

Definition at line 224 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.9.6.4.4 l4\_timeout()

```
L4_CONSTEXPR l4_timeout_t l4_timeout (
    l4_timeout_s snd,
    l4_timeout_s rcv) [inline]
```

Combine send and receive timeout in a timeout.

##### Parameters

<i>snd</i>	Send timeout
<i>rcv</i>	Receive timeout

##### Returns

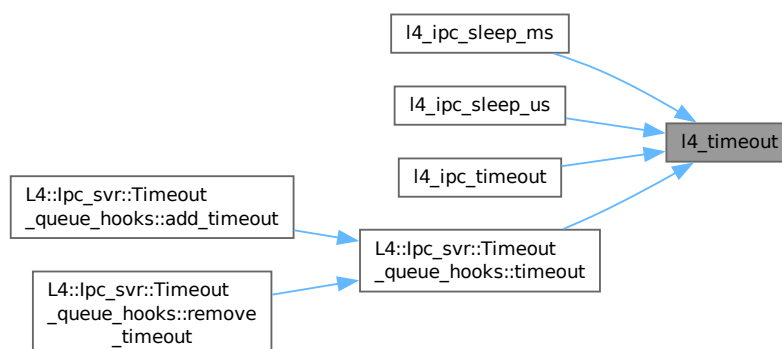

L4 timeout

Definition at line 217 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_ipc\\_sleep\\_ms\(\)](#), [l4\\_ipc\\_sleep\\_us\(\)](#), [l4\\_ipc\\_timeout\(\)](#), and [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN](#)

Here is the caller graph for this function:

#### 13.1.9.6.4.5 l4\_timeout\_abs()

```
l4_timeout_s l4_timeout_abs (
    l4_kernel_clock_t pint,
    int br) [inline]
```

Set an absolute timeout.

##### Parameters

<i>pint</i>	Point in time in clocks
<i>br</i>	The buffer register the timeout shall be placed in. (

##### Note

On 32bit architectures the timeout needs two consecutive buffers.)

The absolute timeout value will be placed into the buffer register *br* of the current thread.

##### Returns

timeout value

Definition at line 392 of file [utcb.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Referenced by [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >::timeout\(\)](#).

Here is the caller graph for this function:

#### 13.1.9.6.4.6 l4\_timeout\_get()

```
L4_CONSTEXPR l4_kernel_clock_t l4_timeout_get (  
    l4_kernel_clock_t cur,  
    l4_timeout_s to) [inline]
```

Get clock value for a clock + a timeout.

##### Parameters

<i>cur</i>	Clock value
<i>to</i>	L4 timeout

##### Returns

Clock sum

Definition at line 261 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#), [l4\\_timeout\\_is\\_absolute\(\)](#), and [l4\\_timeout\\_rel\\_get\(\)](#).

#### 13.1.9.6.4.7 l4\_timeout\_is\_absolute()

```
L4_CONSTEXPR unsigned l4_timeout_is_absolute (  
    l4_timeout_s to) [inline]
```

Return whether the given timeout is absolute or not.

##### Parameters

<i>to</i>	L4 timeout
-----------	------------

**Returns**

!= 0 if absolute, 0 if relative

Definition at line 254 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_timeout\\_get\(\)](#).

Here is the caller graph for this function:

**13.1.9.6.4.8 l4\_timeout\_rel()**

```
L4_CONSTEXPR l4_timeout_s l4_timeout_rel (  
    unsigned man,  
    unsigned exp) [inline]
```

Get relative timeout consisting of mantissa and exponent.

**Parameters**

<i>man</i>	Mantissa of timeout
<i>exp</i>	Exponent of timeout

**Returns**

timeout value

Definition at line 238 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.9.6.4.9 l4\_timeout\_rel\_get()

```
L4_CONSTEXPR l4_kernel_clock_t l4_timeout_rel_get (
    l4_timeout_s to) [inline]
```

Get clock value of out timeout.

##### Parameters

<i>to</i>	L4 timeout
-----------	------------

##### Returns

Clock value

Definition at line 245 of file [\\_\\_timeout.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_timeout\\_get\(\)](#).

Here is the caller graph for this function:

#### 13.1.9.6.4.10 l4\_utcb\_mr64\_idx()

```
unsigned l4_utcb_mr64_idx (
    unsigned idx) [inline]
```

Get index into 64bit message registers alias from native-sized index.

##### Parameters

<i>idx</i>	Index to native-sized message register
------------	--

**Returns**

Index to 64bit message register alias

Definition at line 395 of file [utcb.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

Referenced by [l4\\_icu\\_msi\\_info\\_u\(\)](#).

*Get the error condition of the last invocation from the TCR.*

### 13.1.9.7.1 Detailed Description

Error handling for [L4](#) object invocation.

#### Include File

```
#include <l4/sys/ipc.h>
```

### 13.1.9.7.2 Enumeration Type Documentation

#### 13.1.9.7.2.1 l4\_ipc\_tcr\_error\_t

```
enum l4_ipc_tcr_error_t
```

Error codes in the *error* TCR.

The error codes are accessible via the *error* TCR, see [l4\\_thread\\_regs\\_t.error](#).

#### Enumerator

<a href="#">L4_IPC_ERROR_MASK</a>	Mask for error bits.
<a href="#">L4_IPC_SND_ERR_MASK</a>	Send error mask.
<a href="#">L4_IPC_ENOT_EXISTENT</a>	Non-existing destination or source.
<a href="#">L4_IPC_RETIMEOUT</a>	Timeout during receive operation.
<a href="#">L4_IPC_SETIMEOUT</a>	Timeout during send operation.
<a href="#">L4_IPC_RECANCELED</a>	Receive operation canceled.
<a href="#">L4_IPC_SECANCELED</a>	Send operation canceled.
<a href="#">L4_IPC_REMAPFAILED</a>	Map flexpage failed in receive operation.
<a href="#">L4_IPC_SEMAPFAILED</a>	Map flexpage failed in send operation.
<a href="#">L4_IPC_RESNDPFTO</a>	Send-pagefault timeout in receive operation.
<a href="#">L4_IPC_SESNDPFTO</a>	Send-pagefault timeout in send operation.
<a href="#">L4_IPC_RERCVPFTO</a>	Receive-pagefault timeout in receive operation.

L4_IPC_SERCVPFTO	Receive-pagefault timeout in send operation.
L4_IPC_REABORTED	Receive operation aborted.
L4_IPC_SEABORTED	Send operation aborted.
L4_IPC_REMSGCUT	Received message truncated. Usually returned when the typed items to be sent by the IPC partner exceed the buffer registers of the respective types.
L4_IPC_SEMSGCUT	Sent message truncated. Usually returned when the typed items to be sent exceed the IPC partner's buffer registers of the respective types.

Definition at line 81 of file [ipc.h](#).

### 13.1.9.7.3 Function Documentation

#### 13.1.9.7.3.1 l4\_error()

```
l4_ret_t l4_error (
    l4_msgtag_t tag) [inline]
```

Get IPC error code if any or message tag label otherwise for an IPC call.

This function shall only be used if the IPC operation includes a receive phase (usually a call operation), otherwise no tag label is received and the return value of this function is undefined.

#### Parameters

<i>tag</i>	Message tag returned by the IPC call.
------------	---------------------------------------

#### Returns

In case of an IPC error, a negative error code in the range of [L4\\_EIPC\\_LO](#) to [L4\\_EIPC\\_HI](#) (see [l4\\_ipc\\_to\\_errno\(\)](#) and [l4\\_ipc\\_tcr\\_error\\_t](#)), otherwise the tag label. By convention, the callee can signal errors via a negative tag label (negated value from [l4\\_error\\_code\\_t](#)) and success via a non-negative value.

#### Examples

[examples/libs/l4re/streammap/client.cc](#), [examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/migrate/thread\\_migration.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.9.7.3.2 l4\_ipc\_error()

```

l4_umword_t l4_ipc_error (
    l4_msgtag_t tag,
    l4_utcb_t * utcb) [inline]
  
```

Get the IPC error code for an IPC operation.

### Parameters

<i>tag</i>	Message tag returned by the IPC operation.
<i>utcb</i>	UTCB that was used for the IPC operation.

### Returns

0 if no error condition is set, error code otherwise (see [l4\\_ipc\\_tcr\\_error\\_t](#)).

### Examples

[examples/sys/ipc/ipc\\_example.c](#), and [examples/sys/start-with-exc/main.c](#).

Definition at line 633 of file [ipc.h](#).

Here is the caller graph for this function:

#### 13.1.9.7.3.3 l4\_ipc\_error\_code()

```
int l4_ipc_error_code (  
    l4_utcb_t * utcb)    [inline]
```

Get the error condition of the last invocation from the TCR.

##### Precondition

`l4_msgtag_has_error(tag) == true`

##### Parameters

<i>utcb</i>	UTCB to check.
-------------	----------------

##### Returns

Error condition of type [l4\\_ipc\\_tcr\\_error\\_t](#).

Definition at line 662 of file [ipc.h](#).

References [L4\\_INLINE](#), [L4\\_IPC\\_ERROR\\_MASK](#), and [L4\\_NOTHROW](#).

#### 13.1.9.7.3.4 l4\_ipc\_is\_rcv\_error()

```
int l4_ipc_is_rcv_error (  
    l4_utcb_t * utcb)    [inline]
```

Returns whether an error occurred in receive phase of an invocation.

##### Precondition

`l4_msgtag_has_error(tag) == true`

##### Parameters

<i>utcb</i>	UTCB to check.
-------------	----------------

##### Returns

Boolean value.

Definition at line 659 of file [ipc.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

#### 13.1.9.7.3.5 l4\_ipc\_is\_snd\_error()

```
int l4_ipc_is_snd_error (  
    l4_utcb_t * utcb) [inline]
```

Returns whether an error occurred in send phase of an invocation.

##### Precondition

`l4_msgtag_has_error(tag) == true`

##### Parameters

<i>utcb</i>	UTCB to check.
-------------	----------------

##### Returns

Boolean value.

Definition at line 656 of file [ipc.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

*Create a message tag from the specified values.*

### 13.1.9.9.1 Detailed Description

API related to the message tag data type.

#### Include File

```
#include <l4/sys/types.h>
```

### 13.1.9.9.2 Enumeration Type Documentation

#### 13.1.9.9.2.1 L4\_msgtag\_flags

```
enum L4_msgtag_flags
```

Flags for message tags.

#### Enumerator

L4_MSGTAG_ERROR	Error indicator flag.
L4_MSGTAG_TRANSFER_FPU	Enable FPU transfer flag for IPC. By enabling this flag when sending IPC, the sender indicates that the contents of the FPU shall be transferred to the receiving thread. However, the receiver has to indicate its willingness to receive FPU context in its buffer descriptor register (BDR).
L4_MSGTAG_SCHEDULE	Enable schedule in IPC flag. Usually IPC operations donate the remaining time slice of a thread to the called thread. Enabling this flag when sending IPC does a real scheduling decision. However, this flag decreases IPC performance.
L4_MSGTAG_FLAGS	Mask for all flags.

Definition at line 100 of file [types.h](#).

#### 13.1.9.9.2.2 L4\_msgtag\_protocol

```
enum L4_msgtag_protocol
```

Message tag for IPC operations.

All predefined protocols used by the kernel.

#### Enumerator

L4_PROTO_NONE	Default protocol tag to reply to kernel.
L4_PROTO_ALLOW_SYSCALL	Allow an alien the system call.
L4_PROTO_PF_EXCEPTION	Make an exception out of a page fault.
L4_PROTO_IRQ	IRQ message.
L4_PROTO_PAGE_FAULT	Page fault message.

L4_PROTO_EXCEPTION	Exception.
L4_PROTO_SIGMA0	Sigma0 protocol.
L4_PROTO_IO_PAGE_FAULT	I/O page fault message.
L4_PROTO_THREAD_GROUP	Protocol for messages to a thread group obj.
L4_PROTO_KOBJECT	Protocol for messages to a generic kobject.
L4_PROTO_TASK	Protocol for messages to a task object.
L4_PROTO_THREAD	Protocol for messages to a thread object.
L4_PROTO_LOG	Protocol for messages to a log object.
L4_PROTO_SCHEDULER	Protocol for messages to a scheduler object.
L4_PROTO_FACTORY	Protocol for messages to a factory object.
L4_PROTO_VM	Protocol for messages to a virtual machine object.
L4_PROTO_DMA_SPACE	Protocol for (creating) kernel DMA space objects.
L4_PROTO_IRQ_SENDER	Protocol for IRQ senders (IRQ -> IPC).
L4_PROTO_SEMAPHORE	Protocol for semaphore objects.
L4_PROTO_META	Meta information protocol.
L4_PROTO_IOMMU	Protocol ID for IO-MMUs.
L4_PROTO_DEBUGGER	Protocol ID for the debugger.
L4_PROTO_SMCCC	Protocol ID for ARM SMCCC calls.
L4_PROTO_VCPU_CONTEXT	Protocol for hardware vCPU contexts.

Definition at line 52 of file [types.h](#).

#### 13.1.9.9.2.3 L4\_platform\_ctl\_proto

```
enum L4_platform_ctl_proto
```

Predefined protocol type for messages to platform-control objects.

##### Enumerator

L4_PROTO_PLATFORM_CTL	Protocol messages to a platform control object. See <a href="#">L4_platform_ctl_ops</a> for allowed operations.
-----------------------	---

Definition at line 174 of file [platform\\_control.h](#).

#### 13.1.9.9.3 Function Documentation

##### 13.1.9.9.3.1 l4\_msgtag()

```
l4_msgtag_t l4_msgtag (
    long label,
    unsigned words,
    unsigned items,
    unsigned flags) [inline]
```

Create a message tag from the specified values.

Message tag functions.

## Parameters

<i>label</i>	The user-defined label
<i>words</i>	The number of untyped words within the UTCB
<i>items</i>	The number of typed items (e.g., flexpages) within the UTCB
<i>flags</i>	The IPC flags for realtime and FPU extensions

## Returns

Message tag

## Examples

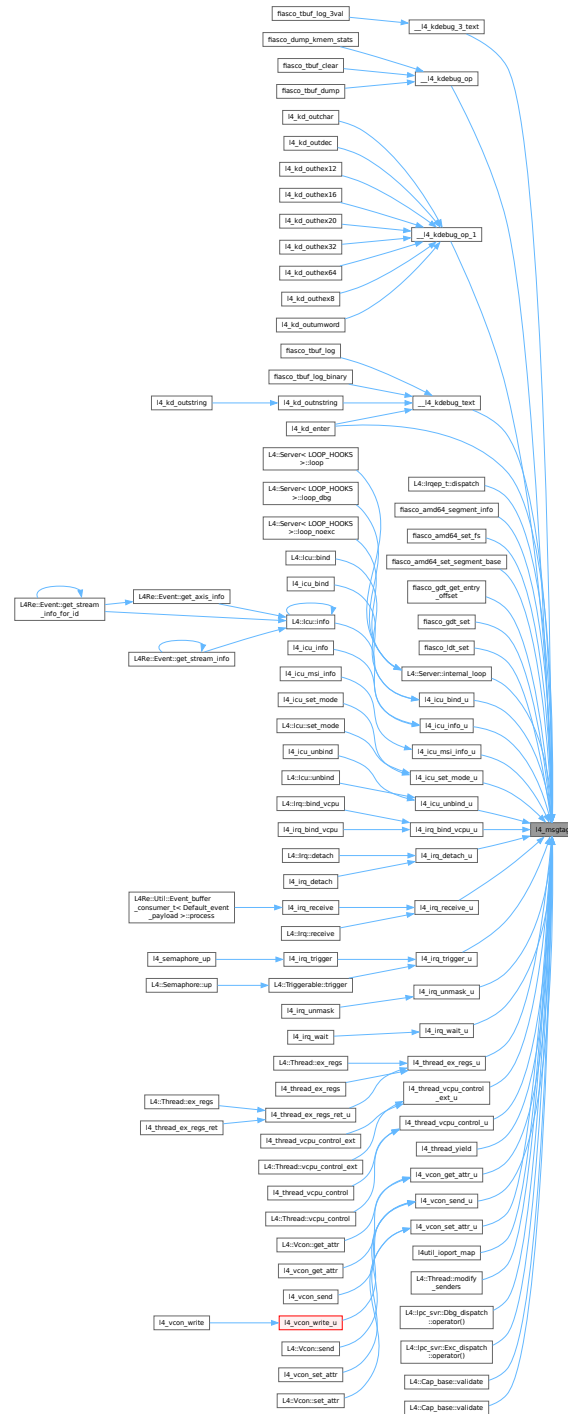

examples/sys/aliens/main.c, examples/sys/ipc/ipc\_example.c, examples/sys/singlestep/main.c, examples/sys/start-with-exo/main.c, and examples/sys/utcb-ipc/main.c.

### 13.1.9.9.3.2 l4\_msgtag\_flags()

```
unsigned l4_msgtag_flags (
    l4_msgtag_t t) [inline]
```

Get the flags.

The flag are defined by [L4\\_msgtag\\_flags](#).

#### Parameters

<i>t</i>	The tag
----------	---------

#### Returns

Flags

Definition at line 451 of file [types.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_msgtag\\_t::flags\(\)](#).

Here is the caller graph for this function:

#### 13.1.9.9.3.3 l4\_msgtag\_has\_error()

```
unsigned l4_msgtag_has_error (  
    l4\_msgtag\_t t) [inline]
```

Test for error indicator flag.

#### Parameters

<i>t</i>	The tag
----------	---------

#### Returns

>0 for yes, 0 for no

Return whether the kernel operation caused a communication error, e.g. with IPC. if true: `utcb->error` is valid, otherwise `utcb->error` is not valid

#### Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

- [l4\\_utcb\\_t](#) \* [l4\\_utcb](#) (void) [L4\\_NOTHROW](#) [L4\\_PURE](#)  
*Get the UTCB address.*
- [l4\\_msg\\_regs\\_t](#) \* [l4\\_utcb\\_mr](#) (void) [L4\\_NOTHROW](#) [L4\\_PURE](#)  
*Get the message-register block of a UTCB.*
- [l4\\_buf\\_regs\\_t](#) \* [l4\\_utcb\\_br](#) (void) [L4\\_NOTHROW](#) [L4\\_PURE](#)  
*Get the buffer-register block of a UTCB.*
- [l4\\_thread\\_regs\\_t](#) \* [l4\\_utcb\\_tcr](#) (void) [L4\\_NOTHROW](#) [L4\\_PURE](#)  
*Get the thread-control-register block of a UTCB.*

### 13.1.9.10.1 Detailed Description

[L4](#) Virtual Registers (UTCB).

#### Include File

```
#include <l4/sys/utcb.h>
```

The virtual registers are part of the micro-kernel API and are located in the user-level thread control block (UTCB). The UTCB is a data structure defined by the micro kernel and located on kernel-provided memory. Each [L4](#) thread gets a unique UTCB assigned when it is bound to a task (see [Thread Control](#) , [l4\\_thread\\_control\\_bind\(\)](#) for more information).

The UTCB is arranged in three blocks of virtual registers.

- [Thread Control Registers \(TCRs\)](#)
- [Message Registers \(MRs\)](#)
- [Buffer Registers \(BRs\)](#)

To access the contents of the virtual registers the [l4\\_utcb\\_mr\(\)](#), [l4\\_utcb\\_tcr\(\)](#), and [l4\\_utcb\\_br\(\)](#) functions must be used.

### 13.1.9.10.2 Typedef Documentation

#### 13.1.9.10.2.1 [l4\\_utcb\\_t](#)

```
typedef struct l4_utcb_t l4_utcb_t
```

Opaque type for the UTCB.

To access the contents of the virtual registers the [l4\\_utcb\\_mr\(\)](#), [l4\\_utcb\\_tcr\(\)](#), and [l4\\_utcb\\_br\(\)](#) functions must be used.

#### Examples

### 13.1.9.10.4.2 Exception registers

Overly definition of the MRs for exception messages.

Collaboration diagram for Exception registers:

## Functions

- `l4_umword_t l4_utcb_exc_pc (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE`  
Access function to get the program counter of the exception state.
- `void l4_utcb_exc_pc_set (l4_exc_regs_t *u, l4_addr_t pc) L4_NOTHROW`  
Set the program counter register in the exception state.
- `unsigned long l4_utcb_exc_typeval (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE`  
Get the value out of an exception UTCB that describes the type of exception.
- `int l4_utcb_exc_is_pf (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE`  
Check whether an exception IPC is a page fault.
- `l4_addr_t l4_utcb_exc_pfa (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE`  
Function to get the L4 style page fault address out of an exception.
- `int l4_utcb_exc_is_ex_regs_exception (l4_exc_regs_t const *u) L4_NOTHROW L4_PURE`  
Check whether an exception IPC was triggered via `l4_thread_ex_regs()`.
- `l4_exc_regs_t * l4_utcb_exc (void) L4_NOTHROW L4_PURE`  
Get the message-register block of a UTCB (for an exception IPC).

## Detailed Description

Overly definition of the MRs for exception messages.

## Function Documentation

### `l4_utcb_exc()`

```
l4_exc_regs_t * l4_utcb_exc (
    void ) [inline]
```

Get the message-register block of a UTCB (for an exception IPC).

**Returns**

A pointer to the exception message in `u`.

**Examples**

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 370 of file `utcb.h`.

References [L4\\_INLINE](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**`l4_utcb_exc_is_ex_regs_exception()`**

```
int l4_utcb_exc_is_ex_regs_exception (
    l4_exc_regs_t const * u) [inline]
```

Check whether an exception IPC was triggered via [l4\\_thread\\_ex\\_regs\(\)](#).

**Return values**

<code>0</code>	Exception was not triggered through <code>ex_regs</code> .
<code>!=0</code>	Exception was triggered through <code>ex_regs</code> .

This function checks if the exception was emitted by using the `L4_THREAD_EX_REGS_TRIGGER_EXCEPTION` flag in an [l4\\_thread\\_ex\\_regs\(\)](#) call.

Definition at line 100 of file `utcb.h`.

References [L4\\_INLINE](#), [L4\\_NOTHROW](#), and [l4\\_utcb\\_exc\\_typeval\(\)](#).

Here is the call graph for this function:

### **l4\_utcb\_exc\_is\_pf()**

```
int l4_utcb_exc_is_pf (
    l4_exc_regs_t const * u) [inline]
```

Check whether an exception IPC is a page fault.

#### **Returns**

0 if not, != 0 if yes

Function to check whether an exception IPC is a page fault, also applies to I/O pagefaults.

Definition at line 90 of file [utcb.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

### **l4\_utcb\_exc\_pc()**

```
l4_umword_t l4_utcb_exc_pc (
    l4_exc_regs_t const * u) [inline]
```

Access function to get the program counter of the exception state.

#### **Parameters**

<i>u</i>	UTCB
----------	------

#### **Returns**

The program counter register out of the exception state.

#### **Examples**

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 75 of file [utcb.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

**l4\_utcb\_exc\_pc\_set()**

```
void l4_utcb_exc_pc_set (
    l4_exc_regs_t * u,
    l4_addr_t pc) [inline]
```

Set the program counter register in the exception state.

**Parameters**

<i>u</i>	UTCB
<i>pc</i>	The program counter to set.

Definition at line 80 of file [utcb.h](#).

References [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

*Bind the IPC receive endpoint to a send destination (a thread).*

#### 13.1.10.2.1 Detailed Description

The C IPC gate interface, see [L4::lpc\\_gate](#) for the C++ interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [Thread](#) the IPC gate is *bound* to (cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) and [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#)). If the capability has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, only IPC using a protocol different from the [L4\\_PROTO\\_KOBJECT](#) protocol is forwarded. Without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.

Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the [Thread](#) interface of that thread is not accessible via an IPC gate. The [IPC-Gate API](#) of an IPC gate is only accessible if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, [IPC-Gate API](#) calls are forwarded to the thread or thread group the IPC gate is bound to instead of being

processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) and [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the [L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#) permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to upon receive (or to the selected thread from the thread group the IPC gate is bound to). However, the configured label of an IPC gate can also be queried via [l4\\_ipc\\_gate\\_get\\_infos\(\)](#) if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [l4\\_thread\\_modify\\_sender\\_start\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.

When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

#### Include File

```
#include <l4/sys/ipc_gate.h>
```

For the C++ interface refer to the [L4::ipc\\_gate](#) documentation.

#### See also

[Object Invocation](#)

### 13.1.10.2.2 Function Documentation

#### 13.1.10.2.2.1 l4\_ipc\_gate\_get\_infos()

```
l4_msgtag_t l4_ipc_gate_get_infos (
    l4_cap_idx_t gate,
    l4_umword_t * label) [inline]
```

Get information about the IPC-gate.

#### Parameters

	<i>gate</i>	The IPC gate object to get information about.
out	<i>label</i>	The label of the IPC gate is returned here.

#### Returns

System call return tag.

**Precondition**

If `gate` does not possess the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the thread or thread group the IPC gate is bound to, blocking the caller if the IPC gate is not bound yet.

Definition at line 166 of file [ipc\\_gate.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.2.2.2 l4\_rcv\_ep\_bind\_snd\_destination()**

```

l4_msgtag_t l4_rcv_ep_bind_snd_destination (
    l4_cap_idx_t ep,
    l4_cap_idx_t snd_dst,
    l4_umword_t label) [inline]
  
```

Bind the IPC receive endpoint to a send destination (a thread).

**Parameters**

<i>ep</i>	The IPC receive endpoint object.
<i>snd_dst</i>	The send destination (thread) object <i>ep</i> shall be bound to.
<i>label</i>	Label to assign to <i>ep</i> . For IPC gates, the two least significant bits must be set to zero.

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	<i>snd_dst</i> is not a thread object or other arguments were malformed.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> right on <i>ep</i> or <i>snd_dst</i> .

**Precondition**

If `ep` is an IPC gate capability without the `L4_FPAGE_C_IPCGATE_SVR` right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the send destination the IPC gate is bound to, blocking the caller if the IPC gate was not bound yet.

The specified `label` is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different send destination. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless `l4_thread_modify_sender_start()` is used to change these labels.

Definition at line 138 of file `rcv_endpoint.h`.

References `l4_utcb()`.

Referenced by `L4::Rcv_endpoint::bind_snd_destination()`.

Here is the call graph for this function:

Here is the caller graph for this function:

**13.1.10.2.2.3 l4\_rcv\_ep\_bind\_thread()**

```

l4_msgtag_t l4_rcv_ep_bind_thread (
    l4_cap_idx_t ep,
    l4_cap_idx_t thread,
    l4_umword_t label) [inline]
  
```

Bind the IPC receive endpoint to a thread.

### Parameters

<i>ep</i>	The IPC receive endpoint object.
<i>thread</i>	The thread object <i>ep</i> shall be bound to.
<i>label</i>	Label to assign to <i>ep</i> . For IPC gates, the two least significant bits must be set to zero.

### Returns

Syscall return tag containing one of the following return codes.

### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	<i>thread</i> is not a thread object or other arguments were malformed.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.

### Precondition

The capabilities *ep* and *thread* both must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

If *ep* is an IPC gate capability without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform this operation. Instead, the underlying IPC message will be forwarded to the thread the IPC gate is bound to, blocking the caller if the IPC gate was not bound yet.

The specified *label* is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless [l4\\_thread\\_modify\\_sender\\_start\(\)](#) is used to change these labels.

### Examples

Definition at line 131 of file [rcv\\_endpoint.h](#).

References [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.3 DMA space

A DMA space represents a device memory address space managed by an IOMMU.

Collaboration diagram for DMA space:

A DMA space represents a device memory address space managed by an IOMMU.

That is, it manages the translation of virtual addresses used by devices to physical addresses. It is accessed via the [L4::Task](#) interface, but with the following caveats:

- No threads can be bound to it.
- No objects (and IO ports on IA32) can be mapped to it.
- No kernel-user memory can be added to it.
- It must be constructed by passing the `L4_PROTO_DMA_SPACE` protocol constant to the kernel factory's [L4::Factory.create\(\)](#) call.

A DMA space must be bound to an [L4::iommu](#) to enable the address translation for specific devices.

The kernel factory allows to create DMA spaces only if the kernel has been configured with IOMMU support and if an IOMMU was detected.

### 13.1.10.4 L4 kernel object type information

Type information for [L4](#) server objects that can be called via IPC.

Collaboration diagram for L4 kernel object type information:

## Data Structures

Get the [L4::Type\\_info](#) for the [L4Re](#) interface given in T.

## Template Parameters

<a href="#">T</a>	The type ( <a href="#">L4Re</a> interface) for which the information shall be returned.
-------------------	---

**Returns**

A pointer to the [L4::Type\\_info](#) structure for T.

Definition at line 682 of file [\\_\\_typeinfo.h](#).

References [L4::Kobject\\_typeid< T >::id\(\)](#).

Referenced by [cap\\_dynamic\\_cast\(\)](#).

*Create a new virtual machine.*
- [l4\\_msgtag\\_t l4\\_factory\\_create\\_vcpu\\_context](#) ([l4\\_cap\\_idx\\_t](#) factory, [l4\\_cap\\_idx\\_t](#) target\_cap) [L4\\_NOTHROW](#)  
*Create a new vCPU context.*
- [l4\\_msgtag\\_t l4\\_factory\\_create\\_thread\\_group](#) ([l4\\_cap\\_idx\\_t](#) factory, [l4\\_cap\\_idx\\_t](#) target\_cap, unsigned policy) [L4\\_NOTHROW](#)  
*Create a new thread group.*
- [l4\\_msgtag\\_t l4\\_factory\\_create](#) ([l4\\_cap\\_idx\\_t](#) factory, long obj, [l4\\_cap\\_idx\\_t](#) target) [L4\\_NOTHROW](#)  
*Create a new object.*

### 13.1.10.5.1 Detailed Description

C factory interface to create objects, see [L4::Factory](#) for the C++ interface.

A factory is used to create all kinds of kernel objects:

- [Task](#)
- [Thread](#)
- [Factory](#)
- [IPC-Gate API](#)
- [IRQs](#)
- [Virtual Machines](#)

To create a new kernel object the caller has to specify the factory to use for creation. The caller has to allocate a capability slot where the kernel stores the new object's capability.

The factory is equipped with a limit that limits the amount of kernel memory available for that factory.

#### Note

The limit does not give any guarantee for the amount of available kernel memory.

#### Include File

```
#include <l4/sys/factory.h>
```

For the C++ interface refer to [L4::Factory](#).

### 13.1.10.5.2 Function Documentation

#### 13.1.10.5.2.1 l4\_factory\_create()

```
l4_msgtag_t l4_factory_create (
    l4_cap_idx_t factory,
    long obj,
    l4_cap_idx_t target) [inline]
```

Create a new object.

#### Parameters

	<i>factory</i>	Factory to use for creation.
	<i>obj</i>	Protocol ID to describe the type of the object to create.
out	<i>target</i>	The kernel stores the new objects's capability into this slot.

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

#### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line 707 of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.5.2.2 l4\_factory\_create\_factory()

```
l4_msgtag_t l4_factory_create_factory (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    unsigned long limit) [inline]
```

Create a new factory.

#### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new factory's capability into this slot.
	<i>limit</i>	Limit for the new factory in bytes.

#### Returns

Syscall return tag

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

#### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

#### Note

The limit of the new factory is subtracted from the available amount of the factory used for creation.

This method is only guaranteed to work with the [Kernel Factory](#). For other services, use the generic [L4::Factory::create\(\)](#) method and consult the service documentation for information on the arguments that need to be passed to the create stream.

Definition at line 545 of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.5.2.3 l4\_factory\_create\_gate()

```
l4_msgtag_t l4_factory_create_gate (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    l4_cap_idx_t snd_dst_cap,
    l4_umword_t label) [inline]
```

Create a new IPC gate, optionally bound to a send destination (a thread or thread group).

#### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new IPC gate's capability into this slot.
	<i>snd_dst_cap</i>	Optional capability selector of a thread or thread group to bind the gate to. Use <a href="#">L4_INVALID_CAP</a> to create an unbound IPC gate.
	<i>label</i>	Optional label of the gate (precisely used if <i>snd_dst_cap</i> is valid). If <i>snd_dst_cap</i> is valid, <i>label</i> must be present.

#### Returns

Syscall return tag containing one of the following return codes.

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_ENOMEM</i>	Out-of-memory during allocation of the <i>lpc_gate</i> object.
<i>-L4_EINVAL</i>	<i>snd_dst_cap</i> is void or points to something that is not a thread or thread group.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.

#### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#). Also *snd\_dst\_cap* (if not [L4\\_INVALID\\_CAP](#)) must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

An unbound IPC gate can be bound to a thread using [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#).

See also

[IPC-Gate API](#)

Definition at line 553 of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.5.2.4 l4\_factory\_create\_irq()

```
l4_msgtag_t l4_factory_create_irq (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap) [inline]
```

Create a new IRQ sender.

##### Parameters

	<i>factory</i>	Factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new IRQ's capability into this slot.

##### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

##### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

##### See also

[IRQs](#)

##### Examples

[examples/sys/isr/main.c](#).

Definition at line [561](#) of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.5.2.5 l4\_factory\_create\_task()

```
l4_msgtag_t l4_factory_create_task (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    l4_fpage_t * utcb_area) [inline]
```

Create a new task.

#### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new task's capability into this slot.
in, out	<i>utcb_area</i>	Pointer to flexpage that describes an area of kernel-user memory that can be used for UTCBs and vCPU state-save-areas of the new task.

On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

#### Returns

Syscall return tag.

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

#### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

#### Note

The size of the UTCB area specifies indirectly the number of UTCBs available for this task. Refer to [l4\\_task\\_add\\_ku\\_mem\(\)](#) for adding more of this type of memory.

#### See also

[Task](#)

Definition at line 531 of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.5.2.6 l4\_factory\_create\_thread()**

```
l4_msgtag_t l4_factory_create_thread (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap) [inline]
```

Create a new thread.

**Parameters**

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new thread's capability into this slot.

**Returns**

Syscall return tag

**Return values**

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt; 0</i>	Error code.

**Precondition**

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

**See also**

[Thread](#)

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line [538](#) of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.5.2.7 l4\_factory\_create\_thread\_group()

```
l4_msgtag_t l4_factory_create_thread_group (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap,
    unsigned policy) [inline]
```

Create a new thread group.

An IPC endpoint can be bound to a thread group. When a message arrives at the IPC endpoint, a specific thread of the thread group is selected to actually receive the message. A thread group is a send destination for an IPC endpoint.

#### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new thread group's capability into this slot.
	<i>policy</i>	Policy parameter for the thread group. See #L4_thread_group_policy for a list of supported values.

#### Returns

Syscall return tag

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_ENOMEM</i>	Out-of-memory during allocation of the thread group object.
<i>-L4_EINVAL</i>	Invalid policy parameter.
<i>-L4_EPERM</i>	The <code>factory</code> instance requires <code>L4_CAP_FPAGE_S</code> rights on <code>factory</code> and <code>L4_CAP_FPAGE_S</code> is not present.
<i>&lt;0</i>	Error code.

#### See also

[Thread groups](#)

Here is the call graph for this function:

#### 13.1.10.5.2.8 l4\_factory\_create\_vcpu\_context()

```
l4_msgtag_t l4_factory_create_vcpu_context (
    l4_cap_idx_t factory,
    l4_cap_idx_t target_cap) [inline]
```

Create a new vCPU context.

A vCPU context typically represents a hardware structure that captures the state of a vCPU on a CPU (e.g. VMX VMCS).

##### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new vCPU context's capability into this slot.

##### Returns

Syscall return tag

##### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

##### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

##### See also

[Virtual Machines](#)

Definition at line [575](#) of file [factory.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.5.2.9 l4\_factory\_create\_vm()

```
l4_msgtag_t l4_factory_create_vm (  
    l4_cap_idx_t factory,  
    l4_cap_idx_t target_cap) [inline]
```

Create a new virtual machine.

##### Parameters

	<i>factory</i>	Capability selector for factory to use for creation.
out	<i>target_cap</i>	The kernel stores the new VM's capability into this slot.

##### Returns

Syscall return tag

##### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

##### Precondition

The capability *factory* must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

##### See also

- `l4_cap_idx_t l4_vm_vmx_get_hw_vmcs (l4_vm_vmx_vcpu_vmcs_t *vmcs) L4_NOTHROW`  
*Get the vCPU context (i.e.*

### 13.1.10.6.3.1 Detailed Description

Virtual machine API for VMX.

### 13.1.10.6.3.2 Typedef Documentation

#### `l4_vm_vmx_vcpu_state_t`

```
typedef struct l4_vm_vmx_vcpu_state_t l4_vm_vmx_vcpu_state_t
```

VMX vCPU state.

This is a specialization of the generic vCPU state for VMX. This data structure represents the following memory layout:

- 0x000 - 0x1ff: Standard vCPU state (with padding). See [l4\\_vcpu\\_state\\_t](#).
- 0x200 - 0x3ff: VMX information members (with padding). See [l4\\_vm\\_vmx\\_vcpu\\_infos\\_t](#).
- 0x400 - 0xffff: VMX software VMCS. See [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#).

**Note**

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

**l4\_vm\_vmx\_vcpu\_vmcs\_t**

```
typedef struct l4_vm_vmx_vcpu_vmcs_t l4_vm_vmx_vcpu_vmcs_t
```

VMX software VMCS.

This data structure represents the following memory layout:

- 0x000 - 0x007: Reserved (ignored by the kernel). In the hardware VMCS, the revision identifier and the abort indicator are stored in this area. Hereby we simply ignore these two entries.
- 0x008 - 0x00f: User space data (ignored by the kernel). This currently stores the pointer to a different software VMCS whose content has been loaded to this software VMCS.
- 0x010 - 0x013: VMCS field index of the software-defined CR2 field in the software VMCS.
- 0x014 - 0x017: Reserved.
- 0x018 - 0x01f: Capability of the vCPU context, i.e. the hardware VMCS object (with padding).
- 0x020 - 0x047: Software VMCS field offset table. See [l4\\_vmx\\_offset\\_table\\_t](#).
- 0x048 - 0x0bf: Reserved.
- 0x0c0 - 0xabf: Software VMCS fields (with padding).
- 0xac0 - 0xbff: Software VMCS fields dirty bitmap (with padding).

**Note**

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

**l4\_vmx\_offset\_table\_t**

```
typedef struct l4_vmx_offset_table_t l4_vmx_offset_table_t
```

Software VMCS field offset table.

This data structure represents the following memory layout:

- 0x00 - 0x02: 3 offsets for 16-bit fields.
- 0x03: Reserved.
- 0x04 - 0x06: 3 offsets for 64-bit fields.
- 0x07: Reserved.
- 0x08 - 0x0a: 3 offsets for 32-bit fields.

- 0x0b: Reserved.
- 0x0c - 0x0e: 3 offsets for natural-width fields.
- 0x0f: Reserved.
- 0x10 - 0x12: 3 limits for 16-bit fields.
- 0x13: Reserved.
- 0x14 - 0x16: 3 limits for 64-bit fields.
- 0x17: Reserved.
- 0x18 - 0x1a: 3 limits for 32-bit fields.
- 0x1b: Reserved.
- 0x1c - 0x1e: 3 limits for natural-width fields.
- 0x1f: Reserved.
- 0x20 - 0x23: 4 index shifts.
- 0x24: Offset of the first software VMCS field.
- 0x25: Size of the software VMCS fields.
- 0x26 - 0x27: Reserved.

The offsets/limits in each size category are in the following order:

- Control fields.
- Read-only fields.
- Guest fields.

The index shifts are in the following order:

- 16-bit.
- 64-bit.
- 32-bit.
- Natural-width.

All offsets/limits/sizes are represented in a 64-byte granule.

The offsets (after being multiplied by 64) are indexes in the values array in [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#) and bit indexes in the dirty\_bitmap array in [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#).

The limits (after being multiplied by 64) represent the range of the available indexes.

#### Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

### 13.1.10.6.3.3 Enumeration Type Documentation

#### L4\_vm\_vmx\_caps\_regs

enum [L4\\_vm\\_vmx\\_caps\\_regs](#)

Exported VMX capability registers.

##### Enumerator

L4_VM_VMX_BASIC_REG	Basic VMX capabilities.
L4_VM_VMX_TRUE_PINBASED_CTLIS_REG	True pin-based control caps.
L4_VM_VMX_TRUE_PROCBASED_CTLIS_REG	True processor based control caps.
L4_VM_VMX_TRUE_EXIT_CTLIS_REG	True exit control caps.
L4_VM_VMX_TRUE_ENTRY_CTLIS_REG	True entry control caps.
L4_VM_VMX_MISC_REG	Misc caps.
L4_VM_VMX_CR0_FIXED0_REG	Fixed to 0 bits of CR0.
L4_VM_VMX_CR0_FIXED1_REG	Fixed to 1 bits of CR0.
L4_VM_VMX_CR4_FIXED0_REG	Fixed to 0 bits of CR4.
L4_VM_VMX_CR4_FIXED1_REG	Fixed to 1 bits of CR4.
L4_VM_VMX_VMCS_ENUM_REG	VMCS enumeration info.
L4_VM_VMX_PROCBASED_CTLIS2_REG	Processor based control 2 caps.
L4_VM_VMX_EPT_VPID_CAP_REG	EPT and VPID caps.
L4_VM_VMX_NESTED_REVISION	Nested VMCS revision.
L4_VM_VMX_NUM_CAPS_REGS	Total number of VMX capability registers.

Definition at line 28 of file [\\_\\_vm-vmx.h](#).

#### L4\_vm\_vmx\_dfl1\_regs

enum [L4\\_vm\\_vmx\\_dfl1\\_regs](#)

Exported VMX capability registers (default to 1 bits).

##### Enumerator

L4_VM_VMX_PINBASED_CTLIS_DFL1_REG	Default 1 bits in pin-based controls.
L4_VM_VMX_PROCBASED_CTLIS_DFL1_REG	Default 1 bits in processor-based controls.
L4_VM_VMX_EXIT_CTLIS_DFL1_REG	Default 1 bits in exit controls.
L4_VM_VMX_ENTRY_CTLIS_DFL1_REG	Default 1 bits in entry controls.
L4_VM_VMX_NUM_DFL1_REGS	Total number of default on registers.

Definition at line 51 of file [\\_\\_vm-vmx.h](#).

## L4\_vm\_vmx\_sw\_fields

```
enum L4_vm_vmx_sw_fields
```

Additional (software-defined) VMCS fields.

The VMCS offsets defined here are actually not in the hardware VMCS. However our VMMs run in user mode and need to have access to certain registers available in kernel mode only. So we put them into our software VMCS.

### Enumerator

L4_VM_VMX_VMCS_CR2	Software VMCS offset for CR2.  <b>Note</b>  You usually need to check this value against the value you get from <a href="#">l4_vm_vmx_get_cr2_index()</a> to make sure you are running on a compatible kernel.
L4_VM_VMX_VMCS_NAT_ARG0	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_NAT_ARG1	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_NAT_ARG2	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_NAT_ARG3	Custom argument passed from kernel to user space.
L4_VM_VMX_VMCS_XCR0	VMCS offset of extended control register XCR0.
L4_VM_VMX_VMCS_MSR_SYSCALL_MASK	VMCS offset of system call flag mask MSR.
L4_VM_VMX_VMCS_MSR_LSTAR	VMCS offset of IA32e mode system call target address MSR.
L4_VM_VMX_VMCS_MSR_CSTAR	VMCS offset of IA32 mode system call target address MSR.
L4_VM_VMX_VMCS_MSR_TSC_AUX	VMCS offset of auxiliary TSC signature MSR.
L4_VM_VMX_VMCS_MSR_STAR	VMCS offset of system call target address MSR.
L4_VM_VMX_VMCS_MSR_KERNEL_GS_BASE	VMCS offset of GS base address swap target MSR.

Definition at line 69 of file [\\_\\_vm-vmx.h](#).

## L4\_vm\_vmx\_vmcs\_sizes

```
enum L4_vm_vmx_vmcs_sizes
```

Sizes of software VMCS members.

### Enumerator

L4_VM_VMX_VMCS_SIZE_VALUES	Size of the software VMCS values member.
L4_VM_VMX_VMCS_SIZE_DIRTY_BITMAP	Size of the software VMCS dirty bitmap member.

Definition at line 170 of file [\\_\\_vm-vmx.h](#).

#### 13.1.10.6.3.4 Function Documentation

##### **l4\_vm\_vmx\_clear()**

```
void l4_vm_vmx_clear (
    l4_vm_vmx_vcpu_vmcs_t * vmcs,
    l4_vm_vmx_vcpu_vmcs_t * dest_vmcs) [inline]
```

Save the content from the software VMCS to a different software VMCS.

##### **Parameters**

<i>vmcs</i>	Pointer to the source software VMCS.
<i>dest_vmcs</i>	Pointer to the destination software VMCS.

This function is comparable to the VMX VMCLEAR instruction.

Definition at line 698 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#), [l4\\_vm\\_vmx\\_get\\_hw\\_vmcs\(\)](#), [l4\\_vm\\_vmx\\_set\\_hw\\_vmcs\(\)](#), and [L4\\_VM\\_VMX\\_VMCS\\_SIZE\\_DIRTY\\_BITM](#)

Referenced by [l4\\_vm\\_vmx\\_ptr\\_load\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### **l4\_vm\_vmx\_field\_len()**

```
unsigned l4_vm_vmx_field_len (  
    unsigned field) [inline]
```

Return length in bytes of a VMCS field.

#### **Parameters**

<i>field</i>	Field number.
--------------	---------------

#### **Returns**

Width of field in bytes.

Definition at line 593 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#), and [l4\\_vm\\_vmx\\_field\\_order\(\)](#).

Here is the call graph for this function:

### **l4\_vm\_vmx\_field\_order()**

```
unsigned l4_vm_vmx_field_order (  
    unsigned field) [inline]
```

Return length in power of two (bytes) of a VMCS field.

#### **Parameters**

<i>field</i>	Field number.
--------------	---------------

**Returns**

Width of field in power of two (bytes).

Definition at line 600 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_field\\_len\(\)](#).

Here is the caller graph for this function:

**`l4_vm_vmx_get_caps()`**

```

l4_uint64_t l4_vm_vmx_get_caps (
    l4_vm_vmx_vcpu_state_t const * vcpu_state,
    enum L4_vm_vmx_caps_regs caps_reg) [inline]
  
```

Get a capability register for VMX.

**Parameters**

<i>vcpu_state</i>	Pointer to the vCPU state.
<i>caps_reg</i>	Capability register index (see <a href="#">L4_vm_vmx_caps_regs</a> ).

**Returns**

The value of the capability register.

Definition at line 884 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

**l4\_vm\_vmx\_get\_caps\_default1()**

```
l4_uint32_t l4_vm_vmx_get_caps_default1 (
    l4_vm_vmx_vcpu_state_t const * vcpu_state,
    enum L4_vm_vmx_dfl1_regs dfl1_reg) [inline]
```

Get a default to one capability register for VMX.

**Parameters**

<i>vcpu_state</i>	Pointer to the vCPU state.
<i>dfl1_reg</i>	Default to 1 capability register index (see <a href="#">L4_vm_vmx_dfl1_regs</a> ).

**Returns**

The value of the capability register.

Definition at line 892 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

**l4\_vm\_vmx\_get\_cr2\_index()**

```
l4_uint32_t l4_vm_vmx_get_cr2_index (
    l4_vm_vmx_vcpu_vmcs_t const * vmcs) [inline]
```

Get the software VMCS field index of the virtual CR2 register.

**Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
-------------	-------------------------------

**Returns**

The field index used for the virtual CR2 register as used by the current Fiasco.OC interface.

The CR2 register is actually not in the hardware VMCS, however our VMMs run in user mode and need to have access to this register so we put it into our software VMCS.

**See also**

[L4\\_VM\\_VMX\\_VMCS\\_CR2](#)

Definition at line 900 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

**l4\_vm\_vmx\_get\_hw\_vmcs()**

```
l4_cap_idx_t l4_vm_vmx_get_hw_vmcs (
    l4_vm_vmx_vcpu_vmcs_t * vmcs) [inline]
```

Get the vCPU context (i.e.

the hardware VMCS object) associated with the software VMCS.

**Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
-------------	-------------------------------

**Returns**

vCPU context (hardware VMCS object) capability.

Definition at line 915 of file [\\_\\_vm-vmx.h](#).

References [L4\\_CAP\\_MASK](#), and [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_clear\(\)](#), and [l4\\_vm\\_vmx\\_ptr\\_load\(\)](#).

Here is the caller graph for this function:

**l4\_vm\_vmx\_ptr\_load()**

```
void l4_vm_vmx_ptr_load (
    l4_vm_vmx_vcpu_vmcs_t * vmcs,
    l4_vm_vmx_vcpu_vmcs_t * src_vmcs) [inline]
```

Load the content from a different software VMCS to the software VMCS.

**Parameters**

<i>vmcs</i>	Pointer to the destination software VMCS.
<i>src_vmcs</i>	Pointer to the source software VMCS.

This function is comparable to the VMX VMPTRLD instruction.

Definition at line 719 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#), [l4\\_vm\\_vmx\\_clear\(\)](#), [l4\\_vm\\_vmx\\_get\\_hw\\_vmcs\(\)](#), [l4\\_vm\\_vmx\\_set\\_hw\\_vmcs\(\)](#), and [L4\\_VM\\_VMX\\_VMCS\\_SIZE\\_DIRTY\\_BITMAP](#).

Here is the call graph for this function:

### **`l4_vm_vmx_read()`**

```

l4_uint64_t l4_vm_vmx_read (
    l4_vm_vmx_vcpu_vmcs_t * vmcs,
    unsigned field) [inline]
  
```

Read any software VMCS field.

#### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

#### **Returns**

The value of the software VMCS field with the given index.

Definition at line 787 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#), [l4\\_vm\\_vmx\\_read\\_16\(\)](#), [l4\\_vm\\_vmx\\_read\\_32\(\)](#), [l4\\_vm\\_vmx\\_read\\_64\(\)](#), and [l4\\_vm\\_vmx\\_read\\_nat\(\)](#).

Here is the call graph for this function:

## **l4\_vm\_vmx\_read\_16()**

```
l4_uint16_t l4_vm_vmx_read_16 (  
    l4_vm_vmx_vcpu_vmcs_t * vmcs,  
    unsigned field) [inline]
```

Read a 16-bit software VMCS field.

### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

### **Returns**

The value of the software VMCS field with the given index.

Definition at line 754 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

## **l4\_vm\_vmx\_read\_32()**

```
l4_uint32_t l4_vm_vmx_read_32 (  
    l4_vm_vmx_vcpu_vmcs_t * vmcs,  
    unsigned field) [inline]
```

Read a 32-bit software VMCS field.

### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

### Returns

The value of the software VMCS field with the given index.

Definition at line 765 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

### **`l4_vm_vmx_read_64()`**

```
l4_uint64_t l4_vm_vmx_read_64 (  
    l4_vm_vmx_vcpu_vmcs_t * vmcs,  
    unsigned field) [inline]
```

Read a 64-bit software VMCS field.

### Parameters

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

### Returns

The value of the software VMCS field with the given index.

Definition at line 776 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

## **l4\_vm\_vmx\_read\_nat()**

```
l4_umword_t l4_vm_vmx_read_nat (
    l4_vm_vmx_vcpu_vmcs_t * vmcs,
    unsigned field) [inline]
```

Read a natural-width software VMCS field.

### **Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>field</i>	The VMCS field index as used on VMX hardware.

### **Returns**

The value of the software VMCS field with the given index.

Definition at line 743 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_read\(\)](#).

Here is the caller graph for this function:

## **l4\_vm\_vmx\_set\_hw\_vmcs()**

```
void l4_vm_vmx_set_hw_vmcs (
    l4_vm_vmx_vcpu_vmcs_t * vmcs,
    l4_cap_idx_t vmcs_cap) [inline]
```

Associate the software VMCS with a vCPU context, i.e.

a hardware VMCS object.

The VMX extended vCPU state is unable to be resumed unless it is associated with a vCPU context, i.e. a hardware VMCS object: An `L4::Vcpu_context` from the user space point of view with its kernel counterpart `Vmx_vmcs`.

**Note**

When replacing the vCPU context, the dirty bitmap of the software VMCS is not touched, neither by the kernel nor by the API functions. This is on purpose, to enable efficient switching between separate VMs in the common case. If there is a logical discrepancy between the content of the software VMCS and the replaced vCPU context, the user is responsible for explicitly setting the relevant software VMCS fields and/or the relevant software VMCS dirty bitmap bits to ensure that the discrepancy is rectified on the next vCPU resume. This needs to be done regardless of using the API functions (the preferred way) or accessing the data structures directly (the discouraged way).

Replacing the vCPU context while the vCPU is currently running has no immediate effect until the next vCPU resume. In addition to that, the kernel might cache the vCPU context internally (in other words, the capability is not looked up on every vCPU resume). To remove the association of the current vCPU context, simply replace it by an another vCPU context. The reference count of the previous vCPU context will be decremented accordingly on the next vCPU resume.

To remove the association of the current vCPU context without replacing it by an another vCPU context, pass an invalid capability with the bit 3 set and trigger a vCPU resume. The vCPU resume will fail in this case (due to the missing vCPU context), but the reference count of the previous vCPU context will be decremented accordingly.

There is no need to explicitly remove the association of the current vCPU context before deleting the software VMCS. Deleting the software VMCS automatically disassociates it from the vCPU context and a vCPU context with a reference count of 0 will be eventually deleted as well.

If the hardware limitations on the usage of the vCPU context are not observed (i.e. no hardware VMCS being active on more than one physical CPU), the vCPU will fail to resume.

**Parameters**

<i>vmcs</i>	Pointer to the software VMCS.
<i>vmcs_cap</i>	vCPU context (hardware VMCS object) capability.

Definition at line 907 of file [\\_\\_vm-vmx.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_vm\\_vmx\\_clear\(\)](#), and [l4\\_vm\\_vmx\\_ptr\\_load\(\)](#).

*Mask an IRQ line.*

### 13.1.10.7.1 Detailed Description

The C Icu interface, see [L4::Icu](#) for the C++ interface.

#### Note

"ICU" is short for "interrupt control unit".

These functions define the interface for interrupt controllers, for binding IRQ objects to interrupt lines and other interrupt sources, as well as functions for masking and unmasking of interrupts.

To setup an IRQ line the following steps are required:

1. [l4\\_icu\\_set\\_mode\(\)](#) (optional if IRQ has a default mode)
2. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) or [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#) to attach the IRQ object to a thread object.
3. [l4\\_icu\\_bind\(\)](#)
4. [l4\\_icu\\_unmask\(\)](#) to receive the first IRQ

For certain interrupt sources only some of these steps are necessary and supported, see [Scheduler](#) and [Virtual Console](#).

At most one [IRQs](#) object can be bound to a certain interrupt source and a certain [IRQs](#) object can be bound to at most one interrupt source.

#### Include File

```
#include <l4/sys/icu.h>
```

### 13.1.10.7.2 Typedef Documentation

#### 13.1.10.7.2.1 l4\_icu\_info\_t

```
typedef struct l4_icu_info_t l4_icu_info_t
```

Info structure for an ICU.

This structure contains information about the features of an ICU.

#### See also

[l4\\_icu\\_info\(\)](#).

### 13.1.10.7.3 Enumeration Type Documentation

#### 13.1.10.7.3.1 L4\_icu\_flags

enum [L4\\_icu\\_flags](#)

Flags for IRQ numbers used for the ICU.

##### Enumerator

<a href="#">L4_ICU_FLAG_MSI</a>	Flag to denote that the IRQ is actually an MSI. This flag may be used for <a href="#">l4_icu_bind()</a> and <a href="#">l4_icu_unbind()</a> functions to denote that the IRQ number is meant to be an MSI.
---------------------------------	--

Definition at line 53 of file [icu.h](#).

### 13.1.10.7.4 Function Documentation

#### 13.1.10.7.4.1 l4\_icu\_bind()

```
l4\_msgtag\_t l4_icu_bind (
    l4\_cap\_idx\_t icu,
    unsigned irqnum,
    l4\_cap\_idx\_t irq) [inline]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

##### Parameters

<i>icu</i>	ICU object to bind <i>irq</i> to.
<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object to bind to this ICU.

##### Returns

Syscall return tag. The caller should check the return value using [l4\\_error\(\)](#) to check for errors and to identify the correct method for unmasking the interrupt. Return values < 0 indicate an error. A return value of 0 means a direct unmask via the IRQ object using [l4\\_irq\\_unmask\(\)](#). A return value of 1 means that the interrupt has to be unmasked via the ICU using [l4\\_icu\\_unmask\(\)](#).

##### Return values

<a href="#">-L4_EINVAL</a>	<i>irq</i> is bound to an interrupt source.
<a href="#">-L4_EPERM</a>	Insufficient permissions; see precondition.

**Precondition**

The capability `irq` must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different IRQ object, only the unbinding happens. An IRQ object that is bound to an interrupt source will get unbound if the IRQ object is deleted.

**Examples**

[examples/sys/isr/main.c](#).

Definition at line 496 of file [icu.h](#).

References [l4\\_icu\\_bind\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.7.4.2 l4\_icu\_bind\_u()**

```

l4_msgtag_t l4_icu_bind_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_cap_idx_t irq,
    l4_utcb_t * utcb) [inline]

```

Bind an interrupt line of an interrupt controller to an interrupt object.

**Parameters**

<i>icu</i>	The ICU object to bind <code>irq</code> to.
<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object for the given IRQ line to bind to this ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag. The caller should check the return value using [l4\\_error\(\)](#) to check for errors and to identify the correct method for unmasking the interrupt. Return values  $< 0$  indicate an error. A return value of 0 means a direct unmask via the IRQ object using [L4::irq::unmask](#). A return value of 1 means that the interrupt has to be unmasked via the ICU using [L4::icu::unmask](#).

## Return values

<a href="#">-L4_EINVAL</a>	<code>irq</code> is bound to an interrupt source.
<a href="#">-L4_EPERM</a>	Insufficient permissions; see precondition.

## Precondition

The capability `irq` must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

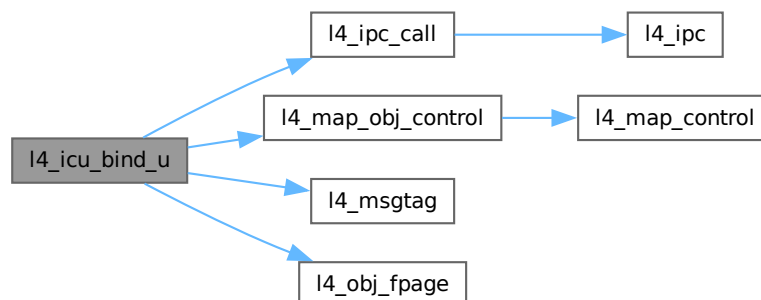

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different [L4::irq](#) object, only the unbinding happens. An [L4::irq](#) object that is bound to an interrupt source will get unbound if the [L4::irq](#) object is deleted.

Here is the caller graph for this function:

**13.1.10.7.4.5 l4\_icu\_mask()**

```

l4_msgtag_t l4_icu_mask (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to) [inline]
  
```

Mask an IRQ line.

**Parameters**

<i>icu</i>	The ICU object where the IRQ line shall be masked.
------------	--

<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If non-NULL, the function also performs an open wait IPC operation waiting for the next message, and the received label is returned here.
<i>to</i>	IPC timeout, if unsure use L4_IPC_NEVER.

#### Returns

Syscall return tag. If *label* is NULL, this function performs an IPC send-only operation and there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. In this case use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 518 of file [icu.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.7.4.6 l4\_icu\_mask\_u()

```

l4_msgtag_t l4_icu_mask_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to,
    l4_utcb_t * utcb) [inline]
  
```

Mask an IRQ line.

#### Parameters

<i>icu</i>	The ICU object where the IRQ line shall be masked.
<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If NULL, this function is a send-only message to the ICU. If not NULL, this function will enter an open wait after sending the mask message and the received label is returned here.
<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL <i>label</i> only.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag. If `label` is `NULL`, this function performs an IPC send-only operation and there is no return value except `L4_MSGTAG_ERROR` indicating success or failure of the send operation. In this case use `l4_ipc_error()` to check for errors and **do not** use `l4_error()`.

Definition at line 483 of file `icu.h`.

References `L4_NOTHROW`.

Referenced by `L4::Icu::mask()`.

Here is the caller graph for this function:

**13.1.10.7.4.7 l4\_icu\_msi\_info()**

```

l4_msgtag_t l4_icu_msi_info (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_uint64_t source,
    l4_icu_msi_info_t * msi_info) [inline]
  
```

Get MSI info about IRQ.

**Parameters**

	<i>icu</i>	The ICU object from which MSI information shall be retrieved.
	<i>irqnum</i>	IRQ line at the ICU.
	<i>source</i>	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	<i>msi_info</i>	A <code>l4_icu_msi_info_t</code> structure receiving the address and the data value to trigger this MSI.

**Returns**

Syscall return tag

Definition at line 508 of file `icu.h`.

References `l4_icu_msi_info_u()`, `L4_NOTHROW`, and `l4_utcb()`.

Here is the call graph for this function:

#### 13.1.10.7.4.8 l4\_icu\_msi\_info\_u()

```

l4_msgtag_t l4_icu_msi_info_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_uint64_t source,
    l4_icu_msi_info_t * msi_info,
    l4_utcb_t * utcb) [inline]
  
```

Get MSI info about IRQ.

#### Parameters

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
	<i>icu</i>	The ICU object from which MSI information shall be retrieved.
	<i>irqnum</i>	IRQ line at the ICU.
	<i>source</i>	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	<i>msi_info</i>	A <a href="#">l4_icu_msi_info_t</a> structure receiving the address and the data value to trigger this MSI.

#### Returns

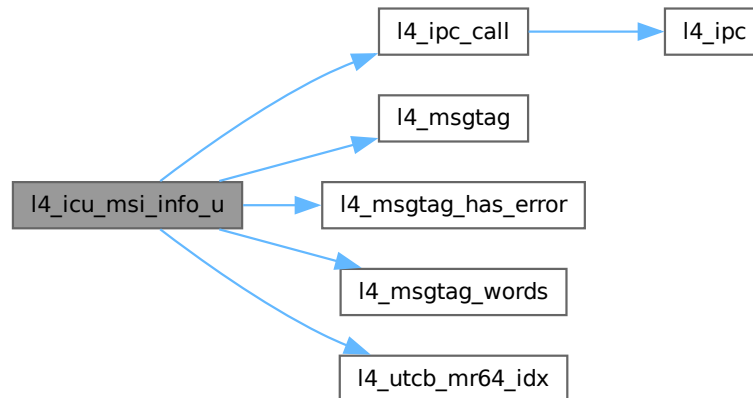

Syscall return tag

Here is the caller graph for this function:

#### 13.1.10.7.4.13 l4\_icu\_unmask()

```

l4_msgtag_t l4_icu_unmask (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to) [inline]
  
```

Unmask an IRQ line.

#### Parameters

<i>icu</i>	The ICU object where the IRQ line shall be unmasked.
<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If non-NULL, the function also performs an open wait IPC operation waiting for the next message, and the received label is returned here.
<i>to</i>	IPC timeout, if unsure use <code>L4_IPC_NEVER</code> .

## Returns

Syscall return tag. If `label` is `NULL`, this function performs an IPC send-only operation and there is no return value except `L4_MSGTAG_ERROR` indicating success or failure of the send operation. In this case use `l4_ipc_error()` to check for errors and **do not** use `l4_error()`.

Definition at line 513 of file `icu.h`.

References `L4_NOTHROW`, and `l4_utcb()`.

Here is the call graph for this function:

#### 13.1.10.7.4.14 l4\_icu\_unmask\_u()

```

l4_msgtag_t l4_icu_unmask_u (
    l4_cap_idx_t icu,
    unsigned irqnum,
    l4_umword_t * label,
    l4_timeout_t to,
    l4_utcb_t * utcb) [inline]
  
```

Unmask the given interrupt line.

## Parameters

<i>icu</i>	The ICU object where the IRQ line shall be unmasked. When the object is an IRQ, the given interrupt line is ignored and instead the line which the IRQ is bound to (if any) is unmasked.
------------	--

Its counterpart for explicitly masking an interrupt line is `L4::l4cu::mask()`.

## Parameters

	<i>irqnum</i>	The interrupt line that shall be unmasked. Ignored if the object is an IRQ.
out	<i>label</i>	If <code>NULL</code> , this is a send-only unmask. If not <code>NULL</code> , this operation enters an open wait and the <i>protected label</i> shall be received here.
	<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non- <code>NULL label</code> only.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <code>l4_utcb</code> .

## Returns

Syscall return tag. If `label` is `NULL`, this function performs an IPC send-only operation and there is no return value except `L4_MSGTAG_ERROR` indicating success or failure of the send operation. In this case use `l4_ipc_error()` to check for errors and **do not** use `l4_error()`.

Definition at line 488 of file `icu.h`.

References `L4_NOTHROW`.

## 13.1.10.8 IRQs

C IRQ interface, see `L4::Irq` for the C++ interface.

Collaboration diagram for IRQs:

## Enumerations

- enum `L4_irq_mode` {

*Unmask this IRQ.*

### 13.1.10.8.1 Detailed Description

C IRQ interface, see [L4::Irq](#) for the C++ interface.

The IRQ interface provides access to abstract interrupts provided by the microkernel. Interrupts may be

- hardware interrupts provided by the platform interrupt controller,
- virtual device interrupts provided by the microkernel's virtual devices (virtual serial or trace buffer) or
- virtual interrupts that can be triggered by user programs (IRQs) via [l4\\_irq\\_trigger\(\)](#).

For hardware and virtual device interrupts the `Irq` object must be bound to an interrupt source, see [Interrupt controller](#). To receive interrupts, the `Irq` object must be bound to a thread, see [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) and [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#).

IRQ objects can be created using a factory, see the [Factory](#) API (use [l4\\_factory\\_create\\_irq\(\)](#)).

#### Include File

```
#include <l4/sys/irq.h>
```

For the C++ interface refer to the [L4::Irq](#) API for an overview.

### 13.1.10.8.2 Enumeration Type Documentation

#### 13.1.10.8.2.1 L4\_irq\_mode

enum `L4_irq_mode`

Interrupt attributes.

##### Enumerator

<code>L4_IRQ_F_NONE</code>	Flow types. None
<code>L4_IRQ_F_SET_MODE</code>	Valid flag, if not set, the <code>set_mode</code> operation does nothing.
<code>L4_IRQ_F_LEVEL</code>	Level triggered.
<code>L4_IRQ_F_EDGE</code>	Edge triggered.
<code>L4_IRQ_F_POS</code>	Positive trigger.
<code>L4_IRQ_F_NEG</code>	Negative trigger.
<code>L4_IRQ_F_BOTH</code>	Both edges trigger.
<code>L4_IRQ_F_LEVEL_HIGH</code>	Level high trigger.
<code>L4_IRQ_F_LEVEL_LOW</code>	Level low trigger.
<code>L4_IRQ_F_POS_EDGE</code>	Positive edge trigger.
<code>L4_IRQ_F_NEG_EDGE</code>	Negative edge trigger.
<code>L4_IRQ_F_BOTH_EDGE</code>	Both edges trigger.
<code>L4_IRQ_F_MASK</code>	Mask.
<code>L4_IRQ_F_SET_WAKEUP</code>	Wakeup source? Use irq as wakeup source
<code>L4_IRQ_F_CLEAR_WAKEUP</code>	Do not use irq as wakeup source.

Definition at line 70 of file `icu.h`.

### 13.1.10.8.3 Function Documentation

#### 13.1.10.8.3.1 l4\_irq\_bind\_vcpu()

```
l4_msgtag_t l4_irq_bind_vcpu (
    l4_cap_idx_t irq,
    l4_cap_idx_t thread,
    l4_umword_t cfg) [inline]
```

Bind a thread to this Irq for vCPU interrupt forwarding.

If the interrupt is triggered, the kernel will directly inject the interrupt into the guest. This requires that the thread is currently in extended vCPU user mode. Otherwise the interrupt will stay pending and gets injected on the next vCPU user mode transition. Optionally a doorbell Irq can be registered on the thread (see `Thread::register_doorbell_irq()`) that is triggered in this case.

If a guest has acknowledged the interrupt but has not yet issued an EOI (i.e. the interrupt is in "active" state), it is not possible to bind the Irq to a new thread object. Either wait for the guest to issue the EOI or `detach()` from the current thread. In this case the interrupt will stay active in the guest and it is the responsibility of the VMM to handle the eventual EOI of the guest.

## Parameters

<i>irq</i>	The IRQ object that shall be bound.
<i>thread</i>	Thread object this Irq shall be bound to.
<i>cfg</i>	Architecture specific interrupt configuration.

## Returns

Syscall return tag

## Return values

<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_EBUSY</i>	Cannot bind to new thread because interrupt is active on previous thread and guest has to issue end-of-interrupt first.
<i>-L4_ENOSYS</i>	The kernel does not support direct interrupt forwarding.

## Precondition

The capabilities `irq` and `thread` both must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line 300 of file `irq.h`.

References [l4\\_irq\\_bind\\_vcpu\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.8.3.2 l4\_irq\_bind\_vcpu\_u()

```

l4_msgtag_t l4_irq_bind_vcpu_u (
    l4_cap_idx_t irq,
    l4_cap_idx_t thread,
    l4_umword_t cfg,
    l4_utcb_t * utcb) [inline]
  
```

Bind a thread to this Irq for vCPU interrupt forwarding.

**Parameters**

<i>irq</i>	The IRQ object that shall be bound. If the interrupt is triggered, the kernel will directly inject the interrupt into the guest. This requires that the thread is currently in extended vCPU user mode. Otherwise the interrupt will stay pending and gets injected on the next vCPU user mode transition. Optionally a doorbell Irq can be registered on the thread (see <code>Thread::register_doorbell_irq()</code> ) that is triggered in this case.
------------	--

If a guest has acknowledged the interrupt but has not yet issued an EOI (i.e. the interrupt is in "active" state), it is not possible to bind the Irq to a new thread object. Either wait for the guest to issue the EOI or `detach()` from the current thread. In this case the interrupt will stay active in the guest and it is the responsibility of the VMM to handle the eventual EOI of the guest.

**Parameters**

<i>thread</i>	Thread object this Irq shall be bound to.
<i>cfg</i>	Architecture specific interrupt configuration.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

**Return values**

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>-L4_EBUSY</code>	Cannot bind to the new thread because interrupt is active on previous thread and guest has to issue end-of-interrupt first.
<code>-L4_ENOSYS</code>	The kernel does not support direct interrupt forwarding.

**Precondition**

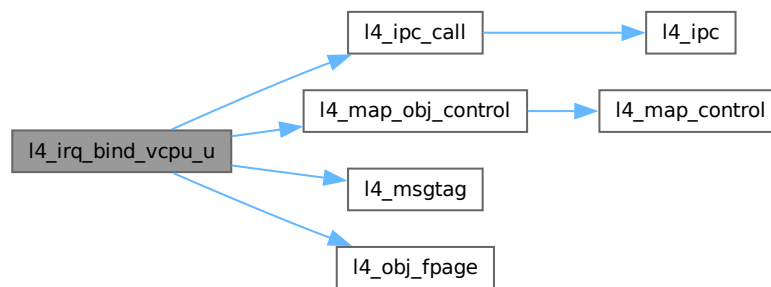

The invoked Irq capability and the capability `thread` both must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line [250](#) of file [irq.h](#).

References [L4\\_CAP\\_FPAGE\\_RWS](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_map\\_obj\\_control\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), [l4\\_obj\\_fpage\(\)](#), [L4\\_PROTO\\_IRQ\\_SENDER](#), [l4\\_msg\\_regs\\_t::mr](#), and [l4\\_fpage\\_t::raw](#).

Referenced by [L4::Irq::bind\\_vcpu\(\)](#), and [l4\\_irq\\_bind\\_vcpu\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.10.8.3.3 l4\_irq\_detach()

```
l4_msgtag_t l4_irq_detach (
    l4_cap_idx_t irq) [inline]
```

Detach from an interrupt source.

#### Parameters

<i>irq</i>	The IRQ object that shall be detached.
------------	--

#### Returns

Syscall return tag

#### Return values

---

---

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
2	Successfully detached, an active vIRQ was abandoned.
-L4_EPERM	Insufficient permissions; see precondition.

#### Precondition

The capability `irq` must have the permission `L4_CAP_FPAGE_S`.

#### Examples

[examples/sys/isr/main.c](#).

Definition at line 294 of file `irq.h`.

References [l4\\_irq\\_detach\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.8.3.4 l4\_irq\_detach\_u()

```

l4_msgtag_t l4_irq_detach_u (
    l4_cap_idx_t irq,
    l4_utcb_t * utcb) [inline]
  
```

Detach from this interrupt.

#### Parameters

<i>irq</i>	The IRQ object that shall be detached.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

**Return values**

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
2	Successfully detached, an active vIRQ was abandoned.
-L4_EPERM	Insufficient permissions; see precondition.

**Precondition**

The invoked Irq capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line 242 of file [irq.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), and [L4\\_PROTO\\_IRQ\\_SENDER](#).

Referenced by [L4::Irq::detach\(\)](#), and [l4\\_irq\\_detach\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.10.8.3.5 l4\_irq\_receive()

```
l4_msgtag_t l4_irq_receive (
    l4_cap_idx_t irq,
    l4_timeout_t to) [inline]
```

Unmask and wait for specified IRQ.

#### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>to</i>	Timeout.

#### Returns

Syscall return tag

Definition at line 313 of file [irq.h](#).

References [l4\\_irq\\_receive\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Referenced by [L4Re::Util::Event\\_buffer\\_consumer\\_t< Default\\_event\\_payload >::process\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.10.8.3.6 l4\_irq\_receive\_u()

```
l4_msgtag_t l4_irq_receive_u (
    l4_cap_idx_t irq,
    l4_timeout_t timeout,
    l4_utcb_t * utcb) [inline]
```

Unmask and wait for this IRQ.

#### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

#### Note

If this is the function normally used for your IRQs consider using [L4::Semaphore](#) instead of [L4::Irq](#).

Definition at line 270 of file [irq.h](#).

References [l4\\_ipc\\_call\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), and [L4\\_PROTO\\_IRQ](#).

Referenced by [l4\\_irq\\_receive\(\)](#), and [L4::Irq::receive\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

## 13.1.10.8.3.7 l4\_irq\_trigger()

```
l4_msgtag_t l4_irq_trigger (
    l4_cap_idx_t irq) [inline]
```

Trigger an IRQ.

## Parameters

<i>irq</i>	The IRQ object that shall be triggered.
------------	---

## Returns

Syscall return tag.

Note that this function is a send only operation, i.e. there is no return value except for a failed send operation. Especially [l4\\_error\(\)](#) will return an error value from the message tag which still contains the IRQ protocol used for the send operation.

Use [l4\\_ipc\\_error\(\)](#) to check for (send) errors.

Definition at line 307 of file [irq.h](#).

References [l4\\_irq\\_trigger\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Referenced by [l4\\_semaphore\\_up\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.10.8.3.8 l4\_irq\_trigger\_u()

```
l4_msgtag_t l4_irq_trigger_u (
    l4_cap_idx_t irq,
    l4_utcb_t * utcb) [inline]
```

Trigger the object.

#### Parameters

<i>irq</i>	The IRQ object that shall be triggered.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 263 of file [irq.h](#).

References [L4\\_IPC\\_BOTH\\_TIMEOUT\\_0](#), [l4\\_ipc\\_send\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), and [L4\\_PROTO\\_IRQ](#).

Referenced by [l4\\_irq\\_trigger\(\)](#), and [L4::Triggerable::trigger\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.10.8.3.9 l4\_irq\_unmask()

```
l4_msgtag_t l4_irq_unmask (
    l4_cap_idx_t irq) [inline]
```

Unmask IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
------------	--

##### Returns

Syscall return tag

##### Note

[l4\\_irq\\_wait\(\)](#) and [l4\\_irq\\_receive\(\)](#) are doing the unmask themselves.

Definition at line 326 of file [irq.h](#).

References [l4\\_irq\\_unmask\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.8.3.10 l4\_irq\_unmask\_u()

```
l4_msgtag_t l4_irq_unmask_u (
    l4_cap_idx_t irq,
    l4_utcb_t * utcb) [inline]
```

Unmask this IRQ.

##### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

`l4q::wait()` and `l4q::receive()` operations already include an `unmask()`, do not use an extra `unmask()` in these cases.

Definition at line 286 of file [irq.h](#).

References [L4\\_IPC\\_NEVER](#), [l4\\_ipc\\_send\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), and [L4\\_PROTO\\_IRQ](#).

Referenced by [l4\\_irq\\_unmask\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**13.1.10.8.3.11 l4\_irq\_wait()**

```

l4_msgtag_t l4_irq_wait (
    l4_cap_idx_t irq,
    l4_umword_t * label,
    l4_timeout_t to) [inline]
  
```

Unmask IRQ and wait for any message.

**Parameters**

<i>irq</i>	The IRQ object that shall be unmasked.
<i>label</i>	Receive label.
<i>to</i>	Timeout.

#### Returns

Syscall return tag

#### Examples

[examples/sys/isr/main.c](#).

Definition at line 319 of file [irq.h](#).

References [l4\\_irq\\_wait\\_u\(\)](#), [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

```

l4_msgtag_t l4_irq_wait_u (
    l4_cap_idx_t irq,
    l4_umword_t * label,
    l4_timeout_t timeout,
    l4_utcb_t * utcb) [inline]

```

Unmask IRQ and (open) wait for any message.

#### Parameters

<i>irq</i>	The IRQ object that shall be unmasked.
<i>label</i>	The <i>protected label</i> shall be received here.
<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

Definition at line 277 of file [irq.h](#).

References [l4\\_ipc\\_send\\_and\\_wait\(\)](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), and [L4\\_PROTO\\_IRQ](#).

### 13.1.10.9 Platform Control C API

C interface for controlling platform-wide properties, see [L4::Platform\\_control](#) for the C++ interface.

Collaboration diagram for Platform Control C API:

## Functions

- `l4_msgtag_t l4_platform_ctl_set_task_asid (l4_cap_idx_t pfc, l4_cap_idx_t task, l4_umword_t asid) L4_NOTHROW`  
*Set ASID of task.*
- `l4_msgtag_t l4_platform_ctl_system_suspend (l4_cap_idx_t pfc, l4_umword_t extras) L4_NOTHROW`  
*Enter suspend to RAM.*
- `l4_msgtag_t l4_platform_ctl_system_shutdown (l4_cap_idx_t pfc, l4_umword_t reboot) L4_NOTHROW`  
*Shutdown or reboot the system.*
- `l4_msgtag_t l4_platform_ctl_cpu_allow_shutdown (l4_cap_idx_t pfc, l4_umword_t phys_id, l4_umword_t enable) L4_NOTHROW`  
*Allow a CPU to be shut down.*
- `l4_msgtag_t l4_platform_ctl_cpu_enable (l4_cap_idx_t pfc, l4_umword_t phys_id) L4_NOTHROW`  
*Enable an offline CPU.*
- `l4_msgtag_t l4_platform_ctl_cpu_disable (l4_cap_idx_t pfc, l4_umword_t phys_id) L4_NOTHROW`  
*Disable an online CPU.*

### 13.1.10.9.1 Detailed Description

C interface for controlling platform-wide properties, see [L4::Platform\\_control](#) for the C++ interface.

#### Include File

```
#include <l4/sys/platform_control.h>
```

The API allows a client to suspend, reboot or shutdown the system.

For the C++ interface refer to [L4::Platform\\_control](#)

### 13.1.10.9.2 Function Documentation

#### 13.1.10.9.2.1 l4\_platform\_ctl\_cpu\_allow\_shutdown()

```
l4_msgtag_t l4_platform_ctl_cpu_allow_shutdown (
    l4_cap_idx_t pfc,
    l4_umword_t phys_id,
    l4_umword_t enable) [inline]
```

Allow a CPU to be shut down.

#### Parameters

<i>pfc</i>	Capability selector for the platform-control object.
<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to enable.
<i>enable</i>	Allow shutdown when 1, disallow when 0.

**Returns**

Syscall return tag

Definition at line 242 of file [platform\\_control.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.9.2.2 l4\_platform\_ctl\_cpu\_disable()**

```

l4_msgtag_t l4_platform_ctl_cpu_disable (
    l4_cap_idx_t pfc,
    l4_umword_t phys_id) [inline]
  
```

Disable an online CPU.

**Parameters**

<i>pfc</i>	Capability to the platform control object.
<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to disable.

**Returns**

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

Definition at line 281 of file [platform\\_control.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.9.2.3 l4\_platform\_ctl\_cpu\_enable()

```
l4_msgtag_t l4_platform_ctl_cpu_enable (
    l4_cap_idx_t pfc,
    l4_umword_t phys_id) [inline]
```

Enable an offline CPU.

#### Parameters

<i>pfc</i>	Capability to the platform control object.
<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to enable.

#### Returns

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

Definition at line 274 of file [platform\\_control.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.9.2.4 l4\_platform\_ctl\_set\_task\_asid()

```
l4_msgtag_t l4_platform_ctl_set_task_asid (
    l4_cap_idx_t pfc,
    l4_cap_idx_t task,
    l4_umword_t asid) [inline]
```

Set ASID of task.

On Cortex-R52 platforms, it might be necessary to control the VMID of a task or virtual machine explicitly. The IOMPU on such platforms will use it for further access control of device memory accesses. A privileged component can use this call to control the value.

The caller must have write permissions to the destination task.

**Parameters**

<i>pfc</i>	Capability selector for the platform-control object.
<i>task</i>	Capability selector of destination task
<i>asid</i>	New ASID value

**Returns**

Syscall return tag

Definition at line 62 of file [\\_\\_platform\\_control-arm.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.9.2.5 l4\_platform\_ctl\_system\_shutdown()**

```
l4_msgtag_t l4_platform_ctl_system_shutdown (  
    l4_cap_idx_t pfc,  
    l4_umword_t reboot) [inline]
```

Shutdown or reboot the system.

**Parameters**

<i>pfc</i>	Capability selector for the platform-control object.
<i>reboot</i>	Shutdown when 0, or reboot when 1.

**Returns**

Syscall return tag

Definition at line 221 of file [platform\\_control.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.9.2.6 l4\_platform\_ctl\_system\_suspend()**

```
l4_msgtag_t l4_platform_ctl_system_suspend (
    l4_cap_idx_t pfc,
    l4_umword_t extras) [inline]
```

Enter suspend to RAM.

**Precondition**

Must only be invoked on the boot CPU. Furthermore it must be ensured that the invoking thread is not migrated to a different CPU during the suspend.

**Parameters**

<i>pfc</i>	Capability selector for the platform-control object.
<i>extras</i>	Some extra platform-specific information needed to enter suspend to RAM. On x86 platforms and when using the Platform_control object provided by Fiasco, the value defines the sleep state. The sleep states are defined in the ACPI table. Other platforms as well as lo's Platform_control object don't make use of this value at the moment.

**Returns**

Syscall return tag

Definition at line 214 of file [platform\\_control.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.10 Scheduler**

C interface of the Scheduler kernel object, see [L4::Scheduler](#) for the C++ interface.

Collaboration diagram for Scheduler:

*Query if a CPU is online.*

### 13.1.10.10.1 Detailed Description

C interface of the Scheduler kernel object, see [L4::Scheduler](#) for the C++ interface.

The Scheduler interface allows a client to manage CPU resources. The API provides functions to query scheduler information, check the online state of CPUs, query CPU idle time and to start threads on defined CPU sets.

The scheduler offers a virtual device IRQ which triggers when the number of online cores changes, e.g. due to hotplug events. In contrast to hardware IRQs, this IRQ implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

It depends on the platform, which hotplug events actually trigger the IRQ. Many platforms only support triggering the IRQ when a CPU core different from the boot CPU goes online.

## Include File

```
#include <l4/sys/scheduler.h>
```

### 13.1.10.10.2 Enumeration Type Documentation

#### 13.1.10.10.2.1 L4\_scheduler\_classes

enum [L4\\_scheduler\\_classes](#)

Supported scheduler classes.

##### Enumerator

L4_SCHEDULER_CLASS_FIXED_PRIO	Fixed-priority scheduler.
L4_SCHEDULER_CLASS_WFQ	Weighted fair queuing scheduler.

Definition at line [46](#) of file [scheduler.h](#).

#### 13.1.10.10.2.2 L4\_scheduler\_ops

enum [L4\\_scheduler\\_ops](#)

Operations on the Scheduler object.

##### Enumerator

L4_SCHEDULER_INFO_OP	Query infos about the scheduler.
L4_SCHEDULER_RUN_THREAD_OP	Run a thread on this scheduler.
L4_SCHEDULER_IDLE_TIME_OP	Query idle time for the scheduler.

Definition at line [269](#) of file [scheduler.h](#).

### 13.1.10.10.3 Function Documentation

#### 13.1.10.10.3.1 l4\_sched\_cpu\_set()

```
l4_sched_cpu_set_t l4_sched_cpu_set (
    l4_umword_t offset,
    unsigned char granularity,
    l4_umword_t map = 1) [inline]
```

##### Parameters

<i>offset</i>	Offset. Must be a multiple of 2 <sup>granularity</sup> .
<i>granularity</i>	Granularity in log2 notation.
<i>map</i>	Bitmap of CPUs, defaults to 1 in C++.

**Returns**

CPU set.

**Examples**

[examples/sys/migrate/thread\\_migrate.cc](#).

Definition at line 279 of file [scheduler.h](#).

References [l4\\_sched\\_cpu\\_set\\_t::gran\\_offset](#), [L4\\_NOTHROW](#), and [l4\\_sched\\_cpu\\_set\\_t::map](#).

Referenced by [l4\\_sched\\_param\(\)](#).

Here is the caller graph for this function:

**13.1.10.10.3.2 l4\_sched\_param()**

```

l4_sched_param_t l4_sched_param (
    unsigned prio,
    l4_umword_t quantum = 0) [inline]
  
```

Construct scheduler parameter.

**Parameters**

<i>prio</i>	Thread priority (1-255).
<i>quantum</i>	Timeslice in micro seconds.

The [l4\\_sched\\_param\\_t::affinity](#) of the returned value contains all CPUs.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/migrate/thread\\_migrate.cc](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 289 of file [scheduler.h](#).

References [l4\\_sched\\_param\\_t::affinity](#), [L4\\_NOTHROW](#), [l4\\_sched\\_cpu\\_set\(\)](#), [l4\\_sched\\_param\\_t::prio](#), and [l4\\_sched\\_param\\_t::quantum](#).

Here is the call graph for this function:

### 13.1.10.10.3.3 l4\_scheduler\_idle\_time()

```

l4_msgtag_t l4_scheduler_idle_time (
    l4_cap_idx_t scheduler,
    l4_sched_cpu_set_t const * cpus,
    l4_kernel_clock_t * us) [inline]
  
```

Query the idle time (in  $\mu$ s) of a CPU.

#### Parameters

	<i>scheduler</i>	Scheduler object.
	<i>cpus</i>	Set of CPUs to query. Only the idle time of the first selected CPU in <code>cpus.map</code> is queried.
out	<i>us</i>	Idle time of queried CPU in $\mu$ s.

#### Return values

0	Success.
-L4_EINVAL	Invalid CPU requested in cpu set.

This function retrieves the idle time in  $\mu$ s of the first selected CPU in `cpus.map`. The idle time is the accumulated time a CPU has spent in the idle thread since its last reset. To calculate a load estimate `l` one has to retrieve the idle time at the beginning (`i1`) and the end (`i2`) of a known time interval `t`. The load is then calculated as  $l = 1 - (i2 - i1)/t$ .

The idle time is only defined for online CPUs. Reading the idle time from offline CPUs is undefined and may result in either getting -L4\_EINVAL or calculating an estimated (incorrect) load of 1.

#### Note

The idle time statistics of remote CPUs is updated on context switch events only, hence may not be up-to-date when requested cross-CPU. To get up-to-date idle time you should use a thread running on the same CPU of which the idle time is requested.

Definition at line 403 of file [scheduler.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.10.3.4 l4\_scheduler\_info()

```

l4_msgtag_t l4_scheduler_info (
    l4_cap_idx_t scheduler,
    l4_umword_t * cpu_max,
    l4_sched_cpu_set_t * cpus) [inline]
  
```

Get scheduler information.

##### Parameters

	<i>scheduler</i>	Scheduler object.
out	<i>cpu_max</i>	Maximum number of CPUs ever available. Optional, can be NULL.
in, out	<i>cpus</i>	<i>cpus.offset</i> is first CPU of interest. <i>cpus.granularity</i> (see <a href="#">l4_sched_cpu_set_t</a> ). <i>cpus.map</i> Bitmap of online CPUs. Must not be NULL.

##### Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

Definition at line 381 of file [scheduler.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.10.3.5 l4\_scheduler\_info\_with\_classes()

```
l4_msgtag_t l4_scheduler_info_with_classes (
    l4_cap_idx_t scheduler,
    l4_umword_t * cpu_max,
    l4_sched_cpu_set_t * cpus,
    l4_umword_t * sched_classes) [inline]
```

Get scheduler information.

#### Parameters

	<i>scheduler</i>	Scheduler object.
out	<i>cpu_max</i>	Maximum number of CPUs ever available. Optional, can be NULL.
in, out	<i>cpus</i>	<i>cpus.offset</i> is first CPU of interest. <i>cpus.granularity</i> (see <a href="#">l4_sched_cpu_set_t</a> ). <i>cpus.map</i> Bitmap of online CPUs. Must not be NULL.
out	<i>sched_classes</i>	A bitmap of available scheduling classes (see <a href="#">L4_scheduler_classes</a> ). Optional, can be NULL.

#### Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

This function delivers the same information as [l4\\_scheduler\\_info](#) plus the available scheduler classes (see [L4\\_scheduler\\_classes](#)).

Definition at line 388 of file [scheduler.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.10.3.6 l4\_scheduler\_is\_online()

```
int l4_scheduler_is_online (
    l4_cap_idx_t scheduler,
    l4_umword_t cpu) [inline]
```

Query if a CPU is online.

#### Parameters

<i>scheduler</i>	Scheduler object.
<i>cpu</i>	CPU number whose online status should be queried.

#### Return values

<i>true</i>	The CPU is online.
<i>false</i>	The CPU is offline

Definition at line 410 of file [scheduler.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.10.3.7 l4\_scheduler\_run\_thread()

```

l4_msgtag_t l4_scheduler_run_thread (
    l4_cap_idx_t scheduler,
    l4_cap_idx_t thread,
    l4_sched_param_t const * sp) [inline]
  
```

Run a thread on a Scheduler.

#### Parameters

<i>scheduler</i>	Scheduler object.
<i>thread</i>	Capability of the thread to run.
<i>sp</i>	Scheduling parameters.

#### Return values

<i>0</i>	Success.
<i>-L4_EINVAL</i>	Invalid size of the scheduling parameter.

This function launches a thread on a CPU determined by the scheduling parameter `sp.affinity`. A thread can be intentionally stopped by migrating it on an offline or an invalid CPU. The thread is only guaranteed to run if the CPU it is migrated to is currently online.

**Note**

If the target CPU is currently not online, there is no guarantee that the thread will ever run, even if the CPU comes online later on.

A scheduler may impose a policy with regard to selecting CPUs. However the scheduler is required to ensure the following two properties:

- Two threads with disjoint CPU sets must be scheduled to different CPUs.
- Two threads with identical CPU sets selecting only a single CPU must be scheduled to the same CPU.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 396 of file [scheduler.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.11 Kernel-provided semaphore**

C semaphore interface, see [L4::Semaphore](#) for the C++ interface.

Collaboration diagram for Kernel-provided semaphore:

**Functions**

- [l4\\_msgtag\\_t l4\\_semaphore\\_up \(l4\\_cap\\_idx\\_t sem\) L4\\_NOTHROW](#)  
*Semaphore up operation (wrapper for trigger()).*
- [l4\\_msgtag\\_t l4\\_semaphore\\_down \(l4\\_cap\\_idx\\_t sem, l4\\_timeout\\_t timeout\) L4\\_NOTHROW](#)  
*Semaphore down operation.*

### 13.1.10.11.1 Detailed Description

C semaphore interface, see [L4::Semaphore](#) for the C++ interface.

#### Include File

```
#include <l4/sys/semaphore.h>
```

### 13.1.10.11.2 Function Documentation

#### 13.1.10.11.2.1 l4\_semaphore\_down()

```
l4_msgtag_t l4_semaphore_down (
    l4_cap_idx_t sem,
    l4_timeout_t timeout) [inline]
```

Semaphore down operation.

#### Parameters

<i>sem</i>	Semaphore object.
<i>timeout</i>	Timeout for blocking the semaphore down operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.

#### Returns

Syscall return tag. Use [l4\\_error\(\)](#) to check for errors.

#### Return values

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
------------------------	---

#### Precondition

The capability `sem` must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

This method decrements the semaphore counter by one, or blocks if the counter is already zero, until either a timeout or cancel condition hits or the counter is increased by an `up()` operation.

Definition at line 100 of file [semaphore.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.11.2.2 l4\_semaphore\_up()

```
l4_msgtag_t l4_semaphore_up (
    l4_cap_idx_t sem) [inline]
```

Semaphore up operation (wrapper for trigger()).

#### Parameters

<i>sem</i>	Semaphore object.
------------	-------------------

#### Returns

Send-only IPC message return tag. Use [l4\\_ipc\\_error\(\)](#) to check for errors, do **not** use [l4\\_error\(\)](#).

Increases the semaphore counter by one if it is smaller than an unspecified limit. The unspecified limit is guaranteed to be at least  $2^{31}-1$ .

Definition at line 45 of file [semaphore.h](#).

References [l4\\_irq\\_trigger\(\)](#), and [L4\\_NOTHROW](#).

Here is the call graph for this function:

### 13.1.10.12 Task

C interface of the Task kernel object, see [L4::Task](#) for the C++ interface.

Collaboration diagram for Task:

#### Enumerations

- enum [l4\\_unmap\\_flags\\_t](#) { [L4\\_FP\\_ALL\\_SPACES](#) , [L4\\_FP\\_DELETE\\_OBJ](#) , [L4\\_FP\\_OTHER\\_SPACES](#) }

*Add kernel-user memory.*

### 13.1.10.12.1 Detailed Description

C interface of the Task kernel object, see [L4::Task](#) for the C++ interface.

A task represents a combination of the address spaces provided by the [L4Re](#) micro kernel. A task consists of at least a memory address space and an object address space. On IA32 there is also an IO-port address space.

Task objects are created using the [Factory](#) interface.

#### Include File

```
#include <l4/sys/task.h>
```

### 13.1.10.12.2 Enumeration Type Documentation

#### 13.1.10.12.2.1 l4\_unmap\_flags\_t

```
enum l4_unmap_flags_t
```

Flags for the unmap operation.

See also

[L4::Task::unmap\(\)](#) and [l4\\_task\\_unmap\(\)](#)

## Enumerator

L4_FP_ALL_SPACES	<p>Flag to tell the unmap operation to revoke permissions from all child mappings including the mapping in the invoked task.</p> <p><b>Note</b></p> <p>Object capabilities are not hierarchical – they have no children. The result of the map operation on an object capability is a copy of that capability in the object space of the destination task. An unmap operation on object capabilities is a no-op if this flag is not specified.</p> <p><b>See also</b></p> <p><a href="#">L4::Task::unmap()</a> <a href="#">l4_task_unmap()</a></p>
L4_FP_DELETE_OBJ	<p>Flag that indicates that an unmap operation on object capabilities shall try to delete the corresponding objects immediately. This flag implies the <a href="#">L4_FP_ALL_SPACES</a> flag. The concept of deletion is only applicable to kernel objects. Therefore, for memory and I/O port capabilities, this flag has the same effect as <a href="#">L4_FP_ALL_SPACES</a> alone.</p> <p><b>See also</b></p> <p><a href="#">L4::Task::unmap()</a> <a href="#">l4_task_unmap()</a></p> <p><b>Note</b></p> <p>Specifying <a href="#">L4_FP_DELETE_OBJ</a> ^ <a href="#">L4_FP_ALL_SPACES</a> is treated as <a href="#">L4_FP_OTHER_SPACES</a>.</p>
L4_FP_OTHER_SPACES	<p>Counterpart to <a href="#">L4_FP_ALL_SPACES</a>; revoke permissions from child mappings only.</p> <p><b>See also</b></p> <p><a href="#">L4::Task::unmap()</a> <a href="#">l4_task_unmap()</a></p>

Definition at line 167 of file [consts.h](#).

## 13.1.10.12.3 Function Documentation

### 13.1.10.12.3.1 l4\_task\_add\_ku\_mem()

```
l4_msgtag_t l4_task_add_ku_mem (
    l4_cap_idx_t task,
    l4_fpage_t * ku_mem) [inline]
```

Add kernel-user memory.

**Parameters**

	<i>task</i>	Capability selector of the task to add the memory to.
<i>in, out</i>	<i>ku_mem</i>	Flexpage describing the virtual area the memory goes to. On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

**Returns**

Syscall return tag

Kernel-user memory (*ku\_mem*) is memory that is shared between the kernel and user-space. It is needed for the UTCB area of threads (see [l4\\_thread\\_control\\_bind\(\)](#)) and for (extended) vCPU state. Note that existing kernel-user memory cannot be unmapped or mapped somewhere else.

**Note**

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page ([L4\\_PAGE\\_SIZE](#)). A portable implementation should not depend on allocations greater than 16KiB to succeed.

This function is only guaranteed to work on [L4::Task](#) objects. It might or might not work on [L4::Vm](#) objects or on [L4Re::Dma\\_space](#) objects but there is no practical use for adding kernel-user memory to [L4::Vm](#) objects or to [L4Re::Dma\\_space](#) objects.

Definition at line 497 of file [task.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.12.3.2 l4\_task\_cap\_equal()**

```

l4_msgtag_t l4_task_cap_equal (
    l4_cap_idx_t task,
    l4_cap_idx_t cap_a,
    l4_cap_idx_t cap_b) [inline]
  
```

Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).

**Parameters**

<i>task</i>	Capability selector for the destination task to do the lookup in.
<i>cap↔ _a</i>	Capability selector for the first capability to compare.
<i>cap↔ _b</i>	Capability selector for the second capability to compare.

**Return values**

<i>l4_msgtag_t::label()</i> = 1	The compared capabilities point to the same object with same considered permission.
<i>l4_msgtag_t::label()</i> = 0	The compared capabilities do <b>not</b> point to the same object or differ in the considered permission.

- For [L4::lpc\\_gate](#) objects, only the permissions [L4\\_CAP\\_FPAGE\\_W](#), [L4\\_CAP\\_FPAGE\\_S](#), and [L4\\_FPAGE\\_C\\_OBJ\\_RIGHT1](#) are considered for the comparison. Differences in other permissions are ignored.
- For other objects, only the permissions [L4\\_CAP\\_FPAGE\\_W](#) and [L4\\_CAP\\_FPAGE\\_S](#) are considered for the comparison. Differences in other permissions are ignored.

Note that having the [L4\\_CAP\\_FPAGE\\_R](#) permission is implicit in possessing the capability.

Definition at line [490](#) of file [task.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.12.3.3 l4\_task\_cap\_valid()**

```

l4_msgtag_t l4_task_cap_valid (
    l4_cap_idx_t task,
    l4_cap_idx_t cap) [inline]
  
```

Check whether a capability is present (refers to an object).

**Parameters**

<i>task</i>	Task to check the capability in.
-------------	----------------------------------

<i>cap</i>	Valid capability to check for presence.
------------	---

### Return values

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
<i>l4_msgtag_t::label()</i> == 0	No capability present (void object).

A capability is considered present when it refers to an existing kernel object.

### Precondition

*cap* must be a valid capability index (i.e. not L4\_INVALID\_CAP or the like).

Definition at line 484 of file [task.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.12.3.4 l4\_task\_delete\_obj()

```

l4_msgtag_t l4_task_delete_obj (
    l4_cap_idx_t task,
    l4_cap_idx_t obj) [inline]
  
```

Release capability and delete object.

### Parameters

<i>task</i>	Capability selector of destination task.
<i>obj</i>	Capability index of the object to delete.

**Returns**

Syscall return tag

If `obj` has the delete permission, initiates the deletion of the object. This implies that all capabilities for that object are gone afterwards. However, kernel-internally, objects are not destroyed until all other kernel objects holding a reference to it drop the reference. Hence, quota used by that object might not be freed immediately.

If `obj` does not have the delete permission, no error will be reported and only the capability `obj` is removed. (Note that, depending on the object's reference counter, this might still imply initiation of deletion.)

This operation is equivalent to `l4_task_unmap()` with `L4_FP_DELETE_OBJ` flag.

Definition at line 463 of file `task.h`.

References `L4_NOTHROW`, and `l4_utcb()`.

Here is the call graph for this function:

**13.1.10.12.3.5 l4\_task\_map()**

```

l4_msgtag_t l4_task_map (
    l4_cap_idx_t dst_task,
    l4_cap_idx_t src_task,
    l4_fpage_t snd_fpage,
    l4_umword_t snd_base) [inline]
  
```

Map resources available in the source task to a destination task.

**Parameters**

<i>dst_task</i>	Capability selector of the destination task.
<i>src_task</i>	Capability selector of the source task.
<i>snd_fpage</i>	Send flexpage that describes an area in the address space or object space of the source task.
<i>snd_base</i>	Send base that describes an offset in the receive window of the destination task. The lower bits contain additional map control flags (see <code>l4_fpage_cacheability_opt_t</code> for memory mappings, <code>Attributes and additional permissions for object send items</code> for object mappings, and <code>L4_MAP_ITEM_GRANT</code> ; also see <code>l4_map_control()</code> and <code>l4_map_obj_control()</code> ).

**Returns**

Syscall return tag. The function [l4\\_error\(\)](#) shall be used to test if the map operation was successful.

**Return values**

<a href="#">L4_EOK</a>	Operation successful (but see notes below).
<a href="#">-L4_EPERM</a>	Insufficient permissions; see precondition.
<a href="#">-L4_EINVAL</a>	Invalid source task capability.
<a href="#">-L4_IPC_SEMAPFAILED</a>	The map operation failed due to limited quota.

**Precondition**

The capability `dst_task` must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

This method allows for asynchronous transfer of capabilities, memory mappings, and IO-port mappings (on IA32) from one task to another. The receive window is the whole address space of `dst_task`. By specifying proper rights in `snd_fpage` and `snd_base`, it is possible to remove rights during transfer.

**Note**

If the send flexpage is of type [L4\\_FPAGE\\_OBJ](#), the [L4\\_CAP\\_FPAGE\\_S](#) right is removed from the transferred capability unless both the source and destination task capabilities possess the [L4\\_CAP\\_FPAGE\\_S](#) right themselves.

Even with [l4\\_error\(\)](#) returning [L4\\_EOK](#) there might be cases where not all pages of the send flexpage were mapped respectively granted to the destination task, for instance, if the corresponding mapping in the destination task does already exist.

For more information on spaces and mappings, see [Spaces and Mappings](#). The flexpage API is described in more detail at [Flexpages](#).

**Note**

For peculiarities when using grant, see [L4\\_MAP\\_ITEM\\_GRANT](#).

Definition at line 433 of file [task.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Referenced by [L4::Cap\\_base::copy\(\)](#), and [L4::Cap\\_base::move\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.10.12.3.6 l4\_task\_release\_cap()

```
l4_msgtag_t l4_task_release_cap (
    l4_cap_idx_t task,
    l4_cap_idx_t cap) [inline]
```

Release object capability.

#### Parameters

<i>task</i>	Capability selector of destination task
<i>cap</i>	Capability selector of object to release

#### Returns

Syscall return tag

This operation unmaps the capability from the specified task. This operation is equivalent to unmapping a single object capability by specifying all object rights as unmap mask.

#### Note

If the reference counter of the kernel object referenced by *cap* goes down to zero, deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 478 of file [task.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.12.3.7 l4\_task\_unmap()**

```
l4_msgtag_t l4_task_unmap (
    l4_cap_idx_t task,
    l4_fpage_t fpage,
    l4_umword_t map_mask) [inline]
```

Revoke rights from the task.

**Parameters**

<i>task</i>	Capability selector of destination task
<i>fpage</i>	Flexpage that describes an area in one capability space of the destination task and the rights to revoke.
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a>

**Returns**

Syscall return tag

This method allows to revoke rights from the destination task. The rights to revoke are specified in the flexpage, see [l4\\_fpage\\_rights\(\)](#). For a flexpage describing IO ports or memory, it also revokes rights from all the tasks that got the rights delegated from the destination task (i.e., this operation does a recursive rights revocation). The capability is unmapped if certain rights are specified, see below for details. It is guaranteed that the rights revocation is completed before this function returns.

Note that this function cannot be used to revoke the reference counting permission (see [L4\\_FPAGE\\_C\\_REF\\_CNT](#)) or the IPC-gate server permission (see [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#)) from object capabilities.

It depends on the platform and the object type which rights need to be specified in the *rights* field of *fpage* to unmap a capability:

- An object capability is unmapped if and only if the [L4\\_CAP\\_FPAGE\\_R](#) right bit is set.
- An IO port is unmapped if and only if any right bit is set.
- Memory is unmapped if and only if the [L4\\_FPAGE\\_RO](#) right bit is set.

**Note**

Depending on the page-table features supported by the hardware, revocation of certain rights from a memory capability can be a no-op (i.e., the rights are not revoked). Further, revocation of certain rights may grant other rights which were not present before. For instance, on an architecture without support for NX, revoking X does nothing. For another example, revoking only X from an execute-only page grants read permission (because the mapping remains present in the page table).

If the reference counter of a kernel object referenced in *fpage* goes down to zero (as a result of deleting capabilities), the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

**Examples**

[examples/sys/utcb-ipc/main.c](#).

Definition at line 440 of file [task.h](#).

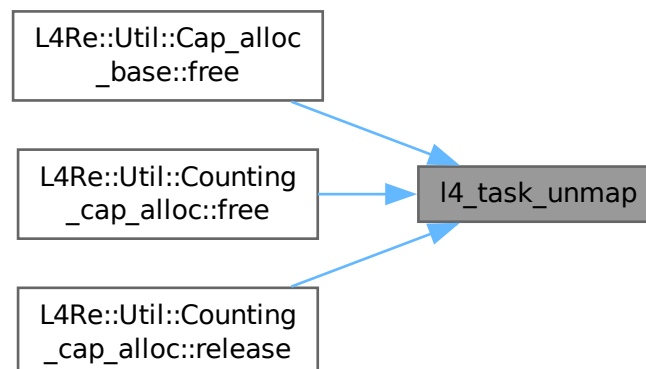

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.1.10.12.3.8 l4\_task\_unmap\_batch()

```

l4_msgtag_t l4_task_unmap_batch (
    l4_cap_idx_t task,
    l4_fpage_t const * fpages,
    unsigned num_fpages,
    l4_umword_t map_mask) [inline]
  
```

Revoke rights from a task.

#### Parameters

<i>task</i>	Capability selector of destination task
<i>fpages</i>	An array of flexpages. Each item describes an area in one capability space of the destination task.
<i>num_fpages</i>	The size of the fpages array in elements (number of fpages sent).
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a>

**Returns**

Syscall return tag

Revoke rights specified in an array of flexpages, see [l4\\_task\\_unmap](#) for details.

**Precondition**

The caller needs to take care that num\_fpages is not bigger than L4\_UTCB\_GENERIC\_DATA\_SIZE - 2.

Definition at line 447 of file [task.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

**13.1.10.12.3.9 l4\_task\_vgicc\_map()**

```

l4_msgtag_t l4_task_vgicc_map (
    l4_cap_idx_t task,
    l4_fpage_t vgicc_fpage) [inline]
  
```

Map the GIC virtual CPU interface page to the task in case Fiasco detected a GIC version 2.

**Parameters**

<i>task</i>	Capability selector of destination task
<i>vgicc_fpage</i>	Flexpage that describes an area in the address space of the destination task to map the vGICC page to

**Returns**

Syscall return tag

Definition at line 46 of file [\\_\\_task-arm.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

*Set the TPIDRURO thread specific register.*

### 13.1.10.13.1 Detailed Description

C Thread object interface, see [L4::Thread](#) for the C++ interface.

An [L4](#) thread is a thread of execution in the [L4](#) context. Usually user-level and kernel threads are mapped 1:1 to each other. Thread kernel objects are created using a factory, see [Factory](#) ([l4\\_factory\\_create\\_thread\(\)](#)).

Amongst other things an [L4](#) thread encapsulates:

- CPU state
  - General-purpose registers
  - Program counter
  - Stack pointer
- FPU state
- Scheduling parameters, see the [Scheduler](#) API
- Execution state
  - Blocked, Runnable, Running

Thread objects provide an API for

- Thread configuration and manipulation
- Thread switching.

The thread control functions are used to control various aspects of a thread. See [l4\\_thread\\_control\\_start\(\)](#) for more information.

On ARM newly created threads run in EL0 by default and the exception level can be changed there with [ex\\_regs\(\)](#).

#### Include File

```
#include <l4/sys/thread.h>
```

For the C++ interface refer to [L4::Thread](#).

### 13.1.10.13.2 Enumeration Type Documentation

#### 13.1.10.13.2.1 L4\_thread\_control\_flags

```
enum L4_thread_control_flags
```

Flags for the thread control operation.

##### Enumerator

L4_THREAD_CONTROL_SET_PAGER	The pager will be given.
L4_THREAD_CONTROL_BIND_TASK	The task to bind the thread to will be given.
L4_THREAD_CONTROL_ALIEN	Alien state of the thread is set.
L4_THREAD_CONTROL_SET_EXC_HANDLER	The exception handler of the thread will be given.

Definition at line 761 of file [thread.h](#).

#### 13.1.10.13.2.2 L4\_thread\_control\_mr\_indices

```
enum L4_thread_control_mr_indices
```

Indices for the values in the message register for thread control.

##### Enumerator

L4_THREAD_CONTROL_MR_IDX_FLAGS	See also <a href="#">L4_thread_control_flags</a> .
L4_THREAD_CONTROL_MR_IDX_PAGER	Index for pager cap.
L4_THREAD_CONTROL_MR_IDX_EXC_HANDLER	Index for exception handler.
L4_THREAD_CONTROL_MR_IDX_FLAG_VALS	Index for feature values.
L4_THREAD_CONTROL_MR_IDX_BIND_UTCB	Index for UTCB address for bind.
L4_THREAD_CONTROL_MR_IDX_BIND_TASK	Index for task flexpage for bind.

Definition at line 782 of file [thread.h](#).

#### 13.1.10.13.2.3 L4\_thread\_ex\_regs\_flags

```
enum L4_thread_ex_regs_flags
```

Flags for the thread ex-regs operation.

**Enumerator**

L4_THREAD_EX_REGS_CANCEL	Cancel ongoing IPC in the thread.
L4_THREAD_EX_REGS_TRIGGER_EXCEPTION	Trigger artificial exception in thread.
L4_THREAD_EX_REGS_ARCH_MASK	Arch specific flags.

Definition at line 797 of file [thread.h](#).

**13.1.10.13.2.4 L4\_thread\_ex\_regs\_flags\_arm**

```
enum L4_thread_ex_regs_flags_arm
```

Arm specific [L4::Thread::ex\\_regs\(\)](#) flags.

Only one option must be used in calls to [L4::Thread::ex\\_regs\(\)](#). Using more than one option results in undefined behaviour.

**Enumerator**

L4_THREAD_EX_REGS_ARM_SET_EL_MASK	Exception level set mask.
L4_THREAD_EX_REGS_ARM_SET_EL_KEEP	Keep current exception level of thread (default).
L4_THREAD_EX_REGS_ARM_SET_EL_EL0	Set exception level of thread to EL0 (usr mode).
L4_THREAD_EX_REGS_ARM_SET_EL_EL1	Set exception level of thread to EL1 (sys mode).

Definition at line 37 of file [thread.h](#).

**13.1.10.13.2.5 L4\_thread\_ex\_regs\_flags\_arm64**

```
enum L4_thread_ex_regs_flags_arm64
```

Arm64 specific [L4::Thread::ex\\_regs\(\)](#) flags.

Only one option must be used in calls to [L4::Thread::ex\\_regs\(\)](#). Using more than one option results in undefined behaviour.

**Enumerator**

L4_THREAD_EX_REGS_ARM64_SET_EL_MASK	Exception level set mask.
L4_THREAD_EX_REGS_ARM64_SET_EL_KEEP	Keep current exception level of thread (default).
L4_THREAD_EX_REGS_ARM64_SET_EL_EL0	Set exception level of thread to EL0.
L4_THREAD_EX_REGS_ARM64_SET_EL_EL1	Set exception level of thread to EL1t.

Definition at line 44 of file [thread.h](#).

### 13.1.10.13.3 Function Documentation

#### 13.1.10.13.3.1 l4\_thread\_arm\_set\_tpidruro()

```
l4_msgtag_t l4_thread_arm_set_tpidruro (
    l4_cap_idx_t thread,
    l4_addr_t tpidruro) [inline]
```

Set the TPIDRURO thread specific register.

##### Parameters

<i>thread</i>	Thread to manipulate
<i>tpidruro</i>	The value to be set

##### Returns

System call return tag

##### Note

When this function is invoked for a thread currently executing on a different core, then the changed register content will not be visible to that thread until a thread switch happens on that core.

Definition at line 70 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.13.3.2 l4\_thread\_ex\_regs()

```
l4_msgtag_t l4_thread_ex_regs (
    l4_cap_idx_t thread,
    l4_addr_t ip,
    l4_addr_t sp,
    l4_umword_t flags) [inline]
```

Exchange basic thread registers.

## Parameters

<i>thread</i>	Capability selector of the thread to manipulate.
<i>ip</i>	New instruction pointer, use <code>~0UL</code> to leave the instruction pointer unchanged.
<i>sp</i>	New stack pointer, use <code>~0UL</code> to leave the stack pointer unchanged.
<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> .

## Returns

System call return tag

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see [L4\\_thread\\_ex\\_regs\\_flags\\_arm](#) and [L4\\_thread\\_ex\\_regs\\_flags\\_arm64](#).

The thread is started using [l4\\_scheduler\\_run\\_thread\(\)](#). However, if at the time [l4\\_scheduler\\_run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to [l4\\_thread\\_ex\\_regs\(\)](#) with a valid instruction pointer might start the thread.

## Examples

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 942 of file [thread.h](#).

References [L4\\_NOTHROW](#), [l4\\_thread\\_ex\\_regs\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### 13.1.10.13.3.3 l4\_thread\_ex\_regs\_ret()

```

l4_msgtag_t l4_thread_ex_regs_ret (
    l4_cap_idx_t thread,
    l4_addr_t * ip,
    l4_addr_t * sp,
    l4_umword_t * flags) [inline]

```

Exchange basic thread registers and return previous values.

### Parameters

	<i>thread</i>	Capability selector of the thread to manipulate.
in, out	<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged, return previous instruction pointer.
in, out	<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged, returns previous stack pointer.
in, out	<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> , return previous CPU flags of the thread.

### Returns

System call return tag

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see [L4\\_thread\\_ex\\_regs\\_flags\\_arm](#) and [L4\\_thread\\_ex\\_regs\\_flags\\_arm64](#).

The thread is started using [l4\\_scheduler\\_run\\_thread\(\)](#). However, if at the time [l4\\_scheduler\\_run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to [l4\\_thread\\_ex\\_regs\(\)](#) with a valid instruction pointer might start the thread.

Returned values are valid only if function returns successfully.

Definition at line 949 of file [thread.h](#).

References [L4\\_NOTHROW](#), [l4\\_thread\\_ex\\_regs\\_ret\\_u\(\)](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.13.3.4 l4\_thread\_ex\_regs\_ret\_u()

```

l4_msgtag_t l4_thread_ex_regs_ret_u (
    l4_cap_idx_t thread,
    l4_addr_t * ip,
    l4_addr_t * sp,
    l4_umword_t * flags,
    l4_utcb_t * utcb) [inline]
  
```

Exchange basic thread registers and return previous values.

## Parameters

	<i>thread</i>	Capability selector of the thread to manipulate.
in, out	<i>ip</i>	New instruction pointer, use <code>~0UL</code> to leave the instruction pointer unchanged, return previous instruction pointer.
in, out	<i>sp</i>	New stack pointer, use <code>~0UL</code> to leave the stack pointer unchanged, returns previous stack pointer.
in, out	<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> , return previous CPU flags of the thread.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

## Returns

System call return tag. [out] parameters are only valid if the function returns successfully. Use [l4\\_error\(\)](#) to check.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see [L4\\_thread\\_ex\\_regs\\_flags\\_arm](#) and [L4\\_thread\\_ex\\_regs\\_flags\\_arm64](#).

The thread is started using [L4::Scheduler::run\\_thread\(\)](#). However, if at the time [L4::Scheduler::run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to `ex_regs()` with a valid instruction pointer might start the thread.

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.1.10.13.3.6 l4\_thread\_modify\_sender\_add()

```

int l4_thread_modify_sender_add (
    l4_umword_t match_mask,
    l4_umword_t match,
    l4_umword_t del_bits,
    l4_umword_t add_bits,
    l4_msgtag_t * tag) [inline]

```

Add a modification pattern to a sender modification sequence.

#### Parameters

<i>tag</i>	Tag received from <a href="#">l4_thread_modify_sender_start()</a> or previous <a href="#">l4_thread_modify_sender_add()</a> calls from the same sequence.
<i>match_mask</i>	Bitmask of bits to match the label.
<i>match</i>	Bitmask that must be equal to the label after applying <i>match_mask</i> .
<i>del_bits</i>	Bits to be deleted from the label.
<i>add_bits</i>	Bits to be added to the label.

#### Returns

0 on success, <0 on error

In pseudo code: if ((sender\_label & match\_mask) == match) { sender\_label = (sender\_label & ~del\_bits) | add\_bits; }

Only the first match is applied.

#### See also

[l4\\_thread\\_modify\\_sender\\_start](#)  
[l4\\_thread\\_modify\\_sender\\_commit](#)

Definition at line 1116 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.13.3.7 l4\_thread\_modify\_sender\_commit()

```

l4_msgtag_t l4_thread_modify_sender_commit (
    l4_cap_idx_t thread,
    l4_msgtag_t tag) [inline]
  
```

Apply (commit) a sender modification sequence.

The modification rules are applied to all IPCs to the thread (whether directly or by IPC gate) that are already in flight, that is that the sender is already blocking on.

##### Note

Modifying the senders of a thread running on a different CPU core is not supported.

To ensure that no in-flight senders are missed, either the thread itself must execute `modify_senders`, or the thread executing the `modify_senders` must synchronize with the target thread. This synchronization must ensure the following:

1. Before `modify_senders` is executed the target thread must execute at least shortly (so that pending DRQs are handled).
2. The target thread must pause its IPC dispatch, until `modify_senders` is completed. In other words, the target thread must not be receive ready, because otherwise an IPC message with an unmodified label can be transferred to its UTCB or vCPU state.

##### See also

[l4\\_thread\\_modify\\_sender\\_start](#)

[l4\\_thread\\_modify\\_sender\\_add](#)

Definition at line 1127 of file [thread.h](#).

Here is the call graph for this function:

### 13.1.10.13.3.8 l4\_thread\_modify\_sender\_start()

```
l4_msgtag_t l4_thread_modify_sender_start (  
    void )    [inline]
```

Start a thread sender modification sequence.

Add modification rules with [l4\\_thread\\_modify\\_sender\\_add\(\)](#) and commit with [l4\\_thread\\_modify\\_sender\\_commit\(\)](#). Do not touch the UTCB between [l4\\_thread\\_modify\\_sender\\_start\(\)](#) and [l4\\_thread\\_modify\\_sender\\_commit\(\)](#).

This mechanism shall be used to change the source object labels of every pending IPC of an IPC gate or an IRQ if the labels in such pending IPC become invalid for the receiving thread, potentially because:

- an IPC gate / IRQ was unbound from a thread, or
- an IPC gate / IRQ was removed, or
- the label of an IPC gate /IRQ bound to a thread was changed.

It is not required to perform the modify\_sender mechanism after an IPC gate or an IRQ was bound to a thread for the first time.

#### 13.1.10.13.3.9 l4\_thread\_register\_del\_irq()

```
l4_msgtag_t l4_thread_register_del_irq (  
    l4_cap_idx_t thread,  
    l4_cap_idx_t irq) [inline]
```

Register an IRQ that will trigger upon deletion events.

##### Parameters

<i>thread</i>	Thread to register IRQ for.
<i>irq</i>	Capability selector for the IRQ object to be triggered.

##### Returns

System call return tag containing the return code.

##### Return values

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
------------------------	---

##### Precondition

The capability `irq` must have the permission `L4_CAP_FPAGE_W`.

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion Irq can only be deregistered by deleting the Irq or the thread.

List of deletion events:

- deletion of one or several IPC gates bound to this thread.

When the deletion event is delivered, there is no indication about which IPC gate was deleted.

Definition at line 1037 of file `thread.h`.

References `L4_NOTHROW`, and `l4_utcb()`.

Here is the call graph for this function:

### 13.1.10.13.3.10 l4\_thread\_register\_doorbell\_irq()

```
l4_msgtag_t l4_thread_register_doorbell_irq (  
    l4_cap_idx_t thread,  
    l4_cap_idx_t irq) [inline]
```

Register an IRQ that will trigger when a forwarded virtual interrupt is pending.

#### Parameters

<i>thread</i>	Thread to register IRQ for.
<i>irq</i>	Capability selector for the IRQ object to be triggered.

#### Returns

System call return tag containing the return code.

#### Return values

<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
------------------	---

#### Precondition

The capability `irq` must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

See [l4\\_irq\\_bind\\_vcpu\(\)](#) for more details about how interrupts can be forwarded directly by the kernel to extended vCPU user mode.

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion `l4r` can only be deregistered by deleting the `l4r` or the thread.

```

l4_msgtag_t l4_thread_vcpu_control_ext (
    l4_cap_idx_t thread,
    l4_addr_t ext_vcpu_state) [inline]
  
```

Enable the extended vCPU feature for the thread.

**Parameters**

<i>thread</i>	Capability selector of the thread for which the extended vCPU feature shall be enabled.
<i>ext_vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">l4_task_add_ku_mem()</a> ).

**Returns**

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT or AMD's SVM.

This function enables the extended vCPU feature of the `thread`. Enabling the extended vCPU feature also enables the vCPU feature.

The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of `L4_PAGESIZE`. It includes the data of [l4\\_vcpu\\_state\\_t](#) at offset 0, the extended vCPU state at offset `L4_VCPU_OFFSET_EXT_STATE`, and, on some platforms, the extended vCPU information at offset `L4_VCPU_OFFSET_EXT_INFOS`.

**Note**

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

Definition at line 1069 of file [thread.h](#).

    l4_cap_idx_t thread,
    l4_addr_t ext_vcpu_state,
    l4_utcb_t * utcb) [inline]
  
```

Enable the extended vCPU feature for the thread.

**Parameters**

<i>thread</i>	Capability selector of the thread for which the extended vCPU feature shall be enabled.
<i>ext_vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT-x (VMX) or AMD's AMD-V (SVM).

This function enables the extended vCPU feature of `this` thread. Enabling the extended vCPU feature also enables the vCPU feature.

The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of `L4_PAGESIZE`. It includes the data of [l4\\_vcpu\\_state\\_t](#) at offset 0, the extended vCPU state at offset `L4_VCPU↵_OFFSET_EXT_STATE`, and, on some platforms, the extended vCPU information at offset `L4_VCPU_OFFSET_↵EXT_INFOS`.

On Intel's VT-x (VMX), the extended vCPU state is [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#) and the extended vCPU information is [l4\\_vm\\_vmx\\_vcpu\\_infos\\_t](#). Furthermore, the extended vCPU state needs to be associated with a vCPU context (see [l4\\_vm\\_vmx\\_set\\_hw\\_vmcs\(\)](#)).

On AMD's AMD-V (SVM), the extended vCPU state is [l4\\_vm\\_svm\\_vmcb\\_t](#).

**Note**

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

### 13.1.10.13.3.17 l4\_thread\_vcpu\_resume\_commit()

```
l4_msgtag_t l4_thread_vcpu_resume_commit (
    l4_cap_idx_t thread,
    l4_msgtag_t tag) [inline]
```

Commit vCPU resume.

#### Parameters

<i>thread</i>	Thread to be resumed, the invalid cap can be used for the current thread.
<i>tag</i>	Tag to use, returned by <a href="#">l4_thread_vcpu_resume_start()</a>

#### Returns

Syscall return tag containing one of the following return codes.

#### Return values

0	Indicates a VM exit, provided that <i>thread</i> is in extended vCPU mode with virtual interrupts cleared.
1	Indicates an incoming IPC message, provided that the <i>thread</i> is in extended vCPU mode with virtual interrupts cleared.
-L4_EPERM	The user task capability set in the vCPU state is missing the <a href="#">L4_CAP_FPAGE_S</a> right. On Intel's VT-x (VMX): The vCPU context capability set in the extended vCPU state is missing the <a href="#">L4_CAP_FPAGE_S</a> right.
-L4_ENOENT	The user task capability set in the vCPU state is invalid.
-L4_EINVAL	<i>thread</i> is not the current running thread, or does not have the vCPU feature enabled. On Intel's VT-x (VMX): No vCPU context associated with the extended vCPU state.
-L4_EBUSY	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state is already active on a different CPU.
-L4_ENODEV	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state cannot be initialized or activated.
<0	A supplied mapping failed.

All flexpages in the UTCB (added with [l4\\_sndfpage\\_add\(\)](#) after [l4\\_thread\\_vcpu\\_resume\\_start\(\)](#)) are unconditionally mapped into the user task configured in the vCPU state.

To resume into another address space, the capability to the target [Task](#) (or [L4::Vm](#)) must be set in [l4\\_vcpu\\_state\\_t::user\\_task](#) together with [L4\\_VCPU\\_F\\_USER\\_MODE](#). The capability selector must have all lower bits clear (see [L4\\_CAP\\_MASK](#)). The kernel adds the [L4\\_SYSF\\_SEND](#) flag there to indicate that the capability has been referenced in the kernel. Consecutive resumes will not reference the task capability again until all lower bits are cleared again. To release a task use a different task capability or use an invalid capability with the [L4\\_SYSF\\_REPLY](#) flag set.

#### 13.1.10.13.4.1 Detailed Description

API for Thread Control method.

The thread control API provides access to almost any parameter of a thread object. The API is based on a single invocation of the thread object. However, because of the huge amount of parameters, the API provides a set of functions to set specific parameters of a thread and a commit function to commit the thread control call (see [l4\\_thread\\_control\\_commit\(\)](#)).

A thread control operation must always start with [l4\\_thread\\_control\\_start\(\)](#) and be committed with [l4\\_thread\\_control\\_commit\(\)](#). All other thread control parameter setter functions must be called between these two functions.

An example for a sequence of thread control API calls can be found below.

```
l4\_thread\_control\_start\(\);
l4\_thread\_control\_pager\(pager\_cap\);
l4\_thread\_control\_bind \(thread\_utcb, task\);
l4\_thread\_control\_commit\(thread\_cap\);
```

#### 13.1.10.13.4.2 Function Documentation

##### **[l4\\_thread\\_control\\_alien\(\)](#)**

```
void l4_thread_control_alien (
    int on) [inline]
```

Enable alien mode.

##### **Parameters**

<i>on</i>	Boolean value defining the state of the feature.
-----------	--

For a thread in alien mode the kernel produces just an exception IPC for each IPC and exception caused by the alien thread instead of handling these events regularly. (Page faults of alien threads and interrupts occurring while the alien thread is running are always handled regularly.) While the alien thread is blocking, the exception handler can inspect and modify the state of the alien thread and potentially also the system call arguments. If the exception handler replies with [L4\\_PROTO\\_ALLOW\\_SYSCALL](#) as message tag, the kernel handles the next IPC or exception of the alien thread in a regular way. If the exception handler leaves certain thread state unchanged (in particular the instruction pointer), this will be the IPC or exception that caused the call of the exception handler. For a regularly processed IPC or exception of the alien thread the kernel also performs an exception IPC on kernel exit.

This feature can be used to attach a debugger to a thread and trace all object invocations and their results. It could also be used to handle other systems that use the same syscall instruction as [L4Re](#).

##### **Examples**

### **`l4_thread_control_bind()`**

```
void l4_thread_control_bind (
    l4_utcb_t * thread_utcb,
    l4_cap_idx_t task) [inline]
```

Bind the thread to a task.

#### **Parameters**

<i>thread_utcb</i>	The thread's UTCB address within the task it shall be bound to. The address must be aligned (architecture dependent; at least word aligned) and it must point to at least <a href="#">L4_UTCB_OFFSET</a> bytes of kernel-user memory.
<i>task</i>	The task the thread shall be bound to.

#### **Precondition**

The thread must not be bound to a task yet.

The capability `task` must have the permission [L4\\_CAP\\_FPAGE\\_S](#), otherwise the later call to [l4\\_thread\\_control\\_commit\(\)](#) will fail with [L4\\_EPERM](#).

A thread may execute code in the context of a task if and only if the thread is bound to the task. To actually start execution, [l4\\_thread\\_ex\\_regs\(\)](#) needs to be used. Execution in the context of the task means that the code has access to all the task's resources (and only those). The executed code itself must be one of those resources. A thread can be bound at most once to a task.

#### **Note**

The UTCBs of different threads in the same task should not overlap in order to prevent data corruption.

#### **Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 975 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### **l4\_thread\_control\_commit()**

```
l4_msgtag_t l4_thread_control_commit (
    l4_cap_idx_t thread) [inline]
```

Commit the thread control parameters.

#### **Parameters**

<i>thread</i>	Capability selector of target thread to commit to.
---------------	--

#### **Returns**

Syscall return tag containing one of the following return codes.

#### **Return values**

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_EINVAL</i>	Malformed thread control parameters.

#### **Precondition**

The capability `thread` must have the permission [L4\\_CAP\\_FPAGE\\_S](#). When using [l4\\_thread\\_control\\_bind\(\)](#), also the respective task capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

#### **Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 987 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

### **`l4_thread_control_exc_handler()`**

```
void l4_thread_control_exc_handler (
    l4_cap_idx_t exc_handler) [inline]
```

Set the exception handler.

#### **Parameters**

<i>exc_handler</i>	Capability selector invoked to send an exception IPC.
--------------------	---

#### **Note**

The exception-handler capability selector is interpreted in the task the thread is bound to (executes in).

#### **Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 968 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## **l4\_thread\_control\_pager()**

```
void l4_thread_control_pager (  
    l4_cap_idx_t pager) [inline]
```

Set the pager.

### **Parameters**

<i>pager</i>	Capability selector invoked to send a page-fault IPC.
--------------	---

### **Note**

The pager capability selector is interpreted in the task the thread is bound to (executes in).

### **Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 962 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

## **l4\_thread\_control\_start()**

```
void l4_thread_control_start (  
    void ) [inline]
```

Start a thread control API sequence.

This function starts a sequence of thread control API functions. After this functions any of following functions may be called in any order.

- [l4\\_thread\\_control\\_pager\(\)](#)
- [l4\\_thread\\_control\\_exc\\_handler\(\)](#)
- [l4\\_thread\\_control\\_bind\(\)](#)
- [l4\\_thread\\_control\\_alien\(\)](#)

To commit the changes to the thread [l4\\_thread\\_control\\_commit\(\)](#) must be called in the end.

**Note**

The thread control API calls store the parameters for the thread in the UTCB of the caller (see [l4\\_utcb\(\)](#)), this means between [l4\\_thread\\_control\\_start\(\)](#) and [l4\\_thread\\_control\\_commit\(\)](#) no functions that modify the UTCB contents must be called.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 956 of file [thread.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

*Offsets for vCPU state layouts.*

### 13.1.10.13.5.1 Detailed Description

vCPU API.

The vCPU API in [L4Re](#) implements virtual processors (vCPUs) on top of [L4::Thread](#). This API can be used for user level threading, operating system rehosting (see [L4Linux](#)) and virtualization.

You switch a thread into vCPU operation with [L4::Thread::vcpu\\_control](#).

In vCPU mode, incoming IPC can be redirected to a handler function. If an IPC is sent to the vCPU, the thread's normal execution is interrupted and the handler called. Which kind of IPC is redirected is specified by the [L4\\_vcpu\\_state\\_flags](#) set in the [l4\\_vcpu\\_state\\_t::state](#) field of [vcpu\\_state](#). All events enabled in the [vcpu\\_state](#) field are redirected to the handler. The handler is set via [l4\\_vcpu\\_state\\_t::entry\\_ip](#) and [l4\\_vcpu\\_state\\_t::entry\\_sp](#). IPC redirection works independent of "kernel" and "user" mode, but see [l4\\_vcpu\\_state\\_t::entry\\_sp](#). When the entry handler is called, the UTCB contains the result of the IPC and content normally found in CPU register is in [l4\\_vcpu\\_state\\_t::i](#).

Furthermore, the thread can execute in the context of different tasks, called the "kernel" and the "user" mode. The kernel task is the one to which the thread was originally bound via [L4::Thread::control\(\)](#). Execution starts in the kernel task and it is always switched to when the asynchronous IPC handler is invoked. When returning from the handler via [l4\\_thread\\_vcpu\\_resume\\_start\(\)](#) and [l4\\_thread\\_vcpu\\_resume\\_commit\(\)](#), a different user task can be specified by setting [l4\\_vcpu\\_state\\_t::user\\_task](#) and enabling the [L4\\_VCPU\\_F\\_USER\\_MODE](#) flag in [l4\\_vcpu\\_state\\_t::state](#). Note that the kernel may cache the user task internally, see [l4\\_thread\\_vcpu\\_resume\\_commit\(\)](#).

If the [L4\\_VCPU\\_F\\_USER\\_MODE](#) flag is enabled, the following flags will be automatically enabled in [l4\\_vcpu\\_state\\_t::state](#) on [L4::Thread::vcpu\\_resume\\_commit\(\)](#):

- [L4\\_VCPU\\_F\\_IRQ](#)
- [L4\\_VCPU\\_F\\_PAGE\\_FAULTS](#)
- [L4\\_VCPU\\_F\\_EXCEPTIONS](#)

When the kernel mode is entered, the following flags will be automatically disabled in [l4\\_vcpu\\_state\\_t::state](#):

- [L4\\_VCPU\\_F\\_IRQ](#)
- [L4\\_VCPU\\_F\\_PAGE\\_FAULTS](#)
- [L4\\_VCPU\\_F\\_USER\\_MODE](#)

Extended vCPU operation is used for hardware CPU virtualization. It can be enabled with [L4::Thread::vcpu\\_control\\_ext\(\)](#).

[vCPU Support Library](#) defines a convenience API for working with vCPUs.

### 13.1.10.13.5.2 Enumeration Type Documentation

#### L4\_vcpu\_state\_flags

```
enum L4_vcpu_state_flags
```

State flags of a vCPU.

#### Enumerator

L4_VCPU_F_IRQ	<p>Receiving of IRQs and IPC enabled. While this flag is not set, the corresponding vCPU thread will not receive any IPC and threads attempting to send an IPC to this thread will block (according to the selected send timeout).</p> <p><b>Note</b></p> <p>On <code>L4::Thread::vcpu_resume_commit()</code> this flag is automatically enabled in <code>l4_vcpu_state_t::state</code> if <code>L4_VCPU_F_USER_MODE</code> is enabled.</p> <p>When the kernel mode is entered, this flags is automatically disabled in <code>l4_vcpu_state_t::state</code>.</p>
L4_VCPU_F_PAGE_FAULTS	<p>Page faults enabled. If this flag is set, a page fault switches to kernel mode (potentially causing a VM exit) and calls the entry handler. If this flag is not set, a page fault generates a page fault IPC to the pager of the vCPU thread.</p> <p><b>Note</b></p> <p>IPC redirection for page faults controlled by this flag works independent of "kernel" and "user" mode.</p> <p>On <code>L4::Thread::vcpu_resume_commit()</code> this flag is automatically enabled in <code>l4_vcpu_state_t::state</code> if <code>L4_VCPU_F_USER_MODE</code> is enabled.</p> <p>When the kernel mode is entered, this flags is automatically disabled in <code>l4_vcpu_state_t::state</code>.</p>
L4_VCPU_F_EXCEPTIONS	<p>Exceptions enabled. If this flag is set, then, on the event of an exception, the vCPU switches to kernel mode (potentially causing a VM exit) and calls the entry handler. If this flag is not set, an exception generates an exception IPC to the exception handler of the vCPU thread.</p> <p><b>Note</b></p> <p>IPC redirection for exceptions controlled by this flag works independent of "kernel" and "user" mode.</p> <p>On <code>L4::Thread::vcpu_resume_commit()</code> this flag is automatically enabled in <code>l4_vcpu_state_t::state</code> if <code>L4_VCPU_F_USER_MODE</code> is enabled.</p>
L4_VCPU_F_USER_MODE	<p>User task will be used. If set, the vCPU switches to user mode on next <code>L4::Thread::vcpu_resume_commit()</code>. If clear, the vCPU stays in "kernel" mode.</p> <p><b>Note</b></p> <p>When the kernel mode is entered, this flags is automatically disabled in <code>l4_vcpu_state_t::state</code>.</p>

L4_VCPU_F_FPU_ENABLED	FPU enabled. This flag is only relevant if <a href="#">L4_VCPU_F_USER_MODE</a> is set. Setting this flag allows code in vCPU mode to use the FPU. IF this flag is not set, any FPU operation will trigger a corresponding exception (FPU fault).
-----------------------	--

Definition at line 101 of file [vcpu.h](#).

#### L4\_vcpu\_state\_offset [1/4]

enum [L4\\_vcpu\\_state\\_offset](#)

Offsets for vCPU state layouts.

##### Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 34 of file [\\_\\_vcpu-arch.h](#).

#### L4\_vcpu\_state\_offset [2/4]

enum [L4\\_vcpu\\_state\\_offset](#)

Offsets for vCPU state layouts.

##### Enumerator

L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 35 of file [\\_\\_vcpu-arch.h](#).

#### L4\_vcpu\_state\_offset [3/4]

enum [L4\\_vcpu\\_state\\_offset](#)

Offsets for vCPU state layouts.

##### Enumerator

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line 36 of file [\\_\\_vcpu-arch.h](#).

**L4\_vcpu\_state\_offset** [4/4]

enum [L4\\_vcpu\\_state\\_offset](#)

Offsets for vCPU state layouts.

**Enumerator**

L4_VCPU_OFFSET_EXT_STATE	Offset where extended state begins.
L4_VCPU_OFFSET_EXT_INFOS	Offset where extended infos begin.

Definition at line [34](#) of file [\\_\\_vcpu-arch.h](#).

**L4\_vcpu\_sticky\_flags**

enum [L4\\_vcpu\\_sticky\\_flags](#)

Sticky flags of a vCPU.

**Enumerator**

L4_VCPU_SF_IRQ_PENDING	An event is pending: Either an IRQ or another thread attempts to send an IPC to this vCPU thread.
------------------------	---

Definition at line [167](#) of file [vcpu.h](#).

**13.1.10.14 Thread groups**

C thread group interface, see [L4::Thread\\_group](#) for the C++ interface.

Collaboration diagram for Thread groups:

**Functions**

- [l4\\_msgtag\\_t l4\\_thread\\_group\\_add](#) ([l4\\_cap\\_idx\\_t](#) tg, [l4\\_cap\\_idx\\_t](#) thread) [L4\\_NOTHROW](#)  
*Add thread to a thread group.*
- [l4\\_msgtag\\_t l4\\_thread\\_group\\_remove](#) ([l4\\_cap\\_idx\\_t](#) tg, [l4\\_cap\\_idx\\_t](#) thread) [L4\\_NOTHROW](#)  
*Remove thread from a thread group.*

### 13.1.10.14.1 Detailed Description

C thread group interface, see [L4::Thread\\_group](#) for the C++ interface.

An [L4](#) thread group is a collection of threads used as indirection for IPC gate and IRQ objects such that these objects can have multiple receivers, from which the kernel selects one according to a policy.

The primary use case for thread groups are multi-threaded servers and CPU core local IRQ / IPC delivery.

A thread can be bound to at most one thread group. Before binding a thread to a thread group, the thread must be bound to a task. All threads bound to the same thread group must belong to the same task.

### 13.1.10.14.2 Function Documentation

#### 13.1.10.14.2.1 l4\_thread\_group\_add()

```
l4_msgtag_t l4_thread_group_add (  
    l4_cap_idx_t tg,  
    l4_cap_idx_t thread) [inline]
```

Add thread to a thread group.

#### Parameters

<i>tg</i>	Thread group object.
<i>thread</i>	Thread to add to the thread group.

Definition at line 114 of file [thread\\_group.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.14.2.2 l4\_thread\_group\_remove()

```
l4_msgtag_t l4_thread_group_remove (
    l4_cap_idx_t tg,
    l4_cap_idx_t thread) [inline]
```

Remove thread from a thread group.

##### Parameters

<i>tg</i>	Thread group object.
<i>thread</i>	Thread to remove from the thread group.

Definition at line 121 of file [thread\\_group.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

#### 13.1.10.15 Virtual Console

C Virtual console interface for simple character based input and output, see [L4::Vcon](#) for the C++ interface.

Collaboration diagram for Virtual Console:

##### Data Structures

*Get attributes of *this* virtual console.*
- void l4\_vcon\_set\_attr\_raw (l4\_vcon\_attr\_t \*attr) L4\_NOTHROW  
*Set terminal attributes to disable all special processing.*

### 13.1.10.15.1 Detailed Description

C Virtual console interface for simple character based input and output, see [L4::Vcon](#) for the C++ interface.

The interrupt for read events is provided by the virtual key interrupt which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

A server implementing the virtual console protocol has a queue for input events. When the first input event is added to the empty queue, the virtual key interrupt is triggered. Further events are added to the queue without generating further interrupts. The queue is emptied when a client reads all queued input events.

#### Include File

```
#include <l4/sys/vcon.h>
```

See [L4::Vcon](#) for the C++ interface.

### 13.1.10.15.2 Typedef Documentation

#### 13.1.10.15.2.1 l4\_vcon\_attr\_t

```
typedef struct l4_vcon_attr_t l4_vcon_attr_t
```

Vcon attribute structure.

The flags members can be a combination of their respective enums.

### 13.1.10.15.3 Enumeration Type Documentation

#### 13.1.10.15.3.1 L4\_vcon\_i\_flags

enum [L4\\_vcon\\_i\\_flags](#)

Input flags.

##### Enumerator

L4_VCON_INLCR	Translate NL to CR.
L4_VCON_IGNCR	Ignore CR.
L4_VCON_ICRNL	Translate CR to NL if L4_VCON_IGNCR is not set.

Definition at line [208](#) of file [vcon.h](#).

#### 13.1.10.15.3.2 L4\_vcon\_l\_flags

enum [L4\\_vcon\\_l\\_flags](#)

Local flags.

##### Enumerator

L4_VCON_ICANON	Canonical mode.
L4_VCON_ECHO	Echo input.

Definition at line [230](#) of file [vcon.h](#).

#### 13.1.10.15.3.3 L4\_vcon\_o\_flags

enum [L4\\_vcon\\_o\\_flags](#)

Output flags.

##### Enumerator

L4_VCON_ONLCR	Translate NL to CR-NL.
L4_VCON_OCRNL	Translate CR to NL.
L4_VCON_ONLRET	Do not output CR.

Definition at line [219](#) of file [vcon.h](#).

### 13.1.10.15.3.4 L4\_vcon\_size\_consts

```
enum L4_vcon_size_consts
```

Size constants.

#### Enumerator

L4_VCON_WRITE_SIZE	Maximum size that can be written with one l4_vcon_write call.
L4_VCON_READ_SIZE	Maximum size that can be read with one l4_vcon_read* call.

Definition at line 95 of file [vcon.h](#).

### 13.1.10.15.4 Function Documentation

#### 13.1.10.15.4.1 l4\_vcon\_get\_attr()

```
l4_msgtag_t l4_vcon_get_attr (
    l4_cap_idx_t vcon,
    l4_vcon_attr_t * attr) [inline]
```

Get attributes of a Vcon.

#### Parameters

	<i>vcon</i>	Vcon object.
out	<i>attr</i>	Attribute structure.

#### Returns

Syscall return tag

#### Examples

[examples/sys/isr/main.c](#).

Definition at line 435 of file [vcon.h](#).

References [L4\\_NOTHROW](#), [l4\\_utcb\(\)](#), and [l4\\_vcon\\_get\\_attr\\_u\(\)](#).

Here is the call graph for this function:

13.1.10.15.4.2 `l4_vcon_get_attr_u()`

```
l4_msgtag_t l4_vcon_get_attr_u (
    l4_cap_idx_t vcon,
    l4_vcon_attr_t * attr,
    l4_utcb_t * utcb) [inline]
```

Get attributes of this virtual console.

**Parameters**

	<i>vcon</i>	Capability index of the vcon object.
out	<i>attr</i>	Attribute structure. Contains the attributes after a successful call of this function.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

Definition at line 417 of file [vcon.h](#).

References [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_NOTHROW](#), [L4\\_PROTO\\_LOG](#), [L4\\_VCON\\_GET\\_ATTR\\_OP](#), and [l4\\_msg\\_regs\\_t::mr](#).

Here is the caller graph for this function:

#### 13.1.10.15.4.3 l4\_vcon\_read()

```
int l4_vcon_read (
    l4_cap_idx_t vcon,
    char * buf,
    unsigned size) [inline]
```

Read data from virtual console.

##### Parameters

	<i>vcon</i>	Vcon object.
out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of buffer in bytes.

##### Return values

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>&gt;size</code>	More bytes to read, <code>size</code> bytes are in the buffer <code>buf</code> .
<code>&lt;=size</code>	Number of bytes read.

##### Precondition

The capability `vcon` must have the permission `L4_CAP_FPAGE_W`.

##### Note

Size must not exceed `L4_VCON_READ_SIZE`.

##### Examples

[examples/sys/isr/main.c](#).

Definition at line 391 of file [vcon.h](#).

References [L4\\_NOTHROW](#), [l4\\_utcb\(\)](#), and [l4\\_vcon\\_read\\_u\(\)](#).

Here is the call graph for this function:

13.1.10.15.4.4 `l4_vcon_read_u()`

```
int l4_vcon_read_u (
    l4_cap_idx_t vcon,
    char * buf,
    unsigned size,
    l4_utcb_t * utcb) [inline]
```

Read data from this virtual console.

**Parameters**

	<i>vcon</i>	Capability index of the vcon object.
out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of the data buffer in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Return values**

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>&gt;size</code>	More bytes to read, <code>size</code> bytes are in the buffer <code>buf</code> .
<code>&lt;=size</code>	Number of bytes read.

**Precondition**

The invoked Vcon capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

**Note**

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

Definition at line 381 of file [vcon.h](#).

References [L4\\_NOTHROW](#), and [L4\\_VCON\\_READ\\_SIZE\\_MASK](#).

Referenced by [l4\\_vcon\\_read\(\)](#), and [L4::Vcon::read\(\)](#).

Here is the caller graph for this function:

#### 13.1.10.15.4.5 l4\_vcon\_read\_with\_flags()

```
int l4_vcon_read_with_flags (
    l4_cap_idx_t vcon,
    char * buf,
    unsigned size) [inline]
```

Read data from virtual console, extended version including flags.

##### Parameters

	<i>vcon</i>	Vcon object.
out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of buffer in bytes.

If this function returns a positive value the caller can check the [L4\\_VCON\\_READ\\_STAT\\_BREAK](#) flag bit for a break condition. The bytes read can be obtained by masking the return value with [L4\\_VCON\\_READ\\_SIZE\\_MASK](#).

If a break condition is signaled, it is always the first event in the transmitted content, i.e. all characters supplied by this read call follow the break condition.

*buf* might be a NULL, in this case the input data will be dropped.

##### Note

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

##### Return values

<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&gt;size</i>	More bytes to read, <i>size</i> bytes are in the buffer <i>buf</i> .
<i>&lt;=size</i>	Number of bytes read.

##### Precondition

The capability *vcon* must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

Definition at line [375](#) of file [vcon.h](#).

References [L4\\_NOTHROW](#), and [l4\\_utcb\(\)](#).

Here is the call graph for this function:

13.1.10.15.4.6 `l4_vcon_send()`

```
l4_msgtag_t l4_vcon_send (
    l4_cap_idx_t vcon,
    char const * buf,
    unsigned size) [inline]
```

Send data to virtual console.

**Parameters**

<i>vcon</i>	Vcon object.
<i>buf</i>	Pointer to data buffer.
<i>size</i>	Size of buffer in bytes.

**Returns**

Syscall return tag

**Note**

Size must not exceed `L4_VCON_WRITE_SIZE`, a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use `l4_ipc_error()` to check for send errors, and **do not** use `l4_error()`.

**Examples**

[examples/sys/utcb-ipc/main.c](#).

Definition at line 315 of file [vcon.h](#).

References [L4\\_NOTHROW](#), [l4\\_utcb\(\)](#), and [l4\\_vcon\\_send\\_u\(\)](#).

Here is the call graph for this function:

#### 13.1.10.15.4.7 l4\_vcon\_send\_u()

```
l4_msgtag_t l4_vcon_send_u (
    l4_cap_idx_t vcon,
    char const * buf,
    unsigned size,
    l4_utcb_t * utcb) [inline]
```

Send data to this virtual console.

##### Parameters

<i>vcon</i>	Capability index of the Vcon object.
<i>buf</i>	Pointer to the data buffer.
<i>size</i>	Size of the data buffer in bytes.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

##### Returns

Syscall return tag

##### Note

Size must not exceed [L4\\_VCON\\_WRITE\\_SIZE](#), a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use [l4\\_ipc\\_error\(\)](#) to check for send errors, do not use [l4\\_error\(\)](#), as [l4\\_error\(\)](#) will always return an error.

### 13.1.11.1 Detailed Description

Kernel Interface Page.

C interface for the Kernel Interface Page:

C++ interface for the Kernel Interface Page:

#### Include File

```
#include <l4/sys/kip>
```

#### Include File

```
#include <l4/sys/kip.h>
```

### 13.1.11.2 Typedef Documentation

#### 13.1.11.2.1 l4\_kernel\_info\_t

```
typedef struct l4_kernel_info_t l4_kernel_info_t
```

[L4 Kernel Interface Page](#).

32-bit architecture may assume that the upper 32 bits of addresses is 0

### 13.1.11.3 Enumeration Type Documentation

#### 13.1.11.3.1 anonymous enum

```
anonymous enum
```

#### Enumerator

L4_KIP_OFFS_READ_US	Offset of KIP code (provided by the kernel) for reading the KIP clock in microseconds. If the kernel is configured for a fine-grained KIP clock (CONFIG_SYNC↔TSC enabled for IA32, ARM_SYNC_CLOCK for ARM), this code provides the KIP clock with microseconds granularity and accuracy by reading the hardware clock used by the kernel and transforming this value into microseconds. Otherwise this code just reads the KIP clock value.
L4_KIP_OFFS_READ_NS	Offset of KIP code (provided by the kernel) for reading the time stamp counter and transforming this value into nanoseconds. If the kernel is configured for fine-grained KIP clock (CONFIG_SYNC enabled for IA32, ARM_SYNC_CLOCK for ARM), this code provides the KIP clock with nanoseconds granularity and accuracy by reading the hardware clock used by the kernel and transforming this value into nanoseconds. Otherwise this code just reads the KIP clock value and multiplies it by 1000.

Definition at line 95 of file [kip.h](#).

### 13.1.11.4 Function Documentation

#### 13.1.11.4.1 l4\_kernel\_info\_version\_offset()

```
int l4_kernel_info_version_offset (
    l4_kernel_info_t const * kip) [inline]
```

Return offset in bytes of version\_strings relative to the KIP base.

##### Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

##### Returns

offset of version\_strings relative to the KIP base address, in bytes.

Definition at line 238 of file [kip.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4\\_kip\\_version\\_string\(\)](#).

Here is the caller graph for this function:

#### 13.1.11.4.2 l4\_kip()

```
l4_kernel_info_t const * l4_kip (
    void ) [inline]
```

Get Kernel Info Page.

##### Returns

Pointer to Kernel Info Page (KIP) structure.

Definition at line 226 of file [kip.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4re\\_kip\(\)](#).

Here is the caller graph for this function:

#### 13.1.11.4.3 l4\_kip\_clock()

```
l4_cpu_time_t l4_kip_clock (
    l4_kernel_info_t const * kip) [inline]
```

Return clock value from the KIP.

##### Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

##### Returns

Value of the clock field in the KIP.

The KIP clock always contains the current (relative) time in micro seconds independently of the CPU frequency. The clock is only guaranteed to be accurate within the scheduling granularity announced in the KIP.

This function basically calls the KIP code for reading the KIP clock with microseconds resolution. The accuracy depends on the platform and the kernel configuration.

##### See also

[L4\\_KIP\\_OFFS\\_READ\\_US](#).

##### Examples

[examples/libs/shmc/prodcons.c](#).

Definition at line 242 of file [kip.h](#).

References [L4\\_KIP\\_OFFS\\_READ\\_US](#), and [L4\\_NOTHROW](#).

Referenced by [l4\\_kip\\_clock\\_lw\(\)](#), [L4::Poll\\_timeout\\_kipclock::set\(\)](#), and [L4::Poll\\_timeout\\_kipclock::test\(\)](#).

Here is the caller graph for this function:

#### 13.1.11.4.4 l4\_kip\_clock\_lw()

```
l4_umword_t l4_kip_clock_lw (
    l4_kernel_info_t const * kip) [inline]
```

Return least significant machine word of clock value from the KIP.

##### Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

##### Returns

Lower machine word of clock value from the KIP.

**Deprecated** Use [l4\\_kip\\_clock\(\)](#) instead.

This function will always provide the least significant machine word of the clock value from the KIP, regardless of the kernel configuration.

Definition at line 261 of file [kip.h](#).

References [l4\\_kip\\_clock\(\)](#), and [L4\\_NOTHROW](#).

Here is the call graph for this function:

#### 13.1.11.4.5 l4\_kip\_clock\_ns()

```
l4_cpu_time_t l4_kip_clock_ns (
    l4_kernel_info_t const * kip) [inline]
```

Return current clock using the KIP in nanoseconds.

##### Parameters

<i>kip</i>	Pointer to the kernel info page (KIP).
------------	--

##### Returns

Value of the current clock in nanoseconds.

This function basically calls the KIP code for reading the KIP clock with nanoseconds resolution. The accuracy depends on the platform and the kernel configuration.

##### See also

[L4\\_KIP\\_OFFS\\_READ\\_NS](#).

Definition at line 252 of file [kip.h](#).

#### 13.1.11.4.6 l4\_kip\_version()

```
l4_umword_t l4_kip_version (
    l4_kernel_info_t const * kip) [inline]
```

Get the kernel version.

##### Parameters

<i>kip</i>	Kernel Info Page.
------------	-------------------

##### Returns

Kernel version string. 0 if KIP could not be mapped.

Definition at line 230 of file [kip.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.11.4.7 l4\_kip\_version\_string()

```
const char * l4_kip_version_string (
    l4_kernel_info_t const * kip) [inline]
```

Get the kernel version string.

##### Parameters

<i>kip</i>	Kernel Info Page.
------------	-------------------

##### Returns

Kernel version string.

Definition at line 234 of file [kip.h](#).

References [l4\\_kernel\\_info\\_version\\_offset\(\)](#), and [L4\\_NOTHROW](#).

*Get virtual flag of the memory descriptor.*

### 13.1.11.5.1 Detailed Description

C Interface for KIP memory descriptors.

#### Include File

```
#include <l4/sys/memdesc.h>
```

This module contains the C functions to access the memory descriptor in the kernel interface page (KIP).

### 13.1.11.5.2 Typedef Documentation

#### 13.1.11.5.2.1 l4\_kernel\_info\_mem\_desc\_t

```
typedef struct l4_kernel_info_mem_desc_t l4_kernel_info_mem_desc_t
```

Memory descriptor data structure.

#### Note

This data type is opaque, and must be accessed by the accessor functions defined in this module.

### 13.1.11.5.3 Enumeration Type Documentation

#### 13.1.11.5.3.1 I4\_mem\_archspecific\_sub\_type\_common\_t

```
enum I4_mem_archspecific_sub_type_common_t
```

Memory sub types for I4\_mem\_type\_archspecific descriptors.

##### Enumerator

I4_mem_archspecific_acpi_tables	Firmware ACPI tables.
I4_mem_archspecific_acpi_nvs	Firmware reserved address space.

Definition at line 63 of file [memdesc.h](#).

#### 13.1.11.5.3.2 I4\_mem\_info\_sub\_type\_t

```
enum I4_mem_info_sub_type_t
```

Memory sub types for I4\_mem\_type\_info descriptors.

##### Enumerator

I4_mem_info_acpi_rsdp	Physical address of the ACPI root pointer.
I4_mem_reserved_kernel	Kernel image.
I4_mem_reserved_heap	Kernel heap.
I4_mem_reserved_mmio	MMIO range reserved by kernel.

Definition at line 50 of file [memdesc.h](#).

#### 13.1.11.5.3.3 I4\_mem\_type\_t

```
enum I4_mem_type_t
```

Type of a memory descriptor.

##### Enumerator

I4_mem_type_undefined	Undefined, unused descriptor.
I4_mem_type_conventional	Conventional memory.
I4_mem_type_reserved	Reserved memory for kernel etc.
I4_mem_type_dedicated	Dedicated memory (some device memory).
I4_mem_type_shared	Shared memory (not implemented).
I4_mem_type_info	Info from the boot loader.
I4_mem_type_bootloader	Memory owned by the boot loader.

<code>l4_mem_type_archspecific</code>	Architecture specific memory (e.g., ACPI memory).
---------------------------------------	---

Definition at line 33 of file [memdesc.h](#).

#### 13.1.11.5.4 Function Documentation

##### 13.1.11.5.4.1 `l4_kernel_info_get_mem_desc_end()`

```
l4_umword_t l4_kernel_info_get_mem_desc_end (
    l4_kernel_info_mem_desc_t * md) [inline]
```

Get end address of the region described by the memory descriptor.

##### Returns

End address.

Definition at line 219 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

##### 13.1.11.5.4.2 `l4_kernel_info_get_mem_desc_is_virtual()`

```
l4_umword_t l4_kernel_info_get_mem_desc_is_virtual (
    l4_kernel_info_mem_desc_t * md) [inline]
```

Get virtual flag of the memory descriptor.

##### Returns

1 if region is virtual memory, 0 if region is physical memory

Definition at line 240 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

##### 13.1.11.5.4.3 `l4_kernel_info_get_mem_desc_start()`

```
l4_umword_t l4_kernel_info_get_mem_desc_start (
    l4_kernel_info_mem_desc_t * md) [inline]
```

Get start address of the region described by the memory descriptor.

##### Returns

Start address.

Definition at line 212 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.11.5.4.4 l4\_kernel\_info\_get\_mem\_desc\_subtype()

```
l4_umword_t l4_kernel_info_get_mem_desc_subtype (  
    l4_kernel_info_mem_desc_t * md) [inline]
```

Get sub-type of memory region.

##### Returns

Sub-type.

The sub type is defined for architecture specific memory descriptors (see [l4\\_mem\\_type\\_archspecific](#)) and has architecture specific meaning.

Definition at line 233 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.11.5.4.5 l4\_kernel\_info\_get\_mem\_desc\_type()

```
l4_umword_t l4_kernel_info_get_mem_desc_type (  
    l4_kernel_info_mem_desc_t * md) [inline]
```

Get type of the memory region.

##### Returns

Type of the region (see [l4\\_mem\\_type\\_t](#)).

Definition at line 226 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.11.5.4.6 l4\_kernel\_info\_get\_num\_mem\_descs()

```
unsigned l4_kernel_info_get_num_mem_descs (  
    l4_kernel_info_t * kip) [inline]
```

Get number of memory descriptors in KIP.

##### Returns

Number of memory descriptors.

Definition at line 190 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.11.5.4.7 l4\_kernel\_info\_set\_mem\_desc()

```
void l4_kernel_info_set_mem_desc (
    l4_kernel_info_mem_desc_t * md,
    l4_addr_t start,
    l4_addr_t end,
    unsigned type,
    unsigned virt,
    unsigned sub_type) [inline]
```

Populate a memory descriptor.

##### Parameters

<i>md</i>	Pointer to memory descriptor
<i>start</i>	Start of region
<i>end</i>	End of region
<i>type</i>	Type of region
<i>virt</i>	1 if virtual region, 0 if physical region
<i>sub_type</i>	Sub type.

Definition at line 197 of file [memdesc.h](#).

References [L4\\_NOTHROW](#).

## 13.1.12 Capabilities

C interface for capabilities.

Collaboration diagram for Capabilities:

### Macros

- **#define L4\_CAP\_SHIFT**  
*Capability index shift.*
- **#define L4\_CAP\_OFFSET**  
*Offset of two consecutive capability selectors.*
- **#define L4\_CAP\_MASK**  
*Mask to get only the relevant bits of an [l4\\_cap\\_idx\\_t](#).*

## Typedefs

- typedef unsigned long [l4\\_cap\\_idx\\_t](#)  
*Capability selector type.*

## Enumerations

- enum [l4\\_default\\_caps\\_t](#) {  
[L4\\_BASE\\_TASK\\_CAP](#) , [L4\\_BASE\\_FACTORY\\_CAP](#) , [L4\\_BASE\\_THREAD\\_CAP](#) , [L4\\_BASE\\_PAGER\\_CAP](#) ,  
[L4\\_BASE\\_LOG\\_CAP](#) , [L4\\_BASE\\_ICU\\_CAP](#) , [L4\\_BASE\\_SCHEDULER\\_CAP](#) , [L4\\_BASE\\_IOMMU\\_CAP](#) ,  
[L4\\_BASE\\_DEBUGGER\\_CAP](#) , [L4\\_BASE\\_ARM\\_SMCCC\\_CAP](#) , [L4\\_BASE\\_CAPS\\_LAST\\_P1](#) , [L4\\_BASE\\_CAPS\\_LAST](#)  
= [L4\\_BASE\\_CAPS\\_LAST\\_P1](#) - 1 }  
*Default capabilities setup for the initial tasks.*

## Functions

- unsigned [l4\\_is\\_invalid\\_cap](#) ([l4\\_cap\\_idx\\_t](#) c) [L4\\_NOTHROW](#)  
*Test if a capability selector is the invalid capability.*
- unsigned [l4\\_is\\_valid\\_cap](#) ([l4\\_cap\\_idx\\_t](#) c) [L4\\_NOTHROW](#)  
*Test if a capability selector is a valid selector.*
- unsigned [l4\\_capability\\_equal](#) ([l4\\_cap\\_idx\\_t](#) c1, [l4\\_cap\\_idx\\_t](#) c2) [L4\\_NOTHROW](#)  
*Test if the capability indices of two capability selectors are equal.*

### 13.1.12.1 Detailed Description

C interface for capabilities.

Add

```
#include <l4/sys/types.h>
#include <l4/sys/consts.h>
```

to your code to use the functions and definitions explained here.

### 13.1.12.2 Typedef Documentation

#### 13.1.12.2.1 [l4\\_cap\\_idx\\_t](#)

```
typedef unsigned long l4\_cap\_idx\_t
```

Capability selector type.

A capability selector is either a (shifted) capability index or the invalid capability selector [L4\\_INVALID\\_CAP](#).

Usage of the invalid capability selector is defined only for invoking IPC (see [Object Invocation](#)): When IPC is invoked on [L4\\_INVALID\\_CAP](#), then it is resolved to a capability for the current thread with full permissions.

Otherwise, the API assumes that each argument of type [l4\\_cap\\_idx\\_t](#) is a capability index, i.e., `idx << L4\_CAP\_SHIFT` for arbitrary `idx`. The behavior for other arguments is then undefined.

## Examples

[examples/libs/shmc/prodcons.c](#), [examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 352 of file [types.h](#).

### 13.1.12.3 Enumeration Type Documentation

#### 13.1.12.3.1 l4\_default\_caps\_t

```
enum l4_default_caps_t
```

Default capabilities setup for the initial tasks.

These capability selectors are setup per default by the micro kernel for the two initial tasks, the Root-Pager (Sigma0) and the Root-Task (Moe).

#### Attention

These constants do not have any particular meaning for applications started by Moe, see [Initial Environment](#) for this kind of information.

#### See also

[Initial Environment](#) for information useful for normal user applications.

#### Enumerator

L4_BASE_TASK_CAP	Capability selector for the current task.
L4_BASE_FACTORY_CAP	Capability selector for the factory.
L4_BASE_THREAD_CAP	Capability selector for the first thread.
L4_BASE_PAGER_CAP	Capability selector for the pager gate. For Sigma0, the pager is not present since it never raises page faults. For Moe, the pager is set to Sigma0.
L4_BASE_LOG_CAP	Capability selector for the log object. Present if the corresponding feature is turned on in the microkernel configuration.
L4_BASE_ICU_CAP	Capability selector for the base icu object.
L4_BASE_SCHEDULER_CAP	Capability selector for the scheduler cap.
L4_BASE_IOMMU_CAP	Capability selector for the IO-MMU cap. Present if the microkernel detected an IO-MMU.
L4_BASE_DEBUGGER_CAP	Capability selector for the debugger cap. Present if the corresponding feature is turned on in the microkernel configuration.
L4_BASE_ARM_SMCCC_CAP	Capability selector for the ARM SMCCC cap. Present if the microkernel detected an ARM SMC capable trusted execution environment.
L4_BASE_CAPS_LAST	Last capability index used for base capabilities.

Definition at line 322 of file [consts.h](#).

### 13.1.12.4 Function Documentation

#### 13.1.12.4.1 l4\_capability\_equal()

```
unsigned l4_capability_equal (
    l4_cap_idx_t c1,
    l4_cap_idx_t c2) [inline]
```

Test if the capability indices of two capability selectors are equal.

#### Parameters

<i>c1</i>	Capability selector.
<i>c2</i>	Capability selector.

#### Return values

0	The index parts of the capability selectors differ.
1	The index parts of the capability selectors are equal.

#### Precondition

Both capability selectors must be valid (cf. [l4\\_is\\_valid\\_cap\(\)](#)) otherwise the return value is undefined.

Definition at line 413 of file [types.h](#).

References [L4\\_CAP\\_SHIFT](#), and [L4\\_NOTHROW](#).

#### 13.1.12.4.2 l4\_is\_invalid\_cap()

```
unsigned l4_is_invalid_cap (
    l4_cap_idx_t c) [inline]
```

Test if a capability selector is the invalid capability.

#### Parameters

<i>c</i>	Capability selector
----------	---------------------

#### Return values

0	The capability selector is not the invalid capability.
>0	The capability selector is the invalid capability.

#### Examples

[examples/libs/l4re/c/ma+rm.c](#), [examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 405 of file [types.h](#).

References [L4\\_NOTHROW](#).

#### 13.1.12.4.3 l4\_is\_valid\_cap()

```
unsigned l4_is_valid_cap (
    l4_cap_idx_t c) [inline]
```

Test if a capability selector is a valid selector.

##### Parameters

<i>c</i>	Capability selector
----------	---------------------

##### Return values

0	The capability selector is not valid.
>0	The capability selector is valid.

Definition at line 409 of file [types.h](#).

References [L4\\_NOTHROW](#).

Referenced by [L4Re::Util::Cap\\_alloc\\_base::free\(\)](#), and [L4Re::Util::Counting\\_cap\\_alloc< COUNTERTYPE, Dbg >::free\(\)](#).

#### 13.1.13 Memory Operations

Operations for memory access.

Collaboration diagram for Memory Operations:

## Enumerations

- enum [L4\\_mem\\_op\\_widths](#) { [L4\\_MEM\\_WIDTH\\_1BYTE](#) = 0 , [L4\\_MEM\\_WIDTH\\_2BYTE](#) = 1 , [L4\\_MEM\\_WIDTH\\_4BYTE](#) = 2 }

*Memory access width definitions.*

## Functions

- unsigned long [l4\\_mem\\_read](#) (unsigned long virtaddress, unsigned width)  
*Read user task memory from kernel privilege level.*
- void [l4\\_mem\\_write](#) (unsigned long virtaddress, unsigned width, unsigned long value)  
*Write user task memory from kernel privilege level.*

### 13.1.13.1 Detailed Description

Operations for memory access.

This module provides functionality to access user task memory from the kernel. This is needed for some devices that are only accessible from privileged processor mode. Only use this when absolutely required. This functionality is only available on the ARM architecture.

```
#include <l4/sys/mem_op.h>
```

### 13.1.13.2 Enumeration Type Documentation

#### 13.1.13.2.1 L4\_mem\_op\_widths

```
enum L4\_mem\_op\_widths
```

Memory access width definitions.

#### Enumerator

<a href="#">L4_MEM_WIDTH_1BYTE</a>	Access one byte (8-bit width).
<a href="#">L4_MEM_WIDTH_2BYTE</a>	Access two bytes (16-bit width).
<a href="#">L4_MEM_WIDTH_4BYTE</a>	Access four bytes (32-bit width).

Definition at line [40](#) of file [mem\\_op.h](#).

### 13.1.13.3 Function Documentation

#### 13.1.13.3.1 l4\_mem\_read()

```
unsigned long l4_mem_read (  
    unsigned long virtaddress,  
    unsigned width)    [inline]
```

Read user task memory from kernel privilege level.

##### Parameters

<i>virtaddress</i>	Virtual address in the calling task.
<i>width</i>	Width of access in bytes in log2,

##### See also

[L4\\_mem\\_op\\_widths](#)

##### Returns

Read value.

Upon an given invalid address or invalid width value the function does nothing.

Definition at line 130 of file [mem\\_op.h](#).

References [l4\\_mem\\_arm\\_op\\_call\(\)](#).

Here is the call graph for this function:

#### 13.1.13.3.2 l4\_mem\_write()

```
void l4_mem_write (  
    unsigned long virtaddress,  
    unsigned width,  
    unsigned long value)    [inline]
```

Write user task memory from kernel privilege level.

### Parameters

<i>virtaddress</i>	Virtual address in the calling task.
<i>width</i>	Width of access in bytes in log2 (i.e. allowed values: 0, 1, 2)
<i>value</i>	Value to write.

Upon an given invalid address or invalid width value the function does nothing.

Definition at line 136 of file [mem\\_op.h](#).

References [l4\\_mem\\_arm\\_op\\_call\(\)](#).

Here is the call graph for this function:

### 13.1.14.1 Detailed Description

#### Include File

```
#include <l4/sys/l4int.h>
```

## 13.2 EDID parsing functionality

### Enumerations

- enum [Libedid\\_consts](#) { [Libedid\\_block\\_size](#) = 128 }  
*EDID constants.*

### Functions

- int [libedid\\_check\\_header](#) (const unsigned char \*edid)  
*Check for valid EDID header.*
- int [libedid\\_checksum](#) (const unsigned char \*edid)  
*Calculates the EDID checksum.*
- unsigned [libedid\\_version](#) (const unsigned char \*edid)  
*Returns the EDID version number.*
- unsigned [libedid\\_revision](#) (const unsigned char \*edid)  
*Returns the EDID revision number.*
- void [libedid\\_pnp\\_id](#) (const unsigned char \*edid, unsigned char \*id)  
*Extracts the display's PnP ID.*
- void [libedid\\_preferred\\_resolution](#) (const unsigned char \*edid, unsigned \*w, unsigned \*h)  
*Extract the display's preferred mode.*
- unsigned [libedid\\_num\\_ext\\_blocks](#) (const unsigned char \*edid)  
*Get the number of EDID extension blocks.*
- unsigned [libedid\\_dump\\_standard\\_timings](#) (const unsigned char \*edid)  
*Dump the standard timings to stdout.*
- void [libedid\\_dump](#) (const unsigned char \*edid)  
*Dump raw EDID data to stdout.*

### 13.2.1 Detailed Description

### 13.2.2 Enumeration Type Documentation

#### 13.2.2.1 Libedid\_consts

```
enum Libedid\_consts
```

EDID constants.

#### Enumerator

---

<code>Libedid_block_size</code>	Size of one EDID block in bytes.
---------------------------------	----------------------------------

Definition at line 23 of file [edid.h](#).

### 13.2.3 Function Documentation

#### 13.2.3.1 `libedid_check_header()`

```
int libedid_check_header (  
    const unsigned char * edid)
```

Check for valid EDID header.

##### Parameters

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

##### Returns

0 if the header is correct, -EINVAL otherwise

#### 13.2.3.2 `libedid_checksum()`

```
int libedid_checksum (  
    const unsigned char * edid)
```

Calculates the EDID checksum.

##### Parameters

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

##### Returns

0 if checksum is correct, -EINVAL otherwise

### 13.2.3.3 libedid\_dump()

```
void libedid_dump (
    const unsigned char * edid)
```

Dump raw EDID data to stdout.

#### Parameters

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

### 13.2.3.4 libedid\_dump\_standard\_timings()

```
unsigned libedid_dump_standard_timings (
    const unsigned char * edid)
```

Dump the standard timings to stdout.

#### Parameters

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

#### Returns

Number of standard timings stored in EDID

### 13.2.3.5 libedid\_num\_ext\_blocks()

```
unsigned libedid_num_ext_blocks (
    const unsigned char * edid)
```

Get the number of EDID extension blocks.

#### Parameters

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

#### Returns

Number of EDID extension blocks

### 13.2.3.6 libedid\_pnp\_id()

```
void libedid_pnp_id (
    const unsigned char * edid,
    unsigned char * id)
```

Extracts the display's PnP ID.

#### Parameters

	<i>edid</i>	Pointer to a 128byte EDID block
out	<i>id</i>	Return the PnP id. Must point to 4 bytes.

### 13.2.3.7 libedid\_preferred\_resolution()

```
void libedid_preferred_resolution (
    const unsigned char * edid,
    unsigned * w,
    unsigned * h)
```

Extract the display's preferred mode.

#### Parameters

	<i>edid</i>	Pointer to a 128byte EDID block
out	<i>w</i>	X resolution of preferred video mode in pixels.
out	<i>h</i>	Y resolution of preferred video mode in pixels.

### 13.2.3.8 libedid\_revision()

```
unsigned libedid_revision (
    const unsigned char * edid)
```

Returns the EDID revision number.

#### Parameters

<i>edid</i>	Pointer to a 128 EDID block
-------------	-----------------------------

#### Returns

Revision number

### 13.2.3.9 libedid\_version()

```
unsigned libedid_version (
    const unsigned char * edid)
```

Returns the EDID version number.

#### Parameters

<i>edid</i>	Pointer to a 128byte EDID block
-------------	---------------------------------

#### Returns

Version number

## 13.3 IO interface

#### Typedefs

- typedef [l4vbus\\_resource\\_t](#) [l4io\\_resource\\_t](#)  
*Resource descriptor.*
- typedef [l4vbus\\_device\\_t](#) [l4io\\_device\\_t](#)  
*Device descriptor.*

#### Enumerations

- enum [l4io\\_iomem\\_flags\\_t](#) {  
[L4IO\\_MEM\\_NONCACHED](#) = 0 , [L4IO\\_MEM\\_CACHED](#) = 1 , [L4IO\\_MEM\\_USE\\_MTRR](#) = 2 , [L4IO\\_MEM\\_ATTR\\_MASK](#) = 0xf ,  
[L4IO\\_MEM\\_WRITE\\_COMBINED](#) = [L4IO\\_MEM\\_USE\\_MTRR](#) | [L4IO\\_MEM\\_CACHED](#) , [L4IO\\_MEM\\_USE\\_RESERVED\\_AREA](#) = 0x40 << 8 , [L4IO\\_MEM\\_EAGER\\_MAP](#) = 0x80 << 8 }  
*Flags for IO memory.*
- enum [l4io\\_device\\_types\\_t](#) {

*Find a device by name.*
- int [l4io\\_lookup\\_resource](#) ([l4io\\_device\\_handle\\_t](#) devhandle, enum [l4io\\_resource\\_types\\_t](#) type, [l4io\\_resource\\_handle\\_t](#) \*reshandle, [l4io\\_resource\\_t](#) \*res)  
*Request a specific resource from a device description.*
- [l4\\_addr\\_t](#) [l4io\\_request\\_resource\\_iomem](#) ([l4io\\_device\\_handle\\_t](#) devhandle, [l4io\\_resource\\_handle\\_t](#) \*reshandle)  
*Request IO memory.*
- int [l4io\\_has\\_resource](#) (enum [l4io\\_resource\\_types\\_t](#) type, [l4vbus\\_paddr\\_t](#) start, [l4vbus\\_paddr\\_t](#) end)  
*Check if a resource is available.*

### 13.3.1 Detailed Description

### 13.3.2 Typedef Documentation

#### 13.3.2.1 [l4io\\_resource\\_t](#)

```
typedef l4vbus\_resource\_t l4io\_resource\_t
```

Resource descriptor.

For IRQ types, the end field is not used, i.e. only a single interrupt can be described with a [l4io\\_resource\\_t](#)

Definition at line 67 of file [types.h](#).

### 13.3.3 Enumeration Type Documentation

#### 13.3.3.1 [l4io\\_device\\_types\\_t](#)

```
enum l4io\_device\_types\_t
```

Device types.

## Enumerator

L4IO_DEVICE_INVALID	Invalid type.
L4IO_DEVICE_PCI	PCI device.
L4IO_DEVICE_USB	USB device.
L4IO_DEVICE_OTHER	Any other device without unique IDs.
L4IO_DEVICE_ANY	any type

Definition at line 36 of file [types.h](#).

### 13.3.3.2 l4io\_iomem\_flags\_t

enum [l4io\\_iomem\\_flags\\_t](#)

Flags for IO memory.

#### Enumerator

L4IO_MEM_NONCACHED	Non-cache memory.
L4IO_MEM_CACHED	Cache memory.
L4IO_MEM_USE_MTRR	Use MTRR.
L4IO_MEM_USE_RESERVED_AREA	Use reserved area for mapping I/O memory. Flag only valid for <a href="#">l4io_request_iomem_region()</a>
L4IO_MEM_EAGER_MAP	Eagerly map the I/O memory. Passthrough to the l4re-rm.

Definition at line 14 of file [types.h](#).

### 13.3.3.3 l4io\_resource\_types\_t

enum [l4io\\_resource\\_types\\_t](#)

Resource types.

#### Enumerator

L4IO_RESOURCE_INVALID	Invalid type.
L4IO_RESOURCE_IRQ	Interrupt resource.
L4IO_RESOURCE_MEM	I/O memory resource.
L4IO_RESOURCE_PORT	I/O port resource (x86 only).
L4IO_RESOURCE_ANY	any type

Definition at line 48 of file [types.h](#).

### 13.3.4 Function Documentation

#### 13.3.4.1 l4io\_has\_resource()

```
int l4io_has_resource (
    enum l4io_resource_types_t type,
    l4vbus_paddr_t start,
    l4vbus_paddr_t end)
```

Check if a resource is available.

##### Parameters

<i>type</i>	Type of resource
<i>start</i>	Minimal value.
<i>end</i>	Maximum value.

References [L4\\_INLINE](#).

#### 13.3.4.2 l4io\_lookup\_device()

```
int l4io_lookup_device (
    const char * devname,
    l4io_device_handle_t * dev_handle,
    l4io_device_t * dev,
    l4io_resource_handle_t * res_handle)
```

Find a device by name.

##### Parameters

	<i>devname</i>	Name of device.
out	<i>dev_handle</i>	Device handle for found device, can be NULL.
out	<i>dev</i>	Device information, filled by the function, can be NULL.
out	<i>res_handle</i>	Resource handle, can be NULL.

##### Returns

0 on success, error code otherwise

References [L4\\_CV](#), and [L4\\_EXPORT](#).

### 13.3.4.3 l4io\_lookup\_resource()

```
int l4io_lookup_resource (
    l4io_device_handle_t devhandle,
    enum l4io_resource_types_t type,
    l4io_resource_handle_t * reshandle,
    l4io_resource_t * res)
```

Request a specific resource from a device description.

#### Parameters

	<i>devhandle</i>	Device handle.
	<i>type</i>	Type of resource to request (see <a href="#">l4io_resource_types_t</a> ).
in, out	<i>reshandle</i>	Resource handle, start with handle returned by device functions. The next resource handle is returned here.
out	<i>res</i>	Device descriptor.

#### Returns

0 on success, error code otherwise, esp. -L4\_ENOENT if no more resources found

References [L4\\_CV](#), and [L4\\_EXPORT](#).

### 13.3.4.4 l4io\_release\_iomem()

```
long l4io_release_iomem (
    l4_addr_t virt,
    unsigned long size)
```

Release an IO memory region.

#### Parameters

<i>virt</i>	Virtual address of region to free, see <a href="#">l4io_request_iomem</a>
<i>size</i>	Size of the region to release.

#### Returns

0 on success, <0 on error

References [L4\\_CV](#), and [L4\\_EXPORT](#).

#### 13.3.4.5 `l4io_release_ioport()`

```
long l4io_release_ioport (
    unsigned portnum,
    unsigned len)
```

Release an IO port region.

##### Parameters

<i>portnum</i>	Start of port range to release
<i>len</i>	Length of range to request

##### Returns

0 on success, <0 on error

##### Note

X86 architecture only

References [L4\\_CV](#), [L4\\_EXPORT](#), and [L4\\_INLINE](#).

#### 13.3.4.6 `l4io_request_iomem()`

```
long l4io_request_iomem (
    l4_addr_t phys,
    unsigned long size,
    int flags,
    l4_addr_t * virt)
```

Request an IO memory region.

##### Parameters

	<i>phys</i>	Physical address of the I/O memory region
	<i>size</i>	Size of the region in Bytes, granularity pages.
	<i>flags</i>	See <a href="#">l4io_iomem_flags_t</a>
<i>in, out</i>	<i>virt</i>	Virtual address where the IO memory region should be mapped to. If the caller passes '0' a region in the caller's address space is searched and the virtual address is returned.

##### Return values

0	Success.
-L4_ENOENT	No area in the caller's address space could be found to map the IO memory region.
-L4_EPERM	Operation not allowed.
-L4_EINVAL	Invalid value.

<code>-L4_EADDRNOTAVAIL</code>	The requested virtual address is not available.
<code>-L4_ENOMEM</code>	The requested IO memory region could not be allocated.
<code>&lt;0</code>	IPC errors.

**Note**

This function uses [L4Re](#) functionality to reserve a part of the virtual address space of the caller.

References [L4\\_CV](#), and [L4\\_EXPORT](#).

**13.3.4.7 l4io\_request\_iomem\_region()**

```
long l4io_request_iomem_region (
    l4_addr_t phys,
    l4_addr_t virt,
    unsigned long size,
    int flags)
```

Request an IO memory region and map it to a specified region.

**Parameters**

<i>phys</i>	Physical address of the I/O memory region
<i>virt</i>	Virtual address.
<i>size</i>	Size of the region in Bytes, granularity pages.
<i>flags</i>	See <a href="#">l4io_iomem_flags_t</a>

**Return values**

<code>0</code>	Success.
<code>-L4_ENOENT</code>	No area could be found to map the IO memory region.
<code>-L4_EPERM</code>	Operation not allowed.
<code>-L4_EINVAL</code>	Invalid value.
<code>-L4_EADDRNOTAVAIL</code>	The requested virtual address is not available.
<code>-L4_ENOMEM</code>	The requested IO memory region could not be allocated.
<code>&lt;0</code>	IPC errors.

**Note**

This function uses [L4Re](#) functionality to reserve a part of the virtual address space of the caller.

References [L4\\_CV](#), and [L4\\_EXPORT](#).

#### 13.3.4.8 l4io\_request\_ioport()

```
long l4io_request_ioport (
    unsigned portnum,
    unsigned len)
```

Request an IO port region.

##### Parameters

<i>portnum</i>	Start of port range to request
<i>len</i>	Length of range to request

##### Returns

0 on success, <0 on error

##### Note

X86 architecture only

References [L4\\_CV](#), and [L4\\_EXPORT](#).

#### 13.3.4.9 l4io\_request\_resource\_iomem()

```
l4_addr_t l4io_request_resource_iomem (
    l4io_device_handle_t devhandle,
    l4io_resource_handle_t * reshandle)
```

Request IO memory.

##### Parameters

	<i>devhandle</i>	Device handle.
<i>in, out</i>	<i>reshandle</i>	Resource handle from which IO memory should be requested. Upon successful completion 'reshandle' points to the device's next resource.

##### Return values

0	An error occurred. The value of 'reshandle' is undefined.
>0	The virtual address of the IO memory mapping.

References [L4\\_CV](#), and [L4\\_EXPORT](#).

## 13.4 IPC Helpers

### Functions

- void [L4::throw\\_ipc\\_exception](#) ([L4::Cap](#)< void > const &o, [l4\\_msgtag\\_t](#) const &err, [l4\\_utcb\\_t](#) \*utcb)  
*Throw an [L4](#) IPC error as exception.*
- void [L4::throw\\_ipc\\_exception](#) (void const \*o, [l4\\_msgtag\\_t](#) const &err, [l4\\_utcb\\_t](#) \*utcb)  
*Throw an [L4](#) IPC error as exception.*

### 13.4.1 Detailed Description

### 13.4.2 Function Documentation

#### 13.4.2.1 throw\_ipc\_exception() [1/2]

```
void L4::throw_ipc_exception (
    L4::Cap< void > const & o,
    l4\_msgtag\_t const & err,
    l4\_utcb\_t * utcb) [inline]
```

Throw an [L4](#) IPC error as exception.

#### Parameters

<i>o</i>	The client side object, for which the IPC was invoked.
<i>err</i>	The IPC result code (error code).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

Definition at line [34](#) of file [ipc\\_helper](#).

References [l4\\_msgtag\\_t::has\\_error\(\)](#).

Referenced by [throw\\_ipc\\_exception\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 13.4.2.2 throw\_ipc\_exception() [2/2]

```
void L4::throw_ipc_exception (
    void const * o,
    l4_msgtag_t const & err,
    l4_utcb_t * utcb) [inline]
```

Throw an [L4](#) IPC error as exception.

#### Parameters

<i>o</i>	The client side object, for which the IPC was invoked.
<i>err</i>	The IPC result code (error code).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

Definition at line 50 of file [ipc\\_helper](#).

References [throw\\_ipc\\_exception\(\)](#).

## 13.5 IRQ handling library

Collaboration diagram for IRQ handling library:

#### Topics

- Interface using direct functionality. . . . . [460](#)
- Interface for asynchronous ISR handlers. . . . . [467](#)  
*This interface has just two (main) functions.*

### 13.5.1 Detailed Description

### 13.5.2 Interface using direct functionality.

Collaboration diagram for Interface using direct functionality.:

### Topics

- Interface using direct functionality. . . . . 465

### Functions

- `l4irq_t * l4irq_attach (int irqnum)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq_attach_ft (int irqnum, unsigned mode)`  
*Attach/connect to IRQ using given type.*
- `l4irq_t * l4irq_attach_thread (int irqnum, l4_cap_idx_t to_thread)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq_attach_thread_ft (int irqnum, l4_cap_idx_t to_thread, unsigned mode)`  
*Attach/connect to IRQ using given type.*
- `long l4irq_wait (l4irq_t *irq)`  
*Wait for specified IRQ.*
- `long l4irq_unmask_and_wait_any (l4irq_t *unmask_irq, l4irq_t **ret_irq)`  
*Unmask a specific IRQ and wait for any attached IRQ.*
- `long l4irq_wait_any (l4irq_t **irq)`  
*Wait for any attached IRQ.*
- `long l4irq_unmask (l4irq_t *irq)`  
*Unmask a specific IRQ.*
- `long l4irq_detach (l4irq_t *irq)`  
*Detach from IRQ.*

### 13.5.2.1 Detailed Description

### 13.5.2.2 Function Documentation

#### 13.5.2.2.1 l4irq\_attach()

```
l4irq_t * l4irq_attach (  
    int irqnum)
```

Attach/connect to IRQ.

##### Parameters

<i>irqnum</i>	IRQ number to request
---------------	-----------------------

##### Returns

Pointer to l4irq\_t structure, 0 on error

This l4irq\_attach has to be called in the same thread as l4irq\_wait and caller has to be a pthread thread.

##### Examples

[examples/libs/libirq/loop.c](#).

References [L4\\_CV](#).

#### 13.5.2.2.2 l4irq\_attach\_ft()

```
l4irq_t * l4irq_attach_ft (  
    int irqnum,  
    unsigned mode)
```

Attach/connect to IRQ using given type.

##### Parameters

<i>irqnum</i>	IRQ number to request
<i>mode</i>	Interrupt type,

##### See also

[L4\\_irq\\_mode](#)

##### Returns

Pointer to l4irq\_t structure, 0 on error

This l4irq\_attach has to be called in the same thread as l4irq\_wait and caller has to be a pthread thread.

References [L4\\_CV](#).

### 13.5.2.2.3 l4irq\_attach\_thread()

```
l4irq_t * l4irq_attach_thread (
    int irqnum,
    l4_cap_idx_t to_thread)
```

Attach/connect to IRQ.

#### Parameters

<i>irqnum</i>	IRQ number to request
<i>to_thread</i>	Attach IRQ to this specified thread.

#### Returns

Pointer to l4irq\_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

References [L4\\_CV](#).

### 13.5.2.2.4 l4irq\_attach\_thread\_ft()

```
l4irq_t * l4irq_attach_thread_ft (
    int irqnum,
    l4_cap_idx_t to_thread,
    unsigned mode)
```

Attach/connect to IRQ using given type.

#### Parameters

<i>irqnum</i>	IRQ number to request
<i>to_thread</i>	Attach IRQ to this specified thread.
<i>mode</i>	Interrupt type,

#### See also

[L4\\_irq\\_mode](#)

#### Returns

Pointer to l4irq\_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

References [L4\\_CV](#).

#### 13.5.2.2.5 l4irq\_detach()

```
long l4irq_detach (  
    l4irq_t * irq)
```

Detach from IRQ.

##### Parameters

<i>irq</i>	IRQ data structure
------------	--------------------

##### Returns

0 on success, != 0 on error

References [L4\\_CV](#).

#### 13.5.2.2.6 l4irq\_unmask()

```
long l4irq_unmask (  
    l4irq_t * irq)
```

Unmask a specific IRQ.

##### Parameters

<i>irq</i>	IRQ data structure
------------	--------------------

##### Returns

0 on success, != 0 on error

This function is useful if a thread wants to wait for multiple IRQs using `l4_ipc_wait`.

References [L4\\_CV](#).

#### 13.5.2.2.7 l4irq\_unmask\_and\_wait\_any()

```
long l4irq_unmask_and_wait_any (  
    l4irq_t * unmask_irq,  
    l4irq_t ** ret_irq)
```

Unmask a specific IRQ and wait for any attached IRQ.

##### Parameters

	<i>unmask_irq</i>	IRQ data structure for unmask.
--	-------------------	--------------------------------

out	<i>ret_irq</i>	Received interrupt.
-----	----------------	---------------------

**Returns**

0 on success, != 0 on error

References [L4\\_CV](#).

**13.5.2.2.8 l4irq\_wait()**

```
long l4irq_wait (
    l4irq_t * irq)
```

Wait for specified IRQ.

**Parameters**

<i>irq</i>	IRQ data structure
------------	--------------------

**Returns**

0 on success, != 0 on error

**Examples**

[examples/libs/libirq/loop.c](#).

References [L4\\_CV](#).

**13.5.2.2.9 l4irq\_wait\_any()**

```
long l4irq_wait_any (
    l4irq_t ** irq)
```

Wait for any attached IRQ.

**Return values**

<i>irq</i>	Received interrupt.
------------	---------------------

**Returns**

0 on success, != 0 on error

References [L4\\_CV](#).

### 13.5.2.3 Interface using direct functionality.

Collaboration diagram for Interface using direct functionality.:

## Functions

- `l4irq_t * l4irq_attach_cap (l4_cap_idx_t irqcap)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq_attach_cap_ft (l4_cap_idx_t irqcap, unsigned mode)`  
*Attach/connect to IRQ using given type.*
- `l4irq_t * l4irq_attach_thread_cap (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread)`  
*Attach/connect to IRQ.*
- `l4irq_t * l4irq_attach_thread_cap_ft (l4_cap_idx_t irqcap, l4_cap_idx_t to_thread, unsigned mode)`  
*Attach/connect to IRQ using given type.*

#### 13.5.2.3.1 Detailed Description

#### 13.5.2.3.2 Function Documentation

##### 13.5.2.3.2.1 l4irq\_attach\_cap()

```
l4irq_t * l4irq_attach_cap (
    l4_cap_idx_t irqcap)
```

Attach/connect to IRQ.

#### Parameters

<code>irqcap</code>	IRQ capability
---------------------	----------------

#### Returns

Pointer to `l4irq_t` structure, 0 on error

This `l4irq_attach` has to be called in the same thread as `l4irq_wait` and caller has to be a pthread thread.

References [L4\\_CV](#).

### 13.5.2.3.2.2 l4irq\_attach\_cap\_ft()

```
l4irq_t * l4irq_attach_cap_ft (
    l4_cap_idx_t irqcap,
    unsigned mode)
```

Attach/connect to IRQ using given type.

#### Parameters

<i>irqcap</i>	IRQ capability
<i>mode</i>	Interrupt type,

See also

[L4\\_irq\\_mode](#)

#### Returns

Pointer to l4irq\_t structure, 0 on error

This l4irq\_attach has to be called in the same thread as l4irq\_wait and caller has to be a pthread thread.

References [L4\\_CV](#).

### 13.5.2.3.2.3 l4irq\_attach\_thread\_cap()

```
l4irq_t * l4irq_attach_thread_cap (
    l4_cap_idx_t irqcap,
    l4_cap_idx_t to_thread)
```

Attach/connect to IRQ.

#### Parameters

<i>irqcap</i>	IRQ capability
<i>to_thread</i>	Attach IRQ to this thread.

#### Returns

Pointer to l4irq\_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

References [L4\\_CV](#).

#### 13.5.2.3.2.4 l4irq\_attach\_thread\_cap\_ft()

```
l4irq_t * l4irq_attach_thread_cap_ft (
    l4_cap_idx_t irqcap,
    l4_cap_idx_t to_thread,
    unsigned mode)
```

Attach/connect to IRQ using given type.

##### Parameters

<i>irqcap</i>	IRQ capability
<i>to_thread</i>	Attach IRQ to this thread.
<i>mode</i>	Interrupt type,

##### See also

[L4\\_irq\\_mode](#)

##### Returns

Pointer to l4irq\_t structure, 0 on error

The pointer to the IRQ structure is used as a label in the IRQ object.

References [L4\\_CV](#).

### 13.5.3 Interface for asynchronous ISR handlers.

This interface has just two (main) functions.

Collaboration diagram for Interface for asynchronous ISR handlers.:

##### Topics

- [Interface for asynchronous ISR handlers with a given IRQ capability.](#) . . . . . 469  
*This group is just an enhanced version to [l4irq\\_request\(\)](#) which takes a capability object instead of a plain number.*

## Functions

- `l4irq_t * l4irq_request` (int irqnum, void(\*isr\_handler)(void \*), void \*isr\_data, int irq\_thread\_prio, unsigned mode)  
*Attach asynchronous ISR handler to IRQ.*
- `long l4irq_release` (l4irq\_t \*irq)  
*Release asynchronous ISR handler and free resources.*

### 13.5.3.1 Detailed Description

This interface has just two (main) functions.

`l4irq_request` to install a handler for an interrupt and `l4irq_release` to uninstall the handler again and release all resources associated with it.

### 13.5.3.2 Function Documentation

#### 13.5.3.2.1 `l4irq_release()`

```
long l4irq_release (
    l4irq_t * irq)
```

Release asynchronous ISR handler and free resources.

#### Parameters

<i>irq</i>	IRQ data structure
------------	--------------------

#### Returns

0 success, != 0 failure

#### Examples

[examples/libs/libirq/async\\_isr.c](#).

References [L4\\_CV](#).

**13.5.3.2.2 l4irq\_request()**

```
l4irq_t * l4irq_request (
    int irqnum,
    void(* isr_handler ) (void *),
    void * isr_data,
    int irq_thread_prio,
    unsigned mode)
```

Attach asynchronous ISR handler to IRQ.

**Parameters**

<i>irqnum</i>	IRQ number to request
<i>isr_handler</i>	Handler routine that is called when an interrupt triggers
<i>isr_data</i>	Pointer given as argument to isr_handler
<i>irq_thread_prio</i>	L4 thread priority of the ISR handler. Give -1 for same priority as creator.
<i>mode</i>	Interrupt type,

**See also**

[L4\\_irq\\_mode](#)

**Returns**

Pointer to l4irq\_t structure, 0 on error

**Examples**

[examples/libs/libirq/async\\_isr.c](#).

References [L4\\_CV](#).

**13.5.3.3 Interface for asynchronous ISR handlers with a given IRQ capability.**

This group is just an enhanced version to [l4irq\\_request\(\)](#) which takes a capability object instead of a plain number.

Collaboration diagram for Interface for asynchronous ISR handlers with a given IRQ capability.:

## Functions

- `l4irq_t * l4irq_request_cap (l4_cap_idx_t irqcap, void(*isr_handler)(void *), void *isr_data, int irq_thread_prio, unsigned mode)`

*Attach asynchronous ISR handler to IRQ.*

### 13.5.3.3.1 Detailed Description

This group is just an enhanced version to `l4irq_request()` which takes a capability object instead of a plain number.

### 13.5.3.3.2 Function Documentation

#### 13.5.3.3.2.1 l4irq\_request\_cap()

```
l4irq_t * l4irq_request_cap (
    l4_cap_idx_t irqcap,
    void(* isr_handler ) (void *),
    void * isr_data,
    int irq_thread_prio,
    unsigned mode)
```

Attach asynchronous ISR handler to IRQ.

## Parameters

<i>irqcap</i>	IRQ capability
<i>isr_handler</i>	Handler routine that is called when an interrupt triggers
<i>isr_data</i>	Pointer given as argument to <i>isr_handler</i>
<i>irq_thread_prio</i>	L4 thread priority of the ISR handler. Give -1 for same priority as creator.
<i>mode</i>	Interrupt type,

## See also

[L4\\_irq\\_mode](#)

## Returns

Pointer to `l4irq_t` structure, 0 on error

## 13.6 L4 IPC Opcodes

List of protocol specific opcodes used for communication with [L4Re](#) and Kernel objects.

## Enumerations

- enum `L4_icu_opcode` {  
`L4_ICU_OP_BIND` , `L4_ICU_OP_UNBIND` , `L4_ICU_OP_INFO` , `L4_ICU_OP_MSI_INFO` ,  
`L4_ICU_OP_UNMASK` , `L4_ICU_OP_MASK` , `L4_ICU_OP_SET_MODE` }  
*Opcodes to the ICU interface.*
- enum `L4_ipc_gate_ops` { `L4_IPC_GATE_BIND_OP` = 0x10 , `L4_IPC_GATE_GET_INFO_OP` = 0x11 }  
*Operations on the IPC-gate.*

L4_ICU_OP_BIND	Bind opcode.  See also <a href="#">l4_icu_bind()</a>
L4_ICU_OP_UNBIND	Unbind opcode.  See also <a href="#">l4_icu_unbind()</a>
L4_ICU_OP_INFO	Info opcode.  See also <a href="#">l4_icu_info()</a>
L4_ICU_OP_MSI_INFO	Msi-info opcode.  See also <a href="#">l4_icu_msi_info()</a>
L4_ICU_OP_UNMASK	Unmask opcode.  See also <a href="#">l4_icu_unmask()</a>
L4_ICU_OP_MASK	Mask opcode.  See also <a href="#">l4_icu_mask()</a>
L4_ICU_OP_SET_MODE	Set-mode opcode.  See also <a href="#">l4_icu_set_mode()</a>

Definition at line 97 of file [icu.h](#).

### 13.6.2.2 L4\_ipc\_gate\_ops

enum [L4\\_ipc\\_gate\\_ops](#)

Operations on the IPC-gate.

#### Enumerator

L4_IPC_GATE_BIND_OP	Bind operation.
L4_IPC_GATE_GET_INFO_OP	Info operation.

Definition at line 108 of file [ipc\\_gate.h](#).

### 13.6.2.3 L4\_platform\_ctl\_ops

enum [L4\\_platform\\_ctl\\_ops](#)

Operations on platform-control objects.

See [L4\\_PROTO\\_PLATFORM\\_CTL](#) for the protocol type to use for messages to platform-control objects.

#### Enumerator

L4_PLATFORM_CTL_SYS_SUSPEND_OP	Suspend.
L4_PLATFORM_CTL_SYS_SHUTDOWN_OP	shutdown/reboot
L4_PLATFORM_CTL_CPU_ALLOW_SHUTDOWN_OP	allow CPU shutdown
L4_PLATFORM_CTL_CPU_ENABLE_OP	enable an offline CPU
L4_PLATFORM_CTL_CPU_DISABLE_OP	disable an online CPU
L4_PLATFORM_CTL_SET_TASK_ASID_OP	Arm: set task ASID.

Definition at line 159 of file [platform\\_control.h](#).

### 13.6.2.4 L4\_task\_ops

enum [L4\\_task\\_ops](#)

Operations on task objects.

#### Enumerator

L4_TASK_MAP_OP	Map.
L4_TASK_UNMAP_OP	Unmap.
L4_TASK_CAP_INFO_OP	Cap info.
L4_TASK_ADD_KU_MEM_OP	Add kernel-user memory.
L4_TASK_LDT_SET_X86_OP	x86: LDT set
L4_TASK_MAP_VGICC_ARM_OP	Arm: Map virtual GICC area.

Definition at line 341 of file [task.h](#).

### 13.6.2.5 L4\_thread\_ops

enum [L4\\_thread\\_ops](#)

Operations on thread objects.

#### Enumerator

L4_THREAD_CONTROL_OP	Control operation.
----------------------	--------------------

L4_THREAD_EX_REGS_OP	Exchange registers operation.
L4_THREAD_SWITCH_OP	Do a thread switch.
L4_THREAD_STATS_OP	Thread statistics.
L4_THREAD_VCPU_RESUME_OP	VCPU resume.
L4_THREAD_REGISTER_DELETE_IRQ_OP	Register an IPC-gate deletion IRQ.
L4_THREAD_MODIFY_SENDER_OP	Modify all senders IDs that match the given pattern.
L4_THREAD_VCPU_CONTROL_OP	Enable / disable VCPU feature.
L4_THREAD_REGISTER_DOORBELL_IRQ_OP	Register direct IRQ injection doorbell IRQ.
L4_THREAD_X86_GDT_OP	Gdt.
L4_THREAD_ARM_TPIDRURO_OP	Set TPIDRURO register.
L4_THREAD_AMD64_SET_SEGMENT_BASE_OP	Set segment base.
L4_THREAD_AMD64_GET_SEGMENT_INFO_OP	Get segment information.
L4_THREAD_OPCODE_MASK	Mask for opcodes.

Definition at line 732 of file [thread.h](#).

### 13.6.2.6 L4\_vcon\_ops

enum [L4\\_vcon\\_ops](#)

Operations on vcon objects.

#### Enumerator

L4_VCON_WRITE_OP	Write.
L4_VCON_READ_OP	Read.
L4_VCON_SET_ATTR_OP	Get console attributes.
L4_VCON_GET_ATTR_OP	Set console attributes.

Definition at line 291 of file [vcon.h](#).

### 13.7.2.1 Detailed Description

[L4](#) specific VIRTIO Transport layer.

The [L4](#) specific VIRTIO Transport layer is based on [L4Re::Dataspace](#) as shared memory and [L4::Irq](#) for signaling. The VIRTIO configuration space is mostly based on a shared memory implementation too and accompanied by two IPC functions to synchronize the configuration between device and driver.

### 13.7.2.2 Typedef Documentation

#### 13.7.2.2.1 [l4virtio\\_config\\_queue\\_t](#)

```
typedef struct l4virtio_config_queue_t l4virtio_config_queue_t
```

Queue configuration entry.

An array of such entries is available at the [l4virtio\\_config\\_hdr\\_t::queues\\_offset](#) in the config data space.

Consistency rules for the queue config are:

- A driver might read `num_max` at any time.
- A driver must write to `num`, `desc_addr`, `avail_addr`, and `used_addr` only when `ready` is zero (0). Values in these fields are validated and used by the device only after successfully setting `ready` to one (1), either by the IPC or by `L4VIRTIO_CMD_CFG_QUEUE`.
- The value of `device_notify_index` is valid only when `ready` is one.
- The driver might write to `device_notify_index` at any time, however the change is guaranteed to take effect after a successful `L4VIRTIO_CMD_CFG_QUEUE` or after a `config_queue` IPC. Note, the change might also have immediate effect, depending on the device implementation.

### 13.7.2.3 Enumeration Type Documentation

#### 13.7.2.3.1 L4\_virtio\_cmd

enum [L4\\_virtio\\_cmd](#)

Virtio commands for device configuration.

##### Enumerator

L4VIRTIO_CMD_NONE	No command pending.
L4VIRTIO_CMD_SET_STATUS	Set the status register.
L4VIRTIO_CMD_CFG_QUEUE	Configure a queue.
L4VIRTIO_CMD_CFG_CHANGED	Device config changed.
L4VIRTIO_CMD_NOTIFY_QUEUE	Configure a queue.
L4VIRTIO_CMD_MASK	Mask to get command bits.

Definition at line 122 of file [virtio.h](#).

#### 13.7.2.3.2 L4\_virtio\_irq\_status

enum [L4\\_virtio\\_irq\\_status](#)

VIRTIO IRQ status codes ([l4virtio\\_config\\_hdr\\_t::irq\\_status](#)).

##### Note

[l4virtio\\_config\\_hdr\\_t::irq\\_status](#) is currently unused.

##### Enumerator

L4VIRTIO_IRQ_STATUS_VRING	VRING IRQ pending flag.
L4VIRTIO_IRQ_STATUS_CONFIG	CONFIG IRQ pending flag.

Definition at line 113 of file [virtio.h](#).

#### 13.7.2.3.3 L4\_virtio\_opcodes

enum [L4\\_virtio\\_opcodes](#)

Opcodes to setup and configure a device.

##### Enumerator

L4VIRTIO_OP_SET_STATUS	Write device status register.
------------------------	-------------------------------

L4VIRTIO_OP_CONFIG_QUEUE	Configure queue.
L4VIRTIO_OP_REGISTER_DS	Register shared memory with device.
L4VIRTIO_OP_DEVICE_CONFIG	Get device config page.
L4VIRTIO_OP_GET_DEVICE_IRQ	Retrieve device notification IRQ.

Definition at line 52 of file [virtio.h](#).

#### 13.7.2.3.4 L4virtio\_device\_ids

enum [L4virtio\\_device\\_ids](#)

Virtio device IDs as reported in the driver's config space.

##### Enumerator

L4VIRTIO_ID_NET	Virtual ethernet card.
L4VIRTIO_ID_BLOCK	General block device.
L4VIRTIO_ID_CONSOLE	Simple device for data IO via ports.
L4VIRTIO_ID_RNG	Entropy source.
L4VIRTIO_ID_BALLOON	Memory ballooning device.
L4VIRTIO_ID_RPMMSG	Device using rpmsg protocol.
L4VIRTIO_ID_SCSI	SCSI host device.
L4VIRTIO_ID_9P	Device using 9P transport protocol.
L4VIRTIO_ID_RPROC_SERIAL	Rproc serial device.
L4VIRTIO_ID_CAIF	Device using CAIF network protocol.
L4VIRTIO_ID_GPU	GPU.
L4VIRTIO_ID_INPUT	Input.
L4VIRTIO_ID_VSOCK	Vsock transport.
L4VIRTIO_ID_CRYPT	Crypto.
L4VIRTIO_ID_FS	FS.
L4VIRTIO_ID_SCM	Scmi device.
L4VIRTIO_ID_I2C	I2C device.
L4VIRTIO_ID_WATCHDOG	Watchdog device.
L4VIRTIO_ID_CAN	CAN device.
L4VIRTIO_ID_GPIO	Gpio device.
L4VIRTIO_ID_SPI	SPI device.
L4VIRTIO_ID_SOCKET	Unofficial socket device.

Definition at line 62 of file [virtio.h](#).

### 13.7.2.3.5 L4virtio\_device\_status

enum [L4virtio\\_device\\_status](#)

Virtio device status bits.

#### Enumerator

L4VIRTIO_STATUS_ACKNOWLEDGE	Guest OS has found device.
L4VIRTIO_STATUS_DRIVER	Guest OS knows how to drive device.
L4VIRTIO_STATUS_DRIVER_OK	Driver is set up.
L4VIRTIO_STATUS_FEATURES_OK	Driver has acknowledged feature set.
L4VIRTIO_STATUS_DEVICE_NEEDS_RESET	Device detected fatal error.
L4VIRTIO_STATUS_FAILED	Driver detected fatal error.

Definition at line 90 of file [virtio.h](#).

### 13.7.2.3.6 L4virtio\_feature\_bits

enum [L4virtio\\_feature\\_bits](#)

L4virtio-specific feature bits.

#### Enumerator

L4VIRTIO_FEATURE_VERSION_1	Virtio protocol version 1 supported. Must be 1 for <a href="#">L4virtio</a> .
L4VIRTIO_FEATURE_CMD_CONFIG	Status and queue config are set via cmd field instead of via IPC.

Definition at line 101 of file [virtio.h](#).

## 13.7.2.4 Function Documentation

### 13.7.2.4.1 l4virtio\_config\_queue()

```
int l4virtio_config_queue (
    l4\_cap\_idx\_t cap,
    unsigned queue)
```

#### Parameters

<i>cap</i>	Capability to the VIRTIO host.
------------	--------------------------------

Trigger queue configuration of the given queue.

Usually all queues are configured when the status is written to running. However, in some cases queues shall be disabled or enabled dynamically, in this case this function triggers a reconfiguration from the shared memory register of the queue config.

**Parameters**

<i>queue</i>	Queue index for the queue to be configured.
--------------	---

**Return values**

<i>0</i>	on success.
<i>-L4_EIO</i>	The queue's status is invalid.
<i>-L4_ERANGE</i>	The queue index exceeds the number of queues.
<i>-L4_EINVAL</i>	Otherwise.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.7.2.4.2 l4virtio\_config\_queues()**

```
L4_BEGIN_DECLS l4virtio_config_queue_t * l4virtio_config_queues (
    l4virtio_config_hdr_t const * cfg) [inline]
```

Get the pointer to the first queue config.

**Parameters**

<i>cfg</i>	Pointer to the config header.
------------	-------------------------------

**Returns**

pointer to queue config of queue 0.

Definition at line 255 of file [virtio.h](#).

References [l4virtio\\_config\\_hdr\\_t::queues\\_offset](#).

**13.7.2.4.3 l4virtio\_device\_config()**

```
void * l4virtio_device_config (
    l4virtio_config_hdr_t const * cfg) [inline]
```

Get the pointer to the device configuration.

**Parameters**

<i>cfg</i>	Pointer to the config header.
------------	-------------------------------

**Returns**

pointer to device configuration structure.

Definition at line 266 of file [virtio.h](#).

#### 13.7.2.4.4 l4virtio\_device\_config\_ds()

```
int l4virtio_device_config_ds (
    l4_cap_idx_t cap,
    l4_cap_idx_t config_ds,
    l4_addr_t * ds_offset)
```

##### Parameters

<i>cap</i>	Capability to the L4-VIRTIO host
------------	----------------------------------

Get the dataspace with the [L4virtio](#) configuration page.

##### Parameters

<i>config_ds</i>	Capability for receiving the dataspace capability for the shared L4-VIRTIO config data space.
<i>ds_offset</i>	Offset into the dataspace where the device configuration structure starts.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.7.2.4.5 l4virtio\_device\_notification\_irq()

```
int l4virtio_device_notification_irq (
    l4_cap_idx_t cap,
    unsigned index,
    l4_cap_idx_t irq)
```

##### Parameters

<i>cap</i>	Capability to the L4-VIRTIO host
------------	----------------------------------

Get the notification interrupt corresponding to the given index.

##### Parameters

	<i>index</i>	Index of the interrupt.
out	<i>irq</i>	Triggerable for the given index.

##### Return values

<i>L4_EOK</i>	Success.
<i>L4_ENOSYS</i>	IRQ notification not supported by device.
<i>&lt;0</i>	Other error.

An index is only guaranteed to return an IRQ object when the index is set in one of the device notify index fields. The device must return the same interrupt for a given index as long as the index is in use. If an index disappears as a result of a configuration change and then is reused later, the interrupt is not guaranteed to be the same.

Interrupts must always be rerequested after a device reset.

References [L4\\_END\\_DECLS](#), and [L4\\_NOTHROW](#).

## 13.7.2.4.6 l4virtio\_register\_ds()

```
int l4virtio_register_ds (
    l4_cap_idx_t cap,
    l4_cap_idx_t ds_cap,
    l4_uint64_t base,
    l4_umword_t offset,
    l4_umword_t size)
```

## Parameters

<i>cap</i>	Capability to the VIRTIO host
------------	-------------------------------

Register a shared data space with VIRTIO host.

## Parameters

<i>ds_cap</i>	Dataspace capability to register. The lower 8 bits determine the rights mask with which the guest's rights are masked during the registration of the dataspace at the VIRTIO host.
<i>base</i>	VIRTIO guest physical start address of shared memory region
<i>offset</i>	Offset within the data space that is attached to the given <i>base</i> in the guest physical memory.
<i>size</i>	Size of the memory region in the guest

## Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	The <i>ds_cap</i> capability is invalid, does not refer to a valid dataspace, is not a trusted dataspace if trusted dataspace validation is enabled, or <i>size</i> and <i>offset</i> specify an invalid region.
<i>-L4_ENOMEM</i>	The limit of dataspaces that can be registered has been reached or no capability slot could be allocated.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.
<i>&lt; 0</i>	Any error returned by the dataspace when queried for information during setup or any error returned by the region manager from attaching the dataspace.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

## 13.7.2.4.7 l4virtio\_set\_status()

```
int l4virtio_set_status (
    l4_cap_idx_t cap,
    unsigned status)
```

## Parameters

<i>cap</i>	Capability to the VIRTIO host
------------	-------------------------------

Write the VIRTIO status register.

#### Parameters

<i>status</i>	Status word to write to the VIRTIO status.
---------------	--

#### Return values

0	on success.
---	-------------

#### Note

All other registers are accessed via shared memory.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

### 13.7.3 L4 VIRTIO Block Device

Collaboration diagram for L4 VIRTIO Block Device:

#### Data Structures

- struct [l4virtio\\_block\\_header\\_t](#)  
*Header structure of a request for a block device.*
- struct [l4virtio\\_block\\_discard\\_t](#)  
*Structure used for the write zeroes and discard commands.*
- struct [l4virtio\\_block\\_config\\_t](#)  
*Device configuration for block devices.*

#### Typedefs

- typedef struct [l4virtio\\_block\\_header\\_t](#) **[l4virtio\\_block\\_header\\_t](#)**  
*Header structure of a request for a block device.*
- typedef struct [l4virtio\\_block\\_discard\\_t](#) **[l4virtio\\_block\\_discard\\_t](#)**  
*Structure used for the write zeroes and discard commands.*

*Status of a finished block request.*
- enum `L4virtio_block_feature_bits`  
*Block device feature bits.*

### 13.7.3.1 Detailed Description

### 13.7.3.2 Enumeration Type Documentation

#### 13.7.3.2.1 L4virtio\_block\_operations

enum `L4virtio_block_operations`

Kinds of operation over a block device.

#### Enumerator

<code>L4VIRTIO_BLOCK_T_IN</code>	Read from device.
<code>L4VIRTIO_BLOCK_T_OUT</code>	Write to device.
<code>L4VIRTIO_BLOCK_T_FLUSH</code>	Flush data to disk.
<code>L4VIRTIO_BLOCK_T_GET_ID</code>	Get device ID.
<code>L4VIRTIO_BLOCK_T_DISCARD</code>	Discard a range of sectors.
<code>L4VIRTIO_BLOCK_T_WRITE_ZEROES</code>	Write zeroes to a range of sectors.

Definition at line 19 of file `virtio_block.h`.

#### 13.7.3.2.2 L4virtio\_block\_status

enum `L4virtio_block_status`

Status of a finished block request.

#### Enumerator

<code>L4VIRTIO_BLOCK_S_OK</code>	Request finished successfully.
<code>L4VIRTIO_BLOCK_S_IOERR</code>	IO error on device.
<code>L4VIRTIO_BLOCK_S_UNSUPP</code>	Operation is not supported.

Definition at line 32 of file `virtio_block.h`.

### 13.7.4 L4 VIRTIO Input Device

Collaboration diagram for L4 VIRTIO Input Device:

#### Data Structures

- struct [l4virtio\\_input\\_absinfo\\_t](#)  
*Information about the absolute axis in the underlying evdev implementation.*

### 13.7.5.1 Detailed Description

## 13.8 L4 Vbus functions

C interface of the Vbus API.

Collaboration diagram for L4 Vbus functions:

## Topics

- [L4vbus GPIO functions](#) . . . . . [497](#)
- [L4vbus PCI functions](#) . . . . . [508](#)
- [L4vbus power management functions](#) . . . . . [514](#)

## Enumerations

- enum `L4vbus_dma_domain_assign_flags` { `L4VBUS_DMAD_UNBIND` = 0 , `L4VBUS_DMAD_BIND` = 1 , `L4VBUS_DMAD_L4RE_DMA_SPACE` = 0 , `L4VBUS_DMAD_KERNEL_DMA_SPACE` = 2 }

*Flags for `l4vbus_assign_dma_domain()`.*

## Functions

- `L4_BEGIN_DECLS` int `l4vbus_get_device_by_hid` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` parent, `l4vbus_device_handle_t` \*child, char const \*hid, int depth, `l4vbus_device_t` \*devinfo)  
*Find a device by the hardware interface identifier (HID).*
- int `l4vbus_get_next_device` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` parent, `l4vbus_device_handle_t` \*child, int depth, `l4vbus_device_t` \*devinfo)  
*Find next child following `child`.*
- int `l4vbus_get_device` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` dev, `l4vbus_device_t` \*devinfo)  
*Obtain detailed information about a Vbus device.*
- int `l4vbus_get_resource` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` dev, unsigned res\_idx, `l4vbus_resource_t` \*res)  
*Obtain the resource description of an individual device resource.*
- int `l4vbus_is_compatible` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` dev, char const \*cid)  
*Check if the given device has a compatibility ID (CID) or HID that matches `cid`.*
- int `l4vbus_get_hid` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` dev, char \*hid, unsigned long max\_len)  
*Get the HID (hardware identifier) of a device.*
- int `l4vbus_get_adr` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` dev, `l4_uint32_t` \*adr)  
*Get the bus-specific address of a device.*
- int `l4vbus_request_ioport` (`l4_cap_idx_t` vbus, `l4vbus_resource_t` const \*res)  
*Request an IO port resource.*
- int `l4vbus_assign_dma_domain` (`l4_cap_idx_t` vbus, unsigned domain\_id, unsigned flags, `l4_cap_idx_t` dma\_space)  
*Bind or unbind a kernel [DMA space](#) or a `L4Re::Dma_space` to a DMA domain.*
- int `l4vbus_release_ioport` (`l4_cap_idx_t` vbus, `l4vbus_resource_t` const \*res)  
*Release a previously requested IO port resource.*
- int `l4vbus_vicu_get_cap` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` icu, `l4_cap_idx_t` cap)  
*Get capability of ICU.*

### 13.8.1 Detailed Description

C interface of the Vbus API.

The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an Icu ([Interrupt controller](#)) for interrupt handling.

The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

#### Include File

```
#include <l4/vbus/vbus.h>
```

Refer to [L4vbus](#) for the C++ API.

## 13.8.2 Enumeration Type Documentation

### 13.8.2.1 L4vbus\_dma\_domain\_assign\_flags

enum [L4vbus\\_dma\\_domain\\_assign\\_flags](#)

Flags for [l4vbus\\_assign\\_dma\\_domain\(\)](#).

#### Enumerator

L4VBUS_DMAD_UNBIND	Unbind the given DMA space from the DMA domain.
L4VBUS_DMAD_BIND	Bind the given DMA space to the DMA domain.
L4VBUS_DMAD_L4RE_DMA_SPACE	The given DMA space is an <a href="#">L4Re::Dma_space</a> .
L4VBUS_DMAD_KERNEL_DMA_SPACE	The given DMA space is a kernel DMA space ( <a href="#">L4::Task</a> ).

Definition at line [174](#) of file [vbus.h](#).

## 13.8.3 Function Documentation

### 13.8.3.1 l4vbus\_assign\_dma\_domain()

```
int l4vbus_assign_dma_domain (
    l4_cap_idx_t vbus,
    unsigned domain_id,
    unsigned flags,
    l4_cap_idx_t dma_space)
```

Bind or unbind a kernel [DMA space](#) or a [L4Re::Dma\\_space](#) to a DMA domain.

#### Parameters

<i>vbus</i>	Capability of the system bus
<i>domain_id</i>	DMA domain ID (resource address of DMA domain found on the vBUS). If the value is ~0U the DMA space of the whole vBUS is used.
<i>flags</i>	A combination of <a href="#">L4vbus_dma_domain_assign_flags</a> .
<i>dma_space</i>	The DMA space capability to bind or unbind, this must either be an <a href="#">L4Re::Dma_space</a> or a kernel <a href="#">DMA space</a> ( <a href="#">L4::Task</a> created with L4_PROTO_DMA_SPACE) and the type must be reflected in the <i>flags</i> .

#### Return values

<i>0</i>	Operation completed successfully.
<i>-L4_ENOENT</i>	The vbus does not support a global DMA domain or no DMA domain could be found.
<i>-L4_EINVAL</i>	Invalid argument used.
<i>-L4_EBUSY</i>	DMA domain is already active, this means another DMA space is already assigned.

References [L4\\_CV](#).

Referenced by [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), and [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#).

Here is the caller graph for this function:

### 13.8.3.2 l4vbus\_get\_adr()

```
int l4vbus_get_adr (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    l4_uint32_t * adr)
```

Get the bus-specific address of a device.

#### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>dev</i>	Handle of the device
out	<i>adr</i>	Address

#### Return values

<i>L4_EOK</i>	Success.
<i>-L4_ENOSYS</i>	Device has no valid address.

References [L4\\_CV](#).

### 13.8.3.3 l4vbus\_get\_device()

```
int l4vbus_get_device (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    l4vbus_device_t * devinfo)
```

Obtain detailed information about a Vbus device.

**Parameters**

	<i>vbus</i>	Capability of the vbus to which the device is connected.
	<i>dev</i>	Device handle of the device from which to retrieve the details.
out	<i>devinfo</i>	Information structure which contains details about the device. The pointer might be NULL.

**Return values**

<i>0</i>	Success.
<i>-L4_ENODEV</i>	No device with the given device handle <i>dev</i> could be found.

References [L4\\_CV](#).

Referenced by [L4vbus::Device::device\(\)](#).

Here is the caller graph for this function:

**13.8.3.4 l4vbus\_get\_device\_by\_hid()**

```

L4_BEGIN_DECLS int l4vbus_get_device_by_hid (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t parent,
    l4vbus_device_handle_t * child,
    char const * hid,
    int depth,
    l4vbus_device_t * devinfo)
  
```

Find a device by the hardware interface identifier (HID).

**Parameters**

<i>vbus</i>	Capability of the system bus
<i>parent</i>	Handle to the parent to start the search

This function searches the vbus for a device with the given HID and returns a handle to the first matching device. The HID usually conforms to an ACPI HID or a Linux device tree compatible identifier.

It is possible to have multiple devices with the same HID on a vbus. In order to find all matching devices this function has to be called repeatedly with *child* pointing to the device found in the previous iteration. The iteration starts at *child* that might be any device node in the tree.

**Parameters**

<i>in, out</i>	<i>child</i>	Handle of the device from where in the device tree the search should start. To start searching from the beginning <i>child</i> must be initialized using the default ( <a href="#">L4VBUS_NULL</a> ). If a matching device is found, its handle is returned through this parameter.
	<i>hid</i>	HID of the device
	<i>depth</i>	Maximum depth for the recursive lookup
<i>out</i>	<i>devinfo</i>	Device information structure (might be NULL)

**Return values**

<i>&gt;=0</i>	A device with the given HID was found.
<i>-L4_ENOENT</i>	No device with the given HID could be found on the vbus.
<i>-L4_EINVAL</i>	Invalid or no HID provided.
<i>-L4_ENODEV</i>	Function called on a non-existing device.

References [L4\\_CV](#).

Referenced by [L4vbus::Device::device\\_by\\_hid\(\)](#).

Here is the caller graph for this function:

**13.8.3.5 l4vbus\_get\_hid()**

```

int l4vbus_get_hid (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    char * hid,
    unsigned long max_len)

```

Get the HID (hardware identifier) of a device.

**Parameters**

<i>vbus</i>	Capability of the system bus
<i>dev</i>	Handle of the device
<i>hid</i>	Pointer to a buffer for the HID string

<i>max_len</i>	The size of the buffer ( <i>hid</i> )
----------------	---------------------------------------

**Returns**

the length of the HID string on success, else failure

References [L4\\_CV](#).

**13.8.3.6 l4vbus\_get\_next\_device()**

```
int l4vbus_get_next_device (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t parent,
    l4vbus_device_handle_t * child,
    int depth,
    l4vbus_device_t * devinfo)
```

Find next child following *child*.

**Parameters**

	<i>vbus</i>	Capability of the system bus
	<i>parent</i>	Handle to the parent device (use <a href="#">L4VBUS_ROOT_BUS</a> for the system bus)
in, out	<i>child</i>	Handle of the device that precedes the device that shall be returned. To start from the beginning, <i>child</i> must be initialized with <a href="#">L4VBUS_NULL</a> . If a device is found, its handle is returned through this parameter.
	<i>depth</i>	Depth to look for
out	<i>devinfo</i>	Device information (might be NULL)

**Returns**

0 on success, else failure

References [L4\\_CV](#).

Referenced by [L4vbus::Device::next\\_device\(\)](#).

Here is the caller graph for this function:

### 13.8.3.7 l4vbus\_get\_resource()

```
int l4vbus_get_resource (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    unsigned res_idx,
    l4vbus_resource_t * res)
```

Obtain the resource description of an individual device resource.

#### Parameters

	<i>vbus</i>	Capability of the vbus to which the device is connected.
	<i>dev</i>	Device handle of the device on the vbus. The device handle can be obtained by using the <a href="#">l4vbus_get_device_by_hid()</a> and <a href="#">l4vbus_get_next_device()</a> functions.
	<i>res_idx</i>	Index of the resource for which the resource description should be returned. The total number of resources for a device is available in the <a href="#">l4vbus_device_t</a> structure that is returned by <a href="#">L4vbus::Device::device_by_hid()</a> and <a href="#">L4vbus::Device::next_device()</a> .
out	<i>res</i>	Descriptor of the resource.

This function returns the resource descriptor of an individual device resource selected by the *res\_idx* parameter.

#### Return values

0	Success.
-L4_ENOENT	Invalid resource index <i>res_idx</i> .

References [L4\\_CV](#).

Referenced by [L4vbus::Device::get\\_resource\(\)](#).

Here is the caller graph for this function:

### 13.8.3.8 l4vbus\_is\_compatible()

```
int l4vbus_is_compatible (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t dev,
    char const * cid)
```

Check if the given device has a compatibility ID (CID) or HID that matches *cid*.

#### Parameters

<i>vbus</i>	Capability of the system bus
<i>dev</i>	device handle for which the CID shall be tested
<i>cid</i>	the compatibility ID to test

#### Returns

1 when the given ID (*cid*) matches this device, 0 when the given ID does not match, <0 on error.

References [L4\\_CV](#).

Referenced by [L4vbus::Device::is\\_compatible\(\)](#).

Here is the caller graph for this function:

#### 13.8.3.9 l4vbus\_release\_ioport()

```
int l4vbus_release_ioport (  
    l4_cap_idx_t vbus,  
    l4vbus_resource_t const * res)
```

Release a previously requested IO port resource.

#### Parameters

	<i>vbus</i>	Capability of the system bus.
in	<i>res</i>	The IO port resource to be released from the bus.

**Returns**

$\geq 0$  on success,  $< 0$  on error.

References [L4\\_CV](#).

Referenced by [L4vbus::Vbus::release\\_ioport\(\)](#).

Here is the caller graph for this function:

**13.8.3.10 l4vbus\_request\_ioport()**

```
int l4vbus_request_ioport (
    l4_cap_idx_t vbus,
    l4vbus_resource_t const * res)
```

Request an IO port resource.

**Parameters**

	<i>vbus</i>	Capability of the system bus.
in	<i>res</i>	The IO port resource to be requested from the bus.

**Return values**

0	Success.
-L4_EINVAL	Resource is not an IO port resource.
-L4_ENOENT	No matching IO port resource found.

If any IO port resource is found that contains the requested IO port range the IO ports are obtained.

Referenced by [L4vbus::Vbus::request\\_ioport\(\)](#).

Here is the caller graph for this function:

### 13.8.3.11 l4vbus\_vicu\_get\_cap()

```
int l4vbus_vicu_get_cap (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t icu,
    l4_cap_idx_t cap)
```

Get capability of ICU.

#### Parameters

<i>vbus</i>	Capability of the system bus.
<i>icu</i>	ICU device handle.
<i>cap</i>	Capability slot for the capability.

#### Returns

0 on success, else failure

References [L4\\_END\\_DECLS](#).

Referenced by [L4vbus::l4vbus\\_vicu\(\)](#).

Here is the caller graph for this function:

## 13.8.4 L4vbus GPIO functions

Collaboration diagram for L4vbus GPIO functions:

## Enumerations

- enum `L4vbus_gpio_generic_func` { `L4VBUS_GPIO_SETUP_INPUT` = 0x100 , `L4VBUS_GPIO_SETUP_OUTPUT` = 0x200 , `L4VBUS_GPIO_SETUP_IRQ` = 0x300 }

*Constants for generic GPIO functions.*

- enum `L4vbus_gpio_pull_modes` { `L4VBUS_GPIO_PIN_PULL_NONE` = 0x100 , `L4VBUS_GPIO_PIN_PULL_UP` = 0x200 , `L4VBUS_GPIO_PIN_PULL_DOWN` = 0x300 }

*Constants for generic GPIO pull up/down resistor configuration.*

## Functions

- int `l4vbus_gpio_setup` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned mode, int value)

*Configure the function of a GPIO pin.*

- int `l4vbus_gpio_config_pull` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned mode)

*Generic function to set pull up/down mode.*

- int `l4vbus_gpio_config_pad` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned func, unsigned value)

*Hardware specific configuration function.*

- int `l4vbus_gpio_config_get` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, unsigned func, unsigned \*value)

*Read hardware specific configuration.*

- int `l4vbus_gpio_get` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin)

*Read value of GPIO input pin.*

- int `l4vbus_gpio_set` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin, int value)

*Set GPIO output pin.*

- int `l4vbus_gpio_multi_setup` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned mask, unsigned mode, unsigned value)

*Configure function of multiple GPIO pins at once.*

- int `l4vbus_gpio_multi_config_pad` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned mask, unsigned func, unsigned value)

*Hardware specific configuration function for multiple GPIO pins.*

- int `l4vbus_gpio_multi_get` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned \*data)

*Read values of multiple GPIO pins at once.*

- int `l4vbus_gpio_multi_set` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned offset, unsigned mask, unsigned data)

*Set multiple GPIO output pins at once.*

- int `l4vbus_gpio_to_irq` (`l4_cap_idx_t` vbus, `l4vbus_device_handle_t` handle, unsigned pin)

*Create IRQ for GPIO pin.*

### 13.8.4.1 Detailed Description

### 13.8.4.2 Enumeration Type Documentation

#### 13.8.4.2.1 L4vbus\_gpio\_generic\_func

enum `L4vbus_gpio_generic_func`

Constants for generic GPIO functions.

#### Enumerator

L4VBUS_GPIO_SETUP_INPUT	Set GPIO pin to input.
L4VBUS_GPIO_SETUP_OUTPUT	Set GPIO pin to output.
L4VBUS_GPIO_SETUP_IRQ	Set GPIO pin to IRQ.

Definition at line 24 of file [vbus\\_gpio.h](#).

#### 13.8.4.2.2 L4vbus\_gpio\_pull\_modes

```
enum L4vbus_gpio_pull_modes
```

Constants for generic GPIO pull up/down resistor configuration.

#### Enumerator

L4VBUS_GPIO_PIN_PULL_NONE	No pull up or pull down resistors.
L4VBUS_GPIO_PIN_PULL_UP	enable pull up resistor
L4VBUS_GPIO_PIN_PULL_DOWN	enable pull down resistor

Definition at line 34 of file [vbus\\_gpio.h](#).

#### 13.8.4.3 Function Documentation

##### 13.8.4.3.1 l4vbus\_gpio\_config\_get()

```
int l4vbus_gpio_config_get (  
    l4_cap_idx_t vbus,  
    l4vbus_device_handle_t handle,  
    unsigned pin,  
    unsigned func,  
    unsigned * value)
```

Read hardware specific configuration.

#### Parameters

	<i>vbus</i>	V-BUS capability
	<i>handle</i>	Device handle for the GPIO chip
	<i>pin</i>	GPIO pin number
	<i>func</i>	Hardware specific configuration register to read from. Usually this is an offset to the GPIO chip's base address.
out	<i>value</i>	The configuration value.

**Returns**

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_pin::config\\_get\(\)](#).

Here is the caller graph for this function:

**13.8.4.3.2 l4vbus\_gpio\_config\_pad()**

```

int l4vbus_gpio_config_pad (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    unsigned func,
    unsigned value)
  
```

Hardware specific configuration function.

**Parameters**

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number
<i>func</i>	Hardware specific configuration register, usually offset to the GPIO chip's base address
<i>value</i>	Value which is written into the hardware specific configuration register for the specified pin

**Returns**

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_pin::config\\_pad\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.3 l4vbus\_gpio\_config\_pull()

```
int l4vbus_gpio_config_pull (  
    l4_cap_idx_t vbus,  
    l4vbus_device_handle_t handle,  
    unsigned pin,  
    unsigned mode)
```

Generic function to set pull up/down mode.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number
<i>mode</i>	mode for pull up/down resistors, see <a href="#">L4vbus_gpio_pull_modes</a>

##### Returns

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_pin::config\\_pull\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.4 l4vbus\_gpio\_get()

```
int l4vbus_gpio_get (  
    l4_cap_idx_t vbus,  
    l4vbus_device_handle_t handle,  
    unsigned pin)
```

Read value of GPIO input pin.

##### Parameters

<i>vbus</i>	V-BUS capability
-------------	------------------

<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number to read from

#### Returns

Value of GPIO pin (usually 0 or 1), negative error code otherwise.

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_pin::get\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.5 l4vbus\_gpio\_multi\_config\_pad()

```

int l4vbus_gpio_multi_config_pad (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned mask,
    unsigned func,
    unsigned value)
  
```

Hardware specific configuration function for multiple GPIO pins.

#### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>offset</i>	Pin corresponding to the LSB in <i>mask</i> . Note: allowed may be hardware specific.
<i>mask</i>	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
<i>func</i>	Hardware specific configuration register, usually offset to the GPIO chip's base address.
<i>value</i>	Value which is written into the hardware specific configuration register for the specified pins

**Returns**

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_module::config\\_pad\(\)](#).

Here is the caller graph for this function:

**13.8.4.3.6 l4vbus\_gpio\_multi\_get()**

```

int l4vbus_gpio_multi_get (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned * data)
  
```

Read values of multiple GPIO pins at once.

**Parameters**

	<i>vbus</i>	V-BUS capability
	<i>handle</i>	Device handle for the GPIO chip
	<i>offset</i>	Pin corresponding to the LSB in <i>data</i> . Note: allowed may be hardware specific.
out	<i>data</i>	Each bit returns the value (0 or 1) for the corresponding GPIO pin. The value of pins that are not accessible is undefined.

**Returns**

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_module::get\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.7 l4vbus\_gpio\_multi\_set()

```
int l4vbus_gpio_multi_set (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned mask,
    unsigned data)
```

Set multiple GPIO output pins at once.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>offset</i>	Pin corresponding to the LSB in <i>data</i> . Note: allowed may be hardware specific.
<i>mask</i>	Mask of GPIO pins to set. A bit set to 1 selects this pin. A maximum of 32 pins can be set at once. The real number depends on the hardware and the driver implementation.
<i>data</i>	Each bit corresponds to the GPIO pin in <i>mask</i> . The value of each bit is written to the GPIO pin if its bit in <i>mask</i> is set.

##### Returns

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_module::set\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.8 l4vbus\_gpio\_multi\_setup()

```
int l4vbus_gpio_multi_setup (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned offset,
    unsigned mask,
    unsigned mode,
    unsigned value)
```

Configure function of multiple GPIO pins at once.

#### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>offset</i>	Pin corresponding to the LSB in <i>mask</i> . Note: allowed may be hardware specific.
<i>mask</i>	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
<i>mode</i>	GPIO function, see <a href="#">L4vbus_gpio_generic_func</a> for generic functions. Hardware specific functions must be provided in the lower 8 bits.
<i>value</i>	Optional value to set the GPIO pins to if they are configured as output pins

#### Returns

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_module::setup\(\)](#).

Here is the caller graph for this function:

#### 13.8.4.3.9 l4vbus\_gpio\_set()

```

int l4vbus_gpio_set (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    int value)
  
```

Set GPIO output pin.

#### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number to write to

<i>value</i>	Value to write to the GPIO pin (usually 0 or 1)
--------------	---

**Returns**

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_pin::set\(\)](#).

Here is the caller graph for this function:

**13.8.4.3.10 l4vbus\_gpio\_setup()**

```

int l4vbus_gpio_setup (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned pin,
    unsigned mode,
    int value)
  
```

Configure the function of a GPIO pin.

**Parameters**

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin number
<i>mode</i>	GPIO function, see <a href="#">L4vbus_gpio_generic_func</a> for generic functions. Hardware specific functions must be provided in the lower 8 bits.
<i>value</i>	Optional value to set the GPIO pin to if it is configured as an output pin

**Returns**

0 if OK, error code otherwise

References [L4\\_CV](#).

Referenced by [L4vbus::Gpio\\_pin::setup\(\)](#).

Here is the caller graph for this function:

**13.8.4.3.11 l4vbus\_gpio\_to\_irq()**

```
int l4vbus_gpio_to_irq (  
    l4_cap_idx_t vbus,  
    l4vbus_device_handle_t handle,  
    unsigned pin)
```

Create IRQ for GPIO pin.

**Parameters**

<i>vbus</i>	V-BUS capability
<i>handle</i>	Device handle for the GPIO chip
<i>pin</i>	GPIO pin to create an IRQ for.

**Returns**

IRQ number if OK, negative error code otherwise

References [L4\\_END\\_DECLS](#).

Referenced by [L4vbus::Gpio\\_pin::to\\_irq\(\)](#).

### 13.8.5 L4vbus PCI functions

Collaboration diagram for L4vbus PCI functions:

#### Functions

- `L4_BEGIN_DECLS int l4vbus_pci_cfg_read (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width)`  
*Read from the vPCI configuration space using the PCI root bridge.*
- `int l4vbus_pci_cfg_write (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width)`  
*Write to the vPCI configuration space using the PCI root bridge.*
- `int l4vbus_pci_irq_enable (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t bus, l4_uint32_t devfn, int pin, unsigned char *trigger, unsigned char *polarity)`  
*Enable PCI interrupt for a specific device using the PCI root bridge.*
- `int l4vbus_pcidev_cfg_read (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t reg, l4_uint32_t *value, l4_uint32_t width)`  
*Read from the device's vPCI configuration space.*
- `int l4vbus_pcidev_cfg_write (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, l4_uint32_t reg, l4_uint32_t value, l4_uint32_t width)`  
*Write to the device's vPCI configuration space.*
- `int l4vbus_pcidev_irq_enable (l4_cap_idx_t vbus, l4vbus_device_handle_t handle, unsigned char *trigger, unsigned char *polarity)`  
*Enable the device's PCI interrupt.*

#### 13.8.5.1 Detailed Description

#### 13.8.5.2 Function Documentation

##### 13.8.5.2.1 l4vbus\_pci\_cfg\_read()

```

L4_BEGIN_DECLS int l4vbus_pci_cfg_read (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t bus,
    l4_uint32_t devfn,
    l4_uint32_t reg,
    l4_uint32_t * value,
    l4_uint32_t width)
  
```

Read from the vPCI configuration space using the PCI root bridge.

**Parameters**

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI root bridge
	<i>bus</i>	Bus number
	<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
	<i>reg</i>	Register in configuration space to read
out	<i>value</i>	Value that has been read
	<i>width</i>	Width to read in bits (e.g. 8, 16, 32)

**Returns**

0 on success, else failure

References [L4\\_CV](#).

Referenced by [L4vbus::Pci\\_host\\_bridge::cfg\\_read\(\)](#).

Here is the caller graph for this function:

**13.8.5.2.2 l4vbus\_pci\_cfg\_write()**

```

int l4vbus_pci_cfg_write (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t bus,
    l4_uint32_t devfn,
    l4_uint32_t reg,
    l4_uint32_t value,
    l4_uint32_t width)
  
```

Write to the vPCI configuration space using the PCI root bridge.

**Parameters**

<i>vbus</i>	Capability of the system bus
<i>handle</i>	Device handle of the PCI root bridge

<i>bus</i>	Bus number
<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
<i>reg</i>	Register in configuration space to write
<i>value</i>	Value to write
<i>width</i>	Width to write in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

References [L4\\_CV](#).

Referenced by [L4vbus::Pci\\_host\\_bridge::cfg\\_write\(\)](#).

Here is the caller graph for this function:

#### 13.8.5.2.3 l4vbus\_pci\_irq\_enable()

```

int l4vbus_pci_irq_enable (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t bus,
    l4_uint32_t devfn,
    int pin,
    unsigned char * trigger,
    unsigned char * polarity)
  
```

Enable PCI interrupt for a specific device using the PCI root bridge.

#### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI root bridge
	<i>bus</i>	Bus number
	<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
	<i>pin</i>	Interrupt pin (normally as reported in configuration register INTR)
out	<i>trigger</i>	False if interrupt is level-triggered

out	<i>polarity</i>	True if interrupt is of low polarity
-----	-----------------	--------------------------------------

**Returns**

On success: Interrupt line to be used, else failure

References [L4\\_CV](#).

Referenced by [L4vbus::Pci\\_host\\_bridge::irq\\_enable\(\)](#).

Here is the caller graph for this function:

**13.8.5.2.4 l4vbus\_pciddev\_cfg\_read()**

```

int l4vbus_pciddev_cfg_read (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    l4_uint32_t reg,
    l4_uint32_t * value,
    l4_uint32_t width)

```

Read from the device's vPCI configuration space.

**Parameters**

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI device
	<i>reg</i>	Register in configuration space to read
out	<i>value</i>	Value that has been read
	<i>width</i>	Width to read in bits (e.g. 8, 16, 32)

**Returns**

0 on success, else failure

References [L4\\_CV](#).

Referenced by [L4vbus::Pci\\_dev::cfg\\_read\(\)](#).

Here is the caller graph for this function:

**13.8.5.2.5 l4vbus\_pciddev\_cfg\_write()**

```
int l4vbus_pciddev_cfg_write (  
    l4_cap_idx_t vbus,  
    l4vbus_device_handle_t handle,  
    l4_uint32_t reg,  
    l4_uint32_t value,  
    l4_uint32_t width)
```

Write to the device's vPCI configuration space.

**Parameters**

<i>vbus</i>	Capability of the system bus
<i>handle</i>	Device handle of the PCI device
<i>reg</i>	Register in configuration space to write
<i>value</i>	Value to write
<i>width</i>	Width to write in bits (e.g. 8, 16, 32)

**Returns**

0 on success, else failure

References [L4\\_CV](#).

Referenced by [L4vbus::Pci\\_dev::cfg\\_write\(\)](#).

Here is the caller graph for this function:

#### 13.8.5.2.6 l4vbus\_pcidev\_irq\_enable()

```

int l4vbus_pcidev_irq_enable (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle,
    unsigned char * trigger,
    unsigned char * polarity)
  
```

Enable the device's PCI interrupt.

##### Parameters

	<i>vbus</i>	Capability of the system bus
	<i>handle</i>	Device handle of the PCI device
out	<i>trigger</i>	False if interrupt is level-triggered
out	<i>polarity</i>	True if interrupt is of low polarity

##### Returns

On success: Interrupt line to be used, else failure

References [L4\\_END\\_DECLS](#).

Referenced by [L4vbus::Pci\\_dev::irq\\_enable\(\)](#).

Here is the caller graph for this function:

### 13.8.6 L4vbus power management functions

Collaboration diagram for L4vbus power management functions:

#### Functions

- [L4\\_BEGIN\\_DECLS](#) `int l4vbus_pm_suspend (l4_cap_idx_t vbus, l4vbus_device_handle_t handle)`  
*Suspend the device.*
- `int l4vbus_pm_resume (l4_cap_idx_t vbus, l4vbus_device_handle_t handle)`  
*Resume the device.*

#### 13.8.6.1 Detailed Description

#### 13.8.6.2 Function Documentation

##### 13.8.6.2.1 l4vbus\_pm\_resume()

```
int l4vbus_pm_resume (
    l4_cap_idx_t vbus,
    l4vbus_device_handle_t handle)
```

Resume the device.

#### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Handle for the device to be resumed Switches the device from low-power mode to normal operation and restores the saved state.

#### Return values

0	Success.
---	----------

References [L4\\_END\\_DECLS](#).

Referenced by [L4vbus::Pm< DEC >::pm\\_resume\(\)](#).

Here is the caller graph for this function:

#### 13.8.6.2.2 l4vbus\_pm\_suspend()

```
L4_BEGIN_DECLS int l4vbus_pm_suspend (  
    l4_cap_idx_t vbus,  
    l4vbus_device_handle_t handle)
```

Suspend the device.

##### Parameters

<i>vbus</i>	V-BUS capability
<i>handle</i>	Handle for the device to be suspended Saves the state of the device and puts it into a low-power mode.

##### Return values

0	Success.
---	----------

References [L4\\_CV](#).

Referenced by [L4vbus::Pm< DEC >::pm\\_suspend\(\)](#).

*Dataspace type.*

### 13.9.3.1 Detailed Description

Dataspace C interface.

### 13.9.3.2 Enumeration Type Documentation

#### 13.9.3.2.1 l4re\_ds\_map\_flags

```
enum l4re_ds_map_flags
```

Flags to specify the memory mapping type of a request.

## Enumerator

L4RE_DS_F_NORMAL	request normal memory mapping
L4RE_DS_F_CACHEABLE	request normal memory mapping
L4RE_DS_F_BUFFERABLE	request bufferable (write buffered) mappings
L4RE_DS_F_UNCACHEABLE	request uncacheable memory mappings
L4RE_DS_F_CACHING_MASK	mask for caching flags
L4RE_DS_F_CACHING_SHIFT	shift value for caching flags

Definition at line 48 of file [dataspace.h](#).

### 13.9.3.3 Function Documentation

#### 13.9.3.3.1 `l4re_ds_allocate()`

```
l4_ret_t l4re_ds_allocate (
    l4re_ds_t ds,
    l4re_ds_offset_t offset,
    l4re_ds_size_t size)
```

Allocate a range in the dataspace.

##### Parameters

<i>ds</i>	Dataspace capability.
<i>offset</i>	Offset in the dataspace, in bytes.
<i>size</i>	Size of the range, in bytes.

##### Return values

<i>L4_EOK</i>	Success
<i>-L4_ERANGE</i>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<i>-L4_ENOMEM</i>	Not enough memory available.
<i>&lt;0</i>	IPC errors

On success, at least the given range is guaranteed to be allocated. The dataspace manager may also allocate more memory due to page granularity.

The memory is allocated with the same rights as the dataspace capability.

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

#### 13.9.3.3.2 `l4re_ds_clear()`

```
l4_ret_t l4re_ds_clear (
    l4re_ds_t ds,
    l4re_ds_offset_t offset,
    l4re_ds_size_t size)
```

Clear parts of a dataspace.

##### Parameters

<i>ds</i>	Dataspace capability.
<i>offset</i>	Offset within dataspace (in bytes).
<i>size</i>	Size of region to clear (in bytes).

**Return values**

$\geq 0$	Success.
<code>-L4_ERANGE</code>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<code>-L4_EACCESS</code>	No <a href="#">L4_CAP_FPAGE_W</a> right on dataspace capability.
$< 0$	IPC errors

Zeroes out the memory. Depending on the type of memory the memory could also be deallocated and replaced by a shared zero-page.

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

**13.9.3.3.3 l4re\_ds\_copy\_in()**

```
l4_ret_t l4re_ds_copy_in (
    l4re_ds_t ds,
    l4re_ds_offset_t dst_offs,
    l4re_ds_t src,
    l4re_ds_offset_t src_offs,
    l4re_ds_size_t size)
```

Copy contents from another dataspace.

**Parameters**

<i>ds</i>	Destination dataspace.
<i>dst_offs</i>	Offset in destination dataspace.
<i>src</i>	Source dataspace to copy from.
<i>src_offs</i>	Offset in the source dataspace.
<i>size</i>	Size to copy (in bytes).

**Return values**

<code>L4_EOK</code>	Success
<code>-L4_EACCESS</code>	No <a href="#">L4_CAP_FPAGE_W</a> right on the destination dataspace.
<code>-L4_EINVAL</code>	Invalid parameter supplied.
$< 0$	IPC errors

The copy operation may use copy-on-write mechanisms. The operation may also fail if both dataspaces are not from the same dataspace manager or the dataspace managers do not cooperate.

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

#### 13.9.3.3.4 l4re\_ds\_flags()

```
l4re_ds_flags_t l4re_ds_flags (
    l4re_ds_t ds)
```

Get flags of the dataspace.

##### Parameters

<i>ds</i>	Dataspace capability.
-----------	-----------------------

##### Return values

$\geq 0$	Flags of the dataspace
$< 0$	IPC errors

##### See also

[L4Re::Dataspace::F::Flags](#)

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

#### 13.9.3.3.5 l4re\_ds\_info()

```
l4_ret_t l4re_ds_info (
    l4re_ds_t ds,
    l4re_ds_stats_t * stats)
```

Get information on the dataspace.

##### Parameters

	<i>ds</i>	Dataspace capability.
<i>out</i>	<i>stats</i>	Dataspace information

##### Return values

<i>0</i>	Success
$< 0$	IPC errors

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

### 13.9.3.3.6 l4re\_ds\_map\_info()

```
l4_ret_t l4re_ds_map_info (
    l4re_ds_t ds,
    l4_addr_t * start_addr,
    l4_addr_t * end_addr)
```

Get mapping range of dataspace.

#### Parameters

<i>ds</i>	Dataspace capability. In case of a MMU-less system, the dataspace must be mapped at the correct address in the task because virtual and physical address must match. This method returns the start and end address of the physically contiguous buffer backing the dataspace.
-----------	---

On MMU-enabled system any page aligned address is permissible. On such systems the method is just a stub.

#### Parameters

out	<i>start_addr</i>	Start address of dataspace.
out	<i>end_addr</i>	End address (inclusive) of dataspace.

#### Return values

>0	Start/end address have been set and need to be obeyed.
0	No constraint of mapping address.
-L4_EPERM	Cannot infer mapping address. Dataspace not mappable.
<0	IPC errors.

References [L4\\_END\\_DECLS](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

### 13.9.3.3.7 l4re\_ds\_size()

```
l4re_ds_size_t l4re_ds_size (
    l4re_ds_t ds)
```

Get size of a dataspace.

#### Parameters

<i>ds</i>	Dataspace capability.
-----------	-----------------------

#### Returns

Size of the dataspace in bytes.

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

### 13.9.4 Debug interface

Collaboration diagram for Debug interface:

#### Functions

Map the given part of this data space into the DMA address space.
- [l4\\_ret\\_t](#) [l4re\\_dma\\_space\\_unmap](#) ([l4re\\_dma\\_space\\_t](#) dma, [l4re\\_dma\\_space\\_dma\\_addr\\_t](#) dma\_addr, [l4\\_size\\_t](#) size, unsigned long attrs, enum [l4re\\_dma\\_space\\_direction](#) dir) [L4\\_NOTHROW](#)  
Unmap the given part of this data space from the DMA address space.
- [l4\\_ret\\_t](#) [l4re\\_dma\\_space\\_associate](#) ([l4re\\_dma\\_space\\_t](#) dma, [l4\\_cap\\_idx\\_t](#) dma\_task, unsigned long attr) [L4\\_NOTHROW](#)  
Associate a (kernel) [DMA space](#) for a device to this *Dma\_space*.
- [l4\\_ret\\_t](#) [l4re\\_dma\\_space\\_disassociate](#) ([l4re\\_dma\\_space\\_t](#) dma)  
Disassociate the (kernel) [DMA space](#) from this *Dma\_space*.

#### 13.9.5.1 Detailed Description

DMA Space C interface.

### 13.9.5.2 Typedef Documentation

#### 13.9.5.2.1 l4re\_dma\_space\_t

```
typedef l4_cap_idx_t l4re_dma_space_t
```

DMA space capability type.

Managed DMA Address Space.

A managed `Dma_space` represents the [L4Re](#) abstraction of an DMA address space of one or several devices. Devices are assigned to a managed `Dma_space` by binding the `Dma_space` to the respective DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)), which might link the `Dma_space` with a kernel [DMA space](#). Note that several DMA domains can be bound to the same `Dma_space`. Whenever a device needs direct access to parts of an [L4Re::Dataspace](#), that part of the data space must be mapped to the managed `Dma_space` that is assigned to that device. Binding to DMA domains must happen before mapping. After the DMA accesses to the memory are finished the memory must be unmapped from the device's DMA address space.

Mapping to a managed DMA address space, using `map()`, makes the given parts of the data space visible to the associated device at the returned DMA address. As long as the memory is mapped into a DMA space it is 'pinned' and cannot be subject to dynamic memory management such as swapping. Additionally, `map()` is responsible for the necessary syncing operations before the DMA.

`unmap()` is the reverse operation to `map()` and unmaps the given data-space part for the DMA address space. `unmap()` is responsible for the necessary sync operations after the DMA.

Definition at line 49 of file [dma\\_space.h](#).

### 13.9.5.3 Function Documentation

#### 13.9.5.3.1 l4re\_dma\_space\_associate()

```
l4_ret_t l4re_dma_space_associate (
    l4re_dma_space_t dma,
    l4_cap_idx_t dma_task,
    unsigned long attr)
```

Associate a (kernel) [DMA space](#) for a device to this `Dma_space`.

#### Parameters

	<i>dma</i>	DMA space capability
in	<i>dma_task</i>	The (kernel) <a href="#">DMA space</a> used for the device that shall be associated with this DMA space. In case no IOMMU is present or configured, the <code>dma_task</code> might be an invalid capability when <a href="#">L4Re::Dma_space::Phys_space</a> is set in <code>attr</code> , in this case the CPUs physical memory is used as DMA address space.
in	<i>attr</i>	Attributes for this DMA space. See <a href="#">L4Re::Dma_space::Space_attrb</a> .

#### Return values

---

<code>L4_EOK</code>	Operation successful.
<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>-L4_EINVAL</code>	
<code>-L4_ENOENT</code>	

**Precondition**

The invoked `Dma_space` capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.5.3.2 `l4re_dma_space_disassociate()`**

```
l4_ret_t l4re_dma_space_disassociate (
    l4re_dma_space_t dma)
```

Disassociate the (kernel) [DMA space](#) from this `Dma_space`.

**Parameters**

<code>dma</code>	DMA space capability
------------------	----------------------

**Return values**

<code>L4_EOK</code>	Operation successful.
<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>-L4_ENOENT</code>	

**Precondition**

The invoked `Dma_space` capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

References [L4\\_END\\_DECLS](#).

**13.9.5.3.3 `l4re_dma_space_map()`**

```
l4_ret_t l4re_dma_space_map (
    l4re_dma_space_t dma,
    l4re_ds_t src,
    l4re_ds_offset_t offset,
    l4_size_t * size,
    unsigned long attrs,
    enum l4re_dma_space_direction dir,
    l4re_dma_space_dma_addr_t * dma_addr)
```

Map the given part of this data space into the DMA address space.

### Parameters

	<i>dma</i>	DMA space capability
in	<i>src</i>	Source data space (that describes the memory). Caller needs write right to the data space.
in	<i>offset</i>	The offset (bytes) within <i>src</i> .
in, out	<i>size</i>	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call <code>map()</code> again with a new offset and the remaining size.
in	<i>attrs</i>	The attributes used for this DMA mapping (a combination of <code>Dma_space::Attribute</code> values).
in	<i>dir</i>	The direction of the DMA transfer issued with this mapping. The same value must later be passed to <code>unmap()</code> .
out	<i>dma_addr</i>	The DMA address to use for DMA with the associated device.

### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_EINVAL</i>	The capability <i>src</i> is invalid or does not refer to a valid dataspace.
<i>-L4_EEXIST</i>	The specified region overlaps an existing mapping.
<i>-L4_ENOMEM</i>	Not enough memory to allocate internal datastructures.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.

### Precondition

The capability *src* must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

### Note

`associate()` must be called prior to mapping memory. Usually this is done implicitly when binding the managed `Dma_space` to a DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)).

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

#### 13.9.5.3.4 l4re\_dma\_space\_unmap()

```
l4_ret_t l4re_dma_space_unmap (
    l4re_dma_space_t dma,
    l4re_dma_space_dma_addr_t dma_addr,
    l4_size_t size,
    unsigned long attrs,
    enum l4re_dma_space_direction dir)
```

Unmap the given part of this data space from the DMA address space.

**Parameters**

<i>dma</i>	DMA space capability
<i>dma_addr</i>	The DMA address (returned by <code>Dma_space::map()</code> ).
<i>size</i>	The size (bytes) of the memory region to unmap.
<i>attrs</i>	The attributes for the unmap (currently none).
<i>dir</i>	The direction of the finished DMA operation.

**Returns**

0 in the case of success, a negative error code otherwise.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.6 Event interface**

Event C interface.

Collaboration diagram for Event interface:

**Functions**

- [l4\\_ret\\_t l4re\\_event\\_get\\_buffer](#) (const [l4\\_cap\\_idx\\_t](#) server, const [l4re\\_ds\\_t](#) ds) [L4\\_NOTHROW](#)  
*Get an event signal buffer.*
- [l4\\_ret\\_t l4re\\_event\\_get\\_num\\_streams](#) (const [l4\\_cap\\_idx\\_t](#) server) [L4\\_NOTHROW](#)  
*Get number of streams.*
- [l4\\_ret\\_t l4re\\_event\\_get\\_stream\\_info](#) (const [l4\\_cap\\_idx\\_t](#) server, int idx, [l4re\\_event\\_stream\\_info\\_t](#) \*info) [L4\\_NOTHROW](#)  
*Get information on a stream.*
- [l4\\_ret\\_t l4re\\_event\\_get\\_stream\\_info\\_for\\_id](#) (const [l4\\_cap\\_idx\\_t](#) server, [l4\\_umword\\_t](#) stream\_id, [l4re\\_event\\_stream\\_info\\_t](#) \*info) [L4\\_NOTHROW](#)  
*Get info for a stream given a stream id.*
- [l4\\_ret\\_t l4re\\_event\\_get\\_axis\\_info](#) (const [l4\\_cap\\_idx\\_t](#) server, [l4\\_umword\\_t](#) id, unsigned naxes, unsigned const \*axis, [l4re\\_event\\_absinfo\\_t](#) \*info) [L4\\_NOTHROW](#)  
*Get Axis information for a stream.*

**13.9.6.1 Detailed Description**

Event C interface.

### 13.9.6.2 Function Documentation

#### 13.9.6.2.1 l4re\_event\_get\_axis\_info()

```
l4_ret_t l4re_event_get_axis_info (
    const l4_cap_idx_t server,
    l4_umword_t id,
    unsigned naxes,
    unsigned const * axis,
    l4re_event_absinfo_t * info)
```

Get Axis information for a stream.

##### Parameters

	<i>server</i>	Server to talk to.
	<i>id</i>	Id of the stream to get information from.
	<i>naxes</i>	Number of axes in <i>axis</i> array.
in	<i>axis</i>	Array of axis IDs whose information should be retrieved.
out	<i>info</i>	Information buffer to store the retrieved axis infos.

##### Return values

0	Success
<0	Error

##### See also

[L4Re::Event::get\\_axis\\_info](#)

References [L4\\_END\\_DECLS](#), and [L4\\_NOTHROW](#).

#### 13.9.6.2.2 l4re\_event\_get\_buffer()

```
l4_ret_t l4re_event_get_buffer (
    const l4_cap_idx_t server,
    const l4re_ds_t ds)
```

Get an event signal buffer.

##### Parameters

<i>server</i>	Server to talk to.
<i>ds</i>	<a href="#">Buffer</a> to event data.

##### Returns

0 for success, <0 on error

##### See also

[L4Re::Event::get\\_buffer](#)

References [L4\\_CV](#), [L4\\_NOTHROW](#), and [l4re\\_ds\\_t](#).

### 13.9.6.2.3 l4re\_event\_get\_num\_streams()

```
l4_ret_t l4re_event_get_num_streams (
    const l4_cap_idx_t server)
```

Get number of streams.

#### Parameters

<i>server</i>	Server to talk to.
---------------	--------------------

#### Returns

0 for success, <0 on error

#### See also

[L4Re::Event::get\\_num\\_streams](#)

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

### 13.9.6.2.4 l4re\_event\_get\_stream\_info()

```
l4_ret_t l4re_event_get_stream_info (
    const l4_cap_idx_t server,
    int idx,
    l4re_event_stream_info_t * info)
```

Get information on a stream.

#### Parameters

	<i>server</i>	Server to talk to.
	<i>idx</i>	Index value.
out	<i>info</i>	Information buffer.

#### Returns

0 for success, <0 on error

#### See also

[L4Re::Event::get\\_stream\\_info](#)

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

### 13.9.6.2.5 l4re\_event\_get\_stream\_info\_for\_id()

```
l4_ret_t l4re_event_get_stream_info_for_id (
    const l4_cap_idx_t server,
    l4_umword_t stream_id,
    l4re_event_stream_info_t * info)
```

Get info for a stream given a stream id.

#### Parameters

	<i>server</i>	Server to talk to.
	<i>stream_id</i>	Stream ID.
out	<i>info</i>	Information buffer.

#### Returns

0 for success, <0 on error

#### See also

[L4Re::Event::get\\_stream\\_info\\_for\\_id](#)

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

## 13.9.7 Log interface

Log C interface.

Collaboration diagram for Log interface:

#### Functions

- [L4\\_BEGIN\\_DECLS](#) void [l4re\\_log\\_print](#) (char const \*string) [L4\\_NOTHROW](#)  
Write a null terminated string to the default log.
- void [l4re\\_log\\_printn](#) (char const \*string, int len) [L4\\_NOTHROW](#)  
Write a string of a given length to the default log.
- void [l4re\\_log\\_print\\_srv](#) (const [l4\\_cap\\_idx\\_t](#) logcap, char const \*string) [L4\\_NOTHROW](#)  
Write a null terminated string to a log.
- void [l4re\\_log\\_printn\\_srv](#) (const [l4\\_cap\\_idx\\_t](#) logcap, char const \*string, int len) [L4\\_NOTHROW](#)  
Write a string of a given length to a log.

### 13.9.7.1 Detailed Description

Log C interface.

### 13.9.7.2 Function Documentation

#### 13.9.7.2.1 l4re\_log\_print()

```
void l4re_log_print (  
    char const * string) [inline]
```

Write a null terminated string to the default log.

#### Parameters

<i>string</i>	Text to print, null terminated.
---------------	---------------------------------

#### See also

[L4Re::Log::print](#)

Definition at line 81 of file [log.h](#).

References [L4\\_NOTHROW](#), and [l4re\\_log\\_print\\_srv\(\)](#).

*Allocate memory.*
- [l4\\_ret\\_t l4re\\_ma\\_alloc\\_align\\_srv](#) ([l4\\_cap\\_idx\\_t](#) srv, long size, [l4re\\_ds\\_t](#) const mem, unsigned long flags, unsigned long align) [L4\\_NOTHROW](#)  
*Allocate memory.*

### 13.9.8.1 Detailed Description

Memory allocator C interface.

### 13.9.8.2 Enumeration Type Documentation

#### 13.9.8.2.1 l4re\_ma\_flags

enum [l4re\\_ma\\_flags](#)

Flags for requesting memory at the memory allocator.

See also

[L4Re::Mem\\_alloc::Mem\\_alloc\\_flags](#)

Definition at line 32 of file [mem\\_alloc.h](#).

### 13.9.8.3 Function Documentation

#### 13.9.8.3.1 l4re\_ma\_alloc()

```
l4_ret_t l4re_ma_alloc (
    long size,
    l4re_ds_t const mem,
    unsigned long flags) [inline]
```

Allocate memory.

**Parameters**

<i>size</i>	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if <i>size</i> is a negative value and <i>flags</i> set the <code>Mem_alloc_flags::Continuous</code> bit, the allocator tries to allocate as much memory as possible leaving an amount of at least <code>-size</code> bytes within the associated quota.
<i>mem</i>	Capability slot where the capability to the dataspace is received.
<i>flags</i>	Special dataspace properties, see <a href="#">l4re_ma_flags</a>

**Return values**

<i>0</i>	Success
<i>-L4_ERANGE</i>	Given size not supported.
<i>-L4_ENOMEM</i>	Not enough memory available.
<i>&lt; 0</i>	IPC error

**See also**

[L4Re::Mem\\_alloc::alloc](#)

The memory allocator returns a dataspace.

**Note**

This function is using the [L4Re::Env::env\(\)->mem\\_alloc\(\)](#) service.

**Examples**

Definition at line 136 of file [mem\\_alloc.h](#).

References [L4\\_NOTHROW](#), [l4re\\_ds\\_t](#), and [l4re\\_ma\\_alloc\\_align\\_srv\(\)](#).

Here is the call graph for this function:

### 13.9.8.3.2 l4re\_ma\_alloc\_align()

```
l4_ret_t l4re_ma_alloc_align (
    long size,
    l4re_ds_t const mem,
    unsigned long flags,
    unsigned long align) [inline]
```

Allocate memory.

#### Parameters

<i>size</i>	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if <i>size</i> is a negative value and <i>flags</i> set the <code>Mem_alloc_flags::Continuous</code> bit, the allocator tries to allocate as much memory as possible leaving an amount of at least <code>-size</code> bytes within the associated quota.
<i>mem</i>	Capability slot where the capability to the dataspace is received.
<i>flags</i>	Special dataspace properties, see <a href="#">l4re_ma_flags</a>
<i>align</i>	Log2 alignment of dataspace if supported by allocator, will be at least <code>L4_PAGESHIFT</code> , with <code>Super_pages</code> flag set at least <code>L4_SUPERPAGESHIFT</code>

#### Return values

<code>0</code>	Success
<code>-L4_ERANGE</code>	Given size not supported.
<code>-L4_ENOMEM</code>	Not enough memory available.
<code>&lt;0</code>	IPC error

#### See also

    l4re_namespace_t srv,
    char const * name,
    l4_cap_idx_t const cap,
    int timeout)
  
```

Query the name space for the object named by `name`.

#### Parameters

<i>timeout</i>	Timeout of query in milliseconds. The client will only wait if a name already has been registered with the server but no object has been attached yet.
<i>srv</i>	Name space server to use for the query.
<i>name</i>	String to query.
<i>cap</i>	Capability slot where the received capability will be stored.

#### Return values

<i>0</i>	Name could be fully resolved.
<i>&gt;0</i>	Name could only be partly resolved. The number of remaining characters is returned.
<i>-L4_ENOENT</i>	Entry could not be found.
<i>-L4_EAGAIN</i>	Entry exists but no object is yet attached. Try again later.
<i>&lt;0</i>	IPC errors, see <a href="#">l4_error_code_t</a> .

References [L4\\_CV](#), [L4\\_INLINE](#), [L4\\_NOTHROW](#), and [l4re\\_namespace\\_t](#).

Referenced by [l4re\\_ns\\_query\\_srv\(\)](#).

Here is the caller graph for this function:

### 13.9.9.3.3 l4re\_ns\_register\_obj\_srv()

```

l4_ret_t l4re_ns_register_obj_srv (
    l4re_namespace_t srv,
    char const * name,
    l4_cap_idx_t const obj,
    unsigned flags)
  
```

Register an object with a name.

#### Parameters

<i>srv</i>	Name space server to use for the query.
<i>name</i>	Name under which the object should be registered.
<i>obj</i>	Capability to object to register. An invalid capability may be given to only reserve the name for later use.
<i>flags</i>	Flags to assign to the entry, see <a href="#">L4Re::Namespace::Register_flags</a> . Note that the rights that are assigned to a capability are not only determined by the rights given in these flags but also by the rights with which the <code>obj</code> capability was mapped to the name space.

#### Return values

<i>0</i>	Object was successfully registered with <i>name</i> .
<i>-L4_EEXIST</i>	Name already registered.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_ENOMEM</i>	Server has insufficient resources.
<i>-L4_EINVAL</i>	Invalid parameter.
<i>&lt;0</i>	IPC errors, see <a href="#">l4_error_code_t</a> .

#### Precondition

The invoked Namespace capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

References [L4\\_CV](#), [L4\\_INLINE](#), [L4\\_NOTHROW](#), and [l4re\\_namespace\\_t](#).

### 13.9.11.1 Detailed Description

Region map C interface.

### 13.9.11.2 Enumeration Type Documentation

#### 13.9.11.2.1 l4re\_rm\_flags\_values

```
enum l4re_rm_flags_values
```

Flags for region operations.

**Enumerator**

L4RE_RM_F_R	Region is read-only.
L4RE_RM_F_KERNEL	Kernel-provided memory (KUMEM).
L4RE_RM_F_DETACH_FREE	Free the portion of the data space after detach.
L4RE_RM_F_PAGER	Region has a pager.
L4RE_RM_F_RESERVED	Region is reserved (blocked).
L4RE_RM_CACHING_SHIFT	Start of region mapper cache bits.
L4RE_RM_F_CACHING	Mask of all region manager cache bits.
L4RE_RM_REGION_FLAGS	Mask of all region flags.
L4RE_RM_F_CACHE_NORMAL	Cache bits for normal cacheable memory.
L4RE_RM_F_CACHE_BUFFERED	Cache bits for buffered (write combining) memory.
L4RE_RM_F_CACHE_UNCACHED	Cache bits for uncached memory.
L4RE_RM_F_SEARCH_ADDR	Search for a suitable address range.
L4RE_RM_F_IN_AREA	Search only in area, or map into area.
L4RE_RM_F_EAGER_MAP	Eagerly map the attached data space in.
L4RE_RM_F_NO_EAGER_MAP	Prevent eager mapping of the attached data space.
L4RE_RM_F_ATTACH_FLAGS	Mask of all attach flags.

Definition at line 30 of file [rm.h](#).

**13.9.11.3 Function Documentation****13.9.11.3.1 l4re\_rm\_attach()**

```
int l4re_rm_attach (
    void ** start,
    unsigned long size,
    l4re_rm_flags_t flags,
    l4re_ds_t mem,
    l4re_rm_offset_t offs,
    unsigned char align) [inline]
```

Attach a data space to a region.

**Parameters**

in, out	<i>start</i>	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If <a href="#">L4Re::Rm::F::Search_addr</a> is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If <a href="#">L4Re::Rm::F::In_area</a> is given the value is used as a selector for the area (see <a href="#">L4Re::Rm::reserve_area</a> ) to attach the data space to.
	<i>size</i>	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.

	<i>flags</i>	The flags control how and with which rights the dataspace is attached to the region. See <a href="#">L4Re::Rm::F::Attach_flags</a> and <a href="#">L4Re::Rm::F::Region_flags</a> . The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the <code>F : ↔ Eager_map</code> flag is set this function may also return <a href="#">L4Re::Dataspace::map</a> error codes if the mapping fails.
	<i>mem</i>	Data space.
	<i>offs</i>	Offset into the data space to use.
	<i>align</i>	Alignment of the virtual region, log2-size, default: a page ( <a href="#">L4_PAGESHIFT</a> ). This is only meaningful if the <a href="#">L4Re::Rm::F::Search_addr</a> flag is used.

### Return values

0	Success
-L4_ENOENT	No area could be found (see <a href="#">L4Re::Rm::F::In_area</a> )
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

### Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is

Here is the caller graph for this function:

### 13.9.11.3.3 l4re\_rm\_detach()

```
int l4re_rm_detach (
    void * addr) [inline]
```

Detach and unmap a region from the address space in the current task.

#### Parameters

<i>addr</i>	Address of the region to detach.
-------------	----------------------------------

#### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<code>-L4_ENOENT</code>	No region found.
<code>&lt;0</code>	IPC errors

Frees a region in the virtual address space given by *addr*. The corresponding part of the address space is now available again.

Also

See also

[L4Re::Rm::detach](#)

This function is using the `L4::Env::env()->rm()` service.

```
int l4re_rm_detach_ds (
    void * addr,
    l4re_ds_t * ds) [inline]
```

Detach and unmap a region and return affected dataspace in the current task.

##### Parameters

	<i>addr</i>	Address of the region to detach.
out	<i>ds</i>	Returns dataspace that is affected.

##### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<code>-L4_ENOENT</code>	No region found.
<code>&lt;0</code>	IPC errors

Frees a region in the virtual address space given by *addr*. The corresponding part of the address space is now available again.

### 13.9.11.3.5 l4re\_rm\_detach\_ds\_unmap()

```

int l4re_rm_detach_ds_unmap (
    void * addr,
    l4re_ds_t * ds,
    l4_cap_idx_t task) [inline]
  
```

Detach and unmap in specified task.

#### Parameters

	<i>addr</i>	Address of the region to detach.
out	<i>ds</i>	Returns dataspace that is affected.
	<i>task</i>	Task to unmap pages from, specify <code>L4_INVALID_CAP</code> to not unmap

#### Returns

0 on success, <0 on error

```
int l4re_rm_detach_unmap (
    l4_addr_t addr,
    l4_cap_idx_t task) [inline]
```

Detach and unmap in specified task.

#### Parameters

<i>addr</i>	Address of the region to detach.
<i>task</i>	Task to unmap pages from, specify L4_INVALID_CAP to not unmap

#### Returns

0 on success, <0 on error

Also

See also

[L4Re::Rm::detach](#)

This function is using the `L4::Env::env()->rm()` service.

Definition at line 359 of file [rm.h](#).

References [L4\\_NOTHROW](#), and [l4re\\_rm\\_detach\\_srv\(\)](#).

Here is the call graph for this function:

### 13.9.11.3.8 l4re\_rm\_find()

```
int l4re_rm_find (
    l4_addr_t * addr,
    unsigned long * size,
    l4re_rm_offset_t * offset,
    l4re_rm_flags_t * flags,
    l4re_ds_t * m) [inline]
```

Find a region given an address and size.

## Parameters

in, out	<i>addr</i>	Address to look for. Returns the start address of the found region.
in, out	<i>size</i>	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	<i>offset</i>	Offset at the beginning of the region within the associated dataspace.
out	<i>flags</i>	Region flags, see <code>F::Region_flags</code> (and <code>F::In_area</code> ).
out	<i>m</i>	Associated dataspace or paging service.

## Return values

0	Success
-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the `addr` and `size` parameter. If no such region is found but a reserved area, the area is returned and `F::In_area` is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

## Note

The value of the `size` input parameter should be 1 to assure that a region can be determined unambiguously.

### 13.9.11.3.10 l4re\_rm\_free\_area()

```
int l4re_rm_free_area (
    l4_addr_t addr) [inline]
```

Free an area from the region map.

#### Parameters

<i>addr</i>	An address within the area to free.
-------------	-------------------------------------

#### Return values

0	Success
-L4_ENOENT	No area found.
<0	IPC errors

**Note**

The data spaces that are attached to that area are not detached by this operation.

**See also**

`reserve_area()` for more information about areas.

[L4Re::Rm::free\\_area](#)

This function is using the `L4::Env::env()->rm()` service.

    l4_addr_t addr,
    char * name,
    unsigned int len,
    l4re_rm_offset_t * backing_offset) [inline]
```

Return auxiliary information of a region.

This is a debugging feature and might not be available.

#### Parameters

	<i>addr</i>	Virtual address of the region.
out	<i>name</i>	Name of the region.
out	<i>backing_offset</i>	Backing offset information.

#### Return values

0	Success
-L4_ENOENT	Region not found.
-L4_ENOSYS	Function not available.
<0	IPC errors

#### Parameters

<i>len</i>	Length of the name given in name argument, in bytes.
------------	--

#### See also

### 13.9.11.3.14 l4re\_rm\_reserve\_area()

```
int l4re_rm_reserve_area (
    l4_addr_t * start,
    unsigned long size,
    l4re_rm_flags_t flags,
    unsigned char align) [inline]
```

Reserve the given area in the region map.

#### Parameters

in, out	<i>start</i>	The virtual start address of the area to reserve. Returns the start address of the area.
	<i>size</i>	The size of the area to reserve (in bytes).
	<i>flags</i>	Flags for the reserved area (see <a href="#">L4Re::Rm::F::Region_flags</a> and <a href="#">L4Re::Rm::F::Attach_flags</a> ).
	<i>align</i>	Alignment of area if searched as bits (log2 value).

#### Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
<0	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (*flags* = [L4Re::Rm::F::Reserved](#)), where no data spaces can be attached
- Special purpose areas (*flags* = 0), where data spaces can be attached to the area via the [L4Re::Rm::F::In\\_area](#) flag and a start address within the area itself.

#### Note

When searching for a free place in the virtual address space (with *flags* = [L4Re::Rm::F::Search\\_addr](#)), the space between *start* and the end of the virtual address space is searched.

`L4_NOTHROW`  
*Set the viewport parameters of a view.*
- `int l4re_video_view_stack (l4re_video_view_t *view, l4re_video_view_t *pivot, int behind)` `L4_NOTHROW`  
*Change the stacking order in the stack of visible views.*

### 13.9.14.1 Detailed Description

### 13.9.14.2 Typedef Documentation

#### 13.9.14.2.1 l4re\_video\_view\_t

```
typedef struct l4re_video_view_t l4re_video_view_t
```

C representation of a goos view.

A view is a visible rectangle that provides a view to the contents of a buffer (frame buffer) memory object and is placed on a real screen.

### 13.9.14.3 Enumeration Type Documentation

#### 13.9.14.3.1 l4re\_video\_goos\_info\_flags\_t

```
enum l4re_video_goos_info_flags_t
```

Flags of information on the goos.

##### Enumerator

F_l4re_video_goos_auto_refresh	The graphics display is automatically refreshed.
F_l4re_video_goos_pointer	We have a mouse pointer.
F_l4re_video_goos_dynamic_views	Supports dynamically allocated views.
F_l4re_video_goos_dynamic_buffers	Supports dynamically allocated buffers.

Definition at line 29 of file [goos.h](#).

#### 13.9.14.3.2 l4re\_video\_view\_info\_flags\_t

```
enum l4re_video_view_info_flags_t
```

Flags of information on a view.

##### Enumerator

F_l4re_video_view_none	everything for this view is static (the VESA-FB case)
F_l4re_video_view_set_buffer	buffer object for this view can be changed
F_l4re_video_view_set_buffer_offset	buffer offset can be set
F_l4re_video_view_set_bytes_per_line	bytes per line can be set
F_l4re_video_view_set_pixel	pixel type can be set
F_l4re_video_view_set_position	position on screen can be set
F_l4re_video_view_dyn_allocated	View is dynamically allocated.
F_l4re_video_view_set_background	Set view as background for session.
F_l4re_video_view_set_flags	Set view property flags.
F_l4re_video_view_above	Flag the view as stay on top.
F_l4re_video_view_flags_mask	Mask containing all possible property flags.

Definition at line 23 of file [view.h](#).

### 13.9.14.4 Function Documentation

#### 13.9.14.4.1 l4re\_video\_goos\_create\_buffer()

```
int l4re_video_goos_create_buffer (
    l4re_video_goos_t goos,
```

```

    unsigned long size,
    l4_cap_idx_t buffer)

```

Create a new buffer (memory buffer) for pixel data.

#### Parameters

<i>goos</i>	the target object for the operation.
<i>size</i>	the size in bytes for the pixel buffer.
<i>buffer</i>	a capability index to receive the data-space capability for the buffer.

#### Returns

$\geq 0$ : The index of the created buffer (used to assign views and for deletion).  $< 0$ : on error

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.2 l4re\_video\_goos\_create\_view()

```

int l4re_video_goos_create_view (
    l4re_video_goos_t goos,
    l4re_video_view_t * view)

```

Create a new view (.).

#### See also

[l4re\\_video\\_view\\_t](#)

#### Parameters

	<i>goos</i>	the goos session to use.
out	<i>view</i>	structure initialized to the new view.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.3 l4re\_video\_goos\_delete\_buffer()

```

int l4re_video_goos_delete_buffer (
    l4re_video_goos_t goos,
    unsigned idx)

```

Delete a pixel buffer.

#### Parameters

<i>goos</i>	the target goos object.
-------------	-------------------------

<i>idx</i>	the buffer index of the buffer to delete (the return value of <a href="#">l4re_video_goos_create_buffer()</a> )
------------	---

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.4 l4re\_video\_goos\_delete\_view()

```
int l4re_video_goos_delete_view (  
    l4re_video_goos_t goos,  
    l4re_video_view_t * view)
```

Delete a view.

##### Parameters

<i>goos</i>	the goos session to use.
<i>view</i>	the view to delete, the given data-structure is invalid afterwards.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.5 l4re\_video\_goos\_get\_static\_buffer()

```
int l4re_video_goos_get_static_buffer (  
    l4re_video_goos_t goos,  
    unsigned idx,  
    l4_cap_idx_t buffer)
```

Get the data-space capability of the static pixel buffer.

##### Parameters

<i>goos</i>	The target goos object.
<i>idx</i>	Index of the static buffer.
<i>buffer</i>	A capability index to receive the data-space capability.

This function allows access to static, preexisting pixel buffers. Such static buffers exist for static configurations, such as the VESA framebuffer.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.6 l4re\_video\_goos\_get\_view()

```
int l4re_video_goos_get_view (  
    l4re_video_goos_t goos,  
    unsigned idx,  
    l4re_video_view_t * view)
```

Get a view for the given index.

##### Parameters

	<i>goos</i>	the target goos session.
	<i>idx</i>	the index of the view to retrieve.
out	<i>view</i>	structure initialized to the view with the given index.

This function allows to access static views as provided by the VESA framebuffer (the monitor). However, it also allows to access dynamic views created with [l4re\\_video\\_goos\\_create\\_view\(\)](#).

References [L4\\_END\\_DECLS](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.7 l4re\_video\_goos\_info()

```
L4_BEGIN_DECLS int l4re_video_goos_info (  
    l4re_video_goos_t goos,  
    l4re_video_goos_info_t * ginfo)
```

Get information on a goos.

##### Parameters

	<i>goos</i>	Goos object
out	<i>ginfo</i>	Pointer to goos information structure.

##### Returns

0 for success, <0 on error

- [-L4\\_ENODEV](#)
- IPC errors

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.14.4.8 l4re\_video\_goos\_refresh()**

```
int l4re_video_goos_refresh (
    l4re_video_goos_t goos,
    int x,
    int y,
    int w,
    int h)
```

Flush a rectangle of pixels of the goos screen.

**Parameters**

<i>goos</i>	the target object of the operation.
<i>x</i>	the x-coordinate of the upper left corner of the rectangle
<i>y</i>	the y-coordinate of the upper left corner of the rectangle
<i>w</i>	the width of the rectangle to be flushed
<i>h</i>	the height of the rectangle

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.14.4.9 l4re\_video\_view\_get\_info()**

```
int l4re_video_view_get_info (
    l4re_video_view_t * view,
    l4re_video_view_info_t * info)
```

Retrieve information about the given *view*.

**Parameters**

	<i>view</i>	the target view for the operation.
out	<i>info</i>	a buffer receiving the information about the view.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.14.4.10 l4re\_video\_view\_refresh()**

```
L4_BEGIN_DECLS int l4re_video_view_refresh (
    l4re_video_view_t * view,
    int x,
    int y,
    int w,
    int h)
```

Flush the given rectangle of pixels of the given *view*.

**Parameters**

<i>view</i>	the target view of the operation.
<i>x</i>	x-coordinate of the upper left corner
<i>y</i>	y-coordinate of the upper left corner
<i>w</i>	the width of the rectangle
<i>h</i>	the height of the rectangle

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.14.4.11 l4re\_video\_view\_set\_info()**

```
int l4re_video_view_set_info (
    l4re_video_view_t * view,
    l4re_video_view_info_t * info)
```

Set properties of the view.

**Parameters**

<i>view</i>	the target view of the operation.
<i>info</i>	the parameters to be set on the view.

Which parameters can be manipulated on a given view can be figured out with [l4re\\_video\\_view\\_get\\_info\(\)](#) and this depends on the concrete instance the view object.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

**13.9.14.4.12 l4re\_video\_view\_set\_viewport()**

```
int l4re_video_view_set_viewport (
    l4re_video_view_t * view,
    int x,
    int y,
    int w,
    int h,
    unsigned long bofs)
```

Set the viewport parameters of a view.

**Parameters**

<i>view</i>	the target view of the operation.
<i>x</i>	the x-coordinate of the upper left corner on the screen.
<i>y</i>	the y-coordinate of the upper left corner on the screen.
<i>w</i>	the width of the view.

<i>h</i>	the height of the view.
<i>bofs</i>	the offset (in bytes) of the upper left pixel in the memory buffer

This function is a convenience wrapper for [l4re\\_video\\_view\\_set\\_info\(\)](#), just setting the often changed parameters of a dynamic view. With this function a view can be placed on the real screen and at the same time on its backing buffer.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

#### 13.9.14.4.13 l4re\_video\_view\_stack()

```
int l4re_video_view_stack (
    l4re_video_view_t * view,
    l4re_video_view_t * pivot,
    int behind)
```

Change the stacking order in the stack of visible views.

##### Parameters

<i>view</i>	the target view for the operation.
<i>pivot</i>	the neighbor view, relative to which <i>view</i> shall be stacked. a NULL value allows top ( <i>behind</i> = 1) and bottom ( <i>behind</i> = 0) placement of the view.
<i>behind</i>	describes the placement of the view relative to the <i>pivot</i> view.

References [L4\\_END\\_DECLS](#), and [L4\\_NOTHROW](#).

### 13.9.15 Initial Environment

C interface of the initial environment that is provided to an [L4](#) task.

Collaboration diagram for Initial Environment:

##### Data Structures

- struct [l4re\\_env\\_cap\\_entry\\_t](#)

Entry in the [L4Re](#) environment array for the named initial objects.

## Typedefs

- typedef struct l4re\_env\_cap\_entry\_t **l4re\_env\_cap\_entry\_t**  
Entry in the [L4Re](#) environment array for the named initial objects.

## Functions

- [l4re\\_env\\_t](#) \* [l4re\\_env](#) (void) [L4\\_NOTHROW](#)  
Get [L4Re](#) initial environment.
- [l4\\_kernel\\_info\\_t](#) const \* [l4re\\_kip](#) (void) [L4\\_NOTHROW](#)  
Get Kernel Info Page.
- [l4\\_cap\\_idx\\_t](#) [l4re\\_env\\_get\\_cap](#) (char const \*name) [L4\\_NOTHROW](#)  
Get the capability selector for the object named name.
- [l4\\_cap\\_idx\\_t](#) [l4re\\_env\\_get\\_cap\\_e](#) (char const \*name, [l4re\\_env\\_t](#) const \*e) [L4\\_NOTHROW](#)  
Get the capability selector for the object named name.
- [l4re\\_env\\_cap\\_entry\\_t](#) const \* [l4re\\_env\\_get\\_cap\\_l](#) (char const \*name, unsigned l, [l4re\\_env\\_t](#) const \*e) [L4\\_NOTHROW](#)  
Get the full [l4re\\_env\\_cap\\_entry\\_t](#) for the object named name.

### 13.9.15.1 Detailed Description

C interface of the initial environment that is provided to an [L4](#) task.

#### Include File

```
#include <l4/re/env.h>
```

For an explanation of the default task capabilities see [l4\\_default\\_caps\\_t](#).

For the C++ interface refer to [L4Re::Env](#).

### 13.9.15.2 Function Documentation

#### 13.9.15.2.1 [l4re\\_env\(\)](#)

```
l4re\_env\_t * l4re\_env (  
    void ) [inline]
```

Get [L4Re](#) initial environment.

**Returns**

Pointer to [L4Re](#) initial environment.

**Examples**

[examples/sys/aliens/main.c](#), [examples/sys/isr/main.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 181 of file [env.h](#).

References [L4\\_NOTHROW](#).

Referenced by [l4re\\_env\\_get\\_cap\(\)](#).

Here is the caller graph for this function:

**13.9.15.2.2 l4re\_env\_get\_cap()**

```
l4_cap_idx_t l4re_env_get_cap (
    char const * name) [inline]
```

Get the capability selector for the object named *name*.

**Parameters**

<i>name</i>	is the name of the object to lookup in the initial objects.
-------------	---

**Returns**

A valid capability selector if the object exists or an invalid capability selector if not ([l4\\_is\\_invalid\\_cap\(\)](#)).

Definition at line 220 of file [env.h](#).

References [L4\\_NOTHROW](#), [l4re\\_env\(\)](#), and [l4re\\_env\\_get\\_cap\\_e\(\)](#).

Here is the call graph for this function:

### 13.9.15.2.3 l4re\_env\_get\_cap\_e()

```
l4_cap_idx_t l4re_env_get_cap_e (
    char const * name,
    l4re_env_t const * e) [inline]
```

Get the capability selector for the object named *name*.

#### Parameters

<i>name</i>	is the name of the object to lookup in the initial objects.
<i>e</i>	is the environment structure to use for the operation.

#### Returns

A valid capability selector if the object exists or an invalid capability selector if not ([l4\\_is\\_invalid\\_cap\(\)](#)).

Definition at line 207 of file [env.h](#).

References [l4re\\_env\\_cap\\_entry\\_t::cap](#), [L4\\_INVALID\\_CAP](#), [L4\\_NOTHROW](#), and [l4re\\_env\\_get\\_cap\\_l\(\)](#).

Referenced by [l4re\\_env\\_get\\_cap\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.9.15.2.4 l4re\_env\_get\_cap\_l()

```
l4re_env_cap_entry_t const * l4re_env_get_cap_l (
    char const * name,
    unsigned l,
    l4re_env_t const * e) [inline]
```

Get the full [l4re\\_env\\_cap\\_entry\\_t](#) for the object named *name*.

##### Parameters

<i>name</i>	is the name of the object to lookup in the initial objects.
<i>l</i>	is the length of the name string, thus <i>name</i> might not be zero terminated.
<i>e</i>	is the environment structure to use for the operation.

##### Returns

A pointer to an [l4re\\_env\\_cap\\_entry\\_t](#) if the object exists or NULL if not.

Definition at line 189 of file [env.h](#).

References [l4re\\_env\\_cap\\_entry\\_t::flags](#), [L4\\_NOTHROW](#), and [l4re\\_env\\_cap\\_entry\\_t::name](#).

Referenced by [L4Re::Env::get\(\)](#), and [l4re\\_env\\_get\\_cap\\_e\(\)](#).

Here is the caller graph for this function:

#### 13.9.15.2.5 l4re\_kip()

```
l4_kernel_info_t const * l4re_kip (
    void ) [inline]
```

Get Kernel Info Page.

**Returns**

Pointer to Kernel Info Page (KIP) structure.

**Examples**

[examples/libs/shmc/prodcons.c](#), and [examples/sys/aliens/main.c](#).

Definition at line 185 of file [env.h](#).

References [l4\\_kip\(\)](#), and [L4\\_NOTHROW](#).

Referenced by [L4::Poll\\_timeout\\_kipclock::set\(\)](#), and [L4::Poll\\_timeout\\_kipclock::test\(\)](#).

Here is the call graph for this function:

### 13.10.2.2.1 Detailed Description

### 13.10.2.2.2 Function Documentation

#### 13.10.2.2.2.1 `make_ref_cap()`

```
template<typename T>
Ref\_cap< T >::Cap L4Re::Util::make\_ref\_cap ()
```

Allocate a capability slot and wrap it in a [Ref\\_cap](#).

#### Template Parameters

<code>T</code>	Type of capability the slot is used for.
----------------	--

Definition at line 195 of file [cap\\_alloc](#).

References [cap\\_alloc](#).

#### 13.10.2.2.2.2 make\_ref\_del\_cap()

```
template<typename T>
Ref_del_cap< T >::Cap L4Re::Util::make_ref_del_cap ()
```

Allocate a capability slot and wrap it in a [Ref\\_del\\_cap](#).

##### Template Parameters

<i>T</i>	Type of capability the slot is used for.
----------	--

Definition at line 204 of file [cap\\_alloc](#).

References [cap\\_alloc](#).

#### 13.10.2.2.3 Variable Documentation

##### 13.10.2.2.3.1 cap\_alloc

```
_Cap_alloc L4Re::Util::cap_alloc [extern]
```

Capability allocator.

This is the instance of the capability allocator that is used by usual applications.

The capability allocator uses the [Counting\\_cap\\_alloc](#), a reference-counting thread-safe capability allocator, that keeps a reference counter for each managed capability selector.

##### Examples

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_d](#) and [examples/libs/l4re/streammap/client.cc](#).

Referenced by [L4Re::Util::Br\\_manager::alloc\\_buffer\\_demand\(\)](#), [L4Re::Util::Smart\\_count\\_cap< Unmap\\_flags >::copy\(\)](#), [L4Re::Util::Smart\\_cap\\_auto< Unmap\\_flags >::free\(\)](#), [L4Re::Util::Smart\\_count\\_cap< Unmap\\_flags >::free\(\)](#), [L4Re::Util::Event\\_t< Default\\_event\\_payload >::init\(\)](#), [L4Re::Util::Event\\_t< Default\\_event\\_payload >::init\\_poll\(\)](#), [make\\_ref\\_cap\(\)](#), [make\\_ref\\_del\\_cap\(\)](#), [make\\_shared\\_cap\(\)](#), [make\\_shared\\_del\\_cap\(\)](#), [make\\_unique\\_cap\(\)](#), [make\\_unique\\_del\\_cap\(\)](#), [L4Re::Util::Br\\_manager::realloc\\_rcv\\_cap\(\)](#), and [L4Re::Util::Object\\_registry::unregister\\_obj\(\)](#).

#### 13.10.2.3 Kumem utilities

Collaboration diagram for Kumem utilities:

## Functions

- `int L4Re::Util::kumem_alloc (l4_addr_t *mem, unsigned pages_order, L4::Cap< L4::Task > task=L4Re::Env::env() ->task(), L4::Cap< L4Re::Rm > rm=L4Re::Env::env() ->rm()) noexcept`  
*Allocate state area.*

### 13.10.2.3.1 Detailed Description

### 13.10.2.3.2 Function Documentation

#### 13.10.2.3.2.1 kumem\_alloc()

```
int L4Re::Util::kumem_alloc (
    l4_addr_t * mem,
    unsigned pages_order,
    L4::Cap< L4::Task > task = L4Re::Env::env() ->task(),
    L4::Cap< L4Re::Rm > rm = L4Re::Env::env() ->rm())    [noexcept]
```

Allocate state area.

#### Parameters

out	<i>mem</i>	Pointer to memory that has been allocated.
	<i>pages_order</i>	Size to allocate, in log2 pages.
	<i>task</i>	Task to use for allocation.
	<i>rm</i>	Region manager to use for allocation.

#### Return values

0	for success
<0	error code on failure

#### Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

References [L4Re::Env::env\(\)](#).

Here is the call graph for this function:

### 13.10.3 Console API

[Console](#) interface.

Collaboration diagram for Console API:

#### Data Structures

- class [L4Re::Console](#)  
*Console class.*

#### 13.10.3.1 Detailed Description

[Console](#) interface.

### 13.10.4 Debugging API

Debugging Interface.

Collaboration diagram for Debugging API:

#### Data Structures

- class [L4Re::Debug\\_obj](#)  
*Debug interface.*

### 13.10.4.1 Detailed Description

Debugging Interface.

The debugging interface can be provided to retrieve, or log debugging information for an object. Each class may realize the debug interface to provide debugging functionality. For example, the region map objects provide a facility to dump the currently established memory regions.

See also

L4::Debug\_obj for more information.

### 13.10.5 L4Re ELF Auxiliary Information

API for embedding auxiliary information into binary programs.

Collaboration diagram for L4Re ELF Auxiliary Information:

#### Data Structures

- struct [l4re\\_elf\\_aux\\_t](#)  
*Generic header for each auxiliary vector element.*
- struct [l4re\\_elf\\_aux\\_vma\\_t](#)  
*Auxiliary vector element for a reserved virtual memory area.*
- struct [l4re\\_elf\\_aux\\_mword\\_t](#)  
*Auxiliary vector element for a single unsigned data word.*

#### Macros

- #define [L4RE\\_ELF\\_AUX\\_ELEM](#) const \_\_attribute\_\_((used, section(".ro.l4re\_elf\_aux"), aligned(sizeof(l4\_umword\_t))))  
*Define an auxiliary vector element.*
- #define [L4RE\\_ELF\\_AUX\\_ELEM\\_T](#)(type, id, tag, val...)  
*Define an auxiliary vector element.*

#### Typedefs

- typedef struct l4re\_elf\_aux\_t **l4re\_elf\_aux\_t**  
*Generic header for each auxiliary vector element.*
- typedef struct l4re\_elf\_aux\_vma\_t **l4re\_elf\_aux\_vma\_t**  
*Auxiliary vector element for a reserved virtual memory area.*
- typedef struct l4re\_elf\_aux\_mword\_t **l4re\_elf\_aux\_mword\_t**  
*Auxiliary vector element for a single unsigned data word.*

## Enumerations

- enum {  
[L4RE\\_ELF\\_AUX\\_T\\_NONE](#) = 0 , [L4RE\\_ELF\\_AUX\\_T\\_VMA](#) , [L4RE\\_ELF\\_AUX\\_T\\_STACK\\_SIZE](#) ,  
[L4RE\\_ELF\\_AUX\\_T\\_STACK\\_ADDR](#) ,  
[L4RE\\_ELF\\_AUX\\_T\\_KIP\\_ADDR](#) , [L4RE\\_ELF\\_AUX\\_T\\_EX\\_REGS\\_FLAGS](#) }

### 13.10.5.1 Detailed Description

API for embedding auxiliary information into binary programs.

This API allows information for the binary loader to be embedded into a binary application. This information can be reserved areas in the virtual memory of an application and things such as the stack size to be allocated for the first application thread.

### 13.10.5.2 Macro Definition Documentation

#### 13.10.5.2.1 L4RE\_ELF\_AUX\_ELEM

```
#define L4RE_ELF_AUX_ELEM const __attribute__((used, section(".ro14re_elf_aux"), aligned(sizeof(l4\_umword\_t))))
```

Define an auxiliary vector element.

This is the generic method for defining auxiliary vector elements. A more convenient way is to use [L4RE\\_ELF\\_AUX\\_ELEM\\_T](#).

Usage:

```
L4RE\_ELF\_AUX\_ELEM l4re\_elf\_aux\_vma\_t decl_name =  
{ L4RE\_ELF\_AUX\_T\_VMA, sizeof(l4re\_elf\_aux\_vma\_t), 0x2000, 0x4000 };
```

Definition at line 41 of file [elf\\_aux.h](#).

#### 13.10.5.2.2 L4RE\_ELF\_AUX\_ELEM\_T

```
#define L4RE_ELF_AUX_ELEM_T(  
    type,  
    id,  
    tag,  
    val...)
```

Value:

```
static L4RE\_ELF\_AUX\_ELEM type id = {tag, sizeof(type), val}
```

Define an auxiliary vector element.

#### Parameters

<i>type</i>	is the data type for the element (e.g., <a href="#">l4re_elf_aux_vma_t</a> )
<i>id</i>	is the identifier (variable name) for the declaration (the variable is defined with <code>static</code> storage class)
<i>tag</i>	is the tag value for the element e.g., <a href="#">L4RE_ELF_AUX_T_VMA</a>

<i>val</i>	are the values to be set in the descriptor
------------	--

Usage:

```
L4RE_ELF_AUX_ELEM_T(l4re_elf_aux_vma_t, decl_name, L4RE_ELF_AUX_T_VMA, 0x2000, 0x4000 );
```

Definition at line 56 of file [elf\\_aux.h](#).

### 13.10.5.3 Enumeration Type Documentation

#### 13.10.5.3.1 anonymous enum

anonymous enum

##### Enumerator

L4RE_ELF_AUX_T_NONE	Tag for an invalid element in the auxiliary vector.
L4RE_ELF_AUX_T_VMA	Tag for descriptor for a reserved virtual memory area.
L4RE_ELF_AUX_T_STACK_SIZE	Tag for descriptor that defines the stack size for the first application thread.
L4RE_ELF_AUX_T_STACK_ADDR	Tag for descriptor that defines the stack address for the first application thread.
L4RE_ELF_AUX_T_KIP_ADDR	Tag for descriptor that defines the KIP address for the binaries address space.
L4RE_ELF_AUX_T_EX_REGS_FLAGS	Tag for descriptor to override ex_regs() flags.

Definition at line 59 of file [elf\\_aux.h](#).

### 13.10.6 Event API

[Event API](#).

Collaboration diagram for Event API:

#### Data Structures

- class [L4Re::Event](#)  
*Event class.*
- struct [L4Re::Default\\_event\\_payload](#)  
*Default event stream payload.*
- class [L4Re::Event\\_buffer\\_t< PAYLOAD >](#)  
*Event buffer class.*

### 13.10.6.1 Detailed Description

Event API.

On top of a shared [L4Re::Dataspace](#) (and optionally using [L4::Triggerable](#)), the event API implements asynchronous event transmission from an event provider (server) to an event receiver (client). Events are put into an [Event\\_buffer\\_t](#) residing on the shared [L4Re::Dataspace](#).

This interface is usually not used directly. Instead use [L4Re::Util::Event\\_t](#) for clients. An example server portion is implemented in [L4Re::Util::Event\\_svr](#).

This interface is usually used with [L4Re::Default\\_event\\_payload](#) which delivers HID events modeled on the Linux evdev API, and the interface's methods allow further querying of information about the HID event streams.

### 13.10.7 Auxiliary data

Collaboration diagram for Auxiliary data:

#### Data Structures

- struct [l4re\\_aux\\_t](#)  
*Auxiliary descriptor.*

#### Typedefs

- typedef struct l4re\_aux\_t [l4re\\_aux\\_t](#)  
*Auxiliary descriptor.*

#### Enumerations

- enum [l4re\\_aux\\_ldr\\_flags\\_t](#)  
*Flags for program loading.*

### 13.10.7.1 Detailed Description

## 13.10.8 Logging interface

Interface for log output.

Collaboration diagram for Logging interface:

### Data Structures

- class [L4Re::Log](#)  
*Log interface class.*

### 13.10.8.1 Detailed Description

Interface for log output.

The logging interface provides a facility sending log output. One purpose of the interface is to serialize the output and provide the possibility to tag output sent to a specific log object.

## 13.10.9 Name-space API

API for name spaces that store capabilities.

Collaboration diagram for Name-space API:

### Data Structures

- class [L4Re::Namespace](#)  
*Name-space interface.*

### 13.10.9.1 Detailed Description

API for name spaces that store capabilities.

This is a basic abstraction for managing a mapping from human-readable names to capabilities. In particular, a name can also be mapped to a capability that refers to another name space object. By this means name spaces can be constructed hierarchically.

Name spaces play a central role in [L4Re](#), because the implementation of the name space objects determines the policy which capabilities (which objects) are accessible to a client of a name space.

### 13.10.10 Parent API

[Parent](#) interface.

Collaboration diagram for Parent API:

#### Data Structures

- class [L4Re::Parent](#)  
*[Parent](#) interface.*

### 13.10.10.1 Detailed Description

[Parent](#) interface.

The parent interface provides means for an [L4](#) task to signal changes in its execution state. The main purpose is to signal program termination to the program that started it, so that its resources can be reclaimed. In a typical [L4Re](#) system, this program will be Moe or Ned.

See also

[L4Re::Parent](#) for information about the concrete interface.

### 13.10.11 L4Re Protocol identifiers

Fix [L4Re](#) Protocol Constants.

Collaboration diagram for L4Re Protocol identifiers:

Definition at line 24 of file [protocols.h](#).

### 13.10.12 Region map API

Virtual address-space management.

Collaboration diagram for Region map API:

#### Data Structures

- class [L4Re::Rm](#)  
*Region map.*

### 13.10.12.1 Detailed Description

Virtual address-space management.

A region map object implements two protocols. The first protocol is the kernel page-fault protocol, to resolve page faults for threads running in an [L4](#) task. The second protocol is the region map protocol itself, which allows managing the virtual memory address space of an [L4](#) task.

There are two basic concepts provided by the region map abstraction:

- **Areas** are reserved ranges in the virtual memory address space.
- **Regions** are ranges that are backed by (part of) a dataspace, i.e. accessing them results in access to the physical memory the dataspace manages.

Note that regions may live outside of areas and that an area does not necessarily contain any region.

Areas can be reserved for special use or for attaching a dataspace at a later time. When attaching a dataspace, the user can instruct the region map to search for an appropriate range to attach to. Regions are skipped in this search since they already have dataspace attached to them, and, depending on [L4Re::Rm::F::In\\_area](#), areas are skipped because they are reserved. Amongst others, areas can be used to attach several dataspace inside a certain range of addresses without interference from other threads.

When a region map receives a page fault IPC, the region map will check if the faulting virtual address lies in a region. If yes, it will answer the page fault IPC with a mapping from the backing dataspace. If not, an error is returned.

Depending on the system type, an attached dataspace might or might not be mapped eagerly. MMU-based systems resort to lazy mapping while systems without MMU do eager mappings by default. The [L4Re::Rm::F::Eager\\_map](#) and [L4Re::Rm::F::No\\_eager\\_map](#) flags can be used to force the respective behaviour, independent of the underlying system. In case both flags are given, the [L4Re::Rm::F::No\\_eager\\_map](#) flag wins.

- class [L4vbus::Pci\\_host\\_bridge](#)  
*A Pci host bridge.*
- class [L4vbus::Pci\\_dev](#)  
*A PCI device.*

### 13.10.15.1 Detailed Description

C++ interface of the Vbus API.

The virtual bus (Vbus) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an Icu ([Interrupt controller](#)) for interrupt handling.

The Vbus interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

Refer to [L4 Vbus functions](#) for the C API.

## 13.11 L4SHM-based ring buffer implementation

The library provides a non-locking (strictly 1:1) shared-memory-based ring buffer implementation based on the L4SHM library.

Collaboration diagram for L4SHM-based ring buffer implementation:

### Topics

- Sender • . . . . . [594](#)
- Receiver . . . . . [594](#)
- Internal • . . . . . [594](#)

### 13.11.1 Detailed Description

The library provides a non-locking (strictly 1:1) shared-memory-based ring buffer implementation based on the L4SHM library.

It requires an already allocated L4SHM area to be attached to sender and receiver. It will allocate an SHM chunk within this area and provides functions to produce data and consume data in FIFO order from the ring buffer.

The sender side of the buffer needs to be initialized *before* the receiver side, because allocation of the SHM chunk and the necessary signals is done on the sender side and the receiver initialization tries to attach to these objects.

### 13.11.2 Sender

Collaboration diagram for Sender:

### 13.11.3 Receiver

Collaboration diagram for Receiver:

### 13.11.4 Internal

Collaboration diagram for Internal:

## Data Structures

### 13.11.4.1 Detailed Description

### 13.11.4.2 Macro Definition Documentation

#### 13.11.4.2.1 L4SHMC\_RINGBUF\_DATA

```
#define L4SHMC_RINGBUF_DATA(  
    ringbuf)
```

##### Value:

```
(L4SHMC\_RINGBUF\_HEAD(ringbuf)->data)
```

Get ring buffer data pointer.

##### Parameters

<i>ringbuf</i>	<a href="#">l4shmc_ringbuf_t</a> struct
----------------	---

Definition at line 114 of file [ringbuf.h](#).

#### 13.11.4.2.2 L4SHMC\_RINGBUF\_DATA\_SIZE

```
#define L4SHMC_RINGBUF_DATA_SIZE(  
    ringbuf)
```

##### Value:

```
((ringbuf)->_size - sizeof(l4shmc\_ringbuf\_head\_t))
```

Get size of data area.

**Parameters**

<i>ringbuf</i>	<a href="#">l4shmc_ringbuf_t</a> struct
----------------	---

Definition at line 123 of file [ringbuf.h](#).

**13.11.4.2.3 L4SHMC\_RINGBUF\_HEAD**

```
#define L4SHMC_RINGBUF_HEAD(  
    ringbuf)
```

**Value:**

```
((l4shmc_ringbuf_head_t*) ((ringbuf)->_addr))
```

Get ring buffer head pointer.

**Parameters**

<i>ringbuf</i>	<a href="#">l4shmc_ringbuf_t</a> struct
----------------	---

Definition at line 105 of file [ringbuf.h](#).

**13.12 Shared Memory Library**

L4SHM provides a shared memory infrastructure that establishes a shared memory area between multiple parties and uses a fast notification mechanism.

Collaboration diagram for Shared Memory Library:

- long [l4shmc\\_chunk\\_overhead](#) (void)  
*Get memory overhead required in addition to the chunk capacity for adding one chunk.*

### 13.12.1 Detailed Description

L4SHM provides a shared memory infrastructure that establishes a shared memory area between multiple parties and uses a fast notification mechanism.

A shared memory area consists of chunks and signals. A chunk is a defined chunk of memory within the memory area with a maximum size. A chunk is filled (written) by a producer and read by a consumer. When a producer has finished writing to the chunk it signals a data ready notification to the consumer.

A consumer attaches to a chunk and waits for the producer to fill the chunk. After reading out the chunk it marks the chunk free again.

A shared memory area can have multiple chunks.

The interface is divided in three roles.

- The master role, responsible for setting up a shared memory area.
- A producer, generating data into a chunk
- A consumer, receiving data.

A signal can be connected with a chunk or can be used independently (e.g. for multiple chunks).

## 13.12.2 Function Documentation

### 13.12.2.1 l4shmc\_area\_overhead()

```
long l4shmc_area_overhead (  
    void )
```

Get memory overhead per area that is not available for chunks.

#### Returns

Size of the overhead in bytes.

References [L4\\_CV](#).

### 13.12.2.2 l4shmc\_area\_size()

```
long l4shmc_area_size (  
    l4shmc_area_t const * shmarea)
```

Get size of shared memory area.

#### Parameters

<i>shmarea</i>	Shared memory area.
----------------	---------------------

#### Return values

$>0$	Size of the shared memory area.
$<0$	Error.

References [L4\\_CV](#).

### 13.12.2.3 l4shmc\_area\_size\_free()

```
long l4shmc_area_size_free (  
    l4shmc_area_t const * shmarea)
```

Get free size of shared memory area.

To get the max size to pass to `l4shmc_add_chunk`, subtract [l4shmc\\_chunk\\_overhead\(\)](#).

#### Parameters

<i>shmarea</i>	Shared memory area.
----------------	---------------------

#### Returns

Size of the shared memory area.

References [L4\\_CV](#).

#### 13.12.2.4 l4shmc\_attach()

```
long l4shmc_attach (
    char const * shmc_name,
    l4shmc_area_t * shmarea)
```

Attach to a shared memory area.

##### Parameters

	<i>shmc_name</i>	Name of the shared memory area.
out	<i>shmarea</i>	Pointer to shared memory area descriptor to be filled with information for the shared memory area.

On success, the data in 'shmarea' contains a client number which can be used to mutual agree about client initialization:

- [l4shmc\\_get\\_client\\_nr\(\)](#) returns the client number stored in 'shmarea'. The first attached client will get 0 and this number is increased for each attached client.
- [l4shmc\\_mark\\_client\\_initialized\(\)](#) tells other clients that this client has finished its initialization.
- [l4shmc\\_get\\_initialized\\_clients\(\)](#) returns the bitmap of initialized clients attached to this shared memory.

##### Return values

0	Success.
<0	Error.

##### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

#### 13.12.2.5 l4shmc\_chunk\_overhead()

```
long l4shmc_chunk_overhead (
    void )
```

Get memory overhead required in addition to the chunk capacity for adding one chunk.

##### Returns

Size of the overhead in bytes.

References [L4\\_END\\_DECLS](#).

### 13.12.2.6 l4shmc\_connect\_chunk\_signal()

```
long l4shmc_connect_chunk_signal (  
    l4shmc_chunk_t * chunk,  
    l4shmc_signal_t * signal)
```

Connect a signal with a chunk.

#### Parameters

<i>chunk</i>	Chunk to attach the signal to.
<i>signal</i>	Signal to attach.

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#), and [L4\\_INLINE](#).

### 13.12.2.7 l4shmc\_create()

```
L4_BEGIN_DECLS long l4shmc_create (  
    char const * shmc_name)
```

Create a shared memory area.

#### Parameters

<i>shmc_name</i>	Name of the shared memory area.
------------------	---------------------------------

#### Return values

0	Success.
-L4_ENOMEM	The requested size is too big.
-L4_ENOENT	No valid capability with the name of the shared memory area found.
<0	Errors from l4re_rm_attach or l4re_ns_register_obj_srv.

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

### 13.12.2.8 l4shmc\_get\_client\_nr()

```
long l4shmc_get_client_nr (
    l4shmc_area_t const * shmarea)
```

Determine the client number of the shared memory region.

#### Parameters

<i>shmarea</i>	The shared memory area.
----------------	-------------------------

#### Returns

client number.

References [L4\\_CV](#).

### 13.12.2.9 l4shmc\_get\_initialized\_clients()

```
long l4shmc_get_initialized_clients (
    l4shmc_area_t * shmarea,
    l4_umword_t * bitmask)
```

Fetch the `_clients_init_done` bitmask of the shared memory area.

#### Parameters

	<i>shmarea</i>	The shared memory area.
out	<i>bitmask</i>	The bitmask describing which clients are initialized.

#### Return values

0	Success.
<0	Error.

#### See also

[l4shmc\\_mark\\_client\\_initialized\(\)](#), [l4shmc\\_get\\_client\\_nr\(\)](#)

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

### 13.12.2.10 l4shmc\_mark\_client\_initialized()

```
long l4shmc_mark_client_initialized (
    l4shmc_area_t * shmarea)
```

Mark this shared memory client as 'initialized'.

The corresponding bit is set in the `_clients_init_done` bitmask. The bitmask can be fetched with [l4shmc\\_get\\_initialized\\_clients\(\)](#).

#### Parameters

<i>shmarea</i>	The shared memory area.
----------------	-------------------------

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

## 13.12.3 Chunks

Collaboration diagram for Chunks:

#### Topics

*Get capacity of a chunk.*
- l4shmc\_signal\_t \* [l4shmc\\_chunk\\_signal](#) (l4shmc\_chunk\_t const \*chunk)  
*Get the registered signal of a chunk.*

### 13.12.3.1 Detailed Description

### 13.12.3.2 Function Documentation

#### 13.12.3.2.1 l4shmc\_add\_chunk()

```
long l4shmc_add_chunk (
    l4shmc_area_t * shmarea,
    char const * chunk_name,
    l4\_umword\_t chunk_capacity,
    l4shmc_chunk_t * chunk)
```

Add a chunk in the shared memory area.

#### Parameters

	<i>shmarea</i>	The shared memory area to put the chunk in.
	<i>chunk_name</i>	Name of the chunk.
	<i>chunk_capacity</i>	Capacity for payload of the chunk in bytes.
out	<i>chunk</i>	Chunk structure to fill in.

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

#### 13.12.3.2.2 l4shmc\_chunk\_capacity()

```
long l4shmc_chunk_capacity (  
    l4shmc_chunk_t const * chunk)    [inline]
```

Get capacity of a chunk.

##### Parameters

<i>chunk</i>	Chunk.
--------------	--------

##### Returns

Capacity of the chunk in bytes.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.2.3 l4shmc\_chunk\_ptr()

```
void * l4shmc_chunk_ptr (  
    l4shmc_chunk_t const * chunk)    [inline]
```

Get data pointer to chunk.

##### Parameters

<i>chunk</i>	Chunk.
--------------	--------

##### Returns

Chunk pointer.

##### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#), and [L4\\_INLINE](#).

**13.12.3.2.4 l4shmc\_chunk\_signal()**

```
l4shmc_signal_t * l4shmc_chunk_signal (
    l4shmc_chunk_t const * chunk) [inline]
```

Get the registered signal of a chunk.

**Parameters**

<i>chunk</i>	Chunk.
--------------	--------

**Return values**

0	No signal has been registered with this chunk.
!=0	Pointer to signal otherwise.

References [L4\\_CV](#), and [L4\\_INLINE](#).

**13.12.3.2.5 l4shmc\_get\_chunk()**

```
long l4shmc_get_chunk (
    l4shmc_area_t * shmarea,
    char const * chunk_name,
    l4shmc_chunk_t * chunk) [inline]
```

Get chunk out of shared memory area.

**Parameters**

	<i>shmarea</i>	Shared memory area.
	<i>chunk_name</i>	Name of the chunk.
out	<i>chunk</i>	Chunk data structure to fill.

**Return values**

0	Success.
<0	Error.

**Examples**

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

### 13.12.3.2.6 l4shmc\_get\_chunk\_to()

```
long l4shmc_get_chunk_to (
    l4shmc_area_t * shmarea,
    char const * chunk_name,
    l4_umword_t timeout_ms,
    l4shmc_chunk_t * chunk)
```

Get chunk out of shared memory area, with timeout.

#### Parameters

	<i>shmarea</i>	Shared memory area.
	<i>chunk_name</i>	Name of the chunk.
	<i>timeout_ms</i>	Timeout in milliseconds to wait for the chunk to appear in the shared memory area.
out	<i>chunk</i>	Chunk data structure to fill.

#### Return values

0	Success.
<0	Error.

References [L4\\_CV](#).

### 13.12.3.2.7 l4shmc\_iterate\_chunk()

```
long l4shmc_iterate_chunk (
    l4shmc_area_t const * shmarea,
    char const ** chunk_name,
    long offs)
```

Iterate over names of all existing chunks.

#### Parameters

<i>shmarea</i>	Shared memory area.
<i>chunk_name</i>	Where the name of the current chunk will be stored
<i>offs</i>	0 to start iteration, return value of previous call to <a href="#">l4shmc_iterate_chunk()</a> to get next chunk

#### Return values

0	No more chunks available.
<0	Error.
>0	Iterator value for the next call.

References [L4\\_CV](#).

### 13.12.3.3 Producer

Collaboration diagram for Producer:

### Functions

- long [l4shmc\\_chunk\\_try\\_to\\_take](#) (l4shmc\_chunk\_t \*chunk)  
*Try to mark chunk busy.*

*Try to mark chunk busy writing.*
- long [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_overwriting](#) (l4shmc\_chunk\_t \*chunk)  
*Try to mark the chunk busy writing after it was ready for reading.*
- long [l4shmc\\_chunk\\_ready](#) (l4shmc\_chunk\_t \*chunk, [l4\\_umword\\_t](#) size)  
*Mark chunk as filled (ready).*
- long [l4shmc\\_chunk\\_ready\\_sig](#) (l4shmc\_chunk\_t \*chunk, [l4\\_umword\\_t](#) size)  
*Mark chunk as filled (ready) and signal consumer.*
- long [l4shmc\\_is\\_chunk\\_clear](#) (l4shmc\_chunk\_t const \*chunk)  
*Check whether chunk is free.*

#### 13.12.3.3.1 Detailed Description

#### 13.12.3.3.2 Function Documentation

##### 13.12.3.3.2.1 l4shmc\_chunk\_ready()

```

long l4shmc_chunk_ready (
    l4shmc_chunk_t * chunk,
    l4_umword_t size) [inline]
  
```

Mark chunk as filled (ready).

### Parameters

<i>chunk</i>	chunk.
<i>size</i>	Size of data in the chunk, in bytes.

**Return values**

<i>0</i>	Success.
<i>&lt;0</i>	Error.

References [L4\\_CV](#), and [L4\\_INLINE](#).

**13.12.3.3.2.2 l4shmc\_chunk\_ready\_sig()**

```
long l4shmc_chunk_ready_sig (  
    l4shmc_chunk_t * chunk,  
    l4_umword_t size) [inline]
```

Mark chunk as filled (ready) and signal consumer.

**Parameters**

<i>chunk</i>	chunk.
<i>size</i>	Size of data in the chunk, in bytes.

**Return values**

<i>0</i>	Success.
<i>&lt;0</i>	Error.

**Examples**

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#), and [L4\\_INLINE](#).

**13.12.3.3.2.3 l4shmc\_chunk\_try\_to\_take()**

```
long l4shmc_chunk_try_to_take (  
    l4shmc_chunk_t * chunk) [inline]
```

Try to mark chunk busy.

**Parameters**

<i>chunk</i>	chunk to mark.
--------------	----------------

**Return values**

<i>0</i>	Chunk could be taken.
----------	-----------------------

$< 0$	Chunk could not be taken, try again.
-------	--------------------------------------

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.3.2.4 l4shmc\_chunk\_try\_to\_take\_for\_overwriting()

```
long l4shmc_chunk_try_to_take_for_overwriting (
    l4shmc_chunk_t * chunk) [inline]
```

Try to mark the chunk busy writing after it was ready for reading.

#### Parameters

<i>chunk</i>	chunk to mark busy writing.
--------------	-----------------------------

This function is used by the producer to overwrite a message if the consumer did not read the message within an expected time. This function can only be used if the consumer uses [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_reading\(\)](#) before reading the chunk.

#### Return values

$0$	Chunk could be taken and can be written.
$< 0$	Chunk could not be taken, try again.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.3.2.5 l4shmc\_chunk\_try\_to\_take\_for\_writing()

```
long l4shmc_chunk_try_to_take_for_writing (
    l4shmc_chunk_t * chunk) [inline]
```

Try to mark chunk busy writing.

This function is actually an alias for [l4shmc\\_chunk\\_try\\_to\\_take\(\)](#).

#### Parameters

<i>chunk</i>	chunk to mark busy writing.
--------------	-----------------------------

#### Return values

---

<code>0</code>	Chunk could be taken and can be written.
<code>&lt;0</code>	Chunk could not be taken, try again.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.3.2.6 `l4shmc_is_chunk_clear()`

```
long l4shmc_is_chunk_clear (
    l4shmc_chunk_t const * chunk) [inline]
```

Check whether chunk is free.

##### Parameters

<code>chunk</code>	Chunk to check.
--------------------	-----------------

##### Return values

<code>!=0</code>	Chunk is clear.
<code>0</code>	Chunk is not clear.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.4 Consumer

Collaboration diagram for Consumer:

##### Functions

- long [l4shmc\\_chunk\\_try\\_to\\_take\\_for\\_reading](#) (l4shmc\_chunk\_t \*chunk)  
*Try to mark chunk busy reading.*
- long [l4shmc\\_enable\\_chunk](#) (l4shmc\_chunk\_t \*chunk)  
*Enable a signal connected with a chunk.*
- long [l4shmc\\_wait\\_chunk](#) (l4shmc\_chunk\_t \*chunk)  
*Wait on a specific chunk.*
- long [l4shmc\\_wait\\_chunk\\_to](#) (l4shmc\_chunk\_t \*chunk, [l4\\_timeout\\_t](#) timeout)

*Check whether a specific chunk has an event pending, with timeout.*

- long [l4shmc\\_wait\\_chunk\\_try](#) (l4shmc\_chunk\_t \*chunk)

*Check whether a specific chunk has an event pending.*

- long [l4shmc\\_chunk\\_consumed](#) (l4shmc\_chunk\_t \*chunk)

*Mark a chunk as free.*

- long [l4shmc\\_is\\_chunk\\_ready](#) (l4shmc\_chunk\_t const \*chunk)

*Check whether data is available.*

- long [l4shmc\\_chunk\\_size](#) (l4shmc\_chunk\_t const \*chunk)

*Get current size of a chunk.*

#### 13.12.3.4.1 Detailed Description

#### 13.12.3.4.2 Function Documentation

##### 13.12.3.4.2.1 l4shmc\_chunk\_consumed()

```
long l4shmc_chunk_consumed (
    l4shmc_chunk_t * chunk) [inline]
```

Mark a chunk as free.

#### Parameters

<i>chunk</i>	Chunk to mark as free.
--------------	------------------------

#### Return values

0	Success.
<0	Error.

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

##### 13.12.3.4.2.2 l4shmc\_chunk\_size()

```
long l4shmc_chunk_size (
    l4shmc_chunk_t const * chunk) [inline]
```

Get current size of a chunk.

#### Parameters

<i>chunk</i>	Chunk.
--------------	--------

#### Returns

Current size of the chunk in bytes.

#### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.4.2.3 l4shmc\_chunk\_try\_to\_take\_for\_reading()

```
long l4shmc_chunk_try_to_take_for_reading (  
    l4shmc_chunk_t * chunk) [inline]
```

Try to mark chunk busy reading.

##### Parameters

<i>chunk</i>	chunk to mark busy reading.
--------------	-----------------------------

##### Return values

0	Chunk could be taken and can be read.
<0	Chunk could not be taken, try again.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.4.2.4 l4shmc\_enable\_chunk()

```
long l4shmc_enable_chunk (  
    l4shmc_chunk_t * chunk)
```

Enable a signal connected with a chunk.

##### Parameters

<i>chunk</i>	Chunk to enable.
--------------	------------------

##### Return values

0	Success.
<0	Error.

A signal must be enabled before waiting when the consumer waits on any signal. Enabling is not needed if the consumer waits for a specific signal or chunk.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.4.2.5 l4shmc\_is\_chunk\_ready()

```
long l4shmc_is_chunk_ready (
    l4shmc_chunk_t const * chunk) [inline]
```

Check whether data is available.

##### Parameters

<i>chunk</i>	Chunk to check.
--------------	-----------------

##### Return values

<i>!=0</i>	Data is available.
<i>0</i>	No data available.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.4.2.6 l4shmc\_wait\_chunk()

```
long l4shmc_wait_chunk (
    l4shmc_chunk_t * chunk) [inline]
```

Wait on a specific chunk.

##### Parameters

<i>chunk</i>	Chunk to wait for.
--------------	--------------------

##### Return values

<i>0</i>	Success.
<i>&lt;0</i>	Error.

##### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

#### 13.12.3.4.2.7 l4shmc\_wait\_chunk\_to()

```
long l4shmc_wait_chunk_to (
    l4shmc_chunk_t * chunk,
    l4_timeout_t timeout)
```

Check whether a specific chunk has an event pending, with timeout.

##### Parameters

<i>chunk</i>	Chunk to check.
<i>timeout</i>	Timeout.

##### Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.3.4.2.8 l4shmc\_wait\_chunk\_try()

```
long l4shmc_wait_chunk_try (
    l4shmc_chunk_t * chunk) [inline]
```

Check whether a specific chunk has an event pending.

##### Parameters

<i>chunk</i>	Chunk to check.
--------------	-----------------

##### Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

References [L4\\_CV](#), and [L4\\_INLINE](#).

### 13.12.4 Signals

Collaboration diagram for Signals:

#### Topics

- [Producer](#) . . . . . 618
- [Consumer](#) . . . . . 619

#### Functions

- [long l4shmc\\_add\\_signal](#) (l4shmc\_area\_t \*shmarea, char const \*signal\_name, l4shmc\_signal\_t \*signal)  
Add a signal for the shared memory area.
- [long l4shmc\\_attach\\_signal](#) (l4shmc\_area\_t \*shmarea, char const \*signal\_name, [l4\\_cap\\_idx\\_t](#) thread, l4shmc\_signal\_t \*signal)  
Attach to signal.
- [long l4shmc\\_get\\_signal](#) (l4shmc\_area\_t \*shmarea, char const \*signal\_name, l4shmc\_signal\_t \*signal)  
Get signal object from the shared memory area.
- [l4\\_cap\\_idx\\_t l4shmc\\_signal\\_cap](#) (l4shmc\_signal\_t const \*signal)  
Get the signal capability of a signal.
- [long l4shmc\\_check\\_magic](#) (l4shmc\_chunk\_t const \*chunk)  
Check magic value of a chunk.

#### 13.12.4.1 Detailed Description

#### 13.12.4.2 Function Documentation

##### 13.12.4.2.1 l4shmc\_add\_signal()

```

long l4shmc_add_signal (
    l4shmc_area_t * shmarea,
    char const * signal_name,
    l4shmc_signal_t * signal)

```

Add a signal for the shared memory area.

**Parameters**

	<i>shmarea</i>	The shared memory area.
	<i>signal_name</i>	Name of the signal.
out	<i>signal</i>	Signal structure to fill in.

**Return values**

0	Success.
<0	Error.

**Examples**

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#), and [L4\\_INLINE](#).

**13.12.4.2.2 l4shmc\_attach\_signal()**

```
long l4shmc_attach_signal (
    l4shmc_area_t * shmarea,
    char const * signal_name,
    l4_cap_idx_t thread,
    l4shmc_signal_t * signal)
```

Attach to signal.

**Parameters**

	<i>shmarea</i>	Shared memory area.
	<i>signal_name</i>	Name of the signal.
	<i>thread</i>	Thread capability index to attach the signal to.
out	<i>signal</i>	Signal data structure to fill.

**Return values**

0	Success.
<0	Error.

**Examples**

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

#### 13.12.4.2.3 l4shmc\_check\_magic()

```
long l4shmc_check_magic (
    l4shmc_chunk_t const * chunk) [inline]
```

Check magic value of a chunk.

##### Parameters

<i>chunk</i>	Chunk.
--------------	--------

##### Return values

0	Magic value is not valid.
>0	Chunk is OK, the magic value is valid.

References [L4\\_CV](#).

#### 13.12.4.2.4 l4shmc\_get\_signal()

```
long l4shmc_get_signal (
    l4shmc_area_t * shmarea,
    char const * signal_name,
    l4shmc_signal_t * signal)
```

Get signal object from the shared memory area.

##### Parameters

	<i>shmarea</i>	Shared memory area.
	<i>signal_name</i>	Name of the signal.
out	<i>signal</i>	Signal data structure to fill.

##### Return values

0	Success.
<0	Error.

References [L4\\_CV](#).

#### 13.12.4.2.5 l4shmc\_signal\_cap()

```
l4\_cap\_idx\_t l4shmc_signal_cap (
    l4shmc_signal_t const * signal) [inline]
```

Get the signal capability of a signal.

**Parameters**

<i>signal</i>	Signal.
---------------	---------

**Returns**

Capability of the signal object.

References [L4\\_CV](#), and [L4\\_INLINE](#).

*Check whether any waited signal has an event pending.*
- long [l4shmc\\_wait\\_any\\_to](#) (l4\_timeout\_t timeout, l4shmc\_signal\_t \*\*retsignal)  
*Wait for any signal with timeout.*
- long [l4shmc\\_wait\\_signal](#) (l4shmc\_signal\_t \*signal)  
*Wait on a specific signal.*
- long [l4shmc\\_wait\\_signal\\_to](#) (l4shmc\_signal\_t \*signal, l4\_timeout\_t timeout)  
*Wait on a specific signal, with timeout.*
- long [l4shmc\\_wait\\_signal\\_try](#) (l4shmc\_signal\_t \*signal)  
*Check whether a specific signal has an event pending.*

#### 13.12.4.4.1 Detailed Description

#### 13.12.4.4.2 Function Documentation

##### 13.12.4.4.2.1 l4shmc\_enable\_signal()

```
long l4shmc_enable_signal (  
    l4shmc_signal_t * signal)
```

Enable a signal.

#### Parameters

<i>signal</i>	Signal to enable.
---------------	-------------------

#### Return values

0	Success.
<0	Error.

A signal must be enabled before waiting when the consumer waits on any signal. Enabling is not needed if the consumer waits for a specific signal or chunk.

References [L4\\_CV](#).

##### 13.12.4.4.2.2 l4shmc\_wait\_any()

```
long l4shmc_wait_any (  
    l4shmc_signal_t ** retsignal) [inline]
```

Wait on any signal.

#### Parameters

out	<i>retsignal</i>	Signal received.
-----	------------------	------------------

#### Return values

0	Success.
<0	Error.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.4.4.2.3 l4shmc\_wait\_any\_to()

```
long l4shmc_wait_any_to (
    l4_timeout_t timeout,
    l4shmc_signal_t ** retsignal)
```

Wait for any signal with timeout.

##### Parameters

	<i>timeout</i>	Timeout.
out	<i>retsignal</i>	Signal that has the event pending if any.

##### Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.4.4.2.4 l4shmc\_wait\_any\_try()

```
long l4shmc_wait_any_try (
    l4shmc_signal_t ** retsignal) [inline]
```

Check whether any waited signal has an event pending.

##### Parameters

out	<i>retsignal</i>	Signal that has the event pending if any.
-----	------------------	---

##### Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

References [L4\\_CV](#).

#### 13.12.4.4.2.5 l4shmc\_wait\_signal()

```
long l4shmc_wait_signal (  
    l4shmc_signal_t * signal)    [inline]
```

Wait on a specific signal.

##### Parameters

<i>signal</i>	Signal to wait for.
---------------	---------------------

##### Return values

0	Success.
<0	Error.

##### Examples

[examples/libs/shmc/prodcons.c](#).

References [L4\\_CV](#).

#### 13.12.4.4.2.6 l4shmc\_wait\_signal\_to()

```
long l4shmc_wait_signal_to (  
    l4shmc_signal_t * signal,  
    l4_timeout_t timeout)
```

Wait on a specific signal, with timeout.

##### Parameters

<i>signal</i>	Signal to wait for.
<i>timeout</i>	Timeout.

##### Return values

0	Success.
<0	Error.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.12.4.4.2.7 l4shmc\_wait\_signal\_try()

```
long l4shmc_wait_signal_try (
    l4shmc_signal_t * signal) [inline]
```

Check whether a specific signal has an event pending.

##### Parameters

<i>signal</i>	Signal to check.
---------------	------------------

##### Return values

0	Success.
<0	Error.

The return code indicates whether an event was pending or not. Success means an event was pending, if an receive timeout error is returned no event was pending.

References [L4\\_CV](#), and [L4\\_INLINE](#).

## 13.13 Sigma0 API

Sigma0 API bindings.

Collaboration diagram for Sigma0 API:

*Get user readable error messages for the return codes.*

### 13.13.1 Detailed Description

Sigma0 API bindings.

Convenience bindings for the Sigma0 protocol.

### 13.13.2 Enumeration Type Documentation

#### 13.13.2.1 l4sigma0\_return\_flags\_t

enum `l4sigma0_return_flags_t`

Return flags of libsigma0 functions.

#### Enumerator

<code>L4SIGMA0_OK</code>	Ok.
<code>L4SIGMA0_NOTALIGNED</code>	Phys, virt or size not aligned.
<code>L4SIGMA0_IPCERROR</code>	IPC error.
<code>L4SIGMA0_NOFPAGE</code>	No fpage received.
<code>L4SIGMA0_SMALLERFPAGE</code>	Superpage requested but smaller flexpage received.

Definition at line 76 of file [sigma0.h](#).

### 13.13.3 Function Documentation

#### 13.13.3.1 `l4sigma0_debug_dump()`

```
void l4sigma0_debug_dump (
    l4_cap_idx_t sigma0)
```

Request sigma0 to dump internal debug information.

##### Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
---------------	--

The debug information, such as internal memory maps, as well as statistics about the internal allocators is dumped to the kernel debugger.

References [L4\\_CV](#), and [L4\\_INLINE](#).

#### 13.13.3.2 `l4sigma0_map_anypage()`

```
int l4sigma0_map_anypage (
    l4_cap_idx_t sigma0,
    l4_addr_t map_area,
    unsigned log2_map_size,
    l4_addr_t * base,
    unsigned sz)
```

Request an arbitrary free page of RAM.

##### Parameters

	<i>sigma0</i>	Capability selector for the sigma0 gate.
	<i>map_area</i>	The base address of the local virtual memory area where the page should be mapped.
	<i>log2_map_size</i>	The size of the requested page log 2 (the size in bytes is $2^{\text{log2\_map\_size}}$ ). This must be at least the minimal page size. By specifying larger sizes the largest possible hardware page size will be used.
out	<i>base</i>	Physical address of the page received (i.e. the send base of the received mapping if any).
	<i>sz</i>	Size to map by the server in $2^{\text{sz}}$ bytes.

##### Return values

<i>0</i>	Success.
<i>-L4SIGMA0_IPCERROR</i>	IPC error.
<i>-L4SIGMA0_NOFPAGE</i>	No fpage received.

This function requests arbitrary free memory from sigma0. It should be used whenever spare memory is needed, instead of requesting specific physical memory with [l4sigma0\\_map\\_mem\(\)](#).

See [l4sigma0\\_map\\_errstr\(\)](#) to get a description of the return value.

References [L4\\_CV](#).

### 13.13.3.3 l4sigma0\_map\_errstr()

```
char const * l4sigma0_map_errstr (
    int err) [inline]
```

Get user readable error messages for the return codes.

#### Parameters

<i>err</i>	The error code reported by the <i>map</i> functions.
------------	--

#### Returns

A string containing the error message.

Definition at line 210 of file [sigma0.h](#).

References [L4\\_INLINE](#).

### 13.13.3.4 l4sigma0\_map\_iomem()

```
int l4sigma0_map_iomem (
    l4_cap_idx_t sigma0,
    l4_addr_t phys,
    l4_addr_t virt,
    l4_addr_t size,
    int cached)
```

Request IO memory from sigma0.

#### Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
<i>phys</i>	The physical address to be requested (page aligned).
<i>virt</i>	The virtual address where the memory should be mapped to (page aligned).
<i>size</i>	The size of the IO memory area to be mapped (multiple of page size)
<i>cached</i>	Requests cacheable IO memory if 1 and uncached if 0.

#### Return values

0	Success.
-L4SIGMA0_NOTALIGNED	<i>phys</i> , <i>virt</i> , or <i>size</i> are not aligned.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function is similar to [l4sigma0\\_map\\_mem\(\)](#), the difference is that it requests IO memory. IO memory is everything that is not known to be normal RAM. Also ACPI tables or the BIOS memory is treated as IO memory.

See [l4sigma0\\_map\\_errstr\(\)](#) to get a description of the return value.

References [L4\\_CV](#).

### 13.13.3.5 l4sigma0\_map\_kip()

```
L4_BEGIN_DECLS l4_kernel_info_t * l4sigma0_map_kip (
    l4_cap_idx_t sigma0,
    void * addr,
    unsigned log2_size)
```

Map the kernel info page from sigma0 to addr.

#### Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
<i>addr</i>	Start of the receive window to receive KIP in.
<i>log2_size</i>	Size of the receive window to receive KIP in.

#### Returns

Address KIP was mapped to, 0 indicates an error.

### 13.13.3.6 l4sigma0\_map\_mem()

```
int l4sigma0_map_mem (
    l4_cap_idx_t sigma0,
    l4_addr_t phys,
    l4_addr_t virt,
    l4_addr_t size)
```

Request a memory mapping from sigma0.

#### Parameters

<i>sigma0</i>	Capability selector for the sigma0 gate.
<i>phys</i>	The physical address of the requested page (must be at least aligned to the minimum page size).
<i>virt</i>	The virtual address where the paged should be mapped in the local address space (must be at least aligned to the minimum page size).
<i>size</i>	The size of the requested page, this must be a multiple of the minimum page size.

#### Return values

0	Success.
-L4SIGMA0_NOTALIGNED	phys, virt, or size are not aligned.
-L4SIGMA0_IPCERROR	IPC error.
-L4SIGMA0_NOFPAGE	No fpage received.

This function only maps normal RAM. To map other memory, use [l4sigma0\\_map\\_iomem\(\)](#). See also there for the distinction between both memory types.

This is the direct method to request memory from sigma0. There is also the indirect method where sigma0 will answer page faults with a mapping that is one-to-one between the faulting virtual page and the backing physical page. See [L4::Pager::page\\_fault\(\)](#). For an overview of the memory hierarchy, see [Memory management - Data Spaces and the Region Map](#).

See [l4sigma0\\_map\\_errstr\(\)](#) to get a description of the return value.

References [L4\\_CV](#).

- `void operator delete (void *, cxx::Nothrow const &) noexcept`  
*Delete operator complementing the new operator not throwing exceptions.*

### 13.14.1 Detailed Description

### 13.14.2 Function Documentation

#### 13.14.2.1 `clamp()`

```
template<typename T1>
T1 cxx::clamp (
    T1 v,
    T1 lo,
    T1 hi) [inline]
```

Limit  $v$  to the range given by  $lo$  and  $hi$ .

#### Parameters

$v$	The value to clamp.
$lo$	The lower boundary to clamp $v$ to.
$hi$	The upper boundary to clamp $v$ to.

Definition at line [109](#) of file [minmax](#).

**13.14.2.2 max()** [1/2]

```
template<typename A, typename ... ARGS>
A const & cxx::max (
    A const & a1,
    A const & a2,
    ARGS const &... a) [constexpr]
```

Get the maximum of a1 and a2 up to aN.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔ a</i>	Arbitrary number of additional parameters.

Matches with automatic argument type deduction.

Definition at line 78 of file [minmax](#).

**13.14.2.3 max()** [2/2]

```
template<typename A, typename ... ARGS>
A const & cxx::max (
    cxx::identity_t< A > const & a1,
    cxx::identity_t< A > const & a2,
    ARGS const &... a) [constexpr]
```

Get the maximum of a1 and a2 up to aN.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔ a</i>	Arbitrary number of additional parameters.

Matches with explicit template type A.

Definition at line 93 of file [minmax](#).

**13.14.2.4 min() [1/2]**

```
template<typename A, typename ...  ARGS>
A const & cxx::min (
    A const & a1,
    A const & a2,
    ARGS const &...  a) [constexpr]
```

Get the minimum of a1 and a2 upt to aN.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔ a</i>	Arbitrary number of additional parameters.

Matches with automatic argument type deduction.

Definition at line 36 of file [minmax](#).

**13.14.2.5 min() [2/2]**

```
template<typename A, typename ...  ARGS>
A const & cxx::min (
    cxx::identity_t< A > const & a1,
    cxx::identity_t< A > const & a2,
    ARGS const &...  a) [constexpr]
```

Get the minimum of a1 and a2 upt to aN.

**Parameters**

<i>a1</i>	The first value.
<i>a2</i>	The second value.
<i>...↔ a</i>	Arbitrary number of additional parameters.

Matches with explicit template type A.

Definition at line 53 of file [minmax](#).

**13.14.2.6 operator new()**

```
void * operator new (
    size_t ,
    void * mem,
    cxx::Nothrow const & ) [inline], [noexcept]
```

Simple placement new operator.

**Parameters**

<i>mem</i>	the address of the memory block to place the new object.
------------	--

**Returns**

the address given by *mem*.

Definition at line 28 of file [std\\_alloc](#).

**13.15 The L4Re IPC Framework**

The mechanisms for IPC communication between [L4Re](#) applications.

### 13.15.2.2 Enumeration Type Documentation

#### 13.15.2.2.1 Reply\_mode

enum [L4::Ipc\\_svr::Reply\\_mode](#)

Reply mode for server loop.

The reply mode specifies if the server loop shall do a compound reply and wait operation ([Reply\\_compound](#)), which is the most performant method. Note, `setup_wait()` is called before the reply. The other way is to call reply and wait separately and call `setup_wait` in between.

The actual mode is determined by the return value of the `before_reply()` hook in the `LOOP_HOOKS` of [L4::Server](#).

#### Enumerator

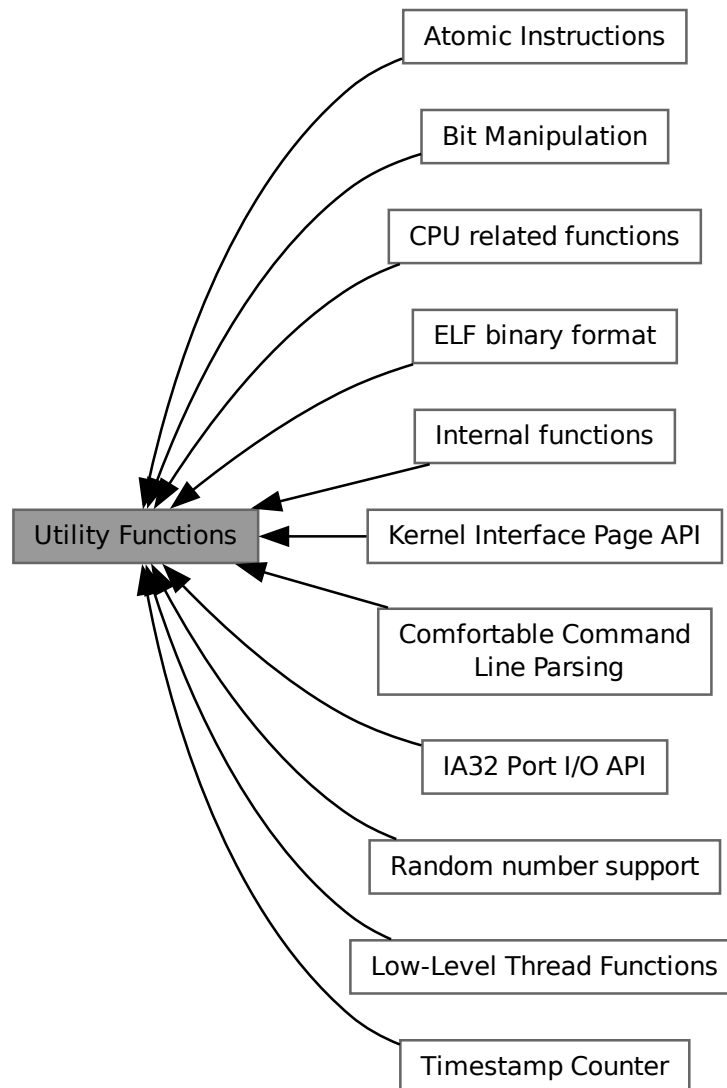

Reply_compound	<a href="#">Server</a> shall use a compound reply and wait (fast).
Reply_separate	<a href="#">Server</a> shall call reply and wait separately.

Definition at line 46 of file [ipc\\_server\\_loop](#).

## 13.16 Utility Functions

Utilities, generic file.

### 13.16.1 Detailed Description

Utilities, generic file.

## 13.16.2 Function Documentation

### 13.16.2.1 l4\_sleep()

```
void l4_sleep (
    l4_uint32_t ms)
```

Suspend thread for a period of *ms* milliseconds.

#### Parameters

<i>ms</i>	Time in milliseconds
-----------	----------------------

#### Examples

[examples/libs/libirq/async\\_isr.c](#), [examples/sys/aliens/main.c](#), [examples/sys/singlestep/main.c](#), and [examples/sys/start-with-exc/main.c](#).

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

Referenced by [L4Re::Namespace::query\(\)](#).

Here is the caller graph for this function:

### 13.16.2.2 l4\_touch\_ro()

```
void l4_touch_ro (
    const void * addr,
    unsigned size) [inline]
```

Touch data area to force mapping (read-only).

#### Parameters

<i>addr</i>	Start of memory area to touch.
<i>size</i>	Size of area to touch.

#### Examples

[examples/sys/singlestep/main.c](#).

Definition at line 92 of file [util.h](#).

References [L4\\_NOTHROW](#), [L4\\_PAGESIZE](#), and [l4\\_trunc\\_page\(\)](#).

Here is the call graph for this function:

### 13.16.2.3 l4\_touch\_rw()

```
void l4_touch_rw (  
    const void * addr,  
    unsigned size) [inline]
```

Touch data areas to force mapping (read-write).

#### Parameters

<i>addr</i>	Start of memory area to touch.
<i>size</i>	Size of area to touch.

#### Examples

[examples/sys/aliens/main.c](#), and [examples/sys/singlestep/main.c](#).

Definition at line 105 of file [util.h](#).

References [L4\\_NOTHROW](#), [L4\\_PAGESIZE](#), and [l4\\_trunc\\_page\(\)](#).

Here is the call graph for this function:

### 13.16.2.4 l4\_usleep()

```
void l4_usleep (
    l4_uint64_t us)
```

Suspend thread for a period of *us* microseconds.

#### Parameters

<i>us</i>	Time in microseconds
-----------	----------------------

#### Note

The timer resolution of L4 kernels is usually 1ms.

References [L4\\_CV](#), [L4\\_INLINE](#), [L4\\_NORETURN](#), and [L4\\_NOTHROW](#).

### 13.16.2.5 l4util\_micros2l4to()

```
L4_BEGIN_DECLS l4_timeout_s l4util_micros2l4to (
    l4_uint64_t us)
```

Calculate l4 timeouts.

#### Parameters

<i>us</i>	time in microseconds. Special cases: <ul style="list-style-type: none"> <li>• 0 -&gt; timeout 0</li> <li>• ~0U -&gt; timeout NEVER</li> </ul>
-----------	---

#### Returns

the corresponding l4\_timeout value

**Deprecated** Use [l4\\_timeout\\_from\\_us\(\)](#).

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

### 13.16.2.6 l4util\_splitlog2\_hdl()

```
L4_END_DECLS long l4util_splitlog2_hdl (
    l4_addr_t start,
    l4_addr_t end,
    long(* handler ) (l4_addr_t s, l4_addr_t e, int log2size)) [inline]
```

Split a range into log2 base and size aligned chunks.

#### Parameters

<i>start</i>	Start of range
<i>end</i>	End of range (inclusive) (e.g. 2-4 is len 3)
<i>handler</i>	Handler function that is called with start and end (both inclusive) of the chunk. On success, the handler must return 0, if it returns !=0 the function will immediately return with the return code of the handler.

#### Returns

0 on success, != 0 otherwise

Definition at line 51 of file [splitlog2.h](#).

References [L4\\_EINVAL](#), and [l4util\\_splitlog2\\_size\(\)](#).

Here is the call graph for this function:

### 13.16.2.7 l4util\_splitlog2\_size()

```
l4_addr_t l4util_splitlog2_size (
    l4_addr_t start,
    l4_addr_t end) [inline]
```

Return log2 base and size aligned length of a range.

#### Parameters

<i>start</i>	Start of range
<i>end</i>	End of range (inclusive) (e.g. 2-4 is len 3)

**Returns**

length of elements in log2size (length is  $1 \ll \log_2 \text{size}$ )

Definition at line 70 of file [splitlog2.h](#).

Referenced by [l4util\\_splitlog2\\_hdl\(\)](#).

Here is the caller graph for this function:

**13.16.3 CPU related functions**

Collaboration diagram for CPU related functions:

**Functions**

- int [l4util\\_cpu\\_has\\_cpuid](#) (void)  
*Check whether the CPU supports the "cpuid" instruction.*
- unsigned int [l4util\\_cpu\\_capabilities](#) (void)  
*Returns the CPU capabilities if the "cpuid" instruction is available.*
- unsigned int [l4util\\_cpu\\_capabilities\\_nocheck](#) (void)  
*Returns the CPU capabilities.*
- void **`l4util_cpu_cpuid`** (unsigned long mode, unsigned long \*eax, unsigned long \*ebx, unsigned long \*ecx, unsigned long \*edx)  
*Generic CPUID access function.*

### 13.16.3.1 Detailed Description

### 13.16.3.2 Function Documentation

#### 13.16.3.2.1 l4util\_cpu\_capabilities()

```
unsigned int l4util_cpu_capabilities (  
    void ) [inline]
```

Returns the CPU capabilities if the "cpuid" instruction is available.

#### Returns

CPU capabilities if the "cpuid" instruction is available, 0 if the "cpuid" instruction is not supported.

Definition at line 95 of file [cpu.h](#).

References [l4util\\_cpu\\_capabilities\\_nocheck\(\)](#), and [l4util\\_cpu\\_has\\_cpuid\(\)](#).

Here is the call graph for this function:

#### 13.16.3.2.2 l4util\_cpu\_capabilities\_nocheck()

```
unsigned int l4util_cpu_capabilities_nocheck (  
    void ) [inline]
```

Returns the CPU capabilities.

#### Returns

CPU capabilities.

Definition at line 84 of file [cpu.h](#).

References [l4util\\_cpu\\_cpuid\(\)](#).

Referenced by [l4util\\_cpu\\_capabilities\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 13.16.3.2.3 l4util\_cpu\_has\_cpuid()

```
int l4util_cpu_has_cpuid (  
    void ) [inline]
```

Check whether the CPU supports the "cpuid" instruction.

##### Returns

1 if it has, 0 if it has not

Definition at line 64 of file [cpu.h](#).

Referenced by [l4util\\_cpu\\_capabilities\(\)](#).

Here is the caller graph for this function:

### 13.16.4 IA32 Port I/O API

Collaboration diagram for IA32 Port I/O API:

#### Functions

- `l4_uint8_t l4util_in8 (l4_uint16_t port)`  
*Read byte from I/O port.*
- `l4_uint16_t l4util_in16 (l4_uint16_t port)`  
*Read 16-bit-value from I/O port.*
- `l4_uint32_t l4util_in32 (l4_uint16_t port)`  
*Read 32-bit-value from I/O port.*
- `void l4util_ins8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Read a block of 8-bit-values from I/O ports.*
- `void l4util_ins16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Read a block of 16-bit-values from I/O ports.*
- `void l4util_ins32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Read a block of 32-bit-values from I/O ports.*
- `void l4util_out8 (l4_uint8_t value, l4_uint16_t port)`  
*Write byte to I/O port.*
- `void l4util_out16 (l4_uint16_t value, l4_uint16_t port)`  
*Write 16-bit-value to I/O port.*
- `void l4util_out32 (l4_uint32_t value, l4_uint16_t port)`  
*Write 32-bit-value to I/O port.*
- `void l4util_outs8 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Write a block of bytes to I/O port.*
- `void l4util_outs16 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Write a block of 16-bit-values to I/O port.*
- `void l4util_outs32 (l4_uint16_t port, l4_umword_t addr, l4_umword_t count)`  
*Write block of 32-bit-values to I/O port.*
- `void l4util_iodelay (void)`  
*delay I/O port access by writing to port 0x80*
- `int l4util_ioport_map (l4_cap_idx_t sigma0id, unsigned port_start, unsigned log2size)`  
*Map a range of I/O ports.*

### 13.16.4.1 Detailed Description

### 13.16.4.2 Function Documentation

#### 13.16.4.2.1 l4util\_in16()

```
l4_uint16_t l4util_in16 (  
    l4_uint16_t port) [inline]
```

Read 16-bit-value from I/O port.

#### Parameters

<i>port</i>	I/O port address
-------------	------------------

#### Returns

value

Definition at line 195 of file [port\\_io.h](#).

#### 13.16.4.2.2 l4util\_in32()

```
l4_uint32_t l4util_in32 (  
    l4_uint16_t port) [inline]
```

Read 32-bit-value from I/O port.

#### Parameters

<i>port</i>	I/O port address
-------------	------------------

#### Returns

value

Definition at line 203 of file [port\\_io.h](#).

#### 13.16.4.2.3 l4util\_in8()

```
l4_uint8_t l4util_in8 (  
    l4_uint16_t port) [inline]
```

Read byte from I/O port.

##### Parameters

<i>port</i>	I/O port address
-------------	------------------

##### Returns

value

Definition at line 187 of file [port\\_io.h](#).

#### 13.16.4.2.4 l4util\_ins16()

```
void l4util_ins16 (  
    l4_uint16_t port,  
    l4_umword_t addr,  
    l4_umword_t count) [inline]
```

Read a block of 16-bit-values from I/O ports.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 220 of file [port\\_io.h](#).

#### 13.16.4.2.5 l4util\_ins32()

```
void l4util_ins32 (  
    l4_uint16_t port,  
    l4_umword_t addr,  
    l4_umword_t count) [inline]
```

Read a block of 32-bit-values from I/O ports.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer

<i>count</i>	number of I/O operations
--------------	--------------------------

Definition at line 229 of file [port\\_io.h](#).

#### 13.16.4.2.6 l4util\_ins8()

```
void l4util_ins8 (  
    l4_uint16_t port,  
    l4_umword_t addr,  
    l4_umword_t count) [inline]
```

Read a block of 8-bit-values from I/O ports.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 211 of file [port\\_io.h](#).

#### 13.16.4.2.7 l4util\_ioport\_map()

```
int l4util_ioport_map (  
    l4_cap_idx_t sigma0id,  
    unsigned port_start,  
    unsigned log2size) [inline]
```

Map a range of I/O ports.

##### Parameters

<i>sigma0id</i>	I/O port service (sigma0).
<i>port_start</i>	(Start) Port to request.
<i>log2size</i>	Log2size of range to request.

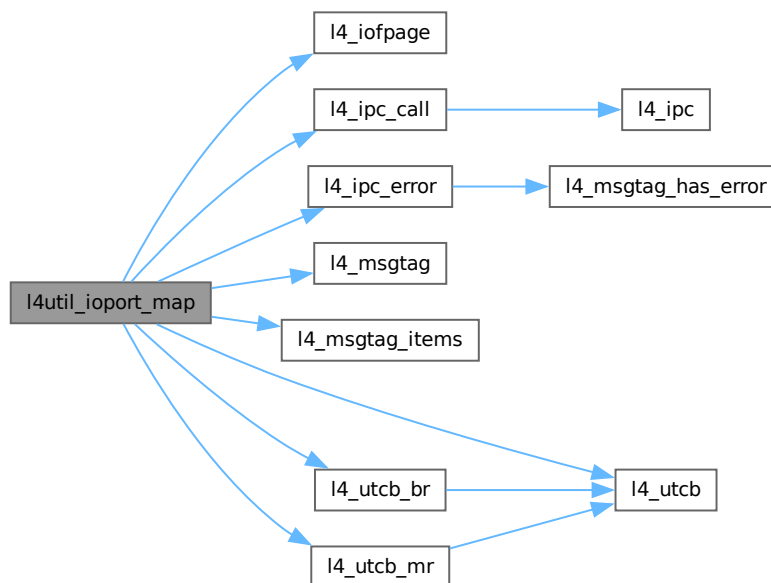

##### Returns

IPC result: 0 if the range could be successfully mapped on error: IPC failure, or -L4\_ENOENT if nothing mapped

Definition at line 289 of file [port\\_io.h](#).

References [l4\\_buf\\_regs\\_t::bdr](#), [l4\\_buf\\_regs\\_t::br](#), [L4\\_ENOENT](#), [l4\\_iofpage\(\)](#), [l4\\_ipc\\_call\(\)](#), [l4\\_ipc\\_error\(\)](#), [L4\\_IPC\\_NEVER](#), [L4\\_ITEM\\_MAP](#), [l4\\_msgtag\(\)](#), [l4\\_msgtag\\_items\(\)](#), [L4\\_PROTO\\_IO\\_PAGE\\_FAULT](#), [l4\\_utcb\(\)](#), [l4\\_utcb\\_br\(\)](#), [l4\\_utcb\\_mr\(\)](#), [l4\\_msg\\_regs\\_t::mr](#), and [l4\\_fpage\\_t::raw](#).

Here is the call graph for this function:

#### 13.16.4.2.8 l4util\_out16()

```
void l4util_out16 (
    l4_uint16_t value,
    l4_uint16_t port) [inline]
```

Write 16-bit-value to I/O port.

##### Parameters

<i>port</i>	I/O port address
<i>value</i>	value to write

Definition at line 244 of file [port\\_io.h](#).

#### 13.16.4.2.9 l4util\_out32()

```
void l4util_out32 (
    l4_uint32_t value,
    l4_uint16_t port) [inline]
```

Write 32-bit-value to I/O port.

**Parameters**

<i>port</i>	I/O port address
<i>value</i>	value to write

Definition at line 250 of file [port\\_io.h](#).

**13.16.4.2.10 l4util\_out8()**

```
void l4util_out8 (  
    l4_uint8_t value,  
    l4_uint16_t port) [inline]
```

Write byte to I/O port.

**Parameters**

<i>port</i>	I/O port address
<i>value</i>	value to write

Definition at line 238 of file [port\\_io.h](#).

**13.16.4.2.11 l4util\_outs16()**

```
void l4util_outs16 (  
    l4_uint16_t port,  
    l4_umword_t addr,  
    l4_umword_t count) [inline]
```

Write a block of 16-bit-values to I/O port.

**Parameters**

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line 265 of file [port\\_io.h](#).

#### 13.16.4.2.12 l4util\_outs32()

```
void l4util_outs32 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count) [inline]
```

Write block of 32-bit-values to I/O port.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line [274](#) of file [port\\_io.h](#).

#### 13.16.4.2.13 l4util\_outs8()

```
void l4util_outs8 (
    l4_uint16_t port,
    l4_umword_t addr,
    l4_umword_t count) [inline]
```

Write a block of bytes to I/O port.

##### Parameters

<i>port</i>	I/O port address
<i>addr</i>	address of buffer
<i>count</i>	number of I/O operations

Definition at line [256](#) of file [port\\_io.h](#).

### 13.16.5 Timestamp Counter

Collaboration diagram for Timestamp Counter:

- void [l4\\_busy\\_wait\\_us](#) ([l4\\_uint64\\_t](#) us)  
*Wait busy for a small amount of time.*
- [l4\\_uint32\\_t l4\\_calibrate\\_tsc](#) ([l4\\_kernel\\_info\\_t](#) const \*kip)  
*Determine scalers for timestamp calculations.*
- [l4\\_uint32\\_t l4\\_tsc\\_init](#) ([l4\\_kernel\\_info\\_t](#) const \*kip)  
*Initialize scaler for TSC calibrations from the kernel.*
- [l4\\_uint32\\_t l4\\_get\\_hz](#) (void)  
*Get CPU frequency in Hz.*

### 13.16.5.1 Detailed Description

### 13.16.5.2 Function Documentation

#### 13.16.5.2.1 l4\_busy\_wait\_ns()

```
void l4_busy_wait_ns (
    l4\_uint64\_t ns) [inline]
```

Wait busy for a small amount of time.

**Parameters**

<i>ns</i>	nano seconds to wait
-----------	----------------------

**Attention**

Not intended for any use!

Definition at line 262 of file [rdtsc.h](#).

References [l4\\_ns\\_to\\_tsc\(\)](#), and [l4\\_rdtsc\(\)](#).

Here is the call graph for this function:

**13.16.5.2.2 l4\_busy\_wait\_us()**

```
void l4_busy_wait_us (  
    l4_uint64_t us) [inline]
```

Wait busy for a small amount of time.

**Parameters**

<i>us</i>	micro seconds to wait
-----------	-----------------------

**Attention**

Not intended for any use!

Definition at line 272 of file [rdtsc.h](#).

References [l4\\_ns\\_to\\_tsc\(\)](#), and [l4\\_rdtsc\(\)](#).

Here is the call graph for this function:

### 13.16.5.2.3 l4\_calibrate\_tsc()

```
l4_uint32_t l4_calibrate_tsc (
    l4_kernel_info_t const * kip) [inline]
```

Determine scalars for timestamp calculations.

Determine some scalars to be able to convert between real time and CPU ticks. Just calls [l4\\_tsc\\_init\(\)](#).

#### Examples

[examples/sys/aliens/main.c](#).

Definition at line 159 of file [rdtsc.h](#).

References [l4\\_tsc\\_init\(\)](#).

Here is the call graph for this function:

### 13.16.5.2.4 l4\_get\_hz()

```
l4_uint32_t l4_get_hz (
    void )
```

Get CPU frequency in Hz.

#### Returns

frequency in Hz

References [L4\\_END\\_DECLS](#), and [L4\\_INLINE](#).

#### 13.16.5.2.5 l4\_ns\_to\_tsc()

```
l4_cpu_time_t l4_ns_to_tsc (
    l4_uint64_t ns) [inline]
```

Convert nano seconds into CPU ticks.

##### Parameters

<i>ns</i>	nano seconds
-----------	--------------

##### Returns

CPU ticks

Definition at line 248 of file [rdtsc.h](#).

Referenced by [l4\\_busy\\_wait\\_ns\(\)](#), and [l4\\_busy\\_wait\\_us\(\)](#).

Here is the caller graph for this function:

#### 13.16.5.2.6 l4\_rdpmc()

```
l4_uint64_t l4_rdpmc (
    int ecx) [inline]
```

Return current value of CPU-internal performance measurement counter.

##### Parameters

<i>ecx</i>	ECX value for the rdpmc instruction. For details see the Intel IA-32 Architectures Software Developer's Manual.
------------	---

##### Returns

64-bit PMC

Definition at line 175 of file [rdtsc.h](#).

#### 13.16.5.2.7 l4\_rdpmc\_32()

```
l4_uint32_t l4_rdpmc_32 (
    int ecx) [inline]
```

Return the least significant 32 bit of a performance counter.

Useful for smaller differences, needs less cycles.

Definition at line 195 of file [rdtsc.h](#).

#### 13.16.5.2.8 l4\_rdtsc()

```
l4_cpu_time_t l4_rdtsc (
    void ) [inline]
```

Read current value of CPU-internal timestamp counter.

##### Returns

64-bit timestamp

##### Examples

[examples/sys/aliens/main.c](#).

Definition at line 165 of file [rdtsc.h](#).

Referenced by [l4\\_busy\\_wait\\_ns\(\)](#), and [l4\\_busy\\_wait\\_us\(\)](#).

Here is the caller graph for this function:

#### 13.16.5.2.9 l4\_rdtsc\_32()

```
l4_uint32_t l4_rdtsc_32 (
    void ) [inline]
```

Read the lest significant 32 bit of the TSC.

Useful for smaller differences, needs less cycles.

Definition at line 185 of file [rdtsc.h](#).

**13.16.5.2.10 l4\_tsc\_init()**

```
l4_uint32_t l4_tsc_init (
    l4_kernel_info_t const * kip)
```

Initialize scaler for TSC calibrations from the kernel.

Initialize the scalers needed by [l4\\_tsc\\_to\\_ns\(\)](#)/[l4\\_ns\\_to\\_tsc\(\)](#) and so on. Use the kernel-provided frequency.

**Parameters**

<i>kip</i>	KIP pointer
------------	-------------

**Returns**

0 on error (no scalers exported by kernel) otherwise returns ( $2^{32} / (\text{tsc per } \mu\text{sec})$ ). This value has the same semantics as the value returned by the `calibrate_delay_loop()` function of the Linux kernel.

References [L4\\_CV](#).

Referenced by [l4\\_calibrate\\_tsc\(\)](#).

Here is the caller graph for this function:

**13.16.5.2.11 l4\_tsc\_to\_ns()**

```
l4_uint64_t l4_tsc_to_ns (
    l4_cpu_time_t tsc) [inline]
```

Convert timestamp to ns value.

**Parameters**

<i>tsc</i>	time value in CPU ticks
------------	-------------------------

**Returns**

time value in ns

**Examples**

[examples/sys/aliens/main.c](#).

Definition at line [205](#) of file [rdtsc.h](#).

### 13.16.5.2.12 l4\_tsc\_to\_s\_and\_ns()

```
void l4_tsc_to_s_and_ns (
    l4_cpu_time_t tsc,
    l4_uint32_t * s,
    l4_uint32_t * ns) [inline]
```

Convert timestamp to s.ns value.

#### Parameters

	<i>tsc</i>	time value in CPU ticks
out	<i>s</i>	seconds
out	<i>ns</i>	nano seconds

Definition at line 233 of file [rdtsc.h](#).

### 13.16.5.2.13 l4\_tsc\_to\_us()

```
l4_uint64_t l4_tsc_to_us (
    l4_cpu_time_t tsc) [inline]
```

Convert timestamp into micro seconds value.

#### Parameters

<i>tsc</i>	time value in CPU ticks
------------	-------------------------

#### Returns

time value in micro seconds

Definition at line 219 of file [rdtsc.h](#).

## 13.16.6 Atomic Instructions

Collaboration diagram for Atomic Instructions:

## Files

- file [atomic.h](#)  
*atomic operations header and generic implementations*

## Functions

- `int l4util_cmpxchg32 (volatile l4_uint32_t *dest, l4_uint32_t cmp_val, l4_uint32_t new_val)`  
*Atomic compare and exchange (32 bit version).*
- `int l4util_cmpxchg16 (volatile l4_uint16_t *dest, l4_uint16_t cmp_val, l4_uint16_t new_val)`  
*Atomic compare and exchange (16 bit version).*
- `int l4util_cmpxchg8 (volatile l4_uint8_t *dest, l4_uint8_t cmp_val, l4_uint8_t new_val)`  
*Atomic compare and exchange (8 bit version).*
- `int l4util_cmpxchg (volatile l4_umword_t *dest, l4_umword_t cmp_val, l4_umword_t new_val)`  
*Atomic compare and exchange (machine wide fields).*
- `l4_uint32_t l4util_xchg32 (volatile l4_uint32_t *dest, l4_uint32_t val)`  
*Atomic exchange (32 bit version).*
- `l4_uint16_t l4util_xchg16 (volatile l4_uint16_t *dest, l4_uint16_t val)`  
*Atomic exchange (16 bit version).*
- `l4_uint8_t l4util_xchg8 (volatile l4_uint8_t *dest, l4_uint8_t val)`  
*Atomic exchange (8 bit version).*
- `l4_umword_t l4util_xchg (volatile l4_umword_t *dest, l4_umword_t val)`  
*Atomic exchange (machine wide fields).*

**13.16.6.1 Detailed Description****13.16.6.2 Function Documentation****13.16.6.2.1 l4util\_add16()**

```
void l4util_add16 (
    volatile l4\_uint16\_t * dest,
    l4\_uint16\_t val) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line [472](#) of file [atomic.h](#).

**13.16.6.2.2 l4util\_add16\_res()**

```
l4\_uint16\_t l4util_add16_res (
    volatile l4\_uint16\_t * dest,
    l4\_uint16\_t val) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line [524](#) of file [atomic.h](#).

### 13.16.6.2.3 l4util\_add32()

```
void l4util_add32 (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 476 of file [atomic.h](#).

### 13.16.6.2.4 l4util\_add32\_res()

```
l4_uint32_t l4util_add32_res (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

#### Returns

res

Definition at line 528 of file [atomic.h](#).

### 13.16.6.2.5 l4util\_add8()

```
void l4util_add8 (  
    volatile l4_uint8_t * dest,  
    l4_uint8_t val) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 468 of file [atomic.h](#).

#### 13.16.6.2.6 l4util\_add8\_res()

```
l4_uint8_t l4util_add8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 520 of file [atomic.h](#).

#### 13.16.6.2.7 l4util\_and16()

```
void l4util_and16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 500 of file [atomic.h](#).

#### 13.16.6.2.8 l4util\_and16\_res()

```
l4_uint16_t l4util_and16_res (
    volatile l4_uint16_t * dest,
    l4_uint16_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 548 of file [atomic.h](#).

#### 13.16.6.2.9 l4util\_and32()

```
void l4util_and32 (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 504 of file [atomic.h](#).

#### 13.16.6.2.10 l4util\_and32\_res()

```
l4_uint32_t l4util_and32_res (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 552 of file [atomic.h](#).

#### 13.16.6.2.11 l4util\_and8()

```
void l4util_and8 (  
    volatile l4_uint8_t * dest,  
    l4_uint8_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 496 of file [atomic.h](#).

### 13.16.6.2.12 l4util\_and8\_res()

```
l4_uint8_t l4util_and8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

#### Returns

res

Definition at line 544 of file [atomic.h](#).

### 13.16.6.2.13 l4util\_atomic\_add()

```
void l4util_atomic_add (
    volatile long * dest,
    long val) [inline]
```

Atomic add.

#### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add

Definition at line 480 of file [atomic.h](#).

### 13.16.6.2.14 l4util\_atomic\_inc()

```
void l4util_atomic_inc (
    volatile long * dest) [inline]
```

Atomic increment.

#### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 423 of file [atomic.h](#).

### 13.16.6.2.15 l4util\_cmpxchg()

```
int l4util_cmpxchg (  
    volatile l4_umword_t * dest,  
    l4_umword_t cmp_val,  
    l4_umword_t new_val) [inline]
```

Atomic compare and exchange (machine wide fields).

#### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

#### Returns

0 if comparison failed, 1 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 379 of file [atomic.h](#).

Referenced by [l4util\\_btr\(\)](#), [l4util\\_bts\(\)](#), [l4util\\_clear\\_bit\(\)](#), and [l4util\\_set\\_bit\(\)](#).

Here is the caller graph for this function:

### 13.16.6.2.16 l4util\_cmpxchg16()

```
int l4util_cmpxchg16 (  
    volatile l4_uint16_t * dest,  
    l4_uint16_t cmp_val,  
    l4_uint16_t new_val) [inline]
```

Atomic compare and exchange (16 bit version).

#### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

#### Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 363 of file [atomic.h](#).

### 13.16.6.2.17 l4util\_cmpxchg32()

```
L4_END_DECLS int l4util_cmpxchg32 (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t cmp_val,  
    l4_uint32_t new_val) [inline]
```

Atomic compare and exchange (32 bit version).

#### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

#### Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 355 of file [atomic.h](#).

#### 13.16.6.2.18 l4util\_cmpxchg8()

```
int l4util_cmpxchg8 (  
    volatile l4_uint8_t * dest,  
    l4_uint8_t cmp_val,  
    l4_uint8_t new_val) [inline]
```

Atomic compare and exchange (8 bit version).

##### Parameters

<i>dest</i>	destination operand
<i>cmp_val</i>	compare value
<i>new_val</i>	new value for dest

##### Returns

0 if comparison failed, !=0 otherwise

Compare the value in *dest* with *cmp\_val*, if equal set *dest* to *new\_val*

Definition at line 371 of file [atomic.h](#).

#### 13.16.6.2.19 l4util\_dec16()

```
void l4util_dec16 (  
    volatile l4_uint16_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 431 of file [atomic.h](#).

#### 13.16.6.2.20 l4util\_dec16\_res()

```
l4_uint16_t l4util_dec16_res (  
    volatile l4_uint16_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

##### Returns

res

Definition at line 456 of file [atomic.h](#).

#### 13.16.6.2.21 l4util\_dec32()

```
void l4util_dec32 (  
    volatile l4_uint32_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 435 of file [atomic.h](#).

#### 13.16.6.2.22 l4util\_dec32\_res()

```
l4_uint32_t l4util_dec32_res (  
    volatile l4_uint32_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

##### Returns

res

Definition at line 460 of file [atomic.h](#).

#### 13.16.6.2.23 l4util\_dec8()

```
void l4util_dec8 (  
    volatile l4_uint8_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 427 of file [atomic.h](#).

#### 13.16.6.2.24 l4util\_dec8\_res()

```
l4_uint8_t l4util_dec8_res (  
    volatile l4_uint8_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

##### Returns

res

Definition at line 452 of file [atomic.h](#).

#### 13.16.6.2.25 l4util\_inc16()

```
void l4util_inc16 (
    volatile l4_uint16_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 415 of file [atomic.h](#).

#### 13.16.6.2.26 l4util\_inc16\_res()

```
l4_uint16_t l4util_inc16_res (
    volatile l4_uint16_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

##### Returns

res

Definition at line 444 of file [atomic.h](#).

#### 13.16.6.2.27 l4util\_inc32()

```
void l4util_inc32 (
    volatile l4_uint32_t * dest) [inline]
```

##### Parameters

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 419 of file [atomic.h](#).

#### 13.16.6.2.28 l4util\_inc32\_res()

```
l4_uint32_t l4util_inc32_res (
    volatile l4_uint32_t * dest) [inline]
```

##### Parameters

---

<i>dest</i>	destination operand
-------------	---------------------

**Returns**

res

Definition at line 448 of file [atomic.h](#).

**13.16.6.2.29 l4util\_inc8()**

```
void l4util_inc8 (  
    volatile l4_uint8_t * dest) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

Definition at line 411 of file [atomic.h](#).

**13.16.6.2.30 l4util\_inc8\_res()**

```
l4_uint8_t l4util_inc8_res (  
    volatile l4_uint8_t * dest) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

**Returns**

res

Definition at line 440 of file [atomic.h](#).

**13.16.6.2.31 l4util\_or16()**

```
void l4util_or16 (  
    volatile l4_uint16_t * dest,  
    l4_uint16_t val) [inline]
```

**Parameters**

<i>dest</i>	destination operand
-------------	---------------------

<i>val</i>	value to add/sub/and/or
------------	-------------------------

Definition at line 512 of file [atomic.h](#).

#### 13.16.6.2.32 l4util\_or16\_res()

```
l4_uint16_t l4util_or16_res (  
    volatile l4_uint16_t * dest,  
    l4_uint16_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 560 of file [atomic.h](#).

#### 13.16.6.2.33 l4util\_or32()

```
void l4util_or32 (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 516 of file [atomic.h](#).

#### 13.16.6.2.34 l4util\_or32\_res()

```
l4_uint32_t l4util_or32_res (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 564 of file [atomic.h](#).

#### 13.16.6.2.35 l4util\_or8()

```
void l4util_or8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 508 of file [atomic.h](#).

#### 13.16.6.2.36 l4util\_or8\_res()

```
l4_uint8_t l4util_or8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 556 of file [atomic.h](#).

#### 13.16.6.2.37 l4util\_sub16()

```
void l4util_sub16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 488 of file [atomic.h](#).

**13.16.6.2.38 l4util\_sub16\_res()**

```
l4_uint16_t l4util_sub16_res (  
    volatile l4_uint16_t * dest,  
    l4_uint16_t val) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line 536 of file [atomic.h](#).

**13.16.6.2.39 l4util\_sub32()**

```
void l4util_sub32 (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 492 of file [atomic.h](#).

**13.16.6.2.40 l4util\_sub32\_res()**

```
l4_uint32_t l4util_sub32_res (  
    volatile l4_uint32_t * dest,  
    l4_uint32_t val) [inline]
```

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

**Returns**

res

Definition at line 540 of file [atomic.h](#).

#### 13.16.6.2.41 l4util\_sub8()

```
void l4util_sub8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

Definition at line 484 of file [atomic.h](#).

#### 13.16.6.2.42 l4util\_sub8\_res()

```
l4_uint8_t l4util_sub8_res (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	value to add/sub/and/or

##### Returns

res

Definition at line 532 of file [atomic.h](#).

#### 13.16.6.2.43 l4util\_xchg()

```
l4_umword_t l4util_xchg (
    volatile l4_umword_t * dest,
    l4_umword_t val) [inline]
```

Atomic exchange (machine wide fields).

##### Parameters

<i>dest</i>	destination operand
<i>val</i>	new value for dest

##### Returns

old value at destination

Definition at line 405 of file [atomic.h](#).

**13.16.6.2.44 l4util\_xchg16()**

```
l4_uint16_t l4util_xchg16 (
    volatile l4_uint16_t * dest,
    l4_uint16_t val) [inline]
```

Atomic exchange (16 bit version).

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	new value for dest

**Returns**

old value at destination

Definition at line 393 of file [atomic.h](#).

**13.16.6.2.45 l4util\_xchg32()**

```
l4_uint32_t l4util_xchg32 (
    volatile l4_uint32_t * dest,
    l4_uint32_t val) [inline]
```

Atomic exchange (32 bit version).

**Parameters**

<i>dest</i>	destination operand
<i>val</i>	new value for dest

**Returns**

old value at destination

Definition at line 387 of file [atomic.h](#).

**13.16.6.2.46 l4util\_xchg8()**

```
l4_uint8_t l4util_xchg8 (
    volatile l4_uint8_t * dest,
    l4_uint8_t val) [inline]
```

Atomic exchange (8 bit version).

### Parameters

<i>dest</i>	destination operand
<i>val</i>	new value for dest

### Returns

old value at destination

Definition at line 399 of file [atomic.h](#).

## 13.16.7 Internal functions

Collaboration diagram for Internal functions:

### Functions

- void **base64\_encode** (const char \*infile, unsigned int in\_size, char \*\*outfile)  
*base-64-encode string infile*
- void **base64\_decode** (const char \*infile, unsigned int in\_size, char \*\*outfile)  
*decode base-64-encoded string infile*

### 13.16.8.1 Detailed Description

### 13.16.8.2 Function Documentation

#### 13.16.8.2.1 l4util\_bsf()

```
int l4util_bsf (
    l4\_umword\_t word) [inline]
```

Bit scan forward.

**Parameters**

<i>word</i>	value (machine size)
-------------	----------------------

**Returns**

index of least significant bit set in word, -1 if no bit is set (word == 0)

"bit scan forward", find least significant bit set in word.

Definition at line 316 of file [bitops.h](#).

**13.16.8.2.2 l4util\_bsr()**

```
int l4util_bsr (
    l4_umword_t word) [inline]
```

Bit scan reverse.

**Parameters**

<i>word</i>	value (machine size)
-------------	----------------------

**Returns**

index of most significant set bit in word, -1 if no bit is set (word == 0)

"bit scan reverse", find most significant set bit in word (-> LOG2(word))

Definition at line 299 of file [bitops.h](#).

**13.16.8.2.3 l4util\_btc()**

```
int l4util_btc (
    int b,
    volatile l4_umword_t * dest) [inline]
```

Bit test and complement.

**Parameters**

<i>b</i>	bit position
<i>dest</i>	destination operand

**Returns**

Old value of bit *b*.

Complement bit *b* and return old value.

Definition at line 394 of file [bitops.h](#).

#### 13.16.8.2.4 l4util\_btr()

```
int l4util_btr (  
    int b,  
    volatile l4_umword_t * dest) [inline]
```

Bit test and reset.

##### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

##### Returns

Old value of bit *b*.

Reset bit *b* and return old value.

Definition at line 278 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

#### 13.16.8.2.5 l4util\_bts()

```
int l4util_bts (  
    int b,  
    volatile l4_umword_t * dest) [inline]
```

Bit test and set.

##### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

**Returns**

Old value of bit *b*.

Set the *b* bit of *dest* to 1 and return the old value.

Definition at line 256 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

**13.16.8.2.6 l4util\_clear\_bit()**

```
void l4util_clear_bit (  
    int b,  
    volatile l4_umword_t * dest) [inline]
```

Clear bit in memory.

**Parameters**

<i>b</i>	bit position
<i>dest</i>	destination operand

Definition at line 226 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

### 13.16.8.2.7 l4util\_complement\_bit()

```
void l4util_complement_bit (
    int b,
    volatile l4_umword_t * dest) [inline]
```

Complement bit in memory.

#### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

Definition at line 359 of file [bitops.h](#).

### 13.16.8.2.8 l4util\_find\_first\_set\_bit()

```
int l4util_find_first_set_bit (
    const void * dest,
    l4_size_t size) [inline]
```

Find the first set bit in a memory region.

#### Parameters

<i>dest</i>	bit string
<i>size</i>	size of string in bits (must be a multiple of L4_MWORD_BITS!)

#### Returns

number of the first set bit, >= size if no bit is set

Definition at line 400 of file [bitops.h](#).

### 13.16.8.2.9 l4util\_find\_first\_zero\_bit()

```
int l4util_find_first_zero_bit (
    const void * dest,
    l4_size_t size) [inline]
```

Find the first zero bit in a memory region.

#### Parameters

<i>dest</i>	bit string
<i>size</i>	size of string in bits (must be a multiple of L4_MWORD_BITS!)

#### Returns

number of the first zero bit, >= size if no bit is set

Definition at line 333 of file [bitops.h](#).

### 13.16.8.2.10 l4util\_next\_power2()

```
int l4util_next_power2 (  
    unsigned long val) [inline]
```

Find the next power of 2 for a given number.

#### Parameters

<i>val</i>	initial value
------------	---------------

#### Returns

next-highest power of 2

Definition at line 373 of file [bitops.h](#).

### 13.16.8.2.11 l4util\_set\_bit()

```
void l4util_set_bit (  
    int b,  
    volatile l4_umword_t * dest) [inline]
```

Set bit in memory.

#### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

Definition at line 207 of file [bitops.h](#).

References [l4util\\_cmpxchg\(\)](#).

Here is the call graph for this function:

#### 13.16.8.2.12 l4util\_test\_bit()

```
int l4util_test_bit (
    int b,
    const volatile l4_umword_t * dest) [inline]
```

Test bit (return value of bit).

##### Parameters

<i>b</i>	bit position
<i>dest</i>	destination operand

##### Returns

Value of bit *b*.

Definition at line 244 of file [bitops.h](#).

### 13.16.9 ELF binary format

Functions and types related to ELF binaries.

Collaboration diagram for ELF binary format:

##### Files

### 13.16.9.1 Detailed Description

Functions and types related to ELF binaries.

### 13.16.9.2 Macro Definition Documentation

#### 13.16.9.2.1 ELF32\_R\_TYPE

```
#define ELF32_R_TYPE(  
    i)
```

**Value:**

```
((unsigned char)(i))
```

**See also**

[Elf\\_R\\_386s](#).

Definition at line [663](#) of file [elf.h](#).

#### 13.16.9.2.2 ELF32\_ST\_BIND

```
#define ELF32_ST_BIND(  
    i)
```

**Value:**

```
((i) >> 4)
```

**See also**

[Elf\\_STBs](#).

Definition at line [893](#) of file [elf.h](#).

#### 13.16.9.2.3 ELF32\_ST\_TYPE

```
#define ELF32_ST_TYPE(  
    i)
```

**Value:**

```
((i) & 0xf)
```

**See also**

[Elf\\_STTs](#).

Definition at line [896](#) of file [elf.h](#).

#### 13.16.9.2.4 ELF64\_R\_TYPE

```
#define ELF64_R_TYPE(  
    i)
```

**Value:**

```
((i) & 0xffffffffL)
```

**See also**

[Elf\\_R\\_386s](#).

Definition at line [671](#) of file [elf.h](#).

#### 13.16.9.2.5 ELF64\_ST\_BIND

```
#define ELF64_ST_BIND(  
    i)
```

**Value:**

```
((i) >> 4)
```

**See also**

[Elf\\_STBs](#)

Definition at line [902](#) of file [elf.h](#).

#### 13.16.9.2.6 ELF64\_ST\_TYPE

```
#define ELF64_ST_TYPE(  
    i)
```

**Value:**

```
((i) & 0xf)
```

**See also**

[Elf\\_STTs](#)

Definition at line [905](#) of file [elf.h](#).

### 13.16.9.3 Enumeration Type Documentation

#### 13.16.9.3.1 anonymous enum

anonymous enum

##### Enumerator

EI_NIDENT	Number of characters.
-----------	-----------------------

Definition at line 117 of file [elf.h](#).

#### 13.16.9.3.2 Elf\_ARM\_SBs

enum [Elf\\_ARM\\_SBs](#)

ARM-specific program header flags.

##### Enumerator

PF_ARM_SB	Segment contains the location addressed by the static base.
-----------	---

Definition at line 770 of file [elf.h](#).

#### 13.16.9.3.3 Elf\_ATs

enum [Elf\\_ATs](#)

Legal values for [Elf32\\_Auxv.atype](#) / [Elf64\\_Auxv.atype](#).

##### Enumerator

AT_NULL	End of vector.
AT_IGNORE	Entry should be ignored.
AT_EXECD	File descriptor of program.
AT_PHDR	Program headers for program.
AT_PHEM	Size of program header entry.
AT_PHNUM	Number of program headers.
AT_PAGESZ	System page size.
AT_BASE	Base address of interpreter.
AT_FLAGS	Flags.
AT_ENTRY	Entry point of program.
AT_NOTELF	Program is not ELF.
AT_UID	Real UID.

AT_EUID	Effective UID.
AT_GID	Real GID.
AT_EGID	Effective GID.
AT_L4_AUX	<a href="#">L4Re</a> AUX section.
AT_L4_ENV	<a href="#">L4Re</a> ENV section.
AT_L4_KIP	<a href="#">L4Re</a> KIP section.

Definition at line [939](#) of file [elf.h](#).

#### 13.16.9.3.4 Elf\_CLASSES

enum [Elf\\_CLASSES](#)

File class or capacity.

##### Enumerator

ELFCLASSNONE	Invalid class.
ELFCLASS32	32-bit object
ELFCLASS64	64-bit object
ELFCLASSNUM	Mask for 32-bit or 64-bit class.

Definition at line [298](#) of file [elf.h](#).

#### 13.16.9.3.5 Elf\_DATAs

enum [Elf\\_DATAs](#)

Data encoding.

##### Enumerator

ELFDATANONE	invalid data encoding
ELFDATA2LSB	0x01020304 => [ 0x04 0x03 0x02 0x01 ]
ELFDATA2MSB	0x01020304 => [ 0x01 0x02 0x03 0x04 ]
ELFDATANUM	Mask for valid data encoding.

Definition at line [307](#) of file [elf.h](#).

**13.16.9.3.6 Elf\_DF\_1s**

enum [Elf\\_DF\\_1s](#)

State flags selectable in the Elf32\_Dyn.d\_un.d\_val / Elf64\_Dyn.d\_un.d\_val element of the DT\_FLAGS\_1 entry in the dynamic section.

**Enumerator**

DF_1_NOW	Set RTLD_NOW for this object.
DF_1_GLOBAL	Set RTLD_GLOBAL for this object.
DF_1_GROUP	Set RTLD_GROUP for this object.
DF_1_NODELETE	Set RTLD_NODELETE for this object.
DF_1_LOADFLTR	Trigger filtee loading at runtime.
DF_1_INITFIRST	Set RTLD_INITFIRST for this object.
DF_1_NOOPEN	Set RTLD_NOOPEN for this object.
DF_1_ORIGIN	\$ORIGIN must be handled.
DF_1_DIRECT	Direct binding enabled.
DF_1_INTERPOSE	Object is used to interpose.
DF_1_NODEFLIB	Ignore default lib search path.
DF_1_NODUMP	Object can't be dldump'ed.
DF_1_CONFALT	Configuration alternative created.
DF_1_ENDFILTEE	Filtee terminates filters search.
DF_1_DISPRELDNE	Disp reloc applied at build time.
DF_1_DISPRELPND	Disp reloc applied at run-time.

Definition at line [594](#) of file [elf.h](#).

**13.16.9.3.7 Elf\_DF\_P1s**

enum [Elf\\_DF\\_P1s](#)

Flags in the DT\_POSFLAG\_1 entry effecting only the next DT\_\* entry.

**Enumerator**

DF_P1_LAZYLOAD	Lazyload following object.
DF_P1_GROUPPERM	Symbols from next object are not generally available.

Definition at line [623](#) of file [elf.h](#).

### 13.16.9.3.8 Elf\_DFs

enum [Elf\\_DFs](#)

Values of Elf32\_Dyn.d\_un.d\_val, Elf64\_Dyn.d\_un.d\_val in the DT\_FLAGS entry.

#### Enumerator

DF_ORIGIN	Object may use DF_ORIGIN.
DF_SYMBOLIC	Symbol resolutions starts here.
DF_TEXTREL	Object contains text relocations.
DF_BIND_NOW	No lazy binding for this object.
DF_STATIC_TLS	Module uses the static TLS model.

Definition at line [581](#) of file [elf.h](#).

### 13.16.9.3.9 Elf\_DTs

enum [Elf\\_DTs](#)

Dynamic Array Tags.

See also

[Elf32\\_Dyn.d\\_tag](#), [Elf64\\_Dyn.d\\_tag](#).

#### Enumerator

DT_NULL	end of _DYNAMIC array
DT_NEEDED	name of a needed library
DT_PLTRELSZ	total size of relocation entry
DT_PLTGOT	address assoc with prog link table
DT_HASH	address of symbol hash table
DT_STRTAB	address of string table
DT_SYMTAB	address of symbol table
DT_RELA	address of relocation table
DT_RELASZ	total size of relocation table
DT_RELAENT	size of DT_RELA relocation entry
DT_STRSZ	size of the string table
DT_SYMENT	size of a symbol table entry
DT_INIT	address of initialization function
DT_FINI	address of termination function
DT_SONAME	name of the shared object
DT_RPATH	search library path
DT_SYMBOLIC	alter symbol resolution algorithm

DT_REL	address of relocation table
DT_RELSZ	total size of DT_REL relocation table
DT_RELENT	size of the DT_REL relocation entry
DT_PTRREL	type of relocation entry
DT_DEBUG	for debugging purposes
DT_TEXTREL	at least on entry changes r/o section
DT_JMPREL	address of relocation entries
DT_BIND_NOW	Process relocations of object.
DT_INIT_ARRAY	Array with addresses of init fct.
DT_FINI_ARRAY	Array with addresses of fini fct.
DT_INIT_ARRAYSZ	Size in bytes of DT_INIT_ARRAY.
DT_FINI_ARRAYSZ	Size in bytes of DT_FINI_ARRAY.
DT_RUNPATH	Library search path.
DT_FLAGS	Flags for the object being loaded.
DT_ENCODING	Start of encoded range.
DT_PREINIT_ARRAY	Array with addresses of preinit fct.
DT_PREINIT_ARRAYSZ	size in bytes of DT_PREINIT_ARRAY
DT_NUM	Number used.
DT_LOOS	Start of OS-specific.
DT_HIOS	End of OS-specific.
DT_LOPROC	processor-specific
DT_HIPROC	processor-specific

Definition at line 535 of file [elf.h](#).

#### 13.16.9.3.10 Elf\_EF\_ARM\_s

enum [Elf\\_EF\\_ARM\\_s](#)

ARM specific declarations.

Processor specific flags for the ELF header e\_flags field.

##### Enumerator

EF_ARM_ALIGN8	8-bit structure alignment is in use
---------------	-------------------------------------

Definition at line 730 of file [elf.h](#).

#### 13.16.9.3.11 Elf\_EIs

enum [Elf\\_EIs](#)

Identification Indices.

See also

[Elf32\\_Ehdr.e\\_ident](#), [Elf64\\_Ehdr.e\\_ident](#)

### Enumerator

EI_MAG0	file id 0
EI_MAG1	file id 1
EI_MAG2	file id 2
EI_MAG3	file id 3
EI_CLASS	file class
EI_DATA	data encoding
EI_VERSION	file version
EI_OSABI	Operating system / ABI identification.
EI_ABIVERSION	ABI version.
EI_PAD	start of padding bytes

Definition at line 274 of file [elf.h](#).

### 13.16.9.3.12 Elf\_EMs

enum [Elf\\_EMs](#)

Required architecture.

See also

[Elf32\\_Ehdr.e\\_machine](#), [Elf64\\_Ehdr.e\\_machine](#)

### Enumerator

EM_NONE	no machine
EM_M32	AT&T WE 32100.
EM_SPARC	SPARC.
EM_386	Intel 80386.
EM_68K	Motorola 68000.
EM_88K	Motorola 88000.
EM_860	Intel 80860.
EM_MIPS	MIPS RS3000 big-endian.
EM_MIPS_RS4_BE	MIPS RS4000 big-endian.
EM_SPARC64	SPARC 64-bit.
EM_PARISC	HP PA-RISC.
EM_VPP500	Fujitsu VPP500.
EM_SPARC32PLUS	Sun's V8plus.
EM_960	Intel 80960.

EM_PPC	PowerPC.
EM_V800	NEC V800.
EM_FR20	Fujitsu FR20.
EM_RH32	TRW RH-32.
EM_RCE	Motorola RCE.
EM_ARM	Advanced RISC Machines ARM.
EM_ALPHA	Digital Alpha.
EM_SH	Hitachi SuperH.
EM_SPARCV9	SPARC v9 64-bit.
EM_TRICORE	Siemens Tricore embedded processor.
EM_ARC	Argonaut RISC Core, Argonaut Techn Inc.
EM_H8_300	Hitachi H8/300.
EM_H8_300H	Hitachi H8/300H.
EM_H8S	Hitachi H8/S.
EM_H8_500	Hitachi H8/500.
EM_IA_64	HP/Intel IA-64.
EM_MIPS_X	Stanford MIPS-X.
EM_COLDFIRE	Motorola Coldfire.
EM_68HC12	Motorola M68HC12.
EM_X86_64	Advanced Micro Devices x86-64.
EM_PDSP	Sony DSP Processor.
EM_FX66	Siemens FX66 microcontroller.
EM_ST9PLUS	STMicroelectronics ST9+ 8/16 mc.
EM_ST7	STmicroelectronics ST7 8 bit mc.
EM_68HC16	Motorola MC68HC16 microcontroller.
EM_68HC11	Motorola MC68HC11 microcontroller.
EM_68HC08	Motorola MC68HC08 microcontroller.
EM_68HC05	Motorola MC68HC05 microcontroller.
EM_SVX	Silicon Graphics SVx.
EM_ST19	STMicroelectronics ST19 8 bit mc.
EM_VAX	Digital VAX.
EM_CRIS	Axis Communications 32-bit embedded processor.
EM_JAVELIN	Infineon Technologies 32-bit embedded processor.
EM_FIREPATH	Element 14 64-bit DSP Processor.
EM_ZSP	LSI Logic 16-bit DSP Processor.
EM_MMIX	Donald Knuth's educational 64-bit processor.
EM_HUANY	Harvard University machine-independent object files.
EM_PRISM	SiTera Prism.
EM_AVR	Atmel AVR 8-bit microcontroller.
EM_FR30	Fujitsu FR30.
EM_D10V	Mitsubishi D10V.
EM_D30V	Mitsubishi D30V.

EM_V850	NEC v850.
EM_M32R	Mitsubishi M32R.
EM_MN10300	Matsushita MN10300.
EM_MN10200	Matsushita MN10200.
EM_PJ	picoJava
EM_OPENRISC	OpenRISC 32-bit embedded processor.
EM_ARC_A5	ARC Cores Tangent-A5.
EM_XTENSA	Tensilica Xtensa Architecture.
EM_ALTERA_NIOS2	Altera Nios II.
EM_AARCH64	ARM AARCH64.
EM_TILEPRO	Tilera TILEPro.
EM_MICROBLAZE	Xilinx MicroBlaze.
EM_TILEGX	Tilera TILE-Gx.
EM_RISCV	RISC-V.

Definition at line 183 of file [elf.h](#).

#### 13.16.9.3.13 Elf\_ETs

enum [Elf\\_ETs](#)

Object file type.

See also

[Elf32\\_Ehdr.e\\_type](#), [Elf64\\_Ehdr.e\\_type](#)

#### Enumerator

ET_NONE	no file type
ET_REL	relocatable file
ET_EXEC	executable file
ET_DYN	shared object file

### 13.16.10 Kernel Interface Page API

Collaboration diagram for Kernel Interface Page API:

#### Files

- file [kip.h](#)

#### Macros

- `#define l4util_kip_for_each_feature(s)`  
*Cycle through kernel features given in the KIP.*

#### Functions

- `L4_BEGIN_DECLS int l4util_kip_kernel_has_feature (l4_kernel_info_t const *k, char const *str)`  
*Check if kernel supports a feature.*
- `unsigned long l4util_kip_kernel_abi_version (l4_kernel_info_t const *k)`  
*Return kernel ABI version.*

#### 13.16.10.1 Detailed Description

#### 13.16.10.2 Macro Definition Documentation

##### 13.16.10.2.1 l4util\_kip\_for\_each\_feature

```
#define l4util_kip_for_each_feature(
    s)
```

#### Value:

`l4_kip_for_each_feature(s)`

Cycle through kernel features given in the KIP.

Cycles through all KIP kernel feature strings. `s` must be a character pointer (`char const *`) initialized with `l4_kip_version_string()`.

**Deprecated** Use `l4_kip_for_each_feature()`.

Definition at line 58 of file [kip.h](#).

### 13.16.10.3 Function Documentation

#### 13.16.10.3.1 l4util\_kip\_kernel\_abi\_version()

```
unsigned long l4util_kip_kernel_abi_version (  
    l4_kernel_info_t const * k)
```

Return kernel ABI version.

##### Parameters

<i>k</i>	Pointer to the kernel info page (KIP).
----------	--

##### Returns

Kernel ABI version.

References [L4\\_CV](#), and [L4\\_END\\_DECLS](#).

#### 13.16.10.3.2 l4util\_kip\_kernel\_has\_feature()

```
L4_BEGIN_DECLS int l4util_kip_kernel_has_feature (  
    l4_kernel_info_t const * k,  
    char const * str)
```

Check if kernel supports a feature.

##### Parameters

<i>k</i>	Pointer to the kernel info page (KIP).
<i>str</i>	Feature name to check.

##### Returns

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.

**Deprecated** Use [l4\\_kip\\_kernel\\_has\\_feature\(\)](#).

References [L4\\_CV](#).

### 13.16.11 Comfortable Command Line Parsing

Collaboration diagram for Comfortable Command Line Parsing:

#### Typedefs

- typedef void(\* **parse\_cmd\_fn\_t**) (int)  
*Function type for PARSE\_CMD\_FN.*
- typedef void(\* **parse\_cmd\_fn\_arg\_t**) (int, const char \*, int)  
*Function type for PARSE\_CMD\_FN\_ARG.*

#### Enumerations

- enum [parse\\_cmd\\_type](#)  
*Types for parsing.*

#### Functions

- [L4\\_BEGIN\\_DECLS](#) int [parse\\_cmdline](#) (int \*argc, const char \*\*\*argv, int arg0,...)  
*Parse the command-line for specified arguments and store the values into variables.*

#### 13.16.11.1 Detailed Description

#### 13.16.11.2 Function Documentation

##### 13.16.11.2.1 [parse\\_cmdline\(\)](#)

```

L4_BEGIN_DECLS int parse_cmdline (
    int * argc,
    const char *** argv,
    int arg0,
    ...)
  
```

Parse the command-line for specified arguments and store the values into variables.

This Functions gets the command-line, and a list of command-descriptors. Then, the command-line is parsed according to the given descriptors, storing strings, switches and numeric arguments at given addresses, and possibly calling specified functions. A default help descriptor is added. Its purpose is to present a short command overview in the case the given command-line does not fit to the descriptors.

Each command-descriptor has the following form:

*short option char, long option name, comment, type, val, addr.*

The *short option char* specifies the short form of the described option. The short form will be recognized after a single dash, or in a group of short options preceeded by a single dash. Specify '' if no short form should be used.

The *long option name* specifies the long form of the described option. The long form will be recognized after two dashes. Specify 0 if no long form should be used for this option.

The *comment* is a string that will be used when presenting the short command-line help.

The *type* specifies, if the option should be recognized as

- a number (PARSE\_CMD\_INT),
- a switch (PARSE\_CMD\_SWITCH),
- a string (PARSE\_CMD\_STRING),
- a function call (PARSE\_CMD\_FN, PARSE\_CMD\_FN\_ARG),
- an increment/decrement operator (PARSE\_CMD\_INC, PARSE\_CMD\_DEC).

If *type* is PARSE\_CMD\_INT, the option requires a second argument on the command-line after the option. This argument is parsed as a number. It can be preceeded by 0x to present a hex-value or by 0 to present an octal form. *addr* is interpreted as an int-pointer. The scanned argument from the command-line is stored in this pointer.

If *type* is PARSE\_CMD\_SWITCH, *addr* must be a pointer to int, and the value from *val* is stored at this pointer.

With PARSE\_CMD\_STRING, an additional argument is expected at the cmdline. *addr* must be a pointer to const char\*, and a pointer to the argument on the command line is stored at this pointer. The value in *val* is a default value, which is stored at *addr* if the corresponding option is not given on the command line.

With PARSE\_CMD\_FN\_ARG, *addr* is interpreted as a function pointer of type `parse_cmd_fn_t`. It will be called with *val* as argument if the corresponding option is found.

If *type* is PARSE\_CMD\_FN\_ARG, *addr* is as a function pointer of type `parse_cmd_fn_arg_t`, and handled similar to PARSE\_CMD\_FN. An additional argument is expected at the command line, however. It is given to the called function as 2nd argument, and parsed as an integer as with PARSE\_CMD\_INT as a third argument.

If *type* is PARSE\_CMD\_INC or PARSE\_CMD\_DEC, *addr* is interpreted as an int-pointer. The value of *val* is stored to this pointer first. For every occurrence of the option in the command line, the integer referenced by *addr* is incremented or decremented, respectively.

The list of command-descriptors is terminated by specifying a binary 0 for the short option char.

Note: The short option char 'h' and the long option name "help" must not be specified. They are used for the default help descriptor and produce a short command-options help when specified on the command-line.

### Parameters

<i>argc</i>	pointer to number of command line parameters as passed to main
<i>argv</i>	pointer to array of command line parameters as passed to main
<i>arg0</i>	format list describing the command line options to parse for

**Returns**

0 if the command-line was successfully parsed, otherwise:

- -1 if the given descriptors are somehow wrong.
- -2 if not enough memory was available to hold temporary structs.
- -3 if the given command-line args did not meet the specified set.
- -4 if the help-option was given.

Upon return, argc and argv point to a list of arguments that were not scanned as arguments. See `getoptlong` for details on scanning.

References [L4\\_CV](#), and [L4\\_END\\_DECLS](#).

### 13.16.13 Low-Level Thread Functions

Collaboration diagram for Low-Level Thread Functions:

## 13.17 Virtio Net Switch

A virtual network switch that can be used as defined in the virtio protocol.

#### Data Structures

- class [Mac\\_addr](#)  
*A wrapper class around the value of a MAC address.*
- class [Mac\\_table](#)< [Size](#) >  
*Mac\_table manages a 1:n association between ports and MAC addresses.*
- class [Switch\\_factory](#)  
*The IPC interface for creating ports.*
- class [L4virtio\\_port](#)  
*A Port on the Virtio Net Switch.*
- class [Net\\_transfer](#)  
*A network request to only a single destination.*
- class [Virtio\\_net\\_request](#)  
*Abstraction for a network request.*
- class [Virtio\\_switch](#)  
*The Virtio switch contains all ports and processes network requests.*
- struct [Buffer](#)  
*Data buffer used to transfer packets.*
- class [Virtio\\_vlan\\_mangle](#)  
*Class for VLAN packet rewriting.*

### 13.17.1 Detailed Description

A virtual network switch that can be used as defined in the virtio protocol.

The abstraction of a single connection with a network device (also called client) from the switch's perspective is a port. A client can register multiple ports on the switch. The communication between a client and the switch happens via IRQs, MMIO and shared memory as defined by the Virtio protocol. The switch supports VLANs and ports can be either 'access' or 'trunk' ports. The optionally available monitor port receives network traffic from all ports, and the monitor can not send.

## 13.18 vCPU Support Library

vCPU handling functionality.

Collaboration diagram for vCPU Support Library:

### Topics

- [Extended vCPU support](#) . . . . . [721](#)  
*Extended vCPU handling functionality.*

*Wait for event.*

- void [l4vcpu\\_print\\_state](#) (const [l4\\_vcpu\\_state\\_t](#) \*vcpu, const char \*prefix) [L4\\_NOTHROW](#)

*Print the state of a vCPU.*

- int [l4vcpu\\_is\\_irq\\_entry](#) ([l4\\_vcpu\\_state\\_t](#) const \*vcpu) [L4\\_NOTHROW](#)

*Return whether the entry reason was an IRQ/IPC message.*

- int [l4vcpu\\_is\\_page\\_fault\\_entry](#) ([l4\\_vcpu\\_state\\_t](#) const \*vcpu) [L4\\_NOTHROW](#)

*Return whether the entry reason was a page fault.*

## 13.18.1 Detailed Description

vCPU handling functionality.

This library provides convenience functionality on top of the l4sys vCPU interface to ease programming. It wraps commonly used code and abstracts architecture depends parts as far as reasonable.

## 13.18.2 Function Documentation

### 13.18.2.1 l4vcpu\_irq\_disable()

```
void l4vcpu_irq_disable (
    l4\_vcpu\_state\_t * vcpu) [inline]
```

Disable a vCPU for event delivery.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.

### 13.18.2.2 l4vcpu\_irq\_disable\_save()

```

unsigned l4vcpu_irq_disable_save (
    l4_vcpu_state_t * vcpu) [inline]
  
```

Disable a vCPU for event delivery and return previous state.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

#### Returns

IRQ state before disabling IRQs.

Definition at line 209 of file [vcpu.h](#).

References [L4\\_NOTHROW](#), and [l4vcpu\\_irq\\_disable\(\)](#).

Referenced by [L4vcpu::Vcpu::irq\\_disable\\_save\(\)](#).

### 13.18.2.3 l4vcpu\_irq\_enable()

```
void l4vcpu_irq_enable (
    l4_vcpu_state_t * vcpu,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc) [inline]
```

Enable a vCPU for event delivery.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>utcb</i>	Utcbl pointer of the calling vCPU.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending.
<i>setup_ipc</i>	Function call-back that is called right before any IPC operation, and before event delivery is enabled.

Definition at line 232 of file [vcpu.h](#).

### 13.18.2.4 l4vcpu\_irq\_restore()

```
void l4vcpu_irq_restore (
    l4_vcpu_state_t * vcpu,
    unsigned s,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc) [inline]
```

Restore a previously saved IRQ/event state.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>s</i>	IRQ state to be restored.
<i>utcb</i>	Utcbl pointer of the calling vCPU.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending after enabling.
<i>setup_ipc</i>	Function call-back that is called right before any IPC operation, and before event delivery is enabled.

### 13.18.2.5 l4vcpu\_is\_irq\_entry()

```
int l4vcpu_is_irq_entry (  
    l4_vcpu_state_t const * vcpu) [inline]
```

Return whether the entry reason was an IRQ/IPC message.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

return 0 if not, !=0 otherwise.

References [L4\\_CV](#), [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

Referenced by [L4vcpu::Vcpu::is\\_irq\\_entry\(\)](#).

### 13.18.2.6 l4vcpu\_is\_page\_fault\_entry()

```
int l4vcpu_is_page_fault_entry (  
    l4_vcpu_state_t const * vcpu) [inline]
```

Return whether the entry reason was a page fault.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
-------------	-----------------------

return 0 if not, !=0 otherwise.

References [L4\\_CV](#), and [L4\\_NOTHROW](#).

Referenced by [L4vcpu::Vcpu::is\\_page\\_fault\\_entry\(\)](#).

Here is the caller graph for this function:

### 13.18.2.7 l4vcpu\_print\_state()

```
void l4vcpu_print_state (
    const l4_vcpu_state_t * vcpu,
    const char * prefix)
```

Print the state of a vCPU.

#### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>prefix</i>	A prefix for each line printed.

References [L4\\_CV](#), [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

Referenced by [L4vcpu::Vcpu::print\\_state\(\)](#).

Here is the caller graph for this function:

### 13.18.2.8 l4vcpu\_wait\_for\_event()

```
void l4vcpu_wait_for_event (
    l4_vcpu_state_t * vcpu,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc) [inline]
```

Wait for event.

### Parameters

<i>vcpu</i>	Pointer to vCPU area.
<i>utcb</i>	Utc b pointer of the calling vCPU.
<i>do_event_work_cb</i>	Call-back function that is called when the vCPU awakes and needs to handle an event/↔ IRQ.
<i>setup_ipc</i>	Function call-back that is called right before any IPC operation.

Note that event delivery remains disabled after this function returns.

Definition at line 270 of file [vcpu.h](#).

References [L4\\_IPC\\_NEVER](#), and [L4\\_NOTHROW](#).

Referenced by [L4vcpu::Vcpu::wait\\_for\\_event\(\)](#).

### 13.18.3 Extended vCPU support

Extended vCPU handling functionality.

Collaboration diagram for Extended vCPU support:

### Functions

- [int l4vcpu\\_ext\\_alloc](#) ([l4\\_vcpu\\_state\\_t](#) \*\*vcpu, [l4\\_addr\\_t](#) \*ext\_state, [l4\\_cap\\_idx\\_t](#) task, [l4\\_cap\\_idx\\_t](#) regmgr)  
[L4\\_NOTHROW](#)  
*Allocate state area for an extended vCPU.*

### 13.18.3.1 Detailed Description

Extended vCPU handling functionality.

### 13.18.3.2 Function Documentation

#### 13.18.3.2.1 l4vcpu\_ext\_alloc()

```
int l4vcpu_ext_alloc (
    l4_vcpu_state_t ** vcpu,
    l4_addr_t * ext_state,
    l4_cap_idx_t task,
    l4_cap_idx_t regmgr)
```

Allocate state area for an extended vCPU.

#### Parameters

out	<i>vcpu</i>	Allocated vcpu-state area.
out	<i>ext_state</i>	Allocated extended vcpu-state area.
	<i>task</i>	Task to use for allocation.
	<i>regmgr</i>	Region manager to use for allocation.

#### Returns

0 for success, error code otherwise

References [L4\\_CV](#), [L4\\_INLINE](#), and [L4\\_NOTHROW](#).

# Chapter 14

## Namespace Documentation

### 14.1 cxx Namespace Reference

Our C++ library.

#### Namespaces

- namespace [Bits](#)  
*Internal helpers for the cxx package.*

#### Data Structures

- class [Avl\\_map](#)  
*AVL tree based associative container.*
- class [Avl\\_set](#)  
*AVL set for simple comparable items.*
- class [Avl\\_tree\\_node](#)  
*Node of an AVL tree.*
- class [Avl\\_tree](#)  
*A generic AVL tree.*
- class [Bitfield](#)  
*Definition for a member (part) of a bit field.*
- class [Bitmap\\_base](#)  
*Basic bitmap abstraction.*
- class [Bitmap](#)  
*A static bitmap.*
- class [Elide\\_dtor](#)  
*Wrapper class to remove destructor calls.*
- class [H\\_list\\_item\\_t](#)  
*Basic element type for a double-linked [H\\_list](#).*
- class [H\\_list](#)  
*General double-linked list of unspecified [cxx::H\\_list\\_item](#) elements.*
- struct [H\\_list\\_t](#)  
*Double-linked list of typed [H\\_list\\_item\\_t](#) elements.*

- class [List\\_item](#)  
*Basic list item.*
- class [List](#)  
*Doubly linked list, with internal allocation.*
- class [List\\_alloc](#)  
*Standard list-based allocator.*
- struct [Pair](#)  
*Pair of two values.*
- class [Pair\\_first\\_compare](#)  
*Comparison functor for [Pair](#).*
- class [Ref\\_ptr](#)  
*A reference-counting pointer with automatic cleanup.*
- struct [Ref\\_obj\\_list\\_item](#)  
*Item for list linked via [cxx::Ref\\_ptr](#) with default reference counting.*
- class [Base\\_slab](#)  
*Basic slab allocator.*
- class [Slab](#)  
*Slab allocator for object of type `Type`.*
- class [Base\\_slab\\_static](#)  
*Merged slab allocator (allocators for objects of the same size are merged together).*
- class [Slab\\_static](#)  
*Merged slab allocator (allocators for objects of the same size are merged together).*
- class [S\\_list](#)  
*Simple single-linked list.*
- class [static\\_vector](#)  
*Simple encapsulation for a dynamically allocated array.*
- class [Nothrow](#)  
*Helper type to distinguish the `operator new` version that does not throw exceptions.*
- class [New\\_allocator](#)  
*Standard allocator based on `operator new ()`.*
- struct [Lt\\_functor](#)  
*Generic comparator class that defaults to the less-than operator.*
- class [String](#)  
*Allocation free string class with explicit length field.*
- class [Weak\\_ref\\_base](#)  
*Generic (base) weak reference to some object.*
- class [Weak\\_ref](#)  
*Typed weak reference to an object of type `T`.*

## Typedefs

- typedef [H\\_list\\_item\\_t](#)< void > [H\\_list\\_item](#)  
*Untyped list item.*
- template<typename T>  
using [Ref\\_ptr\\_list\\_item](#) = [Bits::Smart\\_ptr\\_list\\_item](#)<T, [cxx::Ref\\_ptr](#)<T> >  
*Item for list linked with [cxx::Ref\\_ptr](#).*
- template<typename T>  
using [Ref\\_ptr\\_list](#) = [Bits::Smart\\_ptr\\_list](#)<[Ref\\_ptr\\_list\\_item](#)<T> >  
*Single-linked list where elements are connected via a [cxx::Ref\\_ptr](#).*

- `template<typename T>`  
`using Unique_ptr_list_item = Bits::Smart_ptr_list_item<T, cxx::unique_ptr<T> >`  
*Item for list linked with cxx::unique\_ptr.*
- `template<typename T>`  
`using Unique_ptr_list = Bits::Smart_ptr_list<Unique_ptr_list_item<T> >`  
*Single-linked list where elements are connected with a cxx::unique\_ptr.*

## Functions

- `template<typename A, typename ... ARGS>`  
`constexpr A const & min (A const &a1, A const &a2, ARGS const &...a)`  
*Get the minimum of a1 and a2 upt to aN.*
- `template<typename A, typename ... ARGS>`  
`constexpr A const & min (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)`  
*Get the minimum of a1 and a2 upt to aN.*
- `template<typename A, typename ... ARGS>`  
`constexpr A const & max (A const &a1, A const &a2, ARGS const &...a)`  
*Get the maximum of a1 and a2 upt to aN.*
- `template<typename A, typename ... ARGS>`  
`constexpr A const & max (cxx::identity_t< A > const &a1, cxx::identity_t< A > const &a2, ARGS const &...a)`  
*Get the maximum of a1 and a2 upt to aN.*
- `template<typename T1>`  
`T1 clamp (T1 v, T1 lo, T1 hi)`  
*Limit v to the range given by lo and hi.*
- `template<typename T>`  
`constexpr T gcd (T a, T b)`  
*Compute the greatest common divisor of two unsigned values.*
- `template<typename T>`  
`constexpr T lcm (T a, T b)`  
*Compute the least common multiple of two unsigned values.*
- `template<typename T>`  
`T access_once (T const *a)`  
*Read the value at an address at most once.*
- `template<typename T, typename VAL>`  
`void write_now (T *a, VAL &&val)`  
*Write a value at an address exactly once.*

### 14.1.1 Detailed Description

Our C++ library.

Small Low-Level C++ Library.

Strings.

Various kinds of C++ utilities.

## 14.1.2 Function Documentation

### 14.1.2.1 access\_once()

```
template<typename T>
T cxx::access_once (
    T const * a) [inline]
```

Read the value at an address at most once.

The read might be omitted if the result is not used by any code unless `typename` contains `volatile`. If the read operation has side effects and must not be omitted, use different means like [L4drivers::Mmio\\_register\\_block](#) or similar.

The compiler is disallowed to reuse a previous read at the same address, for example:

```
val1 = *a;
val2 = access_once(a); // compiler may not replace this by val2 = val1;
```

The compiler is also disallowed to repeat the read, for example:

```
val1 = access_once(a);
val2 = val1; // compiler may not replace this by val2 = *a;
```

The above implies that the compiler is also disallowed to move the read out of or into loops.

#### Note

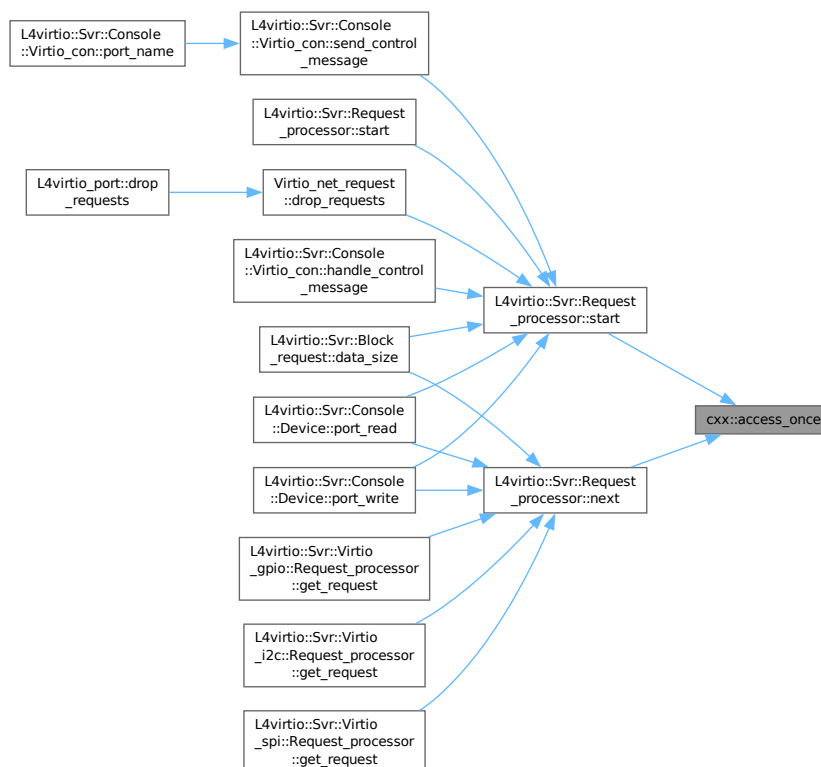

The read might still be moved relative to other code.

The value might be read from a hardware cache, not from RAM.

Definition at line 40 of file [utils](#).

Referenced by [L4virtio::Svr::Request\\_processor::next\(\)](#), and [L4virtio::Svr::Request\\_processor::start\(\)](#).

Here is the caller graph for this function:

### 14.1.2.2 gcd()

```
template<typename T>
T cxx::gcd (
    T a,
    T b) [constexpr]
```

Compute the greatest common divisor of two unsigned values.

This uses the Euclidean modulo algorithm.

#### Note

Contrary to the C++17 specification, this implementation requires the same unsigned type of both arguments and returns the same type (not a common type). This should be fine for most practical use cases.

Contrary to the C++17 specification, this implementation does not accept signed arguments and negative literals.

#### Template Parameters

<i>T</i>	Unsigned integer type of the values.
----------	--------------------------------------

#### Parameters

<i>a</i>	First input.
<i>b</i>	Second input.

#### Returns

Greatest common divisor of the input values.

Definition at line 34 of file [numeric](#).

Referenced by [lcm\(\)](#).

Here is the caller graph for this function:

### 14.1.2.3 lcm()

```
template<typename T>
T cxx::lcm (
    T a,
    T b) [constexpr]
```

Compute the least common multiple of two unsigned values.

This uses the greatest common divisor to compute the least common multiple.

#### Note

Contrary to the C++17 specification, this implementation requires the same unsigned type of both arguments and returns the same type (not a common type). This should be fine for most practical use cases.

Contrary to the C++17 specification, this implementation does not accept signed arguments and negative literals.

#### Template Parameters

<i>T</i>	Unsigned integer type of the values.
----------	--------------------------------------

#### Parameters

<i>a</i>	First input.
<i>b</i>	Second input.

#### Returns

Least common multiple of the input values.

Definition at line 68 of file [numeric](#).

References [gcd\(\)](#).

Here is the call graph for this function:

#### 14.1.2.4 write\_now()

```
template<typename T, typename VAL>
void cxx::write_now (
    T * a,
    VAL && val) [inline]
```

Write a value at an address exactly once.

The compiler is disallowed to skip the write, for example:

```
*a = val;
write_now(a, val); // compiler may not skip this line
```

The compiler is also disallowed to repeat the write.

The above implies that the compiler is also disallowed to move the write out of or into loops.

#### Note

The write might still be moved relative to other code.

The value might be written just to a hardware cache for the moment, not immediately to RAM.

Definition at line 71 of file [utils](#).

## 14.2 cxx::Bits Namespace Reference

Internal helpers for the cxx package.

### Data Structures

- struct [Avl\\_map\\_get\\_key](#)  
*Key-getter for [Avl\\_map](#).*
- class [Avl\\_set\\_iter](#)  
*Generic iterator for the AVL-tree based set.*
- struct [Avl\\_set\\_get\\_key](#)  
*Internal, key-getter for [Avl\\_set](#) nodes.*
- class [Base\\_avl\\_set](#)  
*AVL set with internally managed nodes.*
- class [Bst](#)  
*Basic binary search tree (BST).*
- struct [Direction](#)  
*The direction to go in a binary search tree.*
- class [Bst\\_node](#)  
*Basic type of a node in a binary search tree (BST).*
- class [Basic\\_list](#)  
*Internal: Common functions for all head-based list implementations.*
- class [Smart\\_ptr\\_list\\_item](#)  
*List item for an arbitrary item in a [Smart\\_ptr\\_list](#).*
- class [Smart\\_ptr\\_list](#)  
*List of smart-pointer-managed objects.*

### 14.2.1 Detailed Description

Internal helpers for the cxx package.

## 14.3 Enum\_bitops Namespace Reference

Mechanism to opt-in for enum bitwise operators.

### Data Structures

- struct [Has\\_marker](#)  
*Marker for the opt-in ADL function.*
- struct [Has\\_marker](#)< T, Void< decltype(enum\_bitops\_enable(declval< T >()))> >  
*Marker for the opt-in ADL function.*
- struct [Enable](#)  
*Check whether the given enum type opts in for the bitwise operators.*

### 14.3.1 Detailed Description

Mechanism to opt-in for enum bitwise operators.

For an enumeration type T to opt-in for bitwise operators, there needs to be a declaration of a function

```
void enum_bitops_enable(T)
```

available for the argument-dependent lookup (the function is never actually called, thus no definition is required and no code is generated).

## 14.4 Enum\_bitops\_impl Namespace Reference

Bitwise operators on enumeration types.

### Functions

- template<typename T, typename = L4::Types::Enable\_if\_t<L4::Types::Is\_enum<T>::value>>  
constexpr [L4::Types::Underlying\\_type\\_t](#)< T > **to\_underlying** (T const arg) noexcept  
*Convert enum value to its underlying type value.*
- template<typename T, typename = L4::Types::Enable\_if\_t<Enum\_bitops::Enable<T>::value>>  
constexpr T **operator~** (T const a) noexcept  
*Negate enum value.*
- template<typename T, typename = L4::Types::Enable\_if\_t<Enum\_bitops::Enable<T>::value>>  
constexpr T **operator&** (T l, T r) noexcept  
*Intersect enum values.*
- template<typename T, typename = L4::Types::Enable\_if\_t<Enum\_bitops::Enable<T>::value>>  
constexpr T & **operator&=** (T &a, T const b) noexcept  
*Intersect and assign enum values.*

- `template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>`  
`constexpr T operator| (T l, T r) noexcept`  
*Union enum values.*
- `template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>`  
`constexpr T & operator|= (T &a, T const b) noexcept`  
*Union and assign enum values.*
- `template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>`  
`constexpr T operator- (T l, T r) noexcept`  
*Difference (intersect with negation, clear bits) enum values.*
- `template<typename T, typename = L4::Types::Enable_if_t<Enum_bitops::Enable<T>::value>>`  
`constexpr T & operator-= (T &a, T const b) noexcept`  
*Difference (intersect with negation, clear bits) and assign enum values.*

### 14.4.1 Detailed Description

Bitwise operators on enumeration types.

These operators allow to use the enum type as a bitmask type with '~', '&' and '|' operators that keep the enum type as result. The compound assignment operators '&=' and '|=' are also provided.

The set-difference '-' and '-=' operators (a shorthand for intersection with a negated second argument) can be used to clear specific bits from the enum value. There is also the [to\\_underlying\(\)](#) helper function.

## 14.5 L4 Namespace Reference

[L4](#) low-level kernel interface.

### Namespaces

- namespace [Typeid](#)  
*Definition of interface data-type helpers.*
- namespace [lpc](#)  
*IPC related functionality.*
- namespace [lpc\\_svr](#)  
*Helper classes for [L4::Server](#) instantiation.*
- namespace [Types](#)  
[L4](#) basic type helpers for C++.

## Data Structures

- struct [Type\\_info](#)  
*Dynamic Type Information for [L4Re](#) Interfaces.*
- struct [Kobject\\_typeid](#)  
*Meta object for handling access to type information of Kobjects.*
- struct [Kobject\\_typeid< void >](#)  
*Minimalistic ID for `void` interface.*
- class [Kobject\\_t](#)  
*Helper class to create an [L4Re](#) interface class that is derived from a single base class.*

*reinterpret\_cast* for (smart) capabilities.
- `void throw_ipc_exception (L4::Cap< void > const &o, l4_msgtag_t const &err, l4_utcb_t *utcb)`  
*Throw an L4 IPC error as exception.*
- `void throw_ipc_exception (void const *o, l4_msgtag_t const &err, l4_utcb_t *utcb)`  
*Throw an L4 IPC error as exception.*

## Variables

- `IOModifier` const **hex**  
*Modifies the stream to print numbers as hexadecimal values.*
- `IOModifier` const **dec**  
*Modifies the stream to print numbers as decimal values.*
- `BasicOStream` **cout**  
*Standard output stream.*
- `BasicOStream` **cerr**  
*Standard error stream.*

## 14.5.1 Detailed Description

[L4](#) low-level kernel interface.

## 14.5.2 Enumeration Type Documentation

### 14.5.2.1 anonymous enum

anonymous enum : `l4_proto_t`

#### Enumerator

PROTO_ANY	Default protocol used by <code>Kobject_t</code> and <code>Kobject_x</code> .
PROTO_EMPTY	Empty protocol for empty APIs.

Definition at line 44 of file `__typeinfo.h`.

### 14.5.3 Function Documentation

#### 14.5.3.1 `cap_cast()` [1/2]

```
template<typename T, typename F>
Cap< T > L4::cap_cast (
    Cap< F > const & c) [inline], [noexcept]
```

`static_cast` for capabilities.

#### Template Parameters

<i>T</i>	The target type of the capability
<i>F</i>	The source type (and is usually implicitly set)

#### Parameters

<i>c</i>	The source capability that shall be casted
----------	--

#### Returns

A capability typed to the interface *T*.

The use of this cast operator is similar to the `static_cast<>()` for C++ pointers. It does the same type checking and adjustments like C++ does on pointers.

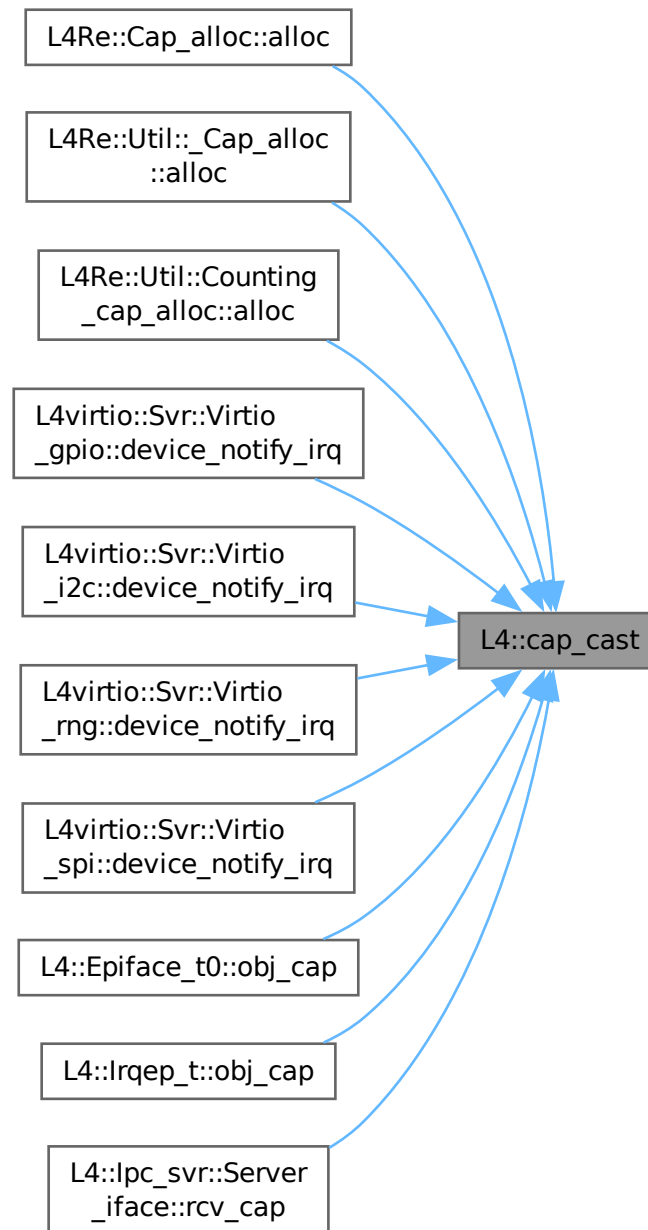

Example code:

```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_cast<L4::Icu>(obj);
```

Definition at line 416 of file [capability.h](#).

Referenced by [L4Re::Cap\\_alloc::alloc\(\)](#), [L4Re::Util::\\_Cap\\_alloc::alloc\(\)](#), [L4Re::Util::Counting\\_cap\\_alloc< COUNTERTYPE, Dbg >::a](#), [L4virtio::Svr::Virtio\\_gpio< Request\\_handler, Epiface >::device\\_notify\\_irq\(\)](#), [L4virtio::Svr::Virtio\\_i2c< Request\\_handler, Epiface >::d](#), [L4virtio::Svr::Virtio\\_rng< Rnd\\_state, Epiface >::device\\_notify\\_irq\(\)](#), [L4virtio::Svr::Virtio\\_spi< Spi\\_request\\_handler, Epiface >::device](#), [L4::Epiface\\_t0< RPC\\_IFACE, BASE >::obj\\_cap\(\)](#), [L4::lrqep\\_t< Derived, BASE, bool >::obj\\_cap\(\)](#), and [L4::lpc\\_svr::Server\\_iface::rcv](#)

Here is the caller graph for this function:

### 14.5.3.2 `cap_cast()` [2/2]

```

template<typename T, typename F, typename SMART>
Smart_cap< T, SMART > L4::cap_cast (
    Smart_cap< F, SMART > const & c) [inline], [noexcept]

```

`static_cast` for (smart) capabilities.

**Template Parameters**

<i>T</i>	Type to cast the capability to.
<i>F</i>	(implicit) Type of the passed capability.
<i>SMART</i>	(implicit) Class implementing the <a href="#">Smart_cap</a> interface.

**Parameters**

<i>c</i>	Capability to be casted.
----------	--------------------------

**Returns**

A smart capability with new type *T*.

Definition at line 192 of file [smart\\_capability](#).

**14.5.3.3 cap\_dynamic\_cast()**

```
template<typename T, typename F>
Cap< T > L4::cap_dynamic_cast (
    Cap< F > const & c) [inline], [noexcept]
```

`dynamic_cast` for capabilities.

**Template Parameters**

<i>T</i>	The target type of the capability.
<i>F</i>	The source type (is usually implicitly set).

**Parameters**

<i>c</i>	The source capability that shall be casted.
----------	---

**Return values**

<a href="#">Cap&lt;T&gt;</a>	Capability of target interface <i>T</i> .
<i>L4_INVALID_CAP</i>	<i>c</i> does not support the target interface <i>T</i> or the <a href="#">L4::Meta</a> interface.

The use of this cast operator is similar to the `dynamic_cast<>()` for C++ pointers. It also induces overhead, because it uses the meta interface ([L4::Meta](#)) to do runtime type checking.

Example code:

```
L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_dynamic_cast<L4::Icu>(obj);
```

Definition at line 116 of file [capability](#).

References [cap\\_reinterpret\\_cast\(\)](#), [L4::Cap\\_base::Invalid](#), [kobject\\_typeid\(\)](#), and [l4\\_error\(\)](#).

Here is the call graph for this function:

#### 14.5.3.4 cap\_reinterpret\_cast() [1/2]

```

template<typename T, typename F>
Cap< T > L4::cap_reinterpret_cast (
    Cap< F > const & c) [inline], [noexcept]
  
```

reinterpret\_cast for capabilities.

##### Template Parameters

<i>T</i>	The target type of the capability
<i>F</i>	The source type (and is usually implicitly set)

##### Parameters

<i>c</i>	The source capability that shall be casted
----------	--

##### Returns

A capability typed to the interface *T*.

The use of this cast operator is similar to the `reinterpret_cast<>()` for C++ pointers. It does not do any type checking or type adjustment.

Example code:

```

L4::Cap<L4::Kobject> obj = ... ;
L4::Cap<L4::Icu> icu = L4::cap_reinterpret_cast<L4::Icu>(obj);
  
```

Definition at line 447 of file [capability.h](#).

Referenced by [cap\\_dynamic\\_cast\(\)](#).

Here is the caller graph for this function:

#### 14.5.3.5 cap\_reinterpret\_cast() [2/2]

```
template<typename T, typename F, typename SMART>
Smart_cap< T, SMART > L4::cap_reinterpret_cast (
    Smart_cap< F, SMART > const & c) [inline], [noexcept]
```

reinterpret\_cast for (smart) capabilities.

##### Template Parameters

<i>T</i>	Type to cast the capability to.
<i>F</i>	(implicit) Type of the passed capability.
<i>SMART</i>	(implicit) Class implementing the <a href="#">Smart_cap</a> interface.

##### Parameters

<i>c</i>	Capability to be casted.
----------	--------------------------

##### Returns

A smart capability with new type *T*.

Definition at line 211 of file [smart\\_capability](#).

#### 14.5.3.6 round\_order()

```
template<typename T>
T L4::round_order (
    T val,
    unsigned char order) [constexpr]
```

Round a value up so the given number of lsb is zero.

### Template Parameters

<i>T</i>	The type of the value (shall be some integral type).
----------	--

### Parameters

<i>val</i>	The value to round up to the next multiple of $2^{\text{order}}$ .
<i>order</i>	order ( $2^{\text{order}}$ ) to round up to.

### Returns

val rounded up to the next  $2^{\text{order}}$ .

Definition at line 32 of file [consts](#).

Referenced by [L4Re::Dataspace::map\\_region\(\)](#).

Here is the caller graph for this function:

#### 14.5.3.7 trunc\_order()

```
template<typename T>
T L4::trunc_order (
    T val,
    unsigned char order) [constexpr]
```

Round a value down so the given number of lsb is zero.

### Template Parameters

<i>T</i>	The type of the value (shall be some integral type).
----------	--

### Parameters

<i>val</i>	The value where the given lsb shall be masked.
------------	--

<i>order</i>	the number of least significant bits (lsb) to mask.
--------------	---

**Returns**

val with order lsb masked to zero.

Definition at line 18 of file [consts](#).

Referenced by [L4Re::Dataspace::map\\_region\(\)](#).

Here is the caller graph for this function:

*Return a pointer to stream array data.*
- `template<typename T>`  
`T read (Istream &s)`  
*Read a value out of a stream.*

## 14.6.1 Detailed Description

IPC related functionality.

## 14.6.2 Function Documentation

### 14.6.2.1 buf\_cp\_in()

```
template<typename T>
Internal::Buf_cp_in< T > L4::Ipc::buf_cp_in (
    T * v,
    unsigned long & size)
```

Extract an array from an `lpc::Istream`.

**Parameters**

	<i>v</i>	Pointer to the array that shall receive the values from the <a href="#">lpc::Istream</a> .
<i>in, out</i>	<i>size</i>	Input: the number of elements the array can take at most Output: the number of elements found in the stream.

[buf\\_cp\\_in\(\)](#) can be used to extract an array from an [lpc::Istream](#). This is the counterpart [buf\\_cp\\_out\(\)](#). The data from the received message is thereby copied to the given buffer and size is set to the number of elements found in the stream. To avoid the copy operation [buf\\_in\(\)](#) may be used instead.

**See also**

[buf\\_in\(\)](#) and [buf\\_cp\\_out\(\)](#).

Definition at line 159 of file [ipc\\_stream](#).

**14.6.2.2 buf\_cp\_out()**

```
template<typename T>
Internal::Buf_cp_out< T > L4::Ipc::buf_cp_out (
    T const * v,
    unsigned long size)
```

Insert an array into an [lpc::Ostream](#).

**Parameters**

<i>v</i>	Pointer to the array that shall be inserted into an <a href="#">lpc::Ostream</a> .
<i>size</i>	Number of elements in the array.

This function inserts an array (e.g. a string) into an [lpc::Ostream](#). The data is copied to the stream. On insertion into the [lpc::Ostream](#) exactly the given number of elements of type T are copied to the message buffer, this means the source buffer is no longer referenced after insertion into the stream.

**See also**

The counterpart is either [buf\\_cp\\_in\(\)](#) or [buf\\_in\(\)](#).

Definition at line 100 of file [ipc\\_stream](#).

### 14.6.2.3 buf\_in()

```
template<typename T>
Internal::Buf_in< T > L4::Ipc::buf_in (
    T *& v,
    unsigned long & size)
```

Return a pointer to stream array data.

#### Parameters

out	<i>v</i>	Pointer to the array within the <a href="#">lpc::lstream</a> .
out	<i>size</i>	The number of elements found in the stream.

This routine provides a possibility to extract an array from an [lpc::lstream](#), without extra copy overhead. In contrast to [buf\\_cp\\_in\(\)](#) the data is not copied to a buffer, but a pointer to the array is returned. The user must make sure the UTCB is not used for other purposes while the returned pointer is still in use.

The mechanism is comparable to that of [Msg\\_ptr](#), however it handles arrays inserted with [buf\\_cp\\_out\(\)](#).

#### See also

[buf\\_cp\\_in\(\)](#) and [buf\\_cp\\_out\(\)](#).

Definition at line 310 of file [ipc\\_stream](#).

### 14.6.2.4 make\_cap()

```
template<typename T>
Cap< T > L4::Ipc::make_cap (
    L4::Cap< T > cap,
    unsigned rights) [noexcept]
```

Make an [L4::lpc::Cap<T>](#) for the given capability and rights.

#### Template Parameters

<i>T</i>	(IMPLICIT) type of the referenced interface
----------	---

#### Parameters

<i>cap</i>	source capability ( <a href="#">L4::Cap&lt;T&gt;</a> )
<i>rights</i>	rights mask that shall be applied on transfer.

Definition at line 785 of file [ipc\\_types](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_region\\_t< No\\_custom\\_data >::Driver\\_mem\\_region\\_t\(\)](#).

Here is the caller graph for this function:

#### 14.6.2.5 make\_cap\_full()

```

template<typename T>
Cap< T > L4::Ipc::make_cap_full (
    L4::Cap< T > cap) [noexcept]
  
```

Make an L4::IPC::Cap<T> for the given capability with full fpage and object-specific rights.

##### Template Parameters

<i>T</i>	(implicit) type of the referenced interface
----------	---

##### Parameters

<i>cap</i>	source capability ( <a href="#">L4::Cap&lt;T&gt;</a> )
------------	--

##### See also

[L4\\_cap\\_fpage\\_rights](#)

[Attributes and additional permissions for object send items](#)

##### Note

Full rights (including object-specific rights) are required when mapping an IPC gate where the receiver should become the server, i.e. where the receiver wants to call [L4::lpc\\_gate::bind\\_thread\(\)](#) or [L4::lpc\\_gate::bind\\_snd\\_destination\(\)](#).

Definition at line 824 of file [ipc\\_types](#).

References [L4\\_CAP\\_FPAGE\\_RWSD](#), and [L4\\_FPAGE\\_C\\_OBJ\\_RIGHTS](#).

### 14.6.2.6 make\_cap\_rw()

```
template<typename T>
Cap< T > L4::Ipc::make_cap_rw (
    L4::Cap< T > cap) [noexcept]
```

Make an [L4::Ipc::Cap<T>](#) for the given capability with [L4\\_CAP\\_FPAGE\\_RW](#) rights.

#### Template Parameters

<i>T</i>	(IMPLICIT) type of the referenced interface
----------	---

#### Parameters

<i>cap</i>	source capability ( <a href="#">L4::Cap&lt;T&gt;</a> )
------------	--

#### Examples

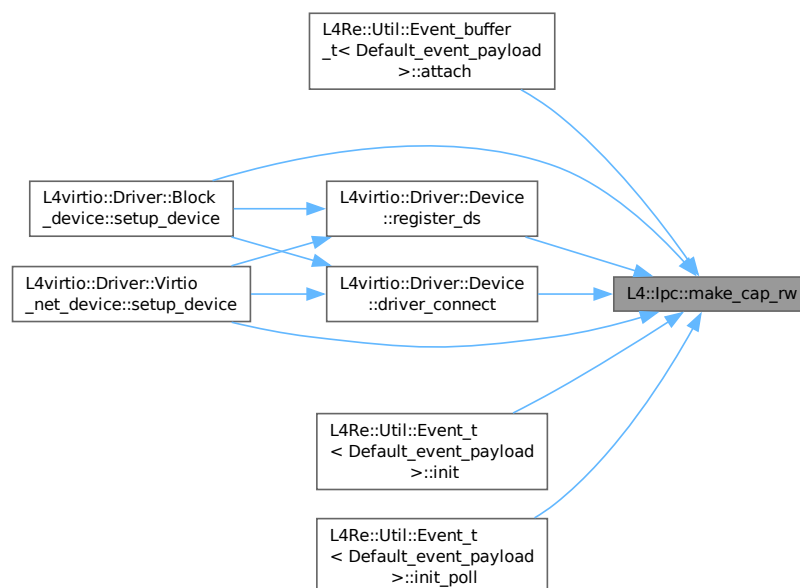

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/c++/shared\\_](#)

Definition at line 795 of file [ipc\\_types](#).

References [L4\\_CAP\\_FPAGE\\_RW](#).

Referenced by [L4Re::Util::Event\\_buffer\\_t< Default\\_event\\_payload >::attach\(\)](#), [L4virtio::Driver::Device::driver\\_connect\(\)](#), [L4Re::Util::Event\\_t< Default\\_event\\_payload >::init\(\)](#), [L4Re::Util::Event\\_t< Default\\_event\\_payload >::init\\_poll\(\)](#), [L4virtio::Driver::Device::register\\_ds\(\)](#), [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#), and [L4virtio::Driver::Virtio\\_net\\_device::setup\\_de](#)

Here is the caller graph for this function:

### 14.6.2.7 make\_cap\_rws()

```
template<typename T>
Cap< T > L4::Ipc::make_cap_rws (
    L4::Cap< T > cap) [noexcept]
```

Make an [L4::ipc::Cap<T>](#) for the given capability with [L4\\_CAP\\_FPAGE\\_RWS](#) rights.

#### Template Parameters

<i>T</i>	(IMPLICIT) type of the referenced interface
----------	---

#### Parameters

<i>cap</i>	source capability ( <a href="#">L4::Cap&lt;T&gt;</a> )
------------	--

Definition at line 805 of file [ipc\\_types](#).

References [L4\\_CAP\\_FPAGE\\_RWS](#).

### 14.6.2.8 msg\_ptr()

```
template<typename T>
Msg_ptr< T > L4::Ipc::msg_ptr (
    T *& p)
```

Create an [Msg\\_ptr](#) to adjust the given pointer.

This function makes it more convenient to extract pointers to data in the message buffer itself from an [ipc::Istream](#). This may be used to avoid copy out of large data structures. (See [Msg\\_ptr](#).)

Definition at line 252 of file [ipc\\_stream](#).

### 14.6.2.9 read()

```
template<typename T>
T L4::Ipc::read (
    Istream & s) [inline]
```

Read a value out of a stream.

#### Parameters

<i>s</i>	An <a href="#">Istream</a> .
----------	------------------------------

#### Returns

The value of type *T*.

The stream position is progressed accordingly.

Definition at line 1289 of file [ipc\\_stream](#).

### 14.6.2.10 str\_cp\_in()

```
template<typename T>
Str_cp_in< T > L4::Ipc::str_cp_in (
    T * v,
    unsigned long & size)
```

Create a [Str\\_cp\\_in](#) for the given values.

#### Parameters

	<i>v</i>	Pointer to the array that shall receive the values from the <a href="#">lpc::lstream</a> .
<i>in, out</i>	<i>size</i>	Input: the number of elements the array can take at most Output: the number of elements found in the stream.

This function makes it more convenient to extract arrays from an [lpc::lstream](#) (

See also

[Str\\_cp\\_in](#).)

Definition at line 213 of file [ipc\\_stream](#).

## 14.7 L4::lpc::Msg Namespace Reference

IPC Message related functionality.

## 14.7.3 Function Documentation

### 14.7.3.1 align\_to() [1/2]

```
template<typename T>
unsigned long L4::Ipc::Msg::align_to (
    unsigned long bytes) [constexpr, [noexcept]
```

Pad *bytes* to the alignment of the type *T*.

#### Template Parameters

<i>T</i>	The data type used for the alignment
----------	--------------------------------------

#### Parameters

<i>bytes</i>	The value to add the padding to
--------------	---------------------------------

#### Returns

*bytes* padded to achieve the alignment of *T*.

Definition at line 40 of file [ipc\\_basics](#).

References [align\\_to\(\)](#).

Here is the call graph for this function:

### 14.7.3.2 align\_to() [2/2]

```
unsigned long L4::Ipc::Msg::align_to (  
    unsigned long bytes,  
    unsigned long align) [constexpr], [noexcept]
```

Pad bytes to the given alignment *align* (in bytes).

#### Parameters

<i>bytes</i>	The input value in bytes
<i>align</i>	The alignment value in bytes

#### Returns

the result after padding *bytes* to *align*.

Definition at line 30 of file [ipc\\_basics](#).

Referenced by [align\\_to\(\)](#), [msg\\_add\(\)](#), and [msg\\_get\(\)](#).

Here is the caller graph for this function:

### 14.7.3.3 `check_size()` [1/2]

```
template<typename T>
bool L4::Ipc::Msg::check_size (
    unsigned offset,
    unsigned limit) [constexpr], [noexcept]
```

Check if there is enough space for T from offset to limit.

#### Template Parameters

<i>T</i>	The data type that shall be fitted at <i>offset</i>
----------	---

#### Parameters

<i>offset</i>	The current offset in bytes (must already be padded if desired).
<i>limit</i>	The limit in bytes that must not be exceeded after adding the size of <i>T</i> .

#### Returns

true if the limit will not be exceeded, false else.

Definition at line 53 of file [ipc\\_basics](#).

Referenced by [msg\\_add\(\)](#), and [msg\\_get\(\)](#).

Here is the caller graph for this function:

### 14.7.3.4 `check_size()` [2/2]

```
template<typename T, typename CTYPE>
bool L4::Ipc::Msg::check_size (
    unsigned offset,
    unsigned limit,
    CTYPE cnt) [inline], [noexcept]
```

Check if there is enough space for an array of T from offset to limit.

**Template Parameters**

<i>T</i>	The data type that shall be fitted at <i>offset</i>
<i>CTYPE</i>	Type of the <i>cnt</i> parameter

**Parameters**

<i>offset</i>	The current offset in bytes (must already be padded if desired).
<i>limit</i>	The limit in bytes that must not be exceeded after adding <i>cnt</i> times the size of <i>T</i> .
<i>cnt</i>	The number of elements of type <i>T</i> that shall be put at <i>offset</i> .

**Returns**

true if the limit will not be exceeded, false else.

Definition at line 71 of file [ipc\\_basics](#).

References [L4\\_UNLIKELY](#).

**14.7.3.5 msg\_add()**

```
template<typename T>
int L4::IpC::Msg::msg_add (
    char * msg,
    unsigned offs,
    unsigned limit,
    T v) [inline], [noexcept]
```

Add some data to a message at offs.

**Template Parameters**

<i>T</i>	The type of the data to add
----------	-----------------------------

**Parameters**

<i>msg</i>	pointer to the start of the message
<i>offs</i>	The current offset within the message, this shall be padded to the alignment of <i>T</i> if <i>v</i> is added.
<i>limit</i>	The size limit in bytes that offset must not exceed.
<i>v</i>	The value to add to the message

**Returns**

The new offset when successful, a negative value if the given limit will be exceeded.

Definition at line 114 of file [ipc\\_basics](#).

References [align\\_to\(\)](#), [check\\_size\(\)](#), [L4\\_MSGTOOLONG](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

**14.7.3.6 msg\_get()**

```

template<typename T>
int L4::Ipc::Msg::msg_get (
    char * msg,
    unsigned offs,
    unsigned limit,
    T & v) [inline], [noexcept]
  
```

Get some data from a message at offs.

**Template Parameters**

<i>T</i>	The type of the data to read
----------	------------------------------

**Parameters**

<i>msg</i>	Pointer to the start of the message
<i>offs</i>	The current offset within the message, this shall be padded to the alignment of <i>T</i> if a <i>v</i> can be read.
<i>limit</i>	The size limit in bytes that offset must not exceed.
<i>v</i>	A reference to receive the value from the message

**Returns**

The new offset when successful, a negative value if the given limit will be exceeded.

Definition at line 135 of file [ipc\\_basics](#).

References [align\\_to\(\)](#), [check\\_size\(\)](#), [L4\\_EMSGTOOSHORT](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

## 14.8 L4::lpc\_svr Namespace Reference

Helper classes for [L4::Server](#) instantiation.

**Data Structures**

- class [Server\\_iface](#)  
*Interface for server-loop related functions.*
- struct [Ignore\\_errors](#)  
*Mix in for LOOP\_HOOKS to ignore IPC errors.*
- struct [Default\\_timeout](#)  
*Mix in for LOOP\_HOOKS to use a 0 send and a infinite receive timeout.*
- struct [Compound\\_reply](#)  
*Mix in for LOOP\_HOOKS to always use compound reply and wait.*
- struct [Default\\_setup\\_wait](#)  
*Mix in for LOOP\_HOOKS for setup\_wait no op.*
- struct [Direct\\_dispatch](#)  
*Direct dispatch helper, for forwarding dispatch calls to a registry R.*
- struct [Direct\\_dispatch< R \\* >](#)  
*Direct dispatch helper, for forwarding dispatch calls via a pointer to a registry R.*
- struct [Exc\\_dispatch](#)  
*Dispatch helper wrapping try {} catch {} around the dispatch call.*
- struct [Dbg\\_dispatch](#)  
*Dispatch helper that, in addition to what [Exc\\_dispatch](#) does, prints exception messages.*
- class [Br\\_manager\\_no\\_buffers](#)  
*Empty implementation of [Server\\_iface](#).*
- struct [Default\\_loop\\_hooks](#)  
*Default LOOP\_HOOKS.*
- class [Timeout](#)  
*Callback interface for [Timeout\\_queue](#).*
- class [Timeout\\_queue](#)  
*[Timeout](#) queue to be used in l4re server loop.*
- class [Timeout\\_queue\\_hooks](#)  
*Loop hooks mixin for integrating a timeout queue into the server loop.*

## Enumerations

- enum [Reply\\_mode](#) { [Reply\\_compound](#) , [Reply\\_separate](#) }  
*Reply mode for server loop.*

### 14.8.1 Detailed Description

Helper classes for [L4::Server](#) instantiation.

## 14.9 L4::Typeid Namespace Reference

Definition of interface data-type helpers.

### Data Structures

- struct [P\\_dispatch](#)  
*Use for protocol based dispatch stage.*
- struct [Raw\\_ipc](#)  
*RPCs list for passing raw incoming IPC to the server object.*
- struct [Rpc](#)  
*Standard list of RPCs of an interface.*
- struct [Rpc\\_code](#)  
*List of RPCs of an interface using a special opcode type.*
- struct [Rpc\\_nocode](#)  
*List of RPCs of an interface using a single operation without an opcode.*
- struct [Rpc\\_sys](#)  
*List of RPCs typically used for kernel interfaces.*

### 14.9.1 Detailed Description

Definition of interface data-type helpers.

#### Note

These type helpers are intended for internal use, if you look for standard C++ type traits use the `<type_traits>` header for the standard C++ library or use `<l4/cxx/type_traits>`.

## 14.10 L4::Types Namespace Reference

[L4](#) basic type helpers for C++.

## Data Structures

- class [Flags](#)  
*Template for defining typical [Flags](#) bitmaps.*
- struct [Int\\_for\\_size](#)  
*Metafunction to get an unsigned integral type for the given size.*
- struct [Int\\_for\\_type](#)  
*Metafunction to get an integral type of the same size as  $T$ .*
- struct [Flags\\_ops\\_t](#)  
*Mixin class to define a set of friend bitwise operators on  $DT$ .*
- struct [Flags\\_t](#)  
*Template type to define a flags type with bitwise operations.*
- struct [\\_\\_Add\\_rvalue\\_reference\\_helper](#)  
*Helper template for [Add\\_rvalue\\_reference](#).*
- struct [\\_\\_Add\\_rvalue\\_reference\\_helper](#)<  $T$ ,  $\text{Void}< T \&\& >$  >  
*Helper template for [Add\\_rvalue\\_reference](#).*
- struct [Add\\_rvalue\\_reference](#)  
*Create an rvalue reference of the given type.*
- struct [Bool](#)  
*Boolean meta type.*
- struct [False](#)  
*[False](#) meta value.*
- struct [True](#)  
*[True](#) meta value.*
- struct [Integral\\_constant](#)  
*Wrapper for a static constant of the given type.*
- struct [Is\\_enum](#)  
*Check whether the given type is an enumeration type.*
- struct [\\_\\_Underlying\\_type\\_helper](#)  
*Helper template for [Underlying\\_type](#).*
- struct [\\_\\_Underlying\\_type\\_helper](#)<  $T$ ,  $\text{false}$  >  
*Helper template for [Underlying\\_type](#).*
- struct [Underlying\\_type](#)  
*Get an underlying type of an enumeration type.*
- struct [Same](#)  
*Compare two data types for equality.*

## Typedefs

- `template<typename...>`  
`using Void = void`  
*Map a sequence of any types to the void type.*
- `template<typename T>`  
`using Add_rvalue_reference_t = typename Add\_rvalue\_reference< $T$ >::type`  
*Helper type for the [Add\\_rvalue\\_reference](#).*
- `template<typename T>`  
`using Underlying_type_t = typename Underlying\_type< $T$ >::type`  
*Helper type for [Underlying\\_type](#).*
- `template<bool Condition, typename T = void>`  
`using Enable_if_t = typename Enable\_if< $\text{Condition}$ ,  $T$ >::type`  
*Helper type for [Enable\\_if](#).*

## Functions

- `template<typename T>`  
`Add_rvalue_reference_t< T > declval () noexcept`  
*Template for writing typed expressions in unevaluated contexts.*

### 14.10.1 Detailed Description

[L4](#) basic type helpers for C++.

### 14.10.2 Function Documentation

#### 14.10.2.1 declval()

```
template<typename T>
Add_rvalue_reference_t< T > L4::Types::declval () [noexcept]
```

Template for writing typed expressions in unevaluated contexts.

In unevaluated contexts, the template converts a type (possibly an incomplete type) to an expression of that type.

#### Template Parameters

<i>T</i>	Type to be converted to an expression of that type.
----------	---

## 14.11 L4Re Namespace Reference

[L4Re](#) C++ Interfaces.

## Namespaces

- namespace [Vfs](#)

*Allocate a capability slot and wrap it in an Unique\_del\_cap.*

### 14.11.1 Detailed Description

[L4Re C++ Interfaces.](#)

[L4 Runtime Environment.](#)

## 14.11.2 Typedef Documentation

### 14.11.2.1 Shared\_cap

```
template<typename T>
using L4Re::Shared_cap = L4::Detail::Shared_cap_impl<T, L4Re::Smart_count_cap<L4_FP_ALL_SPACES>>
```

Shared capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Shared\\_cap](#).

Definition at line 33 of file [shared\\_cap](#).

### 14.11.2.2 Shared\_del\_cap

```
template<typename T>
using L4Re::Shared_del_cap = L4::Detail::Shared_cap_impl<T, L4Re::Smart_count_cap<L4_FP_DELETE_OBJ>>
```

Shared capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to [Shared\\_cap](#) is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::Shared\\_del\\_cap](#).

Definition at line 70 of file [shared\\_cap](#).

### 14.11.2.3 Unique\_cap

```
template<typename T>
using L4Re::Unique_cap = L4::Detail::Unique_cap_impl<T, L4Re::Smart_cap_auto<L4_FP_ALL_SPACES>>
```

Unique capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The ownership of the capability is managed in the same way as `unique_ptr`.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use `L4Re::Util::Unique_cap`.

Definition at line 31 of file `unique_cap`.

### 14.11.2.4 Unique\_del\_cap

```
template<typename T>
using L4Re::Unique_del_cap = L4::Detail::Unique_cap_impl<T, L4Re::Smart_cap_auto<L4_FP_DELETE_OBJ>>
```

Unique capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The main difference to `Unique_cap` is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Note

This type is intended for users who implement a custom capability allocator; otherwise use `L4Re::Util::Unique_del_cap`.

Definition at line 65 of file `unique_cap`.

### 14.11.3 Function Documentation

#### 14.11.3.1 chkcap()

```
template<typename T>
T L4Re::chkcap (
    T && cap,
    char const * extra = "",
    l4_ret_t err = -L4_ENOMEM) [inline]
```

Check for valid capability or raise C++ exception.

#### Template Parameters

<i>T</i>	Type of object to check, must be capability-like ( <a href="#">L4::Cap</a> , <a href="#">L4Re::Util::Unique_cap</a> etc.)
----------	---

#### Parameters

<i>cap</i>	Capability value to check.
<i>extra</i>	Optional text for exception.
<i>err</i>	Error value for exception or 0 if the error code stored in the invalid capability should be used.

This function checks whether the capability is valid. If the capability is invalid, a C++ exception is generated, using *err* if *err* is not zero, otherwise the capability value is used. A valid capability will just be returned.

Definition at line 149 of file [error\\_helper](#).

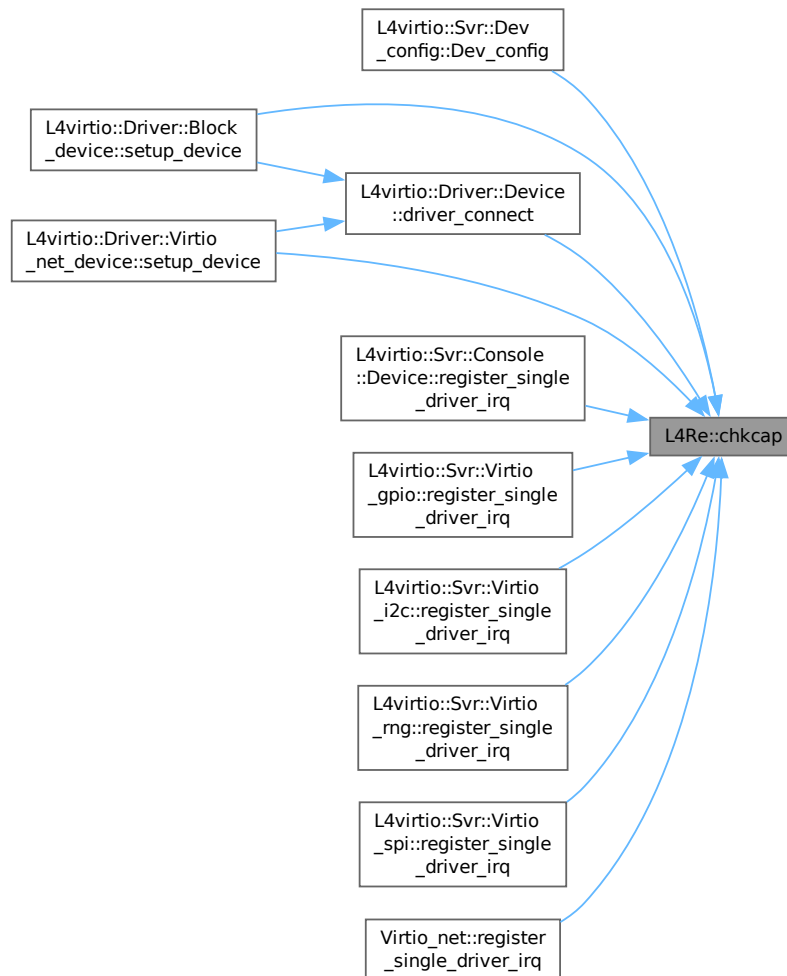

References [L4\\_ENOMEM](#), [L4\\_UNLIKELY](#), and [throw\\_error\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 14.11.3.2 chkipc()

```

14_msgtag_t L4Re::chkipc (
    14_msgtag_t tag,
    char const * extra = "",
    14_utcb_t * utcb = 14_utcb()) [inline]

```

Test a message tag for IPC errors.

#### Parameters

<i>tag</i>	Message tag returned by the IPC.
<i>extra</i>	Exception message in case of error.
<i>utcb</i>	The UTCB used in the IPC operation.

**Returns**

On IPC error an exception is thrown, otherwise `tag` is returned.

**Exceptions**

<code>L4::Runtime_exception</code>	with the translated IPC error code
------------------------------------	------------------------------------

This function does not check the message tag's label value.

**Note**

This must be called on a message tag before the UTCB is changed.

Definition at line 180 of file [error\\_helper](#).

References [chksys\(\)](#), [l4\\_msgtag\\_t::has\\_error\(\)](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

**14.11.3.3 chksys() [1/3]**

```

l4_ret_t L4Re::chksys (
    l4_msgtag_t const & t,
    char const * extra = "",
    l4_utcb_t * utcb = l4_utcb(),
    l4_ret_t ret = 0) [inline]
  
```

Generate C++ exception on error.

**Parameters**

<code>t</code>	Message tag.
<code>extra</code>	Optional text for exception (default "")
<code>utcb</code>	Option UTCB
<code>ret</code>	Optional value for exception, default is error value (err)

This function throws an exception if the message tag contains an error or the label in the message tag is negative. Otherwise the label in the message tag is returned.

Definition at line 93 of file [error\\_helper](#).

References [l4\\_msgtag\\_t::has\\_error\(\)](#), [L4\\_UNLIKELY](#), [l4\\_msgtag\\_t::label\(\)](#), and [throw\\_error\(\)](#).

#### 14.11.3.4 `chksys()` [2/3]

```

l4_ret_t L4Re::chksys (
    l4_msgtag_t const & t,
    l4_utcb_t * utcb,
    char const * extra = "") [inline]

```

Generate C++ exception on error.

##### Parameters

<i>t</i>	Message tag.
<i>utcb</i>	UTCB.
<i>extra</i>	Optional text for exception (default "")

This function throws an exception if the message tag contains an error or the label in the message tag is negative. Otherwise the label in the message tag is returned.

Definition at line 116 of file [error\\_helper](#).

References [chksys\(\)](#).

Here is the call graph for this function:

14.11.3.5 `chksys()` [3/3]

```

l4_ret_t L4Re::chksys (
    l4_ret_t err,
    char const * extra = "",
    l4_ret_t ret = 0) [inline]

```

Generate C++ exception on error.

**Parameters**

<i>err</i>	Error value, if negative exception will be thrown
<i>extra</i>	Optional text for exception (default "")
<i>ret</i>	Optional value for exception, default is error value (err)

This function throws an exception if the `err` is negative and otherwise returns `err`.

### 14.11.3.6 make\_shared\_cap()

```

template<typename T>
Shared_cap< T > L4Re::make_shared_cap (
    L4Re::Cap_alloc * ca)

```

Allocate a capability slot and wrap it in a [Shared\\_cap](#).

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

#### Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

#### Note

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_shared\\_cap<T>\(\)](#).

Definition at line 50 of file [shared\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

#### 14.11.3.7 make\_shared\_del\_cap()

```

template<typename T>
Shared\_del\_cap< T > L4Re::make_shared_del_cap (
    L4Re::Cap\_alloc * ca)
  
```

Allocate a capability slot and wrap it in a [Shared\\_del\\_cap](#).

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

#### Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

**Note**

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_shared\\_del\\_cap<T>\(\)](#).

Definition at line 87 of file [shared\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

**14.11.3.8 make\_unique\_cap()**

```

template<typename T>
Unique_cap< T > L4Re::make_unique_cap (
    L4Re::Cap_alloc * ca)
  
```

Allocate a capability slot and wrap it in an [Unique\\_cap](#).

**Template Parameters**

<i>T</i>	Type of the object the capability refers to.
----------	--

**Parameters**

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

**Note**

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_unique\\_cap<T>\(\)](#).

Definition at line 48 of file [unique\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

### 14.11.3.9 make\_unique\_del\_cap()

```
template<typename T>
Unique_del_cap< T > L4Re::make_unique_del_cap (
    L4Re::Cap_alloc * ca)
```

Allocate a capability slot and wrap it in an [Unique\\_del\\_cap](#).

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

#### Parameters

<i>ca</i>	Capability allocator to use.
-----------	------------------------------

#### Note

This function is intended for users who implement a custom capability allocator; otherwise use [L4Re::Util::make\\_unique\\_del\\_cap<T>\(\)](#).

Definition at line 82 of file [unique\\_cap](#).

References [L4Re::Cap\\_alloc::alloc\(\)](#).

Here is the call graph for this function:

### 14.11.3.10 throw\_error()

```
void L4Re::throw_error (
    long err,
    char const * extra = "") [inline]
```

Generate C++ exception.

#### Parameters

<i>err</i>	Error value
------------	-------------

<i>extra</i>	Optional text for exception (default "")
--------------	--

This function throws an [L4](#) exception. The exact exception type depends on the error value (err). This function does never return.

### 14.12.1 Detailed Description

Documentation of the [L4](#) Runtime Environment utility functionality in C++.

## 14.12.2 Typedef Documentation

### 14.12.2.1 Shared\_cap

```
template<typename T>
```

```
using L4Re::Util::Shared_cap = L4::Detail::Shared_cap_impl<T, L4Re::Util::Smart_count_cap<L4_FP_ALL_SPACES>>
```

Shared capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

Usage:

```
L4Re::Util::Shared_cap<L4Re::Dataspace> global_ds_cap;

{
    L4Re::Util::Shared_cap<L4Re::Dataspace>
        ds_cap = make_shared_cap<L4Re::Dataspace>();
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
```

Definition at line 48 of file [shared\\_cap](#).

### 14.12.2.2 Shared\_del\_cap

```
template<typename T>
```

```
using L4Re::Util::Shared_del_cap = L4::Detail::Shared_cap_impl<T, L4Re::Util::Smart_count_cap<L4_FP_DELETE_OB
```

Shared capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

This shared capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to [Shared\\_cap](#) is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

Usage:

```

L4Re::Util::Shared_del_cap<L4Re::Dataspace> global_ds_cap;

{
    L4Re::Util::Shared_del_cap<L4Re::Dataspace>
        ds_cap = make_shared_del_cap<L4Re::Dataspace>();
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
...
global_ds_cap = L4_INVALID_CAP;
// reference count dropped to 0 (data space shall be deleted).

```

Definition at line 99 of file [shared\\_cap](#).

### 14.12.2.3 Unique\_cap

```

template<typename T>
using L4Re::Util::Unique_cap = L4::Detail::Unique_cap_impl<T, L4Re::Util::Smart_cap_auto<L4_FP_ALL_SPACES>>

```

Unique capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The ownership of the capability is managed in the same way as `unique_ptr`.

Usage:

```

{
    L4Re::Util::Unique_cap<L4Re::Dataspace>
        ds_cap = L4Re::Util::make_unique_cap<L4Re::Dataspace>();

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

    ...

    // At the end of the scope ds_cap is unmapped and the capability
    // selector is freed.
}

```

Definition at line 43 of file [unique\\_cap](#).

#### 14.12.2.4 Unique\_del\_cap

```
template<typename T>
using L4Re::Util::Unique_del_cap = L4::Detail::Unique_cap_impl<T, L4Re::Util::Smart_cap_auto<L4_FP_DELETE_OBJ
```

Unique capability that implements automatic free and unmap+delete of the capability selector.

##### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

The main difference to [Unique\\_cap](#) is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

Usage:

```
{
    L4Re::Util::Unique_del_cap<L4Re::Dataspace>
        ds_cap = make_unique_del_cap<L4Re::Dataspace>();

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(L4_PAGESIZE, ds_cap.get()));

    ...

    // At the end of the scope ds_cap is unmapped and the capability
    // selector is freed. Because the deletion flag is set the data space
    // shall also be deleted (even if there are other references to this
    // data space).
}
```

Definition at line 87 of file [unique\\_cap](#).

### 14.12.3 Function Documentation

#### 14.12.3.1 make\_shared\_cap()

```
template<typename T>
Shared_cap< T > L4Re::Util::make_shared_cap ()
```

Allocate a capability slot and wrap it in a [Shared\\_cap](#).

##### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

Definition at line 61 of file [shared\\_cap](#).

References [cap\\_alloc](#).

#### 14.12.3.4 make\_unique\_del\_cap()

```
template<typename T>
Unique_del_cap< T > L4Re::Util::make_unique_del_cap ()
```

Allocate a capability slot and wrap it in an [Unique\\_del\\_cap](#).

##### Template Parameters

<i>T</i>	Type of the object the capability refers to.
----------	--

Definition at line 100 of file [unique\\_cap](#).

References [cap\\_alloc](#).

### 14.13 L4Re::Vfs Namespace Reference

Virtual file system for interfaces in POSIX libc.

#### Data Structures

- class [Be\\_file](#)  
*Boiler plate class for implementing an open file for L4Re::Vfs.*
- class [Be\\_file\\_system](#)  
*Boilerplate class for implementing a L4Re::Vfs::File\_system.*
- class [Generic\\_file](#)  
*The common interface for an open POSIX file.*
- class [Directory](#)  
*Interface for a POSIX file that is a directory.*
- class [Regular\\_file](#)  
*Interface for a POSIX file that provides regular file semantics.*
- class [Special\\_file](#)  
*Interface for a POSIX file that provides special file semantics.*
- class [File](#)  
*The basic interface for an open POSIX file.*
- class [Mman](#)  
*Interface for POSIX memory management.*
- class [File\\_system](#)  
*Basic interface for an L4Re::Vfs file system.*
- class [Fs](#)  
*POSIX File-system related functionality.*
- class [Ops](#)  
*Interface for the POSIX backends of an application.*

#### Functions

- [L4Re::Vfs::Ops](#) \*vfs\_ops **asm** ("l4re\_env\_posix\_vfs\_ops")  
*Reference to the applications L4Re::Vfs::Ops singleton.*

### 14.13.1 Detailed Description

Virtual file system for interfaces in POSIX libc.

## 14.14 L4vbus Namespace Reference

C++ interface of the [Vbus](#) API.

### Data Structures

- class [Pm](#)  
*Power-management API mixin.*
- class [Device](#)  
*Device on a [L4vbus::Vbus](#).*
- class [Icu](#)  
*Vbus Interrupt controller API.*
- class [Vbus](#)  
*The virtual bus ([Vbus](#)) interface.*
- class [Gpio\\_pin](#)  
*A GPIO pin.*
- class [Gpio\\_module](#)  
*A [Gpio\\_module](#) groups multiple GPIO pins together.*
- class [Pci\\_host\\_bridge](#)  
*A Pci host bridge.*
- class [Pci\\_dev](#)  
*A PCI device.*

### 14.14.1 Detailed Description

C++ interface of the [Vbus](#) API.

The virtual bus ([Vbus](#)) is a hierarchical (tree) structure of device nodes where each device has a set of resources attached to it. Each virtual bus provides an [Icu](#) ([Interrupt controller](#)) for interrupt handling.

The [Vbus](#) interface allows a client to find and query devices present on his virtual bus. After obtaining a device handle for a specific device the client can enumerate its resources.

Refer to [L4 Vbus functions](#) for the C API.

#### Include File

```
#include <l4/vbus/vbus>
```

#### Include File

```
#include <l4/vbus/vbus_gpio>
```

#### Include File

```
#include <l4/vbus/vbus_pci>
```

## 14.15 L4virtio Namespace Reference

L4-VIRTIO Transport C++ API.

### Data Structures

- class [Device](#)  
*IPC interface for virtio over [L4](#) IPC.*
- class [Ptr](#)  
*Pointer used in virtio descriptors.*
- class [Virtqueue](#)  
*Low-level [Virtqueue](#).*

### 14.15.1 Detailed Description

L4-VIRTIO Transport C++ API.

## Chapter 15

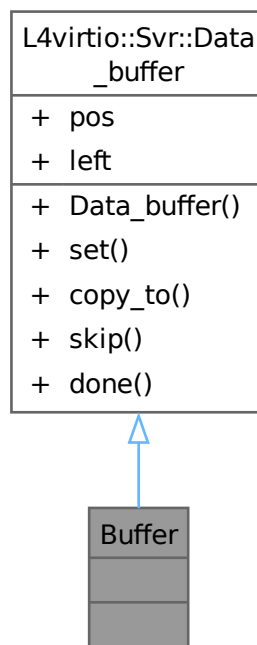

# Data Structure Documentation

### 15.1 Buffer Struct Reference

Data buffer used to transfer packets.

```
#include <virtio_net_buffer.h>
```

Inheritance diagram for Buffer:

Collaboration diagram for Buffer:

### Additional Inherited Members

### Public Member Functions inherited from [L4virtio::Svr::Data\\_buffer](#)

- `template<typename T>`  
`Data_buffer (T *p)`  
*Create buffer for object `p`.*
- `template<typename T>`  
`void set (T *p)`  
*Set buffer for object `p`.*
- `l4_uint32_t copy_to (Data_buffer *dst, l4_uint32_t max=UINT_MAX)`  
*Copy contents from this buffer to the destination buffer.*
- `l4_uint32_t skip (l4_uint32_t bytes)`  
*Skip given number of bytes in this buffer.*
- `bool done () const`  
*Check if there are no more bytes left in the buffer.*

### Data Fields inherited from [L4virtio::Svr::Data\\_buffer](#)

- `char * pos`  
*Current buffer position.*
- `l4_uint32_t left`  
*Bytes left in buffer.*

### 15.1.1 Detailed Description

Data buffer used to transfer packets.

Definition at line 19 of file [virtio\\_net\\_buffer.h](#).

The documentation for this struct was generated from the following file:

- `pkg/virtio-net-switch/server/switch/virtio_net_buffer.h`

## 15.2 `cxx::arith::Ld< V >` Struct Template Reference

Computes the binary logarithm of the given number at compile time.

```
#include <arith>
```

Collaboration diagram for `cxx::arith::Ld< V >`:

### 15.2.1 Detailed Description

```
template<unsigned long V>
struct cxx::arith::Ld< V >
```

Computes the binary logarithm of the given number at compile time.

#### Parameters

<i>val</i>	Number whose logarithm to compute, must be greater than zero.
------------	---

#### Returns

The binary logarithm of `val`.

Definition at line 48 of file [arith](#).

The documentation for this struct was generated from the following file:

- `l4/cxx/arith`

## 15.3 cxx::Avl\_map< KEY\_TYPE, DATA\_TYPE, COMPARE, ALLOC > Class Template Reference

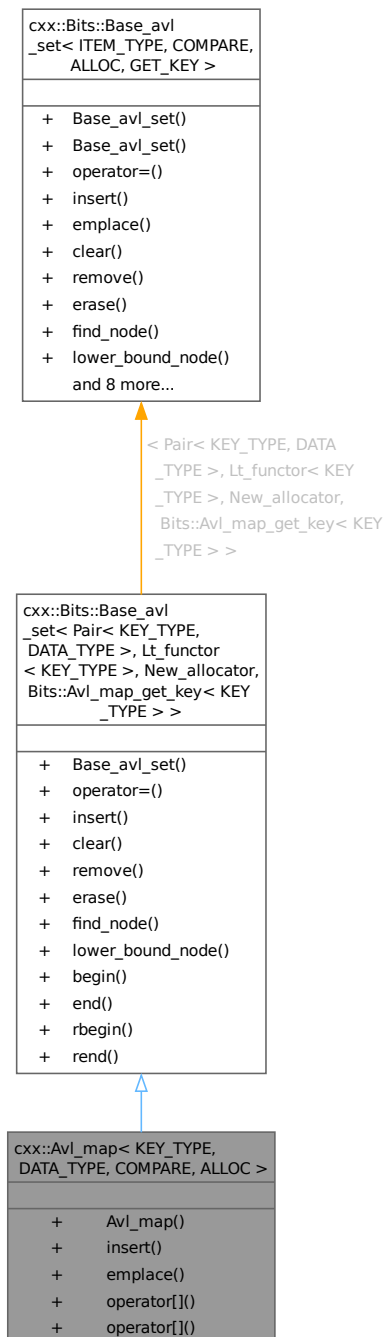

AVL tree based associative container.

```
#include <avl_map>
```

Inheritance diagram for cxx::Avl\_map< KEY\_TYPE, DATA\_TYPE, COMPARE, ALLOC >:

Collaboration diagram for `cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >`:

## Public Types

- `Const_rev_iterator rend () const`  
*Get the end marker for the constant backward iterator.*

**15.3.1 Detailed Description**

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↵
func<, template< typename B > class ALLOC = New_allocator>
class cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >
```

AVL tree based associative container.

**Template Parameters**

<code>KEY_TYPE</code>	Type of the key values.
<code>DATA_TYPE</code>	Type of the data values.
<code>COMPARE</code>	Type comparison functor for the key values.
<code>ALLOC</code>	Type of the allocator used for the nodes.

Definition at line 45 of file [avl\\_map](#).

## 15.3.2 Constructor & Destructor Documentation

### 15.3.2.1 Avl\_map()

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↔
functor, template< typename B > class ALLOC = New_allocator>
cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::Avl_map (
    Node_allocator const & alloc = Node_allocator()) [inline]
```

Create an empty AVL-tree based map.

#### Parameters

<i>alloc</i>	The node allocator.
--------------	---------------------

Definition at line 80 of file [avl\\_map](#).

## 15.3.3 Member Function Documentation

### 15.3.3.1 emplace()

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↔
functor, template< typename B > class ALLOC = New_allocator>
template<typename... Args>
cxx::Pair< Iterator, int > cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::emplace (
    Args &&... args) [inline]
```

Emplace a pair into the map.

#### Parameters

<i>args</i>	The <a href="#">cxx::Pair</a> constructor arguments for key & value.
-------------	--

#### Returns

A pair of iterator (*first*) and return value (*second*). *second* will be 0 if the element was inserted into the set and `−#E_exist` if the key was already in the set and the set was therefore not updated. In both cases, *first* contains an iterator that points to the element. *second* may also be `−#E_nomem` when memory for the new node could not be allocated. *first* is then invalid.

Definition at line 117 of file [avl\\_map](#).

### 15.3.3.2 insert()

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↵
functor, template< typename B > class ALLOC = New_allocator>
cxx::Pair< Iterator, int > cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::insert (
    Key_type const & key,
    Data_type const & data) [inline]
```

Insert a <key, data> pair into the map.

#### Parameters

<i>key</i>	The key value.
<i>data</i>	The data value to insert.

#### Returns

A pair of iterator (*first*) and return value (*second*). *second* will be 0 if the element was inserted into the set and `-#E_exist` if the key was already in the set and the set was therefore not updated. In both cases, *first* contains an iterator that points to the element. *second* may also be `-#E_nomem` when memory for the new node could not be allocated. *first* is then invalid.

Definition at line 99 of file [avl\\_map](#).

### 15.3.3.3 operator[]() [1/2]

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↵
functor, template< typename B > class ALLOC = New_allocator>
Data_type & cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::operator[] (
    Key_type const & key) [inline]
```

Get or insert data for the given key.

#### Parameters

<i>key</i>	The key value to use for lookup.
------------	----------------------------------

#### Returns

If the item already exists, a reference to the data item. Otherwise a new data item is default-constructed and inserted under the given key before a reference is returned.

Definition at line 137 of file [avl\\_map](#).

#### 15.3.3.4 operator[]() [2/2]

```
template<typename KEY_TYPE, typename DATA_TYPE, template< typename A > class COMPARE = Lt_↔
functor, template< typename B > class ALLOC = New_allocator>
Data_type const & cxx::Avl_map< KEY_TYPE, DATA_TYPE, COMPARE, ALLOC >::operator[] (
    Key_type const & key) const [inline]
```

Get the data for the given key.

#### Parameters

<i>key</i>	The key value to use for lookup.
------------	----------------------------------

#### Precondition

A <key, data> pair for the given key value must exist.

Definition at line 125 of file [avl\\_map](#).

### 15.4.1 Detailed Description

```
template<typename ITEM_TYPE, template< typename T > class COMPARE = Lt_functor, template< type-  
name A > class ALLOC = New_allocator>  
class cxx::Avl_set< ITEM_TYPE, COMPARE, ALLOC >
```

AVL set for simple comparable items.

The AVL set can store any kind of items where a partial order is defined. The default relation is defined by the '<' operator.

#### Template Parameters

<i>ITEM_TYPE</i>	The type of the items to be stored in the set.
<i>COMPARE</i>	The relation to define the partial order, default is to use operator '<'. 
<i>ALLOC</i>	The allocator to use for the nodes of the AVL set.

Definition at line 538 of file [avl\\_set](#).

### 15.5.1 Detailed Description

```
template<typename Node, typename Get_key, typename Compare = Lt_functor<typename Get_key::Key↵
_type>>
class cxx::Avl_tree< Node, Get_key, Compare >
```

A generic AVL tree.

#### Template Parameters

<i>Node</i>	The data type of the nodes (must inherit from <a href="#">Avl_tree_node</a> ).
<i>Get_key</i>	The meta function to get the key value from a node. The implementation uses <code>Get_key::key↵_of(ptr_to_node)</code> . The type of the key values must be defined in <code>Get_key::Key_type</code> .
<i>Compare</i>	Binary relation to establish a total order for the nodes of the tree. <code>Compare() (l, r)</code> must return true if the key $l$ is smaller than the key $r$ .

This implementation does not provide any memory management. It is the responsibility of the caller to allocate nodes before inserting them and to free them when they are removed or when the tree is destroyed. Conversely, the caller must also ensure that nodes are removed from the tree before they are destroyed.

#### Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 100 of file [avl\\_tree](#).

## 15.5.2 Member Typedef Documentation

### 15.5.2.1 Iterator

```
template<typename Node, typename Get_key, typename Compare = Lt_functor<typename Get_key::←
Key_type>>>
typedef Bst::Iterator cxx::Avl_tree< Node, Get_key, Compare >::Iterator
```

Forward iterator for the tree.

Definition at line 130 of file [avl\\_tree](#).

## 15.5.3 Member Function Documentation

### 15.5.3.1 insert()

```
template<typename Node, typename Get_key, class Compare>
Pair< Node *, bool > cxx::Avl_tree< Node, Get_key, Compare >::insert (
    Node * new_node)
```

Insert a new node into this AVL tree.

#### Parameters

<i>new_node</i>	A pointer to the new node.
-----------------	----------------------------

#### Returns

A pair, with *second* set to `true` and *first* pointing to *new\_node*, on success. If there is already a node with the same key then *first* points to this node and *second* is 'false'.

Definition at line 220 of file [avl\\_tree](#).

### 15.5.3.2 remove()

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Avl_tree< Node, Get_key, Compare >::remove (
    Key_param_type key) [inline]
```

Remove the node with *key* from the tree.

#### Parameters

<i>key</i>	The key to the node to remove.
------------	--------------------------------

#### Returns

The pointer to the removed node on success, or 0 if no node with the *key* exists.

Definition at line 282 of file [avl\\_tree](#).

References [cxx::Bits::Bst< Node, Get\\_key, Compare >::dir\(\)](#), [cxx::Bits::Bst< Node, Get\\_key, Compare >::greater\(\)](#), [cxx::Bits::Direction::L](#), and [cxx::Bits::Direction::N](#).

*Get the number of objects which can be allocated before a new empty slab needs to be added to the slab allocator.*

### 15.7.1 Detailed Description

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc
= New_allocator>
class cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >
```

Basic slab allocator.

#### Template Parameters

<i>Obj_size</i>	The size of the objects managed by the allocator (in bytes).
<i>Slab_size</i>	The size of a slab (in bytes).
<i>Max_free</i>	The maximum number of free slabs. When this limit is reached slabs are freed, provided that the backend allocator supports allocated memory to be freed.
<i>Alloc</i>	The backend allocator used to allocate slabs.

Definition at line 31 of file [slab\\_alloc](#).

## 15.7.2 Member Enumeration Documentation

### 15.7.2.1 anonymous enum

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
anonymous enum
```

#### Enumerator

<code>object_size</code>	Size of an object.
<code>slab_size</code>	Size of a slab.
<code>objects_per_slab</code>	Objects per slab.
<code>max_free_slabs</code>	Maximum number of free slabs.

Definition at line 65 of file [slab\\_alloc](#).

## 15.7.3 Member Function Documentation

### 15.7.3.1 `alloc()`

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void * cxx::Base\_slab< Obj_size, Slab_size, Max_free, Alloc >::alloc () [inline], [noexcept]
```

Allocate a new object.

#### Returns

A pointer to the new object if the allocation succeeds, or 0 on failure to acquire memory from the backend allocator when the slab cache memory is already exhausted.

#### Note

The user is responsible for initializing the object.

Definition at line 207 of file [slab\\_alloc](#).

### 15.7.3.2 `free()`

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void cxx::Base\_slab< Obj_size, Slab_size, Max_free, Alloc >::free (
    void * _o) [inline], [noexcept]
```

Free the given object (`_o`).

#### Precondition

The object must have been allocated with this allocator.

Definition at line 246 of file [slab\\_alloc](#).

### 15.7.3.3 free\_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::free_objects () const [inline],
[noexcept]
```

Get the number of objects which can be allocated before a new empty slab needs to be added to the slab allocator.

#### Returns

The number of free objects in the slab allocator.

Definition at line 308 of file [slab\\_alloc](#).

### 15.7.3.4 total\_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::total_objects () const [inline],
[noexcept]
```

Get the total number of objects managed by the slab allocator.

#### Returns

The number of objects managed by the allocator (including the free objects).

Definition at line 299 of file [slab\\_alloc](#).

The documentation for this class was generated from the following file:

- l4/cxx/slab\_alloc

## 15.8 cxx::Base\_slab< Obj\_size, Slab\_size, Max\_free, Alloc >::Slab\_i Struct Reference

Type of a slab.

### 15.8.1 Detailed Description

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc
= New_allocator>
struct cxx::Base_slab< Obj_size, Slab_size, Max_free, Alloc >::Slab_i
```

Type of a slab.

Definition at line 86 of file [slab\\_alloc](#).

The documentation for this struct was generated from the following file:

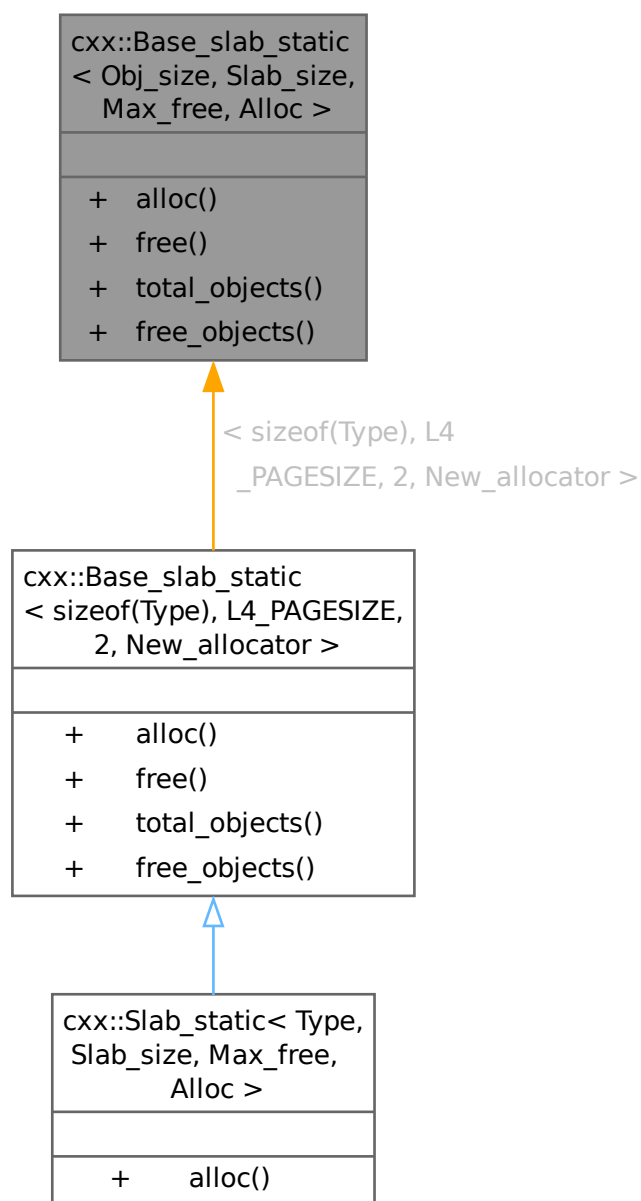

- `l4/cxx/slab_alloc`

## 15.9 `cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >` Class Template Reference

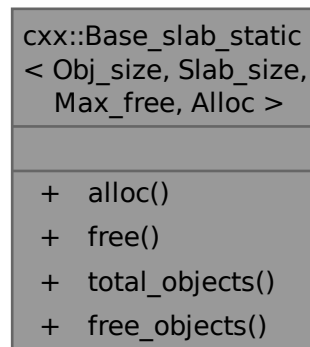

Merged slab allocator (allocators for objects of the same size are merged together).

```
#include <slab_alloc>
```

Inheritance diagram for `cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >`:

Collaboration diagram for `cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >`:

## Public Types

- enum { `object_size` = `Obj_size` , `slab_size` = `Slab_size` , `objects_per_slab` = `_A::objects_per_slab` , `max_free_slabs` = `Max_free` }

## Public Member Functions

- void \* `alloc` () noexcept  
*Allocate an object.*
- void `free` (void \*p) noexcept  
*Free the given object (p).*
- unsigned `total_objects` () const noexcept  
*Get the total number of objects managed by the slab allocator.*
- unsigned `free_objects` () const noexcept  
*Get the number of free objects in the slab allocator.*

### 15.9.1 Detailed Description

```

template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class Alloc
= New_allocator>
class cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >
  
```

Merged slab allocator (allocators for objects of the same size are merged together).

## Template Parameters

<i>Obj_size</i>	The size of an object managed by the slab allocator.
<i>Slab_size</i>	The size of a slab.

<i>Max_free</i>	The maximum number of free slabs.
<i>Alloc</i>	The allocator for the slabs.

This slab allocator class is useful for merging slab allocators with the same parameters (equal `Obj_size`, `Slab_size`, `Max_free`, and `Alloc` parameters) together and share the overhead for the slab caches among all equal-sized objects.

Definition at line 388 of file [slab\\_alloc](#).

## 15.9.2 Member Enumeration Documentation

### 15.9.2.1 anonymous enum

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
anonymous enum
```

#### Enumerator

<code>object_size</code>	Size of an object.
<code>slab_size</code>	Size of a slab.
<code>objects_per_slab</code>	Number of objects per slab.
<code>max_free_slabs</code>	Maximum number of free slabs.

Definition at line 395 of file [slab\\_alloc](#).

## 15.9.3 Member Function Documentation

### 15.9.3.1 `alloc()`

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void * cxx::Base\_slab\_static< Obj_size, Slab_size, Max_free, Alloc >::alloc () [inline],
[noexcept]
```

Allocate an object.

#### Note

The user is responsible for initializing the object.

Definition at line 412 of file [slab\\_alloc](#).

### 15.9.3.2 free()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::free (
    void * p) [inline], [noexcept]
```

Free the given object (p).

#### Parameters

<i>p</i>	The pointer to the object to free.
----------	------------------------------------

#### Precondition

*p* must be a pointer to an object allocated by this allocator.

Definition at line 420 of file [slab\\_alloc](#).

### 15.9.3.3 free\_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::free_objects () const
[inline], [noexcept]
```

Get the number of free objects in the slab allocator.

#### Returns

The number of free objects in all free and partially used slabs managed by this allocator.

#### Note

The value is the merged value for all equal parameterized [Base\\_slab\\_static](#) instances.

Definition at line 440 of file [slab\\_alloc](#).

### 15.9.3.4 total\_objects()

```
template<int Obj_size, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
unsigned cxx::Base_slab_static< Obj_size, Slab_size, Max_free, Alloc >::total_objects () const
[inline], [noexcept]
```

Get the total number of objects managed by the slab allocator.

#### Returns

The number of objects managed by the allocator (including the free objects).

#### Note

The value is the merged value for all equal parameterized [Base\\_slab\\_static](#) instances.

Definition at line 430 of file [slab\\_alloc](#).

The documentation for this class was generated from the following file:

- `I4/cxx/slab_alloc`

## 15.10 `cxx::Bitfield< T, LSB, MSB >` Class Template Reference

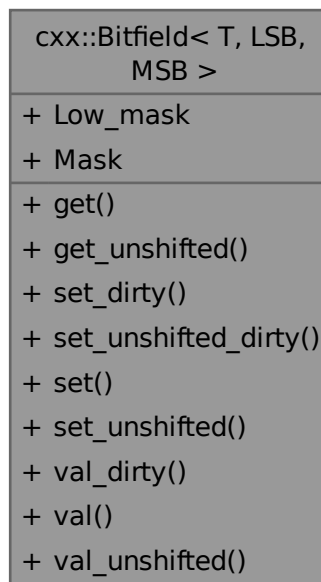

Definition for a member (part) of a bit field.

```
#include <bitfield>
```

Inheritance diagram for `cxx::Bitfield< T, LSB, MSB >`:

Collaboration diagram for `cxx::Bitfield< T, LSB, MSB >`:

*Get the shifted bits for **val**.*

## Static Public Attributes

- static constexpr Base\_type **Low\_mask** = Base\_type(~0ULL) >> (sizeof(Base\_type) \* 8 - **Bits**)  
*Mask value to get **Bits** bits.*
- static constexpr Base\_type **Mask** = **Low\_mask** << **Lsb**  
*Mask value to the bits out of a **T**.*

### 15.10.1 Detailed Description

```
template<typename T, unsigned LSB, unsigned MSB>  
class cxx::Bitfield< T, LSB, MSB >
```

Definition for a member (part) of a bit field.

#### Parameters

<i>T</i>	The underlying type of the bit field.
<i>LSB</i>	The least significant bit of our bits.
<i>MSB</i>	The most significant bit of our bits.

Definition at line 24 of file [bitfield](#).

### 15.10.2 Member Typedef Documentation

#### 15.10.2.1 Bits\_type

```
template<typename T, unsigned LSB, unsigned MSB>  
typedef Best_type<Bits>::Type cxx::Bitfield< T, LSB, MSB >::Bits_type
```

Type to hold at least [Bits](#) bits.

This type can handle all values that can be stored in this part of the bit field.

Definition at line 71 of file [bitfield](#).

#### 15.10.2.2 Shift\_type

```
template<typename T, unsigned LSB, unsigned MSB>  
typedef Best_type<Bits+Lsb>::Type cxx::Bitfield< T, LSB, MSB >::Shift_type
```

Type to hold at least [Bits](#) + [Lsb](#) bits.

This type can handle all values that can be stored in this part of the bit field when they are at the target location ([Lsb](#) bits shifted to the left).

Definition at line 79 of file [bitfield](#).

## 15.10.3 Member Enumeration Documentation

### 15.10.3.1 anonymous enum

```
template<typename T, unsigned LSB, unsigned MSB>
anonymous enum
```

#### Enumerator

Bits	Number of bits.
Lsb	index of the LSB
Msb	index of the MSB

Definition at line 52 of file [bitfield](#).

## 15.10.4 Member Function Documentation

### 15.10.4.1 `get()`

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Bits_type cxx::Bitfield< T, LSB, MSB >::get (
    Shift_type val) [inline], [static], [constexpr]
```

Get the bits out of `val`.

#### Parameters

<code>val</code>	The raw value of the whole bit field.
------------------	---------------------------------------

#### Returns

The bits from `Lsb` to `Msb` shifted to the right.

Definition at line 96 of file [bitfield](#).

### 15.10.4.2 `get_unshifted()`

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::get_unshifted (
    Shift_type val) [inline], [static], [constexpr]
```

Get the bits in place out of `val`.

#### Parameters

<code>val</code>	The raw value of the whole bit field.
------------------	---------------------------------------

#### Returns

The bits from `Lsb` to `Msb` (unshifted).

This means other bits are masked out, however the result is not shifted to the right.

Definition at line 109 of file [bitfield](#).

### 15.10.4.3 set()

```
template<typename T, unsigned LSB, unsigned MSB>
Base_type cxx::Bitfield< T, LSB, MSB >::set (
    Base_type dest,
    Bits_type val) [inline], [static]
```

Set the bits corresponding to `val`.

#### Parameters

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value to set into the bits.

#### Returns

The new value of the whole bit field.

Definition at line 158 of file `bitfield`.

### 15.10.4.4 set\_dirty()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::set_dirty (
    Base_type dest,
    Shift_type val) [inline], [static], [constexpr]
```

Set the bits corresponding to `val`.

#### Parameters

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value to set into the bits.

#### Returns

The new value of the whole bit field.

#### Precondition

`val` must not contain more than `Bits` bits.

**Note**

This function does not mask `val` to the right number of bits.

Definition at line 124 of file `bitfield`.

Referenced by `cxx::Bitfield< decltype(raw), 0, 0 >::set()`.

Here is the caller graph for this function:

**15.10.4.5 set\_unshifted()**

```

template<typename T, unsigned LSB, unsigned MSB>
Base_type cxx::Bitfield< T, LSB, MSB >::set_unshifted (
    Base_type dest,
    Shift_type val) [inline], [static]
  
```

Set the bits corresponding to `val`.

**Parameters**

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value shifted <code>Lsb</code> bits to the left that shall be set into the bit field.

**Returns**

the new value of the whole bit field.

Definition at line 170 of file `bitfield`.

**15.10.4.6 set\_unshifted\_dirty()**

```

template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::set_unshifted_dirty (
    Base_type dest,
    Shift_type val) [inline], [static], [constexpr]
  
```

Set the bits corresponding to `val`.

**Parameters**

<i>dest</i>	The current value of the whole bit field.
<i>val</i>	The value shifted <a href="#">Lsb</a> bits to the left that shall be set into the bits.

**Returns**

The new value of the whole bit field.

**Precondition**

[val](#) must not contain more than [Bits](#) bits shifted [Lsb](#) bits to the left.

**Note**

This function does not mask [val](#) to the right number of bits.

Definition at line [144](#) of file [bitfield](#).

Referenced by [cxx::Bitfield< decltype\(raw\), 0, 0 >::set\\_unshifted\(\)](#).

Here is the caller graph for this function:

**15.10.4.7 val()**

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val (
    Bits\_type val) [inline], [static], [constexpr]
```

Get the shifted bits for [val](#).

**Parameters**

<i>val</i>	The value to set into the bits.
------------	---------------------------------

**Returns**

The raw bit field value.

Definition at line [193](#) of file [bitfield](#).

15.10.4.8 `val_dirty()`

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val_dirty (
    Shift_type val) [inline], [static], [constexpr]
```

Get the shifted bits for `val`.

## Parameters

<code>val</code>	The value to set into the bits.
------------------	---------------------------------

## Returns

The raw bit field value.

## Precondition

`val` must not contain more than `Bits` bits.

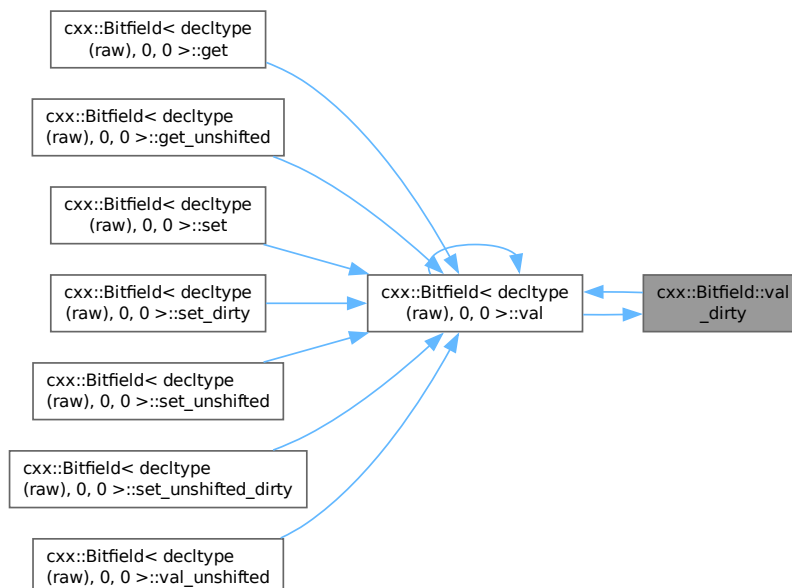

## Note

This function does not mask `val` to the right number of bits.

Definition at line 184 of file `bitfield`.

Referenced by `cxx::Bitfield< decltype(raw), 0, 0 >::val()`.

Here is the caller graph for this function:

#### 15.10.4.9 val\_unshifted()

```
template<typename T, unsigned LSB, unsigned MSB>
constexpr Base_type cxx::Bitfield< T, LSB, MSB >::val_unshifted (
    Shift_type val) [inline], [static], [constexpr]
```

Get the shifted bits for [val](#).

#### Parameters

<i>val</i>	The value shifted <a href="#">Lsb</a> bits to the left that shall be set into the bits.
------------	---

#### Returns

The raw bit field value.

Definition at line [203](#) of file [bitfield](#).

*Scan for the first zero bit.*

### Additional Inherited Members

### Static Public Member Functions inherited from `cxx::Bitmap_base`

- static long `words` (long `bits`) noexcept  
*Get the number of `Words` that are used for the bitmap.*
- static long `chars` (long `bits`) noexcept  
*Get the number of chars that are used for the bitmap.*

### Protected Types inherited from `cxx::Bitmap_base`

- enum { `W_bits` = sizeof(`word_type`) \* 8 , `C_bits` = 8 }
- typedef unsigned long `word_type`  
*Data type for each element of the bit buffer.*

### Static Protected Member Functions inherited from `cxx::Bitmap_base`

- static unsigned `word_index` (unsigned `bit`)  
*Get the word index for the given bit.*
- static unsigned `bit_index` (unsigned `bit`)  
*Get the bit index within `word_type` for the given bit.*

### Protected Attributes inherited from `cxx::Bitmap_base`

- `word_type` \* `_bits`  
*Pointer to the buffer storing the bits.*

### 15.14.1 Detailed Description

```
template<int BITS>
class cxx::Bitmap< BITS >
```

A static bitmap.

#### Template Parameters

<i>BITS</i>	The number of bits that shall be in the bitmap.
-------------	---

Definition at line 220 of file [bitmap](#).

### 15.14.2 Member Function Documentation

#### 15.14.2.1 scan\_zero()

```
template<int BITS>
long cxx::Bitmap< BITS >::scan_zero (
    long start_bit = 0) const [inline], [noexcept]
```

Scan for the first zero bit.

#### Parameters

<i>start_bit</i>	Hint at the number of the first bit to look at. Zero bits below <i>start_bit</i> may or may not be taken into account by the implementation.
------------------	--

#### Return values

<i>&gt;=</i>	0 Number of first zero bit found.
<i>-1</i>	All bits at <i>start_bit</i> or higher are set.

Compared to [Bitmap\\_base::scan\\_zero\(\)](#), the upper bound is set to BITS.

## 15.15.1 Detailed Description

Basic bitmap abstraction.

This abstraction keeps a pointer to a memory area that is used as bitmap.

Definition at line 18 of file `bitmap`.

## 15.15.2 Member Enumeration Documentation

### 15.15.2.1 anonymous enum

anonymous enum [protected]

#### Enumerator

W_bits	number of bits in <a href="#">word_type</a>
C_bits	number of bits in char

Definition at line 26 of file [bitmap](#).

## 15.15.3 Member Function Documentation

### 15.15.3.1 atomic\_clear\_bit()

```
void cxx::Bitmap_base::atomic_clear_bit (
    long bit) [inline], [noexcept]
```

Clear bit [bit](#) atomically.

Use this function for multi-threaded access to the bitmap.

#### Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 269 of file [bitmap](#).

References [\\_bits](#), [bit\(\)](#), [bit\\_index\(\)](#), and [word\\_index\(\)](#).

Here is the call graph for this function:

### 15.15.3.2 atomic\_get\_and\_clear()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_clear (
    long bit) [inline], [noexcept]
```

Clear bit `bit` atomically and return old state.

Use this function for multi-threaded access to the bitmap.

#### Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 279 of file [bitmap](#).

References [\\_bits](#), [bit\(\)](#), [bit\\_index\(\)](#), and [word\\_index\(\)](#).

Here is the call graph for this function:

### 15.15.3.3 atomic\_get\_and\_set()

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_set (
    long bit) [inline], [noexcept]
```

Set bit `bit` atomically and return old state.

Use this function for multi-threaded access to the bitmap.

#### Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 308 of file [bitmap](#).

References [\\_bits](#), [bit\(\)](#), [bit\\_index\(\)](#), and [word\\_index\(\)](#).

Here is the call graph for this function:

### 15.15.3.4 atomic\_set\_bit()

```
void cxx::Bitmap_base::atomic_set_bit (
    long bit) [inline], [noexcept]
```

Set bit *bit* atomically.

Use this function for multi-threaded access to the bitmap.

#### Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 298 of file [bitmap](#).

References [\\_bits](#), [bit\(\)](#), [bit\\_index\(\)](#), and [word\\_index\(\)](#).

Here is the call graph for this function:

### 15.15.3.5 bit() [1/2]

```
Bitmap_base::word_type cxx::Bitmap_base::bit (
    long bit) const [inline], [noexcept]
```

Get the truth value of a bit.

#### Parameters

<i>bit</i>	The number of the bit to read.
------------	--------------------------------

#### Return values

0	Bit is not set.
!= 0	Bit is set.

Definition at line 318 of file [bitmap](#).

References [\\_bits](#), [bit\(\)](#), [bit\\_index\(\)](#), and [word\\_index\(\)](#).

Here is the call graph for this function:

### 15.15.3.6 bit() [2/2]

```
void cxx::Bitmap_base::bit (
    long bit,
    bool on) [inline], [noexcept]
```

Set the value of bit `bit` to `on`.

#### Parameters

<i>bit</i>	The number of the bit.
<i>on</i>	The boolean value that shall be assigned to the bit.

Definition at line 251 of file `bitmap`.

References `_bits`, `bit()`, `bit_index()`, and `word_index()`.

Referenced by `atomic_clear_bit()`, `atomic_get_and_clear()`, `atomic_get_and_set()`, `atomic_set_bit()`, `bit()`, `bit()`, `bit_index()`, `clear_bit()`, `operator[]()`, `operator[]()`, `set_bit()`, and `word_index()`.

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.15.3.7 bit\_index()

```
unsigned cxx::Bitmap_base::bit_index (
    unsigned bit) [inline], [static], [protected]
```

Get the bit index within [word\\_type](#) for the given bit.

#### Parameters

<i>bit</i>	The bit index in the bitmap.
------------	------------------------------

#### Returns

the bit index within [word\\_type](#) ( $\text{bit} \% W\_bits$ ).

Definition at line 53 of file [bitmap](#).

References [bit\(\)](#), and [W\\_bits](#).

Referenced by [atomic\\_clear\\_bit\(\)](#), [atomic\\_get\\_and\\_clear\(\)](#), [atomic\\_get\\_and\\_set\(\)](#), [atomic\\_set\\_bit\(\)](#), [bit\(\)](#), [bit\(\)](#), [clear\\_bit\(\)](#), and [set\\_bit\(\)](#).

Here is the call graph for this function:

**15.15.3.9 operator[]() [1/2]**

```
word_type cxx::Bitmap_base::operator[] (
    long bit) const [inline], [noexcept]
```

Get the bit at index `bit`.

**Parameters**

<i>bit</i>	The number of the bit to read.
------------	--------------------------------

**Return values**

0	Bit is not set.
!= 0	Bit is set.

Definition at line 181 of file `bitmap`.

References `bit()`.

Here is the call graph for this function:

**15.15.3.10 operator[]() [2/2]**

```
Bit cxx::Bitmap_base::operator[] (
    long bit) [inline], [noexcept]
```

Get the lvalue for the bit at index `bit`.

**Parameters**

<i>bit</i>	The number.
------------	-------------

**Returns**

lvalue for [bit](#)

Definition at line 191 of file [bitmap](#).

References [bit\(\)](#).

Here is the call graph for this function:

**15.15.3.11 scan\_zero()**

```
long cxx::Bitmap_base::scan_zero (
    long max_bit,
    long start_bit = 0) const [inline], [noexcept]
```

Scan for the first zero bit.

**Parameters**

<i>max_bit</i>	Upper bound (exclusive) for the scanning operation.
<i>start_bit</i>	Hint at the number of the first bit to look at. Zero bits below <i>start_bit</i> may or may not be taken into account by the implementation.

**Return values**

<i>&gt;=</i>	0 Number of first zero bit found.
<i>-1</i>	All bits between <i>start_bit</i> and <i>max_bit</i> are set.

Definition at line 339 of file [bitmap](#).

References [\\_bits](#), [W\\_bits](#), and [word\\_index\(\)](#).

Referenced by [cxx::Bitmap< BITS >::scan\\_zero\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.15.3.12 set\_bit()

```
void cxx::Bitmap_base::set_bit (
    long bit) [inline], [noexcept]
```

Set bit `bit`.

#### Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 289 of file `bitmap`.

References `_bits`, `bit()`, `bit_index()`, and `word_index()`.

Here is the call graph for this function:

### 15.15.3.13 word\_index()

```
unsigned cxx::Bitmap_base::word_index (
    unsigned bit) [inline], [static], [protected]
```

Get the word index for the given bit.

#### Parameters

<i>bit</i>	The index of the bit in question.
------------	-----------------------------------

**Returns**

the index in `Bitmap_base::_bits` for the given bit (`bit / W_bits`).

Definition at line 44 of file `bitmap`.

References `bit()`, and `W_bits`.

Referenced by `atomic_clear_bit()`, `atomic_get_and_clear()`, `atomic_get_and_set()`, `atomic_set_bit()`, `bit()`, `bit()`, `clear_bit()`, `scan_zero()`, and `set_bit()`.

Here is the call graph for this function:

*Set the iterator to the next element (pre increment).*
- [Avl\\_set\\_iter](#) [operator++](#) (int)  
*Set the iterator to the next element (post increment).*

### 15.21.1 Detailed Description

```
template<typename Node, typename Key, typename Node_op>
class cxx::Bits::Avl_set_iter< Node, Key, Node_op >
```

Generic iterator for the AVL-tree based set.

Definition at line 35 of file [avl\\_set](#).

### 15.21.2 Constructor & Destructor Documentation

#### 15.21.2.1 Avl\_set\_iter() [1/2]

```
template<typename Node, typename Key, typename Node_op>
cxx::Bits::Avl_set_iter< Node, Key, Node_op >::Avl_set_iter (
    Node const * t) [inline]
```

Create an iterator for the given tree.

#### Parameters

<i>t</i>	the root node of the tree to iterate.
----------	---------------------------------------

Definition at line 59 of file [avl\\_set](#).

### 15.21.2.2 Avl\_set\_iter() [2/2]

```
template<typename Node, typename Key, typename Node_op>
cxx::Bits::Avl_set_iter< Node, Key, Node_op >::Avl_set_iter (
    Base const & o) [inline]
```

Create an iterator from a BST iterator.

#### Parameters

<i>o</i>	The BST iterator that shall be copied.
----------	--

Definition at line 65 of file [avl\\_set](#).

## 15.21.3 Member Function Documentation

### 15.21.3.1 operator\*()

```
template<typename Node, typename Key, typename Node_op>
Key & cxx::Bits::Avl_set_iter< Node, Key, Node_op >::operator* () const [inline]
```

Dereference the iterator and get the item out of the tree.

#### Returns

A reference to the data stored in the AVL tree.

Definition at line 80 of file [avl\\_set](#).

### 15.21.3.2 operator->()

```
template<typename Node, typename Key, typename Node_op>
Key * cxx::Bits::Avl_set_iter< Node, Key, Node_op >::operator-> () const [inline]
```

Member access to the item the iterator points to.

#### Returns

A pointer to the item in the node.

Definition at line 87 of file [avl\\_set](#).

The documentation for this class was generated from the following file:

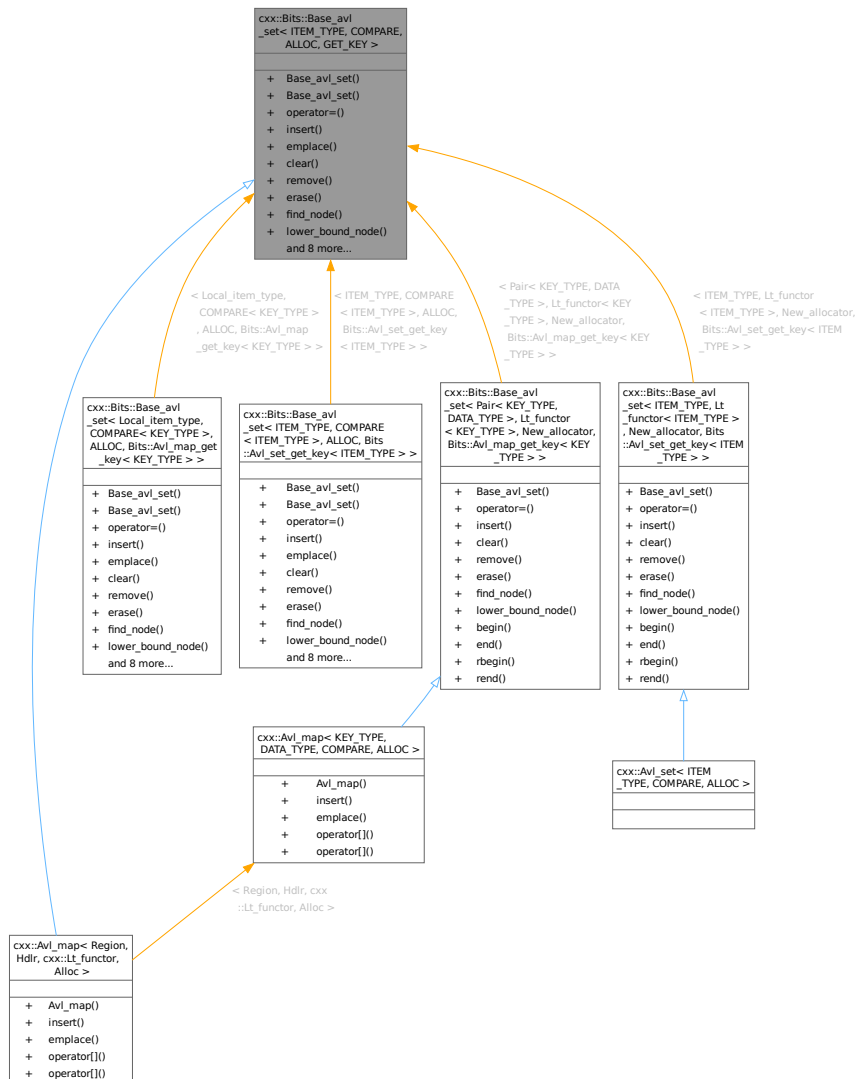

- [I4/cxx/avl\\_set](#)

## 15.22 cxx::Bits::Base\_avl\_set< ITEM\_TYPE, COMPARE, ALLOC, GET\_KEY > Class Template Reference

AVL set with internally managed nodes.

```
#include <avl_set>
```

Inheritance diagram for cxx::Bits::Base\_avl\_set< ITEM\_TYPE, COMPARE, ALLOC, GET\_KEY >:

Collaboration diagram for `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >`:

<code>cxx::Bits::Base_avl_set&lt; ITEM_TYPE, COMPARE, ALLOC, GET_KEY &gt;</code>
<ul style="list-style-type: none"> <li>+ <code>Base_avl_set()</code></li> <li>+ <code>Base_avl_set()</code></li> <li>+ <code>operator=()</code></li> <li>+ <code>insert()</code></li> <li>+ <code>emplace()</code></li> <li>+ <code>clear()</code></li> <li>+ <code>remove()</code></li> <li>+ <code>erase()</code></li> <li>+ <code>find_node()</code></li> <li>+ <code>lower_bound_node()</code></li> <li>and 8 more...</li> </ul>

## Data Structures

- class [Node](#)  
A smart pointer to a tree item.

## Public Types

- enum { `E_noent` = 2 , `E_exist` = 17 , `E_nomem` = 12 , `E_inval` = 22 }  
Return status constants.
- typedef `ITEM_TYPE` **Item\_type**  
Type for the items store in the set.
- typedef `GET_KEY` **Get\_key**  
Key-getter type to derive the sort key of an internal node.
- typedef `GET_KEY::Key_type` **Key\_type**  
Type of the sort key used for the items.
- typedef `Type_traits< Item\_type >::Const_type` **Const\_item\_type**  
Type used for const items within the set.
- typedef `COMPARE` **Item\_compare**  
Type for the comparison functor.
- typedef `ALLOC< _Node >` **Node\_allocator**  
Type for the node allocator.
- typedef `Avl_set_iter< _Node, Item\_type, Fwd >` **Iterator**

- Forward iterator for the set.*
- typedef `Avl_set_iter`< `_Node`, `Const_item_type`, `Fwd` > **`Const_iterator`**  
*Constant forward iterator for the set.*
- typedef `Avl_set_iter`< `_Node`, `Item_type`, `Rev` > **`Rev_iterator`**  
*Backward iterator for the set.*
- typedef `Avl_set_iter`< `_Node`, `Const_item_type`, `Rev` > **`Const_rev_iterator`**  
*Constant backward iterator for the set.*

## Public Member Functions

- `Base_avl_set` (`Node_allocator` const &alloc=`Node_allocator`())  
*Create a AVL-tree based set.*

- `Node` `find_node` (`Key_type` const &item) const  
*Lookup a node equal to `item`.*
- `Node` `lower_bound_node` (`Key_type` const &key) const  
*Find the first node greater or equal to `key`.*
- `Const_iterator` `begin` () const  
*Get the constant forward iterator for the first element in the set.*
- `Const_iterator` `end` () const  
*Get the end marker for the constant forward iterator.*
- `Iterator` `begin` ()  
*Get the mutable forward iterator for the first element of the set.*
- `Iterator` `end` ()  
*Get the end marker for the mutable forward iterator.*
- `Const_rev_iterator` `rbegin` () const  
*Get the constant backward iterator for the last element in the set.*
- `Const_rev_iterator` `rend` () const  
*Get the end marker for the constant backward iterator.*
- `Rev_iterator` `rbegin` ()  
*Get the mutable backward iterator for the last element of the set.*
- `Rev_iterator` `rend` ()  
*Get the end marker for the mutable backward iterator.*

### 15.22.1 Detailed Description

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
```

```
class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >
```

AVL set with internally managed nodes.

Definition at line 127 of file [avl\\_set](#).

### 15.22.2 Member Enumeration Documentation

#### 15.22.2.1 anonymous enum

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
```

```
anonymous enum
```

Return status constants.

These constants are compatible with the [L4](#) error codes, see [l4\\_error\\_code\\_t](#).

#### Enumerator

<code>E_noent</code>	Item does not exist.
<code>E_exist</code>	Item exists already.
<code>E_nomem</code>	Memory allocation failed.
<code>E_inval</code>	Internal error.

Definition at line 138 of file [avl\\_set](#).

### 15.22.3 Constructor & Destructor Documentation

#### 15.22.3.1 `Base_avl_set()` [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
```

```
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Base_avl_set (
    Node_allocator const & alloc = Node_allocator()) [inline], [explicit]
```

Create a AVL-tree based set.

#### Parameters

<i>alloc</i>	<a href="#">Node</a> allocator.
--------------	---------------------------------

Create an empty set (AVL-tree based).

Definition at line 268 of file [avl\\_set](#).

### 15.22.3.2 Base\_avl\_set() [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Base_avl_set (
    Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > const & o,
    Node_allocator const & alloc = Node_allocator()) [inline]
```

Create a copy of an AVL-tree based set.

#### Parameters

<i>o</i>	The set to copy.
<i>alloc</i>	<a href="#">Node</a> allocator.

Creates a deep copy of the set with all its items.

Definition at line [283](#) of file [avl\\_set](#).

## 15.22.4 Member Function Documentation

### 15.22.4.1 begin() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::begin () [inline]
```

Get the mutable forward iterator for the first element of the set.

#### Returns

The mutable forward iterator for the first element of the set.

Definition at line [431](#) of file [avl\\_set](#).

### 15.22.4.2 begin() [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::begin () const
[inline]
```

Get the constant forward iterator for the first element in the set.

#### Returns

Constant forward iterator for the first element in the set.

Definition at line [417](#) of file [avl\\_set](#).

### 15.22.4.3 `emplace()`

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
template<typename... Args>
cxx::Pair< Iterator, int > cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >←
::emplace (
    Args &&... args)
```

Emplace an item into the set.

#### Parameters

<code>args</code>	Constructor arguments for the item constructor.
-------------------	---

#### Returns

A pair of iterator (`first`) and return value (`second`). `second` will be 0 if the element was inserted into the set and `−#E_exist` if the element was already in the set and the set was therefore not updated. In both cases, `first` contains an iterator that points to the element. `second` may also be `−#E_nomem` when memory for the node could not be allocated. `first` is then invalid.

The element will always be constructed, even if there is already an existing element in the set. In case of such a collision the newly created element will then be immediately destructed.

### 15.22.4.4 `end()` [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::end () [inline]
```

Get the end marker for the mutable forward iterator.

#### Returns

The end marker for mutable forward iterator.

Definition at line 438 of file `avl_set`.

### 15.22.4.5 `end()` [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::end () const
[inline]
```

Get the end marker for the constant forward iterator.

**Returns**

The end marker for the constant forward iterator.

Definition at line 424 of file [avl\\_set](#).

Referenced by [insert\(\)](#).

Here is the caller graph for this function:

**15.22.4.6 erase()**

```

template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
int cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::erase (
    Key_type const & item) [inline]
  
```

Erase the item with the given key.

**Parameters**

<i>item</i>	The key of the item to remove.
-------------	--------------------------------

Definition at line 384 of file [avl\\_set](#).

**15.22.4.7 find\_node()**

```

template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Node cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::find_node (
    Key_type const & item) const [inline]
  
```

Lookup a node equal to *item*.

**Parameters**

<i>item</i>	The value to search for.
-------------	--------------------------

**Returns**

A smart pointer to the element found. If no element was found the smart pointer will be invalid.

Definition at line 395 of file [avl\\_set](#).

## 15.22.4.8 insert()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Pair< typename Base_avl_set< Item, Compare, Alloc, KEY_TYPE >::Iterator, int > cxx::Bits::Base_avl_set<
Item, Compare, Alloc, KEY_TYPE >::insert (
    Item_type const & item)
```

Insert an item into the set.

## Parameters

<i>item</i>	The item to insert.
-------------	---------------------

## Returns

A pair of iterator (*first*) and return value (*second*). *second* will be 0 if the element was inserted into the set and `−#E_exist` if the element was already in the set and the set was therefore not updated. In both cases, *first* contains an iterator that points to the element. *second* may also be `−#E_nomem` when memory for the node could not be allocated. *first* is then invalid.

Insert a new item into the set, each item can only be once in the set.

Definition at line 485 of file [avl\\_set](#).

References [E\\_exist](#), [E\\_nomem](#), [end\(\)](#), [cxx::Pair< First, Second >::first](#), and [cxx::Pair< First, Second >::second](#).

Here is the call graph for this function:

## 15.22.4.9 lower\_bound\_node()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Node cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::lower_bound_node (
    Key_type const & key) const [inline]
```

Find the first node greater or equal to *key*.

**Parameters**

<i>key</i>	Minimum key to look for.
------------	--------------------------

**Returns**

Smart pointer to the first node greater or equal to *key*. Will be invalid if no such element was found.

Definition at line 406 of file [avl\\_set](#).

**15.22.4.10 operator=()**

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Base_avl_set & cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::operator= (
    Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY > const & o) [inline]
```

Copy assignment operator of an AVL-tree based set.

**Parameters**

<i>o</i>	The set to copy-assign.
----------	-------------------------

Creates a deep copy of the set with all its items.

Definition at line 295 of file [avl\\_set](#).

**15.22.4.11 rbegin() [1/2]**

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin () [inline]
```

Get the mutable backward iterator for the last element of the set.

**Returns**

The mutable backward iterator for the last element of the set.

Definition at line 459 of file [avl\\_set](#).

**15.22.4.12 rbegin() [2/2]**

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rbegin ()
const [inline]
```

Get the constant backward iterator for the last element in the set.

**Returns**

The constant backward iterator for the last element in the set.

Definition at line 445 of file [avl\\_set](#).

## 15.22.4.13 remove()

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
int cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::remove (
    Key_type const & item) [inline]
```

Remove an item from the set.

## Parameters

<i>item</i>	The item to remove.
-------------	---------------------

## Return values

0	Success
-E_noent	Item does not exist

Definition at line 366 of file [avl\\_set](#).

Referenced by [cxx::Bits::Base\\_avl\\_set< Local\\_item\\_type, COMPARE< KEY\\_TYPE >, ALLOC, Bits::Avl\\_map\\_get\\_key< KEY\\_TYPE](#)

Here is the caller graph for this function:

## 15.22.4.14 rend() [1/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend () [inline]
```

Get the end marker for the mutable backward iterator.

## Returns

The end marker for mutable backward iterator.

Definition at line 466 of file [avl\\_set](#).

**15.22.4.15** `rend()` [2/2]

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Const_rev_iterator cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::rend ()
const [inline]
```

Get the end marker for the constant backward iterator.

**Returns**

The end marker for the constant backward iterator.

Definition at line [452](#) of file [avl\\_set](#).

The documentation for this class was generated from the following file:

- [l4/cxx/avl\\_set](#)

**15.23** `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node` Class Reference

A smart pointer to a tree item.

```
#include <avl_set>
```

Collaboration diagram for `cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node`:

cxx::Bits::Base_avl _set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node	
+	Node()
+	operator*()
+	operator->()
+	valid()
+	operator Item_type const *()

## Public Member Functions

### 15.23.1 Detailed Description

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
class cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node
```

A smart pointer to a tree item.

Definition at line 182 of file `avl_set`.

### 15.23.2 Member Function Documentation

#### 15.23.2.1 `operator*()`

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Item_type const & cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::operator*
() [inline]
```

Dereference the pointer.

#### Precondition

`Node` is valid.

Definition at line 200 of file `avl_set`.

#### 15.23.2.2 `operator->()`

```
template<typename ITEM_TYPE, class COMPARE, template< typename A > class ALLOC, typename
GET_KEY>
Item_type const * cxx::Bits::Base_avl_set< ITEM_TYPE, COMPARE, ALLOC, GET_KEY >::Node::operator->
() [inline]
```

Dereferenced member access.

#### Precondition

`Node` is valid.

Definition at line 207 of file `avl_set`.

Collaboration diagram for cxx::Bits::Basic\_list< POLICY >:

```
template<typename POLICY>
class cxx::Bits::Basic_list< POLICY >
```

Internal: Common functions for all head-based list implementations.

Definition at line 39 of file [list\\_basics.h](#).

### 15.24.2 Member Function Documentation

#### 15.24.2.1 clear()

```
template<typename POLICY>
void cxx::Bits::Basic_list< POLICY >::clear () [inline]
```

Remove all elements from the list.

After the operation the state of the elements is undefined.

Definition at line 135 of file [list\\_basics.h](#).

References [\\_f](#).

#### 15.24.2.2 iter()

```
template<typename POLICY>
Const_iterator cxx::Bits::Basic_list< POLICY >::iter (
    Const_value_type c) [inline], [static]
```

Return a const iterator that begins at the given element.

#### Parameters

<i>c</i>	Element where the iterator should start.
----------	--

#### Precondition

The element *c* must already be in a list.

Definition at line 148 of file [list\\_basics.h](#).

The documentation for this class was generated from the following file:

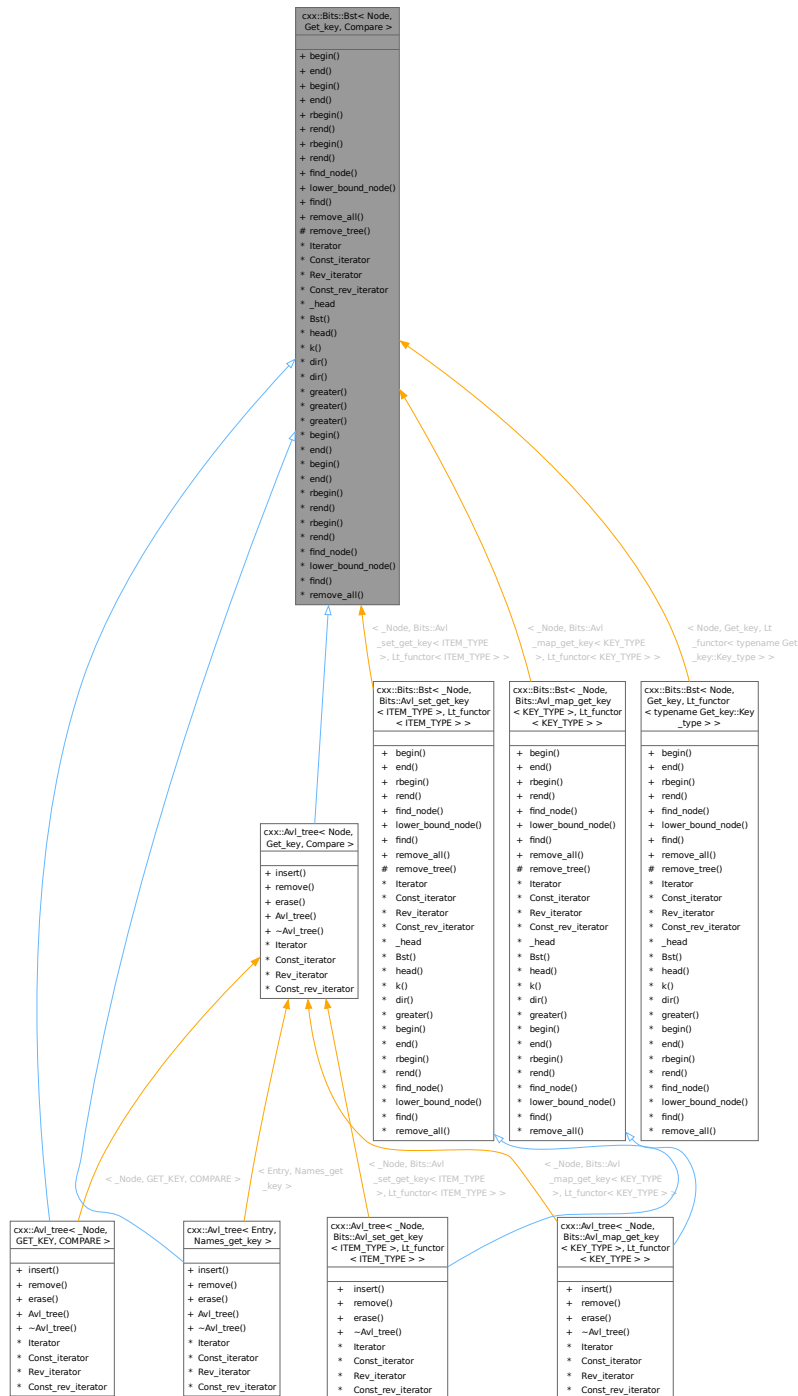

- I4/cxx/bits/list\_basics.h

## 15.25 cxx::Bits::Bst< Node, Get\_key, Compare > Class Template Reference

Basic binary search tree (BST).

```
#include <bst.h>
```

Inheritance diagram for cxx::Bits::Bst< Node, Get\_key, Compare >:

Collaboration diagram for `cxx::Bits::Bst< Node, Get_key, Compare >`:

## Public Types

- `typedef Get_key::Key_type Key_type`  
*The type of key values used to generate the total order of the elements.*
- `typedef Type_traits< Key\_type >::Param_type Key_param_type`  
*The type for key parameters.*
- `typedef Fwd Fwd_iter_ops`

*Helper for building forward iterators for different wrapper classes.*

- typedef Rev **Rev\_iter\_ops**

*Helper for building reverse iterators for different wrapper classes.*

### Iterators

- typedef \_\_Bst\_iter< Node, Node, Fwd > **Iterator**  
*Forward iterator.*
- typedef \_\_Bst\_iter< Node, Node const, Fwd > **Const\_iterator**  
*Constant forward iterator.*
- typedef \_\_Bst\_iter< Node, Node, Rev > **Rev\_iterator**  
*Backward iterator.*
- typedef \_\_Bst\_iter< Node, Node const, Rev > **Const\_rev\_iterator**  
*Constant backward.*

### Public Member Functions

#### Get default iterators for the ordered tree.

- [Const\\_iterator begin](#) () const  
*Get the constant forward iterator for the first element in the set.*
- [Const\\_iterator end](#) () const  
*Get the end marker for the constant forward iterator.*
- [Iterator begin](#) ()  
*Get the mutable forward iterator for the first element of the set.*
- [Iterator end](#) ()  
*Get the end marker for the mutable forward iterator.*
- [Const\\_rev\\_iterator rbegin](#) () const  
*Get the constant backward iterator for the last element in the set.*
- [Const\\_rev\\_iterator rend](#) () const  
*Get the end marker for the constant backward iterator.*
- [Rev\\_iterator rbegin](#) ()  
*Get the mutable backward iterator for the last element of the set.*
- [Rev\\_iterator rend](#) ()  
*Get the end marker for the mutable backward iterator.*

#### Lookup functions.

- Node \* [find\\_node](#) (Key\_param\_type key) const  
*find the node with the given key.*
- Node \* [lower\\_bound\\_node](#) (Key\_param\_type key) const  
*Find the first node with a key not less than the given key.*
- [Const\\_iterator find](#) (Key\_param\_type key) const  
*find the node with the given key.*
- template<typename FUNC>  
void [remove\\_all](#) (FUNC &&callback)  
*Clear the tree.*

### Static Protected Member Functions

- template<typename FUNC>  
static void [remove\\_tree](#) (Bst\_node \*head, FUNC &&callback)  
*Remove all elements in the subtree of head.*

### Interior access for descendants.

As this class is an intended base class we provide protected access to our interior, use 'using' to make this private in concrete implementations.

- `Bst_node * _head`  
*The head pointer of the tree.*
- `Bst ()`  
*Create an empty tree.*
- `Node * head () const`  
*Access the head node as object of type Node.*
- `static Key_type k (Bst_node const *n)`  
*Get the key value of n.*
- `static Dir dir (Key_param_type l, Key_param_type r)`  
*Get the direction to go from l to search for r.*
- `static Dir dir (Key_param_type l, Bst_node const *r)`  
*Get the direction to go from l to search for r.*
- `static bool greater (Key_param_type l, Key_param_type r)`  
*Is l greater than r.*
- `static bool greater (Key_param_type l, Bst_node const *r)`  
*Is l greater than r.*
- `static bool greater (Bst_node const *l, Bst_node const *r)`  
*Is l greater than r.*

## 15.25.1 Detailed Description

```
template<typename Node, typename Get_key, typename Compare>
class cxx::Bits::Bst< Node, Get_key, Compare >
```

Basic binary search tree (BST).

This class is intended as a base class for concrete binary search trees, such as an AVL tree. This class already provides the basic lookup methods and iterator definitions for a BST.

Definition at line 31 of file [bst.h](#).

## 15.25.2 Member Function Documentation

### 15.25.2.1 begin() [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Iterator cxx::Bits::Bst< Node, Get_key, Compare >::begin () [inline]
```

Get the mutable forward iterator for the first element of the set.

**Returns**

The mutable forward iterator for the first element of the set.

Definition at line 184 of file [bst.h](#).

References [head\(\)](#).

Here is the call graph for this function:

**15.25.2.2 `begin()` [2/2]**

```
template<typename Node, typename Get_key, typename Compare>
Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::begin () const [inline]
```

Get the constant forward iterator for the first element in the set.

**Returns**

Constant forward iterator for the first element in the set.

Definition at line 173 of file [bst.h](#).

References [head\(\)](#).

Here is the call graph for this function:

### 15.25.2.3 `dir()` [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Dir cxx::Bits::Bst< Node, Get_key, Compare >::dir (
    Key_param_type l,
    Bst_node const * r) [inline], [static], [protected]
```

Get the direction to go from `l` to search for `r`.

#### Parameters

<code>l</code>	is the key to look for.
<code>r</code>	is the node at the current position.

#### Return values

<code>Direction::L</code>	For left.
<code>Direction::R</code>	For right.
<code>Direction::N</code>	If <code>l</code> is equal to <code>r</code> .

Definition at line 129 of file `bst.h`.

References `dir()`, and `k()`.

Here is the call graph for this function:

### 15.25.2.4 `dir()` [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Dir cxx::Bits::Bst< Node, Get_key, Compare >::dir (
    Key_param_type l,
    Key_param_type r) [inline], [static], [protected]
```

Get the direction to go from `l` to search for `r`.

**Parameters**

<i>l</i>	is the key to look for.
<i>r</i>	is the key at the current position.

**Return values**

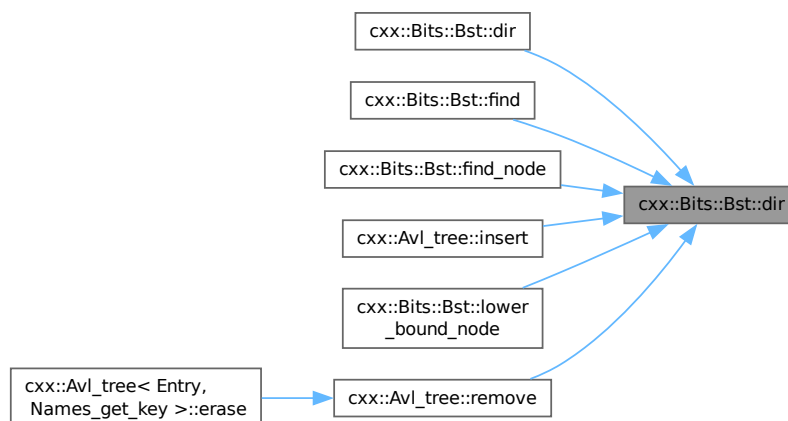

<a href="#"><code>Direction::L</code></a>	for left
<a href="#"><code>Direction::R</code></a>	for right
<a href="#"><code>Direction::N</code></a>	if <code>l</code> is equal to <code>r</code> .

Definition at line 112 of file [bst.h](#).

References [`cxx::Bits::Direction::L`](#), and [`cxx::Bits::Direction::N`](#).

Referenced by [dir\(\)](#), [find\(\)](#), [find\\_node\(\)](#), [cxx::Avl\\_tree< Node, Get\\_key, Compare >::insert\(\)](#), [lower\\_bound\\_node\(\)](#), and [cxx::Avl\\_tree< Node, Get\\_key, Compare >::remove\(\)](#).

Here is the caller graph for this function:

**15.25.2.5 end() [1/2]**

```
template<typename Node, typename Get_key, typename Compare>
Iterator cxx::Bits::Bst< Node, Get_key, Compare >::end () [inline]
```

Get the end marker for the mutable forward iterator.

**Returns**

The end marker for mutable forward iterator.

Definition at line 189 of file [bst.h](#).

### 15.25.2.6 end() [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::end () const [inline]
```

Get the end marker for the constant forward iterator.

#### Returns

The end marker for the constant forward iterator.

Definition at line 178 of file [bst.h](#).

### 15.25.2.7 find()

```
template<typename Node, typename Get_key, class Compare>
Bst< Node, Get_key, Compare >::Const_iterator cxx::Bits::Bst< Node, Get_key, Compare >::find
(
    Key_param_type key) const [inline]
```

find the node with the given *key*.

#### Parameters

<i>key</i>	The key value of the element to search.
------------	---

#### Returns

A valid iterator for the node with the given *key*, or an invalid iterator if *key* was not found.

Definition at line 306 of file [bst.h](#).

References [\\_head](#), [dir\(\)](#), [cxx::Bits::Direction::L](#), [cxx::Bits::Direction::N](#), and [cxx::Bits::Bst\\_node::next\(\)](#).

Here is the call graph for this function:

### 15.25.2.8 `find_node()`

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Bits::Bst< Node, Get_key, Compare >::find_node (
    Key_param_type key) const [inline]
```

find the node with the given *key*.

#### Parameters

<i>key</i>	The key value of the element to search.
------------	---

#### Returns

A pointer to the node with the given *key*, or NULL if *key* was not found.

Definition at line 270 of file `bst.h`.

References `_head`, `dir()`, `cxx::Bits::Direction::N`, and `cxx::Bits::Bst_node::next()`.

Here is the call graph for this function:

### 15.25.2.9 `lower_bound_node()`

```
template<typename Node, typename Get_key, class Compare>
Node * cxx::Bits::Bst< Node, Get_key, Compare >::lower_bound_node (
    Key_param_type key) const [inline]
```

Find the first node with a key not less than the given *key*.

#### Parameters

<i>key</i>	The key used for the search.
------------	------------------------------

**Returns**

A pointer to the found node, or `NULL` if no node was found.

Definition at line 286 of file [bst.h](#).

References [\\_head](#), [dir\(\)](#), [cxx::Bits::Direction::L](#), [cxx::Bits::Direction::N](#), and [cxx::Bits::Bst\\_node::next\(\)](#).

Here is the call graph for this function:

**15.25.2.10 rbegin() [1/2]**

```
template<typename Node, typename Get_key, typename Compare>
Rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rbegin () [inline]
```

Get the mutable backward iterator for the last element of the set.

**Returns**

The mutable backward iterator for the last element of the set.

Definition at line 206 of file [bst.h](#).

References [head\(\)](#).

Here is the call graph for this function:

**15.25.2.11** `rbegin()` [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Const_rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rbegin () const [inline]
```

Get the constant backward iterator for the last element in the set.

**Returns**

The constant backward iterator for the last element in the set.

Definition at line 195 of file [bst.h](#).

References [head\(\)](#).

Here is the call graph for this function:

**15.25.2.12** `remove_all()`

```
template<typename Node, typename Get_key, typename Compare>
template<typename FUNC>
void cxx::Bits::Bst< Node, Get_key, Compare >::remove_all (
    FUNC && callback) [inline]
```

Clear the tree.

**Parameters**

<i>callback</i>	Optional function to be called on each removed element.
-----------------	---

The callback may delete the elements. The function guarantees that the elements are no longer used after the callback has been called.

Definition at line 252 of file [bst.h](#).

References [\\_head](#), [head\(\)](#), and [remove\\_tree\(\)](#).

Referenced by [cxx::Avl\\_tree< Entry, Names\\_get\\_key >::~~Avl\\_tree\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.25.2.13 remove\_tree()

```

template<typename Node, typename Get_key, typename Compare>
template<typename FUNC>
void cxx::Bits::Bst< Node, Get_key, Compare >::remove_tree (
    Bst_node * head,
    FUNC && callback) [inline], [static], [protected]
  
```

Remove all elements in the subtree of head.

#### Parameters

<i>head</i>	Head of the the subtree to remove
<i>callback</i>	Optional function called on each removed element.

Definition at line 152 of file [bst.h](#).

References [head\(\)](#), [cxx::Bits::Direction::L](#), [cxx::Bits::Bst\\_node::next\(\)](#), [cxx::Bits::Direction::R](#), and [remove\\_tree\(\)](#).

Referenced by [remove\\_all\(\)](#), and [remove\\_tree\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.25.2.14 `rend()` [1/2]

```
template<typename Node, typename Get_key, typename Compare>
Rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rend () [inline]
```

Get the end marker for the mutable backward iterator.

##### Returns

The end marker for mutable backward iterator.

Definition at line 211 of file [bst.h](#).

#### 15.25.2.15 `rend()` [2/2]

```
template<typename Node, typename Get_key, typename Compare>
Const_rev_iterator cxx::Bits::Bst< Node, Get_key, Compare >::rend () const [inline]
```

Get the end marker for the constant backward iterator.

##### Returns

The end marker for the constant backward iterator.

Definition at line 200 of file [bst.h](#).

The documentation for this class was generated from the following file:

- [l4/cxx/bits/bst.h](#)

## 15.26 cxx::Bits::Bst\_node Class Reference

Basic type of a node in a binary search tree (BST).

```
#include <bst_base.h>
```

Inheritance diagram for cxx::Bits::Bst\_node:

Collaboration diagram for cxx::Bits::Bst\_node:

cxx::Bits::Bst_node	
#	Bst_node()
#	Bst_node()
#	next()
#	next()
#	next_p()
#	next()
#	rotate()
*	next()

*Uninitialized direction.*
- **Direction** ([Direction\\_e](#) d)  
*Convert a literal direction ([L](#), [R](#), [N](#)) to an object.*
- **Direction** (bool b)  
*Convert a boolean to a direction (false == [L](#), true == [R](#)).*
- **Direction operator!** () const  
*Negate the direction.*

## Comparison operators (equality and inequality)

- bool **operator==** ([Direction\\_e](#) o) const  
*Compare for equality.*
- bool **operator!=** ([Direction\\_e](#) o) const  
*Compare for inequality.*
- bool **operator==** ([Direction](#) o) const  
*Compare for equality.*
- bool **operator!=** ([Direction](#) o) const  
*Compare for inequality.*

## 15.27.1 Detailed Description

The direction to go in a binary search tree.

Definition at line 28 of file [bst\\_base.h](#).

## 15.27.2 Member Enumeration Documentation

### 15.27.2.1 Direction\_e

```
enum cxx::Bits::Direction::Direction_e
```

The literal direction values.

#### Enumerator

L	Go to the left child.
R	Go to the right child.
N	Stop.

Definition at line 31 of file [bst\\_base.h](#).

### 15.27.3 Member Function Documentation

#### 15.27.3.1 operator"!")()

```
Direction cxx::Bits::Direction::operator! () const [inline]
```

Negate the direction.

##### Note

This is only defined for a current value of [L](#) or [R](#)

Definition at line [52](#) of file [bst\\_base.h](#).

References [Direction\(\)](#).

Here is the call graph for this function:

The documentation for this struct was generated from the following file:

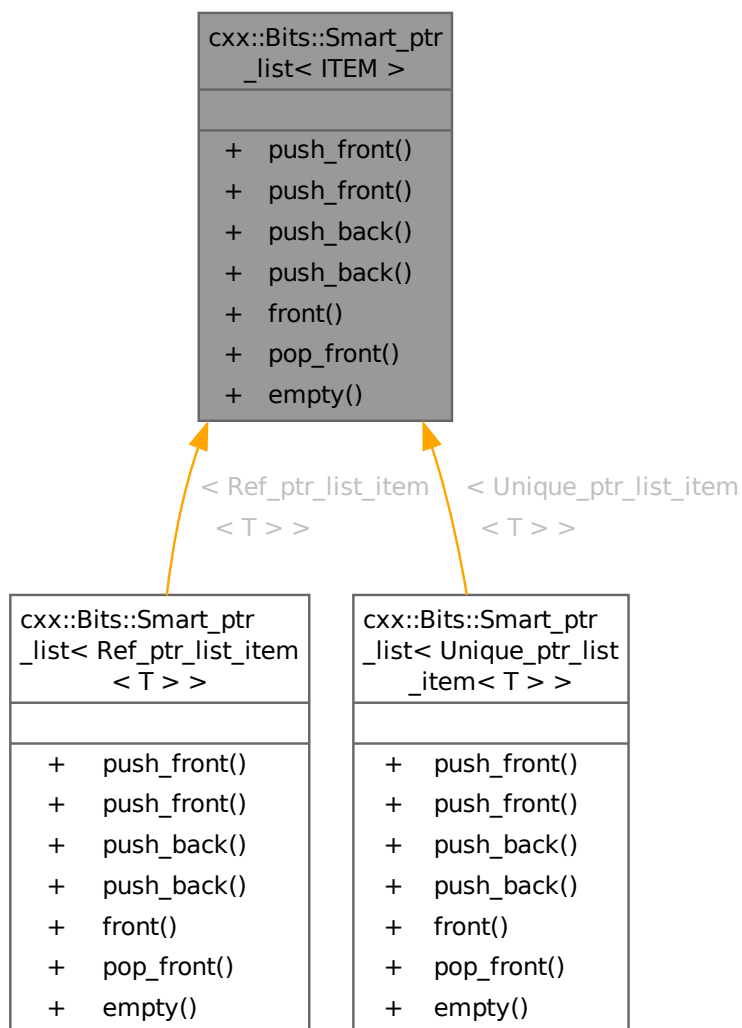

- [I4/cxx/bits/bst\\_base.h](#)

## 15.28 cxx::Bits::Smart\_ptr\_list< ITEM > Class Template Reference

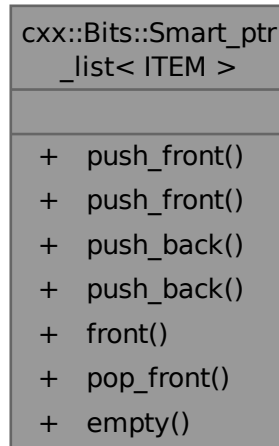

[List](#) of smart-pointer-managed objects.

```
#include <smart_ptr_list.h>
```

Inheritance diagram for cxx::Bits::Smart\_ptr\_list< ITEM >:

Collaboration diagram for `cxx::Bits::Smart_ptr_list< ITEM >`:

### Public Member Functions

- void **push\_front** (Next\_type &&e)  
*Add an element to the front of the list.*
- void **push\_front** (Next\_type const &e)  
*Add an element to the front of the list.*
- void **push\_back** (Next\_type &&e)  
*Add an element at the end of the list.*
- void **push\_back** (Next\_type const &e)  
*Add an element at the end of the list.*
- Value\_type \* **front** () const  
*Return a pointer to the first element in the list.*
- Next\_type **pop\_front** ()  
*Remove the element in front of the list and return it.*
- bool **empty** () const  
*Check if the list is empty.*

### 15.28.1 Detailed Description

```
template<typename ITEM>
class cxx::Bits::Smart_ptr_list< ITEM >
```

[List](#) of smart-pointer-managed objects.

### Template Parameters

---

<i>ITEM</i>	Type of the list items.
-------------	-------------------------

The list is implemented as a single-linked list connected via smart pointers, so that they are automatically cleaned up when they are removed from the list.

Definition at line 46 of file [smart\\_ptr\\_list.h](#).

## 15.28.2 Member Function Documentation

### 15.28.2.1 `pop_front()`

```
template<typename ITEM>
Next_type cxx::Bits::Smart_ptr_list< ITEM >::pop_front () [inline]
```

Remove the element in front of the list and return it.

#### Returns

The element that was previously in front of the list as a managed pointer or a nullptr-equivalent when the list was already empty.

Definition at line 149 of file [smart\\_ptr\\_list.h](#).

The documentation for this class was generated from the following file:

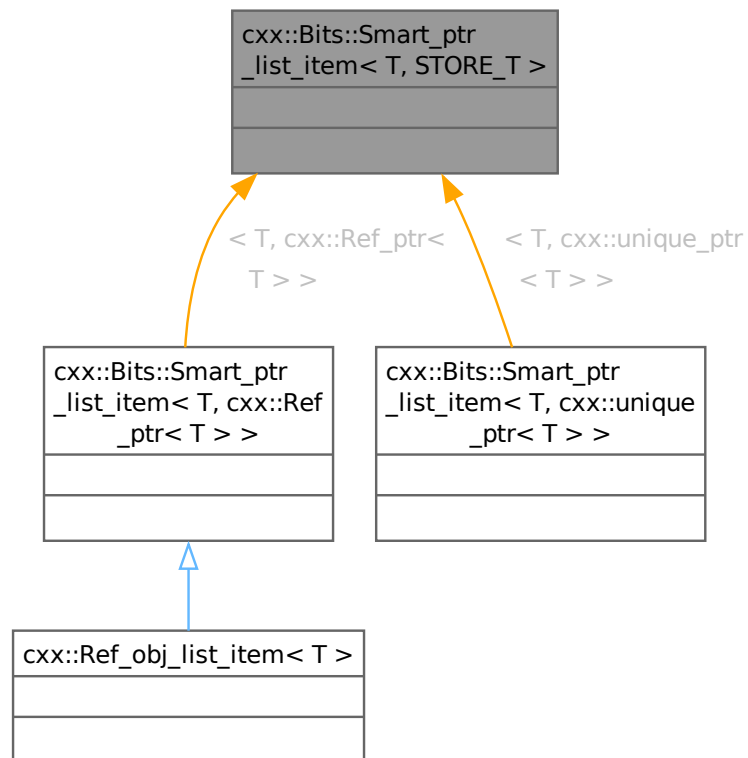

- [I4/cxx/bits/smart\\_ptr\\_list.h](#)

## 15.29 `cxx::Bits::Smart_ptr_list_item< T, STORE_T >` Class Template Reference

[List](#) item for an arbitrary item in a [Smart\\_ptr\\_list](#).

```
#include <smart_ptr_list.h>
```

Inheritance diagram for `cxx::Bits::Smart_ptr_list_item< T, STORE_T >`:

Collaboration diagram for `cxx::Bits::Smart_ptr_list_item< T, STORE_T >`:

### 15.29.1 Detailed Description

```

template<typename T, typename STORE_T>
class cxx::Bits::Smart_ptr_list_item< T, STORE_T >

```

[List](#) item for an arbitrary item in a [Smart\\_ptr\\_list](#).

## Template Parameters

<i>T</i>	Type of object to be stored in the list.
<i>STORE↔ _T</i>	Storage type for pointer to next item. The class must implement a <code>get()</code> function that returns a pointer to the stored object and destroy the stored object when the item goes out of scope.

Definition at line 27 of file [smart\\_ptr\\_list.h](#).

The documentation for this class was generated from the following file:

- [I4/cxx/bits/smart\\_ptr\\_list.h](#)

## 15.30 `cxx::Elide_dtor< T >` Class Template Reference

Wrapper class to remove destructor calls.

```
#include <elide_dtor>
```

Collaboration diagram for `cxx::Elide_dtor< T >`:

### 15.30.1 Detailed Description

```
template<typename T>
class cxx::Elide_dtor< T >
```

Wrapper class to remove destructor calls.

Use this class for global or static local objects that shall not be destructed. This can save some code size if the destructor of `T` is not trivial. It also prevents calls to `atexit()` at runtime.

#### Attention

Be careful if you use [Elide\\_dtor](#) in the global scope. Even if `T` is trivially constructible, the wrapper will force the compiler to emit a static initializer!

Definition at line 28 of file [elide\\_dtor](#).

The documentation for this class was generated from the following file:

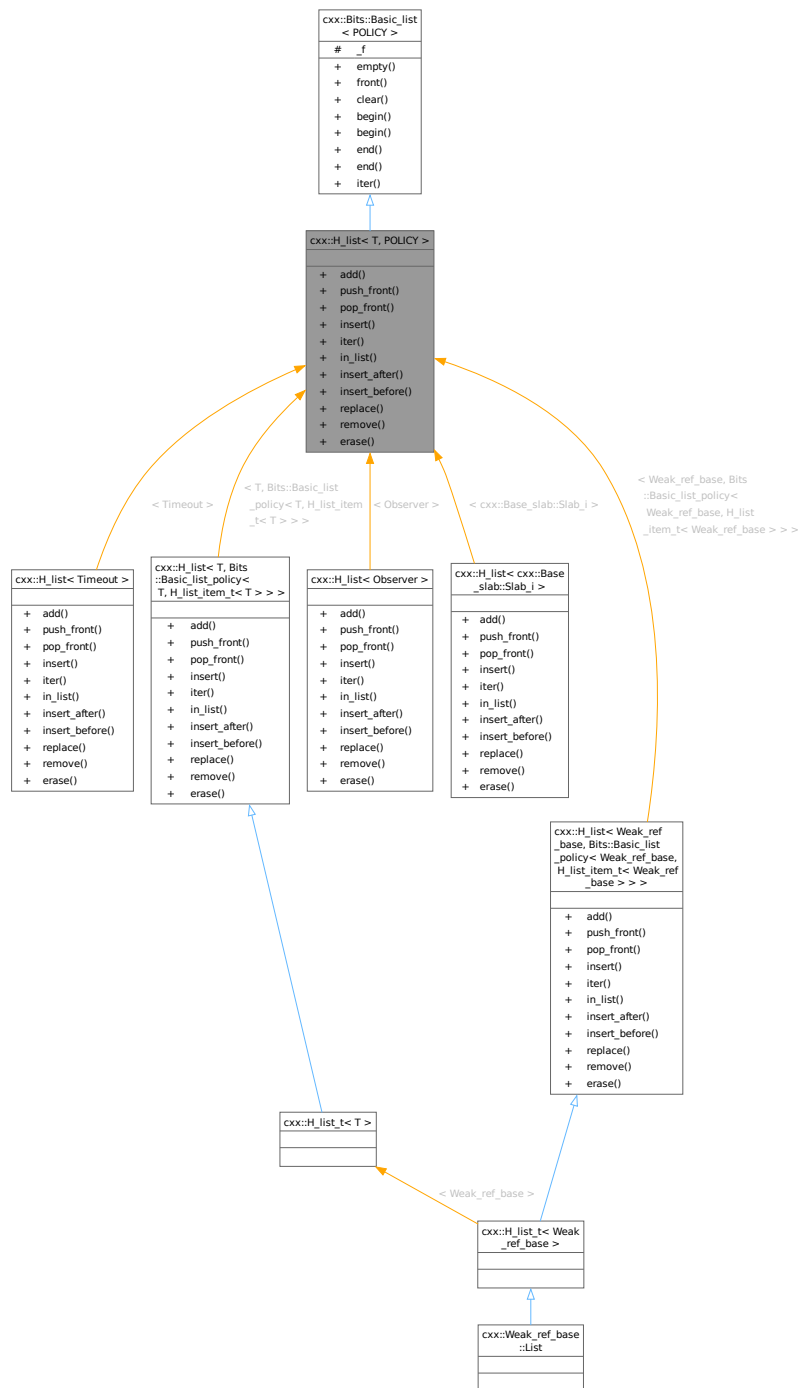

- [I4/cxx/elide\\_dtor](#)

## 15.31 cxx::H\_list< T, POLICY > Class Template Reference

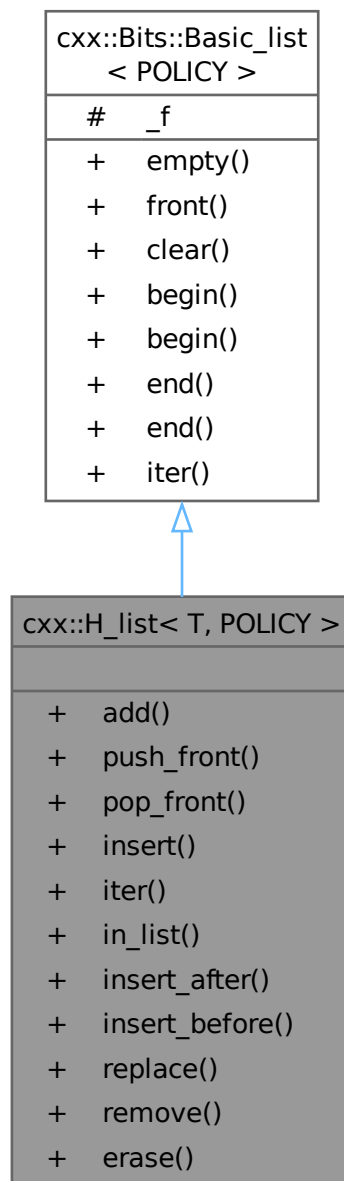

General double-linked list of unspecified [cxx::H\\_list\\_item](#) elements.

```
#include <hlist>
```

Inheritance diagram for `cxx::H_list< T, POLICY >`:

Collaboration diagram for `cxx::H_list< T, POLICY >`:

### Public Member Functions

- void **add** (T \*e)  
*Add element to the front of the list.*
- void **push\_front** (T \*e)  
*Add element to the front of the list.*
- T \* **pop\_front** ()  
*Remove and return the head element of the list.*
- Iterator **insert** (T \*e, Iterator const &pred)  
*Insert an element at the iterator position.*

## Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- `bool empty () const`  
*Check if the list is empty.*
- `Value_type front () const`  
*Return the first element in the list.*
- `void clear ()`  
*Remove all elements from the list.*
- `Iterator begin ()`  
*Return an iterator to the beginning of the list.*
- `Const_iterator begin () const`  
*Return a const iterator to the beginning of the list.*
- `Const_iterator end () const`  
*Return a const iterator to the end of the list.*
- `Iterator end ()`  
*Return an iterator to the end of the list.*

## Static Public Member Functions

- `static Iterator iter (T *c)`  
*Return an iterator for an arbitrary list element.*
- `static bool in_list (T const *e)`  
*Check if the given element is currently part of a list.*
- `static Iterator insert_after (T *e, Iterator const &pred)`  
*Insert an element after the iterator position.*
- `static void insert_before (T *e, Iterator const &succ)`  
*Insert an element before the iterator position.*
- `static void replace (T *p, T *e)`  
*Replace an element in a list with a new element.*
- `static void remove (T *e)`  
*Remove the given element from its list.*
- `static Iterator erase (Iterator const &e)`  
*Remove the element at the given iterator position.*

## Static Public Member Functions inherited from `cxx::Bits::Basic_list< POLICY >`

- `static Const_iterator iter (Const_value_type c)`  
*Return a const iterator that begins at the given element.*

## Additional Inherited Members

## Protected Attributes inherited from `cxx::Bits::Basic_list< POLICY >`

- `POLICY::Head_type _f`  
*Pointer to front of the list.*

### 15.31.1 Detailed Description

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
class cxx::H_list< T, POLICY >
```

General double-linked list of unspecified `cxx::H_list_item` elements.

Most of the time, you want to use `H_list_t`.

Definition at line 69 of file `hlist`.

### 15.31.2 Member Function Documentation

#### 15.31.2.1 `erase()`

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::erase (
    Iterator const & e) [inline], [static]
```

Remove the element at the given iterator position.

##### Parameters

<code>e</code>	Iterator pointing to the element to be removed. Must not point to <code>end()</code> .
----------------	--

##### Returns

New iterator pointing to the element after the removed one.

##### Note

The `hlist` implementation guarantees that the original iterator is still valid after the element has been removed. In fact, the iterator returned is the same as the one supplied in the `e` parameter.

Definition at line 236 of file `hlist`.

#### 15.31.2.2 `insert()`

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::insert (
    T * e,
    Iterator const & pred) [inline]
```

Insert an element at the iterator position.

##### Parameters

<i>e</i>	New Element to be inserted
<i>pred</i>	Iterator pointing to the element after which the element will be inserted. If <a href="#">end()</a> is given, the element will be inserted at the beginning of the queue.

**Returns**

Iterator pointing to the newly inserted element.

Definition at line [133](#) of file [hlist](#).

**15.31.2.3 insert\_after()**

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H\_list< T, POLICY >::insert_after (
    T * e,
    Iterator const & pred) [inline], [static]
```

Insert an element after the iterator position.

**Parameters**

<i>e</i>	New element to be inserted.
<i>pred</i>	Iterator pointing to the element after which the element will be inserted. Must not be <a href="#">end()</a> .

**Returns**

Iterator pointing to the newly inserted element.

**Precondition**

The list must not be empty.

Definition at line [160](#) of file [hlist](#).

**15.31.2.4 insert\_before()**

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
void cxx::H\_list< T, POLICY >::insert_before (
    T * e,
    Iterator const & succ) [inline], [static]
```

Insert an element before the iterator position.

**Parameters**

<i>e</i>	New element to be inserted.
<i>succ</i>	Iterator pointing to the element before which the element will be inserted. Must not be <code>end()</code> .

Definition at line 180 of file `hlist`.

#### 15.31.2.5 `iter()`

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
Iterator cxx::H_list< T, POLICY >::iter (
    T * c)    [inline], [static]
```

Return an iterator for an arbitrary list element.

##### Parameters

<i>c</i>	<code>List</code> element to start the iteration.
----------	---

##### Returns

A mutable forward iterator.

##### Precondition

The element must be in a list.

Definition at line 93 of file `hlist`.

Referenced by `cxx::H_list< Timeout >::insert()`, and `cxx::H_list< Timeout >::insert_after()`.

Here is the caller graph for this function:

### 15.31.2.6 pop\_front()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
T * cxx::H_list< T, POLICY >::pop_front () [inline]
```

Remove and return the head element of the list.

#### Precondition

The list must not be empty or the behaviour will be undefined.

Definition at line 116 of file [hlist](#).

### 15.31.2.7 remove()

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
void cxx::H_list< T, POLICY >::remove (
    T * e) [inline], [static]
```

Remove the given element from its list.

#### Parameters

<i>e</i>	Element to be removed. Must be in a list.
----------	---

Definition at line 220 of file [hlist](#).

Referenced by [cxx::H\\_list< Timeout >::pop\\_front\(\)](#).

Here is the caller graph for this function:

**15.31.2.8 replace()**

```
template<typename T, typename POLICY = Bits::Basic_list_policy< T, H_list_item>>
void cxx::H_list< T, POLICY >::replace (
    T * p,
    T * e) [inline], [static]
```

Replace an element in a list with a new element.

**Parameters**

<i>p</i>	Element in list to be replaced.
<i>e</i>	Replacement element, must not yet be in a list.

**Precondition**

*p* and *e* must not be NULL.

After the operation the *p* element is no longer in the list and may be reused.

Definition at line 204 of file [hlist](#).

The documentation for this class was generated from the following file:

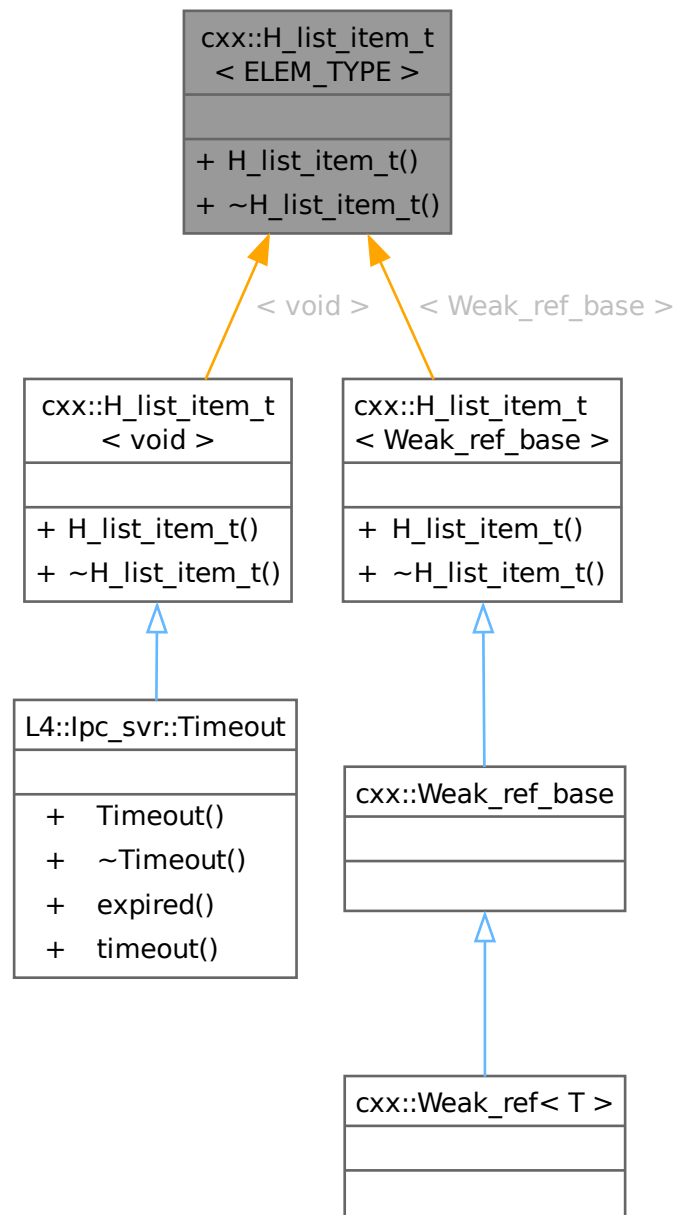

- I4/cxx/hlist

**15.32 cxx::H\_list\_item\_t< ELEM\_TYPE > Class Template Reference**

Basic element type for a double-linked [H\\_list](#).

```
#include <hlist>
```

Inheritance diagram for `cxx::H_list_item_t< ELEM_TYPE >`:

Collaboration diagram for cxx::H\_list\_item\_t< ELEM\_TYPE >:

### 15.32.1 Detailed Description

```
template<typename ELEM_TYPE>
class cxx::H_list_item_t< ELEM_TYPE >
```

Basic element type for a double-linked [H\\_list](#).

#### Template Parameters

<i>ELEM_TYPE</i>	Base class of the list element.
------------------	---------------------------------

Definition at line 22 of file [hlist](#).

### 15.32.2 Constructor & Destructor Documentation

#### 15.32.2.1 H\_list\_item\_t()

```
template<typename ELEM_TYPE>
cxx::H_list_item_t< ELEM_TYPE >::H_list_item_t () [inline]
```

Constructor.

Creates an element that is not in any list.

Definition at line 30 of file [hlist](#).

### 15.32.2.2 ~H\_list\_item\_t()

```
template<typename ELEM_TYPE>
cxx::H_list_item_t< ELEM_TYPE >::~~H_list_item_t () [inline], [noexcept]
```

Destructor.

Automatically removes the element from any list it still might be enchainned in.

Definition at line 37 of file [hlist](#).

The documentation for this class was generated from the following file:

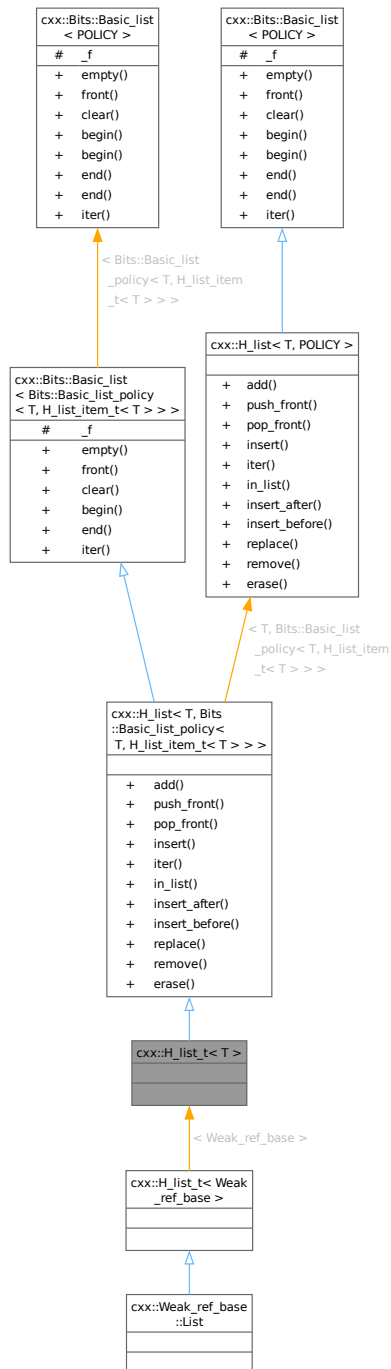

- I4/cxx/hlist

## 15.33 cxx::H\_list\_t< T > Struct Template Reference

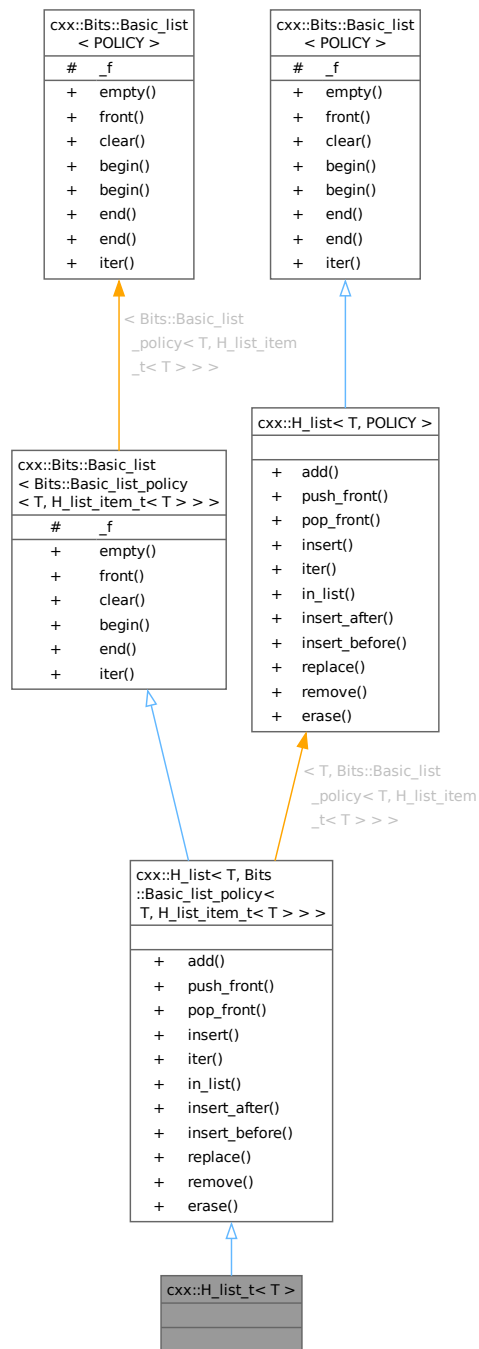

Double-linked list of typed [H\\_list\\_item\\_t](#) elements.

```
#include <hlist>
```

Inheritance diagram for cxx::H\_list\_t< T >:

### 15.34.1 Detailed Description

`template<typename D, template< typename A > class Alloc = New_allocator>`  
`class cxx::List< D, Alloc >`

Doubly linked list, with internal allocation.

Container for items of type D, implemented by a doubly linked list. Alloc defines the allocator policy.

Definition at line 323 of file `list`.

### 15.34.2 Member Function Documentation

#### 15.34.2.1 `operator[]()` [1/2]

```
template<typename D, template< typename A > class Alloc = New_allocator>
D const & cxx::List< D, Alloc >::operator[] (
    unsigned long idx) const [inline], [noexcept]
```

Random access.

Complexity is O(n).

Definition at line 393 of file `list`.

### 15.34.2.2 operator[]() [2/2]

```
template<typename D, template< typename A > class Alloc = New_allocator>
D & cxx::List< D, Alloc >::operator[] (
    unsigned long idx) [inline], [noexcept]
```

Random access.

Complexity is O(n).

Definition at line 397 of file [list](#).

The documentation for this class was generated from the following file:

- l4/cxx/list

## 15.35 cxx::List< D, Alloc >::Iter Class Reference

Iterator.

```
#include <list>
```

Collaboration diagram for cxx::List< D, Alloc >::Iter:

### Public Member Functions

- **operator E\* ()** const noexcept  
*operator for testing validity (syntactically equal to pointers)*

### 15.35.1 Detailed Description

```
template<typename D, template< typename A > class Alloc = New_allocator>
class cxx::List< D, Alloc >::Iter
```

Iterator.

Forward and backward iterable.

Definition at line 343 of file [list](#).

The documentation for this class was generated from the following file:

- l4/cxx/list

## 15.36 `cxx::List_alloc` Class Reference

Standard list-based allocator.

```
#include <list_alloc>
```

Collaboration diagram for `cxx::List_alloc`:

### Public Member Functions

- [List\\_alloc](#) ()  
*Initializes an empty list allocator.*
- void [free](#) (void \*block, unsigned long size, bool initial\_free=false)  
*Return a free memory block to the allocator.*
- void \* [alloc](#) (unsigned long size, unsigned long align, unsigned long lower=0, unsigned long upper=~0UL)  
*Allocate a memory block.*
- void \* [alloc\\_max](#) (unsigned long min, unsigned long \*max, unsigned long align, unsigned granularity, unsigned long lower=0, unsigned long upper=~0UL)  
*Allocate a memory block of  $min \leq size \leq max$ .*
- unsigned long [avail](#) ()  
*Get the amount of available memory.*

### 15.36.1 Detailed Description

Standard list-based allocator.

Definition at line 22 of file [list\\_alloc](#).

## 15.36.2 Constructor & Destructor Documentation

### 15.36.2.1 List\_alloc()

```
cxx::List_alloc::List_alloc () [inline]
```

Initializes an empty list allocator.

#### Note

To initialize the allocator with available memory use the [free\(\)](#) function.

Definition at line 47 of file [list\\_alloc](#).

## 15.36.3 Member Function Documentation

### 15.36.3.1 alloc()

```
void * cxx::List_alloc::alloc (
    unsigned long size,
    unsigned long align,
    unsigned long lower = 0,
    unsigned long upper = ~0UL) [inline]
```

Allocate a memory block.

#### Parameters

<i>size</i>	Size of the memory block.
<i>align</i>	Alignment constraint.
<i>lower</i>	Lower bound of the physical region the memory block should be allocated from.
<i>upper</i>	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

#### Returns

Pointer to memory block

#### Precondition

```
0 < size <= ~0UL - 32.
```

Definition at line 390 of file [list\\_alloc](#).

## 15.36.3.2 alloc\_max()

```
void * cxx::List_alloc::alloc_max (
    unsigned long min,
    unsigned long * max,
    unsigned long align,
    unsigned granularity,
    unsigned long lower = 0,
    unsigned long upper = ~0UL) [inline]
```

Allocate a memory block of  $\text{min} \leq \text{size} \leq \text{max}$ .

## Parameters

	<i>min</i>	Minimal size to allocate (in bytes).
<i>in, out</i>	<i>max</i>	Maximum size to allocate (in bytes). The actual allocated size is returned here.
	<i>align</i>	Alignment constraint.
	<i>granularity</i>	Granularity to use for the allocation (power of 2).
	<i>lower</i>	Lower bound of the physical region the memory block should be allocated from.
	<i>upper</i>	Upper bound of the physical region the memory block should be allocated from, value is inclusive.

## Returns

Pointer to memory block

## Precondition

$0 < \text{min} \leq \sim 0\text{UL} - 32$ .

$0 < \text{max}$ .

Definition at line 270 of file [list\\_alloc](#).

References [l4\\_round\\_size\(\)](#), and [l4\\_trunc\\_size\(\)](#).

Here is the call graph for this function:

### 15.36.3.3 avail()

```
unsigned long cxx::List_alloc::avail () [inline]
```

Get the amount of available memory.

#### Returns

Available memory in bytes

Definition at line 478 of file [list\\_alloc](#).

### 15.36.3.4 free()

```
void cxx::List_alloc::free (
    void * block,
    unsigned long size,
    bool initial_free = false) [inline]
```

Return a free memory block to the allocator.

#### Parameters

<i>block</i>	Pointer to memory block.
<i>size</i>	Size of memory block.
<i>initial_free</i>	Set to true for putting fresh memory to the allocator. This will enforce alignment on that memory.

#### Precondition

*block* must not be NULL.  
 $2 * \text{sizeof}(\text{void} *) \leq \text{size} \leq \sim 0\text{UL} - 32$ .

Definition at line 229 of file [list\\_alloc](#).

The documentation for this class was generated from the following file:

- I4/cxx/list\_alloc

## 15.37 cxx::List\_item Class Reference

Basic list item.

```
#include <list>
```

Collaboration diagram for cxx::List\_item:

cxx::List_item
<ul style="list-style-type: none"> <li>+ get_prev_item()</li> <li>+ get_next_item()</li> <li>+ insert_prev_item()</li> <li>+ insert_next_item()</li> <li>+ remove_me()</li> <li>+ push_back()</li> <li>+ push_front()</li> <li>+ remove()</li> </ul>

### Data Structures

- class [Iter](#)  
*Iterator for a list of ListItem-s.*
- class [T\\_iter](#)  
*Iterator for derived classes from ListItem.*

### Public Member Functions

- List\_item \* **get\_prev\_item** () const noexcept  
*Get previous item.*
- List\_item \* **get\_next\_item** () const noexcept  
*Get next item.*
- void **insert\_prev\_item** (List\_item \*p) noexcept  
*Insert item p before this item.*
- void **insert\_next\_item** (List\_item \*p) noexcept  
*Insert item p after this item.*
- void **remove\_me** () noexcept  
*Remove this item from the list.*

## Static Public Member Functions

- `template<typename C, typename N>`  
`static C * push\_back (C *head, N *p) noexcept`  
*Append item to a list.*
- `template<typename C, typename N>`  
`static C * push\_front (C *head, N *p) noexcept`  
*Prepend item to a list.*
- `template<typename C, typename N>`  
`static C * remove (C *head, N *p) noexcept`  
*Remove item from a list.*

### 15.37.1 Detailed Description

Basic list item.

Basic item that can be member of a doubly linked, cyclic list.

Definition at line [26](#) of file [list](#).

### 15.37.2 Member Function Documentation

#### 15.37.2.1 [push\\_back\(\)](#)

```
template<typename C, typename N>
C * cxx::List_item::push_back (
    C * head,
    N * p) [inline], [static], [noexcept]
```

Append item to a list.

Convenience function for empty-head corner case.

#### Parameters

<i>head</i>	Pointer to the current list head.
<i>p</i>	Pointer to new item.

#### Returns

the pointer to the new head.

Definition at line [237](#) of file [list](#).

Referenced by [cxx::List< D, Alloc >::push\\_back\(\)](#).

Here is the caller graph for this function:

### 15.37.2.2 push\_front()

```
template<typename C, typename N>
C * cxx::List_item::push_front (
    C * head,
    N * p) [inline], [static], [noexcept]
```

Prepend item to a list.

Convenience function for empty-head corner case.

#### Parameters

<i>head</i>	pointer to the current list head.
<i>p</i>	pointer to new item.

#### Returns

the pointer to the new head.

Definition at line 248 of file [list](#).

Referenced by [cxx::List< D, Alloc >::push\\_front\(\)](#).

Here is the caller graph for this function:

### 15.37.2.3 remove()

```
template<typename C, typename N>
C * cxx::List_item::remove (
    C * head,
    N * p) [inline], [static], [noexcept]
```

Remove item from a list.

Convenience function for remove-head corner case.

#### Parameters

<i>head</i>	pointer to the current list head.
<i>p</i>	pointer to the item to remove.

#### Returns

the pointer to the new head.

Definition at line 258 of file [list](#).

Referenced by [cxx::List< D, Alloc >::remove\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

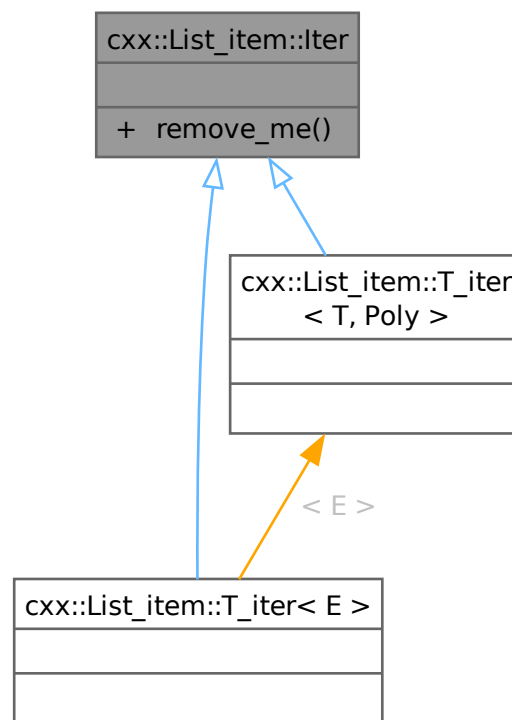

- `I4/cxx/list`

## 15.38 cxx::List\_item::Iter Class Reference

Iterator for a list of ListItem-s.

```
#include <list>
```

Inheritance diagram for cxx::List\_item::Iter:

Collaboration diagram for cxx::List\_item::Iter:

## Public Member Functions

- List\_item \* **remove\_me** () noexcept  
*Remove item pointed to by iterator, and return pointer to element.*

### 15.38.1 Detailed Description

Iterator for a list of ListItem-s.

The Iterator iterates till it finds the first element again.

Definition at line 34 of file [list](#).

The documentation for this class was generated from the following file:

- l4/cxx/list

## 15.39 cxx::List\_item::T\_iter< T, Poly > Class Template Reference

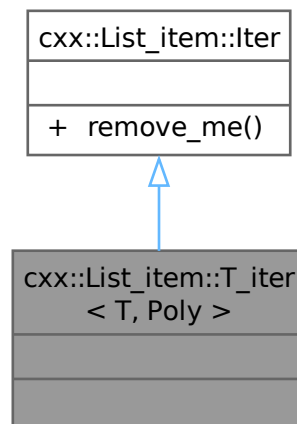

Iterator for derived classes from ListItem.

```
#include <list>
```

Inheritance diagram for cxx::List\_item::T\_iter< T, Poly >:

Collaboration diagram for cxx::List\_item::T\_iter< T, Poly >:

#### Additional Inherited Members

#### Public Member Functions inherited from `cxx::List_item::Iter`

- `List_item * remove_me () noexcept`  
*Remove item pointed to by iterator, and return pointer to element.*

### 15.39.1 Detailed Description

```
template<typename T, bool Poly = false>
class cxx::List_item::T_iter< T, Poly >
```

Iterator for derived classes from ListItem.

Allows direct access to derived classes by \* operator.

Example: `class Foo : public ListItem { public: typedef T_iter<Foo> Iter; ... };`

Definition at line 108 of file [list](#).

The documentation for this class was generated from the following file:

- `I4/cxx/list`

## 15.40 `cxx::Lt_functor< Obj >` Struct Template Reference

Generic comparator class that defaults to the less-than operator.

```
#include <std_ops>
```

Collaboration diagram for `cxx::Lt_functor< Obj >`:

### 15.40.1 Detailed Description

```
template<typename Obj>
struct cxx::Lt_functor< Obj >
```

Generic comparator class that defaults to the less-than operator.

Definition at line 18 of file [std\\_ops](#).

The documentation for this struct was generated from the following file:

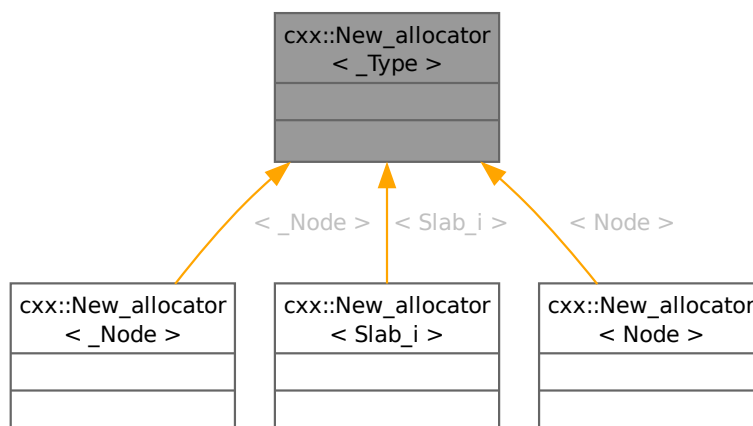

- `I4/cxx/std_ops`

## 15.41 `cxx::New_allocator< _Type >` Class Template Reference

Standard allocator based on `operator new ()` .

```
#include <std_alloc>
```

Inheritance diagram for `cxx::New_allocator<_Type>`:

Collaboration diagram for `cxx::New_allocator<_Type>`:

### 15.41.1 Detailed Description

```

template<typename _Type>
class cxx::New_allocator<_Type>

```

Standard allocator based on `operator new ()`.

This allocator is the default allocator used for the *cxx Containers*, such as `cxx::Avl_set` and `cxx::Avl_map`, to allocate the internal data structures.

Definition at line 56 of file `std_alloc`.

The documentation for this class was generated from the following file:

- `I4/cxx/std_alloc`

## 15.42 cxx::Nothrow Class Reference

Helper type to distinguish the `operator new` version that does not throw exceptions.

```
#include <std_alloc>
```

Collaboration diagram for `cxx::Nothrow`:

### 15.42.1 Detailed Description

Helper type to distinguish the `operator new` version that does not throw exceptions.

Definition at line 19 of file [std\\_alloc](#).

The documentation for this class was generated from the following file:

- `I4/cxx/std_alloc`

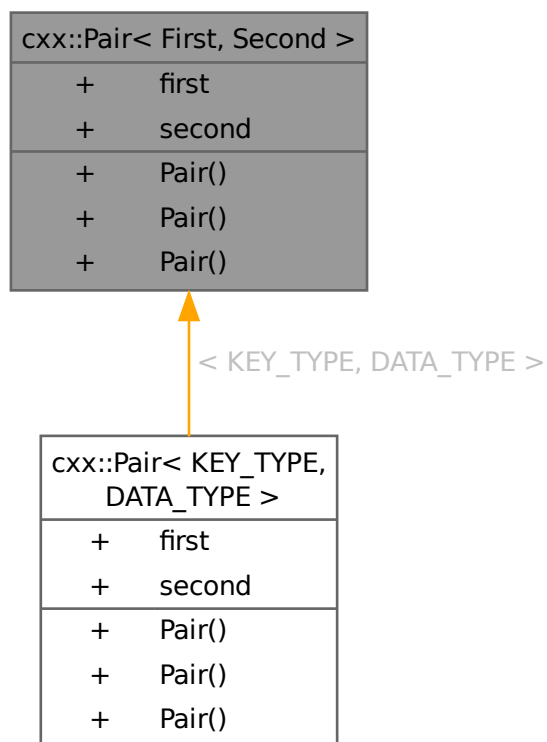

## 15.43 cxx::Pair< First, Second > Struct Template Reference

[Pair](#) of two values.

```
#include <pair>
```

Inheritance diagram for cxx::Pair< First, Second >:

Collaboration diagram for cxx::Pair< First, Second >:

## Public Types

- typedef First **First\_type**

*Type of first value.*

- typedef Second **Second\_type**

*Type of second value.*

## Public Member Functions

- template<typename A1, typename A2>  
[Pair](#) (A1 &&[first](#), A2 &&[second](#))  
*Create a pair from the two values.*
- template<typename A1>  
[Pair](#) (A1 &&[first](#))  
*Create a pair, default constructing the second value.*
- **Pair** ()=default  
*Default construction.*

## Data Fields

- First **first**  
*First value.*
- Second **second**  
*Second value.*

## 15.43.1 Detailed Description

```
template<typename First, typename Second>
struct cxx::Pair< First, Second >
```

[Pair](#) of two values.

Standard container for a pair of values.

### Parameters

<i>First</i>	Type of the first value.
<i>Second</i>	Type of the second value.

Definition at line 27 of file [pair](#).

## 15.43.2 Constructor & Destructor Documentation

### 15.43.2.1 Pair() [1/2]

```
template<typename First, typename Second>
template<typename A1, typename A2>
cxx::Pair< First, Second >::Pair (
    A1 && first,
    A2 && second) [inline]
```

Create a pair from the two values.

#### Parameters

<i>first</i>	The first value.
<i>second</i>	The second value.

Definition at line 45 of file [pair](#).

### 15.43.2.2 Pair() [2/2]

```
template<typename First, typename Second>
template<typename A1>
cxx::Pair< First, Second >::Pair (
    A1 && first) [inline]
```

Create a pair, default constructing the second value.

#### Parameters

<i>first</i>	The first value.
--------------	------------------

Definition at line 53 of file [pair](#).

The documentation for this struct was generated from the following file:

- [l4/cxx/pair](#)

## 15.44 cxx::Pair\_first\_compare< Cmp, Typ > Class Template Reference

Comparison functor for [Pair](#).

```
#include <pair>
```

Collaboration diagram for `cxx::Pair_first_compare< Cmp, Typ >`:

### Public Member Functions

- `Pair_first_compare` (`Cmp const &cmp=Cmp()`)  
*Construction.*
- `bool operator()` (`Typ const &l, Typ const &r`) `const`  
*Do the comparison based on the first value.*

## 15.44.1 Detailed Description

```
template<typename Cmp, typename Typ>
class cxx::Pair_first_compare< Cmp, Typ >
```

Comparison functor for [Pair](#).

### Parameters

<i>Cmp</i>	Comparison functor for the first value of the pair.
<i>Typ</i>	The pair type.

This functor can be used to compare [Pair](#) values with respect to the first value.

Definition at line 74 of file [pair](#).

## 15.44.2 Constructor & Destructor Documentation

### 15.44.2.1 Pair\_first\_compare()

```
template<typename Cmp, typename Typ>
cxx::Pair_first_compare< Cmp, Typ >::Pair_first_compare (
    Cmp const & cmp = Cmp()) [inline]
```

Construction.

**Parameters**

<code>cmp</code>	The comparison functor used for the first value.
------------------	--

Definition at line 84 of file [pair](#).

**15.44.3 Member Function Documentation****15.44.3.1 `operator>()()`**

```
template<typename Cmp, typename Typ>
bool cxx::Pair_first_compare< Cmp, Typ >::operator() (
    Typ const & l,
    Typ const & r) const [inline]
```

Do the comparison based on the first value.

**Parameters**

<code>l</code>	The lefthand value.
<code>r</code>	The righthand value.

Definition at line 91 of file [pair](#).

The documentation for this class was generated from the following file:

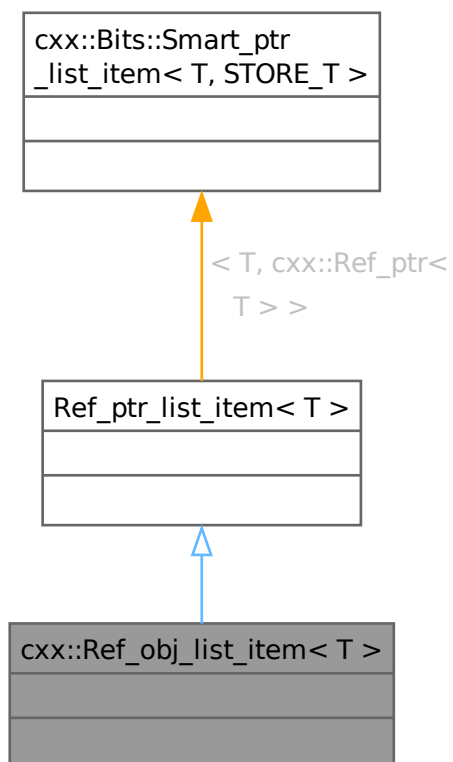

- [l4/cxx/pair](#)

**15.45 `cxx::Ref_obj_list_item< T >` Struct Template Reference**

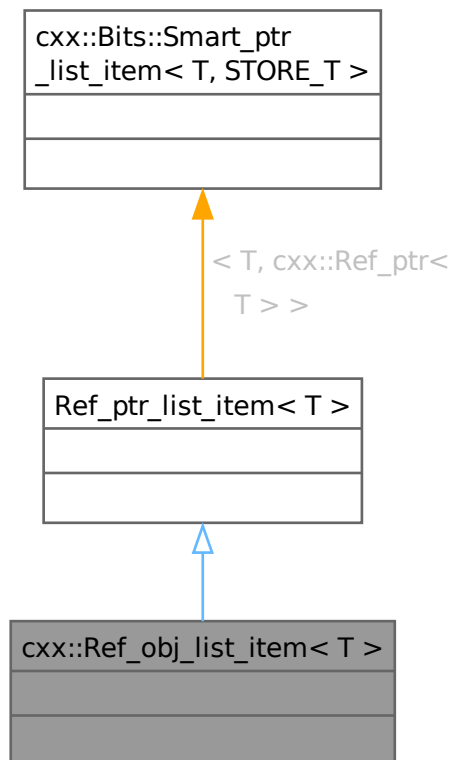

Item for list linked via [cxx::Ref\\_ptr](#) with default reference counting.

```
#include <ref_ptr_list>
```

*Release the shared pointer without removing the reference.*

### 15.46.1 Detailed Description

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
class cxx::Ref_ptr< T, CNT >
```

A reference-counting pointer with automatic cleanup.

## Template Parameters

<i>T</i>	Type of object the pointer points to.
<i>CNT</i>	Type of management class that manages the life time of the object.

This pointer is similar to the standard C++-11 `shared_ptr` but it does the reference counting directly in the object being pointed to, so that no additional management structures need to be allocated from the heap.

Classes that use this pointer type must implement two functions:

```
int remove_ref()
```

is called when a reference is removed and must return 0 when there are no further references to the object.

```
void add_ref()
```

is called when another `ref_ptr` to the object is created.

`Ref_obj` provides a simple implementation of this interface from which classes may inherit.

## Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 70 of file [ref\\_ptr](#).

## 15.46.2 Constructor & Destructor Documentation

### 15.46.2.1 Ref\_ptr() [1/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    Wp const & o) [inline], [noexcept]
```

Create a shared pointer from a weak pointer.

Increases references.

Definition at line 88 of file [ref\\_ptr](#).

### 15.46.2.2 Ref\_ptr() [2/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
template<typename X>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    X * o) [inline], [explicit], [noexcept]
```

Create a shared pointer from a raw pointer.

In contrast to C++11 `shared_ptr` it is safe to use this constructor multiple times and have the same reference counter.

Definition at line 101 of file [ref\\_ptr](#).

**15.46.2.3 Ref\_ptr()** [3/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    T * o,
    bool d) [inline], [noexcept]
```

Create a shared pointer from a raw pointer without creating a new reference.

**Parameters**

<i>o</i>	Pointer to the object.
<i>d</i>	Dummy parameter to select this constructor at compile time. The value may be true or false.

This is the counterpart to [release\(\)](#).

Definition at line 114 of file [ref\\_ptr](#).

**15.46.3 Member Function Documentation****15.46.3.1 get()**

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::get () const [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.

This does not release the pointer or decrease the reference count.

Definition at line 121 of file [ref\\_ptr](#).

**15.46.3.2 ptr()**

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::ptr () const [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.

This does not release the pointer or decrease the reference count.

Definition at line 127 of file [ref\\_ptr](#).

**15.46.3.3 release()**

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref_ptr< T, CNT >::release () [inline], [noexcept]
```

Release the shared pointer without removing the reference.

**Returns**

A raw pointer to the managed object.

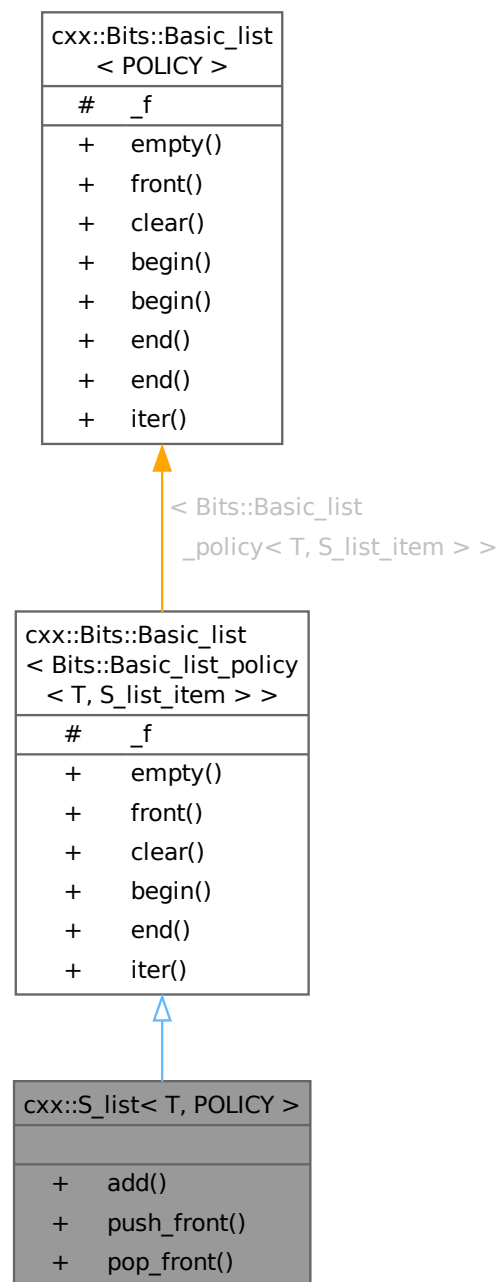

Definition at line 138 of file [ref\\_ptr](#).

The documentation for this class was generated from the following file:

- I4/cxx/ref\_ptr

template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class
Alloc = New_allocator>
class cxx::Slab< Type, Slab_size, Max_free, Alloc >
```

[Slab](#) allocator for object of type `Type`.

### Template Parameters

<i>Type</i>	The type of the objects to manage.
<i>Slab_size</i>	Size of a slab.
<i>Max_free</i>	The maximum number of free slabs.
<i>Alloc</i>	The allocator for the slabs.

Definition at line 335 of file [slab\\_alloc](#).

## 15.48.2 Member Function Documentation

### 15.48.2.1 alloc()

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
Type * cxx::Slab< Type, Slab\_size, Max\_free, Alloc >::alloc () [inline], [noexcept]
```

Allocate an object of type `Type`.

**Returns**

A pointer to the object just allocated, or 0 on failure.

**Note**

The user is responsible for initializing the object.

Definition at line 355 of file `slab_alloc`.

References `cxx::Base_slab< sizeof(Type), Slab_size, Max_free, Alloc >::alloc()`.

Here is the call graph for this function:

**15.48.2.2 free()**

```

template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
void cxx::Slab< Type, Slab_size, Max_free, Alloc >::free (
    Type * o) [inline], [noexcept]
  
```

Free the object addressed by `o`.

**Parameters**

<code>o</code>	The pointer to the object to free.
----------------	------------------------------------

**Precondition**

The object must have been allocated with this allocator.

Definition at line 366 of file `slab_alloc`.

References `free()`.

Referenced by `free()`.

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

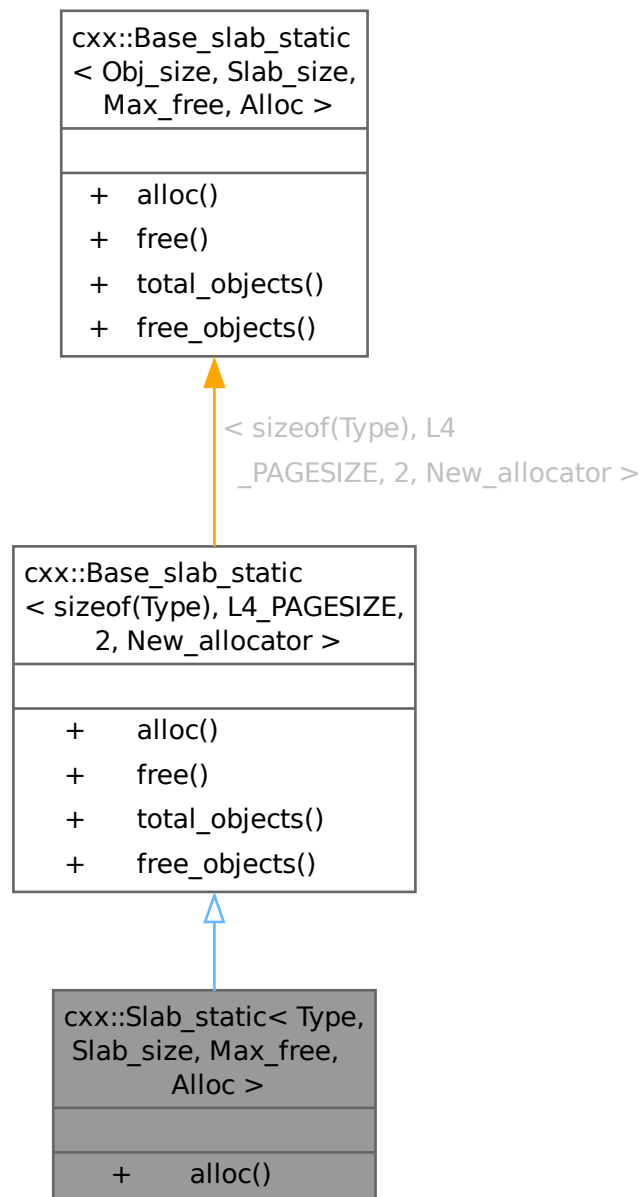

- `I4/cxx/slab_alloc`

## 15.49 `cxx::Slab_static< Type, Slab_size, Max_free, Alloc > Class` Template Reference

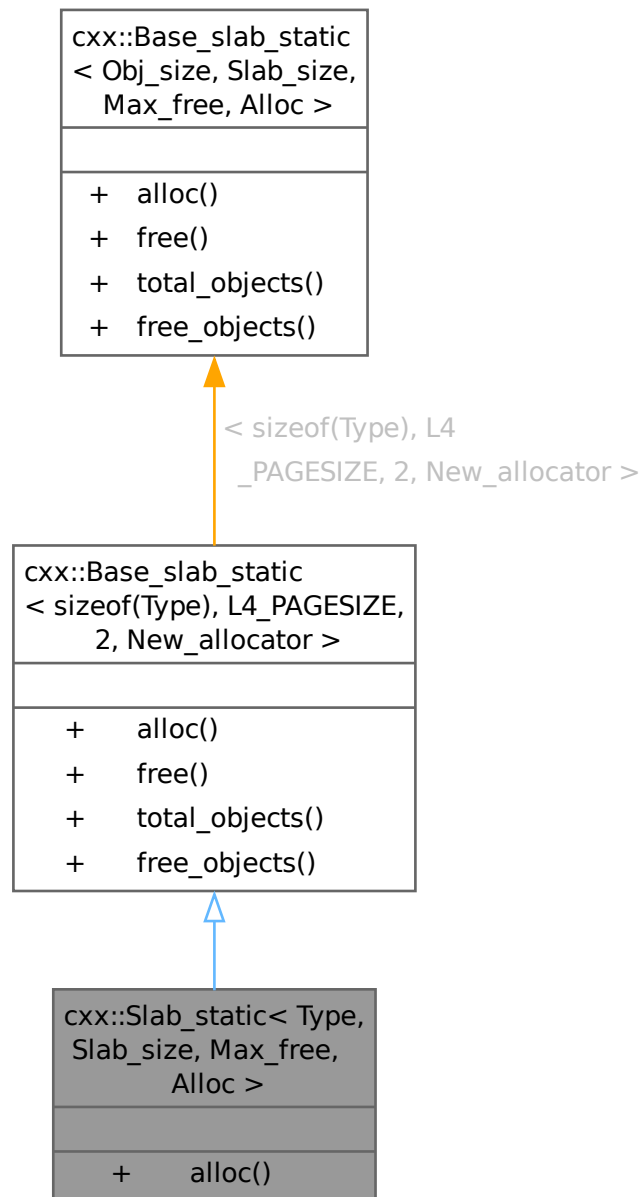

Merged slab allocator (allocators for objects of the same size are merged together).

```
#include <slab_alloc>
```

Inheritance diagram for cxx::Slab\_static< Type, Slab\_size, Max\_free, Alloc >:

Collaboration diagram for `cxx::Slab_static< Type, Slab_size, Max_free, Alloc >`:

### Public Member Functions

- `Type * alloc () noexcept`  
Allocate an object of type *Type*.

### Public Member Functions inherited from

`cxx::Base_slab_static< sizeof(Type), L4_PAGESIZE, 2, New_allocator >`

- `void * alloc () noexcept`

*Allocate an object.*

- void `free` (void \*p) noexcept

*Free the given object (p).*

- unsigned `total_objects` () const noexcept

*Get the total number of objects managed by the slab allocator.*

- unsigned `free_objects` () const noexcept

*Get the number of free objects in the slab allocator.*

## Additional Inherited Members

## Public Types inherited from

`cxx::Base_slab_static< sizeof(Type), L4_PAGESIZE, 2, New_allocator >`

## 15.49.1 Detailed Description

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A > class
Alloc = New_allocator>
```

```
class cxx::Slab_static< Type, Slab_size, Max_free, Alloc >
```

Merged slab allocator (allocators for objects of the same size are merged together).

## Template Parameters

<i>Type</i>	The type of the objects to manage.
<i>Slab_size</i>	The size of a slab.
<i>Max_free</i>	The maximum number of free slabs.
<i>Alloc</i>	The allocator for the slabs.

This slab allocator class is useful for merging slab allocators with the same parameters (equal `sizeof(Type)`, `Slab_size`, `Max_free`, and `Alloc` parameters) together and share the overhead for the slab caches among all equal-sized objects.

Definition at line 465 of file `slab_alloc`.

## 15.49.2 Member Function Documentation

### 15.49.2.1 `alloc()`

```
template<typename Type, int Slab_size = L4_PAGESIZE, int Max_free = 2, template< typename A >
class Alloc = New_allocator>
Type * cxx::Slab_static< Type, Slab_size, Max_free, Alloc >::alloc () [inline], [noexcept]
```

Allocate an object of type `Type`.

## Returns

A pointer to the just allocated object, or 0 on failure.

**Note**

The object is not zeroed out by the slab allocator.

Definition at line 478 of file [slab\\_alloc](#).

References [alloc\(\)](#).

Referenced by [alloc\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.51.1 Detailed Description

Allocation free string class with explicit length field.

This class is used to group characters of a string which belong to one syntactical token types number, identifier, string, whitespace or another single character.

Stings in this class can contain null bytes and may denote parts of other strings.

#### Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 30 of file [string](#).

### 15.51.2 Constructor & Destructor Documentation

#### 15.51.2.1 String()

```
cxx::String::String (  
    char const * s,  
    char const * e) [inline], [noexcept]
```

Initialize with start and end pointer.

#### Parameters

<i>s</i>	first character of the string
<i>e</i>	pointer to first byte behind the string

Definition at line 48 of file [string](#).

### 15.51.3 Member Function Documentation

#### 15.51.3.1 find()

```
char const * cxx::String::find (  
    char const * c,  
    char const * s) const [inline]
```

Find character set at position.

#### Parameters

<i>c</i>	zero-terminated string of characters to search for
<i>s</i>	start position of search in string

**Return values**

<a href="#">end()</a>	if no char in <code>c</code> is contained in string at or behind <code>s</code> .
<i>position</i>	in string of some character in <code>c</code> .

Definition at line 191 of file [string](#).

References [end\(\)](#), and [eof\(\)](#).

Here is the call graph for this function:

**15.51.3.2 from\_dec()**

```

template<typename INT>
int cxx::String::from_dec (
    INT * v) const [inline]
  
```

Convert decimal string to integer.

**Template Parameters**

<i>INT</i>	result integer type
------------	---------------------

**Parameters**

<i>out</i>	<i>v</i>	conversion result
------------	----------	-------------------

**Returns**

position of first character not converted.

Definition at line 228 of file [string](#).

References [eof\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

### 15.51.3.3 from\_hex()

```
template<typename INT>  
int cxx::String::from_hex (  
    INT * v) const [inline]
```

Convert hex string to integer.

#### Template Parameters

<i>INT</i>	result integer type
------------	---------------------

#### Parameters

out	<i>v</i>	conversion result
-----	----------	-------------------

#### Return values

<i>-1</i>	if the maximal amount of digits fitting into <code>INT</code> have been read,
<i>position</i>	of first character not converted otherwise.

Definition at line 257 of file [string](#).

References [eof\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

#### 15.51.3.4 starts\_with()

```
Index cxx::String::starts_with (  
    cxx::String const & c) const [inline]
```

Check if `c` is a prefix of string.

##### Returns

0 if `c` is not a prefix, if it is a prefix, return first position not in `c` (which might be `end()`).

Definition at line 155 of file `string`.

References `start()`.

Here is the call graph for this function:

The documentation for this class was generated from the following file:

- `I4/cxx/string`

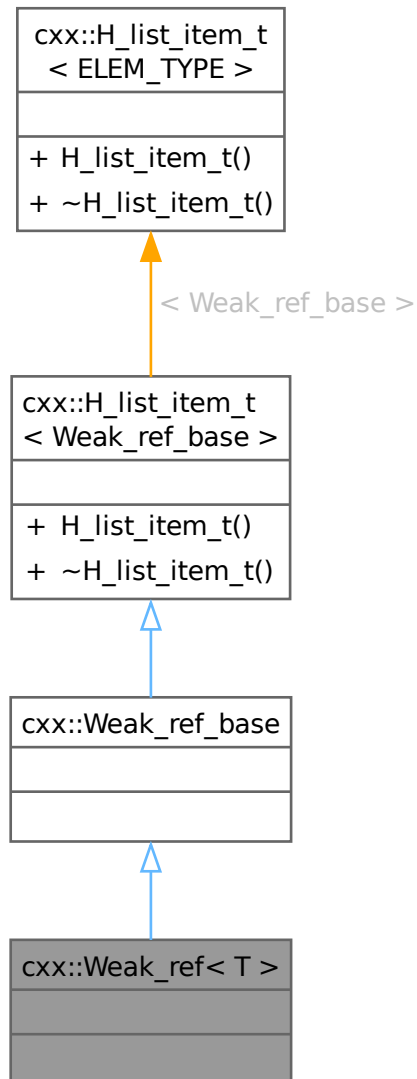

## 15.52 cxx::Weak\_ref< T > Class Template Reference

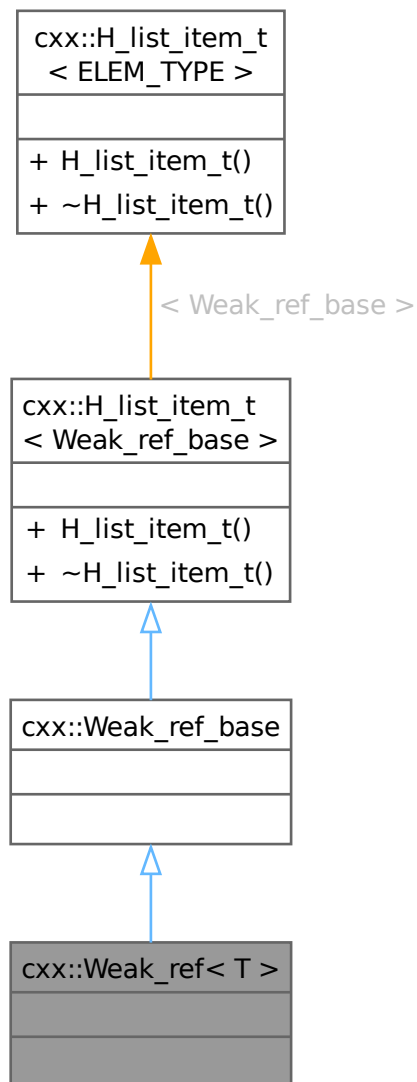

Typed weak reference to an object of type T.

```
#include <weak_ref>
```

Inheritance diagram for cxx::Weak\_ref< T >:

Collaboration diagram for `cxx::Weak_ref< T >`:

#### Additional Inherited Members

#### Public Member Functions inherited from `cxx::H_list_item_t< Weak_ref_base >`

- `H_list_item_t()`  
*Constructor.*
- `~H_list_item_t()` noexcept  
*Destructor.*

### 15.52.1 Detailed Description

```
template<typename T>
class cxx::Weak_ref< T >
```

Typed weak reference to an object of type `T`.

#### Template Parameters

<code>T</code>	The type of the referenced object.
----------------	------------------------------------

A weak reference is a reference that is invalidated when the referenced object is about to be deleted. All weak references to an object are kept in a linked list (see [Weak\\_ref\\_base::List](#)) and all the weak references are iterated and reset by the [Weak\\_ref\\_base::List](#) destructor or `Weak_ref_base::List::reset()`.

The type `T` must provide two methods that handle the housekeeping of weak references: `remove_weak_ref(Weak_ref_base *)` and `add_weak_ref(Weak_ref_base *)`. These functions must handle the insertion and removal of the weak reference into the respective [Weak\\_ref\\_base::List](#) object. For convenience one can use the `cxx::Weak_ref_obj` as a base class that handles weak references for you.

For example:

```
class C : public cxx::Weak_ref_obj {};

int main()
{
    cxx::Weak_ref<C> r; // r is nullptr
    {
        C c;
        r = &c; // now r points to c
    } // c is destructed, which implies resetting all weak references to c
    // now r is nullptr
    return 0;
}
```

#### Note

Weak references have no effect on the lifetime of the referenced object. Hence, a referenced object is *not* deleted when all weak references for it are gone. If automatic deletion is needed, see [cxx::Ref\\_ptr](#).

Definition at line 95 of file [weak\\_ref](#).

The documentation for this class was generated from the following file:

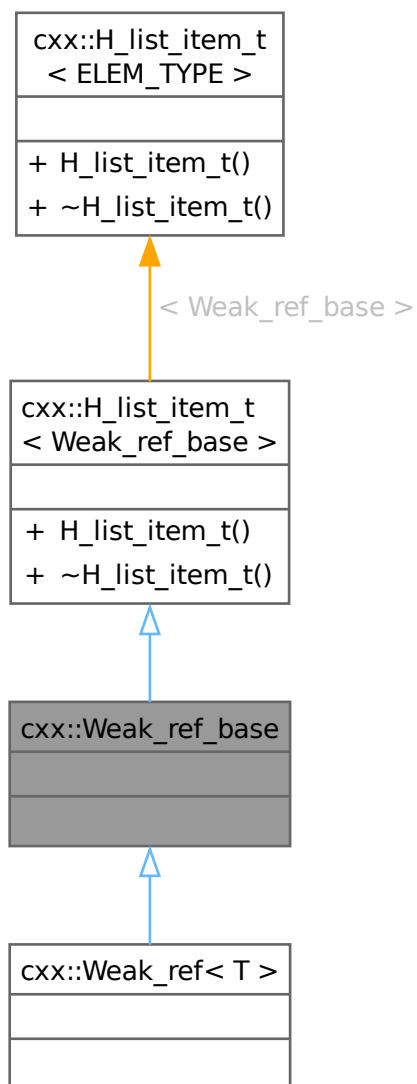

- `I4/cxx/weak_ref`

## 15.53 cxx::Weak\_ref\_base Class Reference

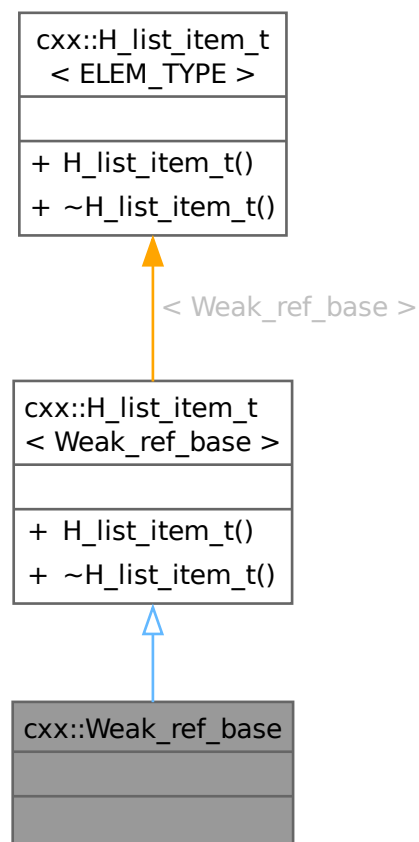

Generic (base) weak reference to some object.

```
#include <weak_ref>
```

Inheritance diagram for `cxx::Weak_ref_base`:

## Data Structures

- struct [List](#)

*The list type for keeping all weak references to an object.*

## Additional Inherited Members

## Public Member Functions inherited from [cxx::H\\_list\\_item\\_t< Weak\\_ref\\_base >](#)

- [H\\_list\\_item\\_t](#) ()  
*Constructor.*
- [~H\\_list\\_item\\_t](#) () noexcept  
*Destructor.*

### 15.53.1 Detailed Description

Generic (base) weak reference to some object.

A weak reference is a reference that gets reset to NULL when the object shall be deleted. All weak references to the same object are kept in a linked list of weak references.

For typed weak references see [cxx::Weak\\_ref](#).

Definition at line 24 of file [weak\\_ref](#).

The documentation for this class was generated from the following file:

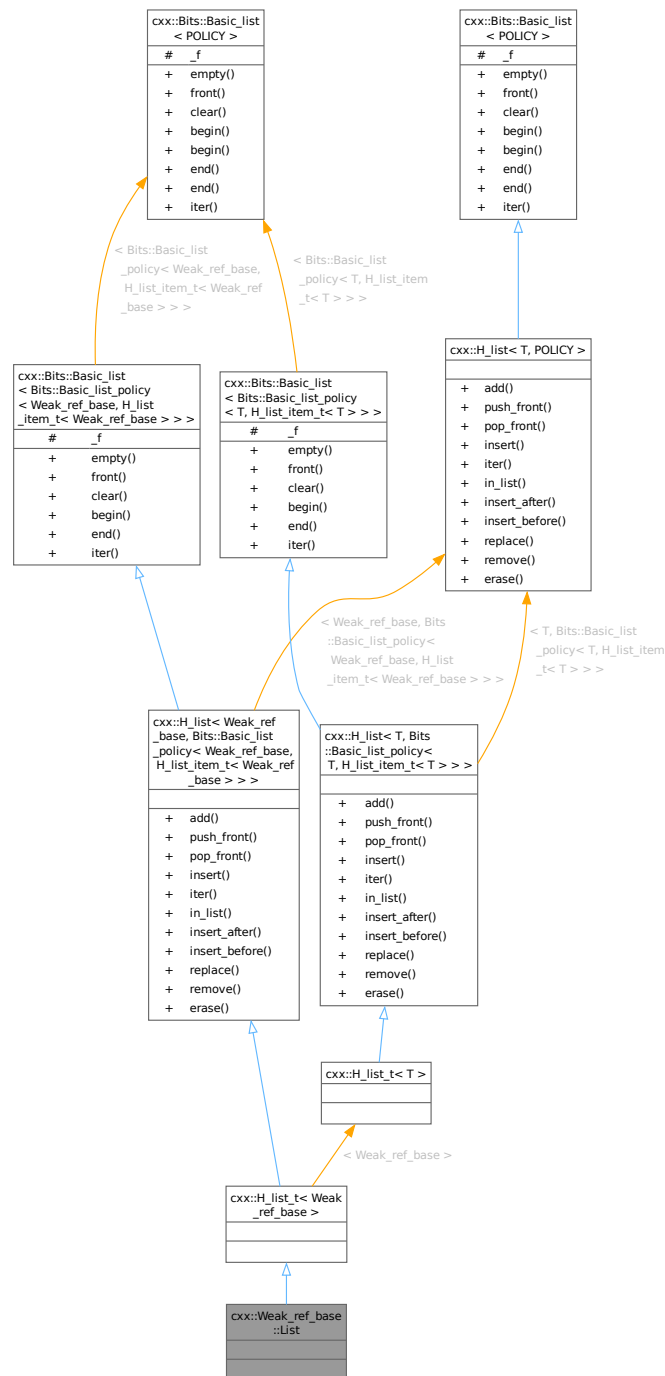

- I4/cxx/weak\_ref

## 15.54 cxx::Weak\_ref\_base::List Struct Reference

The list type for keeping all weak references to an object.

```
#include <weak_ref>
```

Inheritance diagram for cxx::Weak\_ref\_base::List:

Collaboration diagram for `cxx::Weak_ref_base::List`:

- static void **insert\_before** (`Weak_ref_base *e`, Iterator const &succ)  
*Insert an element before the iterator position.*
- static void **replace** (`Weak_ref_base *p`, `Weak_ref_base *e`)  
*Replace an element in a list with a new element.*
- static void **remove** (`Weak_ref_base *e`)  
*Remove the given element from its list.*
- static Iterator **erase** (Iterator const &e)  
*Remove the element at the given iterator position.*

### Static Public Member Functions inherited from

`cxx::Bits::Basic_list< Bits::Basic_list_policy< Weak_ref_base, H_list_item_t< Weak_ref_base > > >`

- static Const\_iterator **iter** (Const\_value\_type c)  
*Return a const iterator that begins at the given element.*

**Protected Attributes inherited from**

[cxx::Bits::Basic\\_list](#)< [Bits::Basic\\_list\\_policy](#)< [Weak\\_ref\\_base](#), [H\\_list\\_item\\_t](#)< [Weak\\_ref\\_base](#) > > >

- [Bits::Basic\\_list\\_policy](#)< [Weak\\_ref\\_base](#), [H\\_list\\_item\\_t](#)< [Weak\\_ref\\_base](#) > >::Head\_type\_f  
*Pointer to front of the list.*

**15.54.1 Detailed Description**

The list type for keeping all weak references to an object.

On destruction of a list, all weak references to the respective object are set to `nullptr`.

Definition at line 38 of file [weak\\_ref](#).

The documentation for this struct was generated from the following file:

- `l4/cxx/weak_ref`

**15.55 Elf32\_Auxv Struct Reference**

    l4_umword_t in5,
    l4_umword_t * out0,
    l4_umword_t * out1,
    l4_umword_t * out2,

```

```

14_umword_t * out3,
14_umword_t client_id)

```

ARM SMC/HVC function call.

The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.

### Parameters

	<i>func</i>	Function identifier. <ul style="list-style-type: none"> <li>• Bit 31 has to be set: This marks the call as <i>Fast Call</i>. <i>Yielding Calls</i> (bit 31 unset) are rejected by the kernel.</li> <li>• Bit 30 defines the calling convention:</li> <li>• Bit 30 == 1: 64-bit calling convention.</li> <li>• Bit 30 == 0: 32-bit calling convention.</li> <li>• Bits 24..29 determine the service call ID. The permitted IDs are set in the kernel configuration. By default only service IDs <math>\geq 0x30000000</math> (<i>Trusted Application Calls</i> and <i>Trusted OS Calls</i>) are allowed.</li> </ul>
in	<i>in0</i>	First input parameter.
in	<i>in1</i>	Second input parameter.
in	<i>in2</i>	Third input parameter.
in	<i>in3</i>	Fourth input parameter.
in	<i>in4</i>	Fifth input parameter.
in	<i>in5</i>	Sixth input parameter.
out	<i>out0</i>	First output parameter.
out	<i>out1</i>	Second output parameter.
out	<i>out2</i>	Third output parameter.
out	<i>out3</i>	Fourth output parameter.
in	<i>client_id</i>	Client ID. According to the specification, this value might be ignored by certain functions.

### Return values

-L4_ENOSYS	Either bit 31 of the function call not set or service ID outside the range permitted by kernel configuration.
-L4_EINVAL	Invalid number of parameters.
< 0	Other <a href="#">L4</a> error.
0	Success.

## 15.76 L4::Base\_exception Class Reference

Base class for all exceptions, thrown by the [L4Re](#) framework.

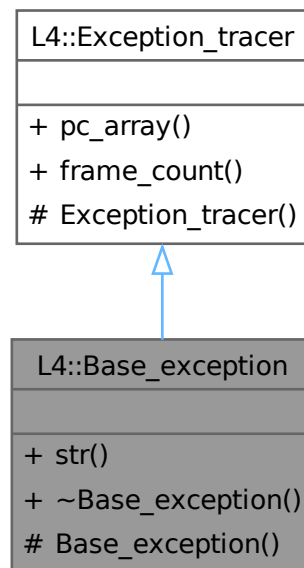

```
#include <l4/cxx/exceptions>
```

Inheritance diagram for L4::Base\_exception:

Collaboration diagram for L4::Base\_exception:

### Public Member Functions

- virtual char const \* **str** () const noexcept=0  
*Return a human readable string for the exception.*
- virtual ~**Base\_exception** () noexcept  
*Destruction.*

### Public Member Functions inherited from [L4::Exception\\_tracer](#)

- void const \*const \* **pc\_array** () const noexcept  
*Get the array containing the call trace.*
- int **frame\_count** () const noexcept  
*Get the number of entries that are valid in the call trace.*

### Protected Member Functions

- **Base\_exception** () noexcept  
*Create a base exception.*

### Protected Member Functions inherited from [L4::Exception\\_tracer](#)

- **Exception\_tracer** () noexcept  
*Create a back trace.*

### 15.76.1 Detailed Description

Base class for all exceptions, thrown by the [L4Re](#) framework.

This is the abstract base of all exceptions thrown within the [L4Re](#) framework. It is basically also a good idea to use it as base of all user defined exceptions.

Definition at line 105 of file [exceptions](#).

The documentation for this class was generated from the following file:

- [l4/cxx/exceptions](#)

## 15.77 L4::Basic\_registry Class Reference

This registry returns the corresponding server object based on the label of an [lpc\\_gate](#).

```
#include <ipc_epiface>
```

Inheritance diagram for L4::Basic\_registry:

Collaboration diagram for L4::Basic\_registry:

### Static Public Member Functions

- static Value \* [find](#) ([l4\\_umword\\_t](#) label)  
*Get the server object for an [lpc\\_gate](#) label.*
- static [l4\\_msgtag\\_t](#) [dispatch](#) ([l4\\_msgtag\\_t](#) tag, [l4\\_umword\\_t](#) label, [l4\\_utcb\\_t](#) \*utcb)  
*The dispatch function called by the server loop.*

## 15.77.1 Detailed Description

This registry returns the corresponding server object based on the label of an [lpc\\_gate](#).

Definition at line [529](#) of file [ipc\\_epiface](#).

## 15.77.2 Member Function Documentation

### 15.77.2.1 dispatch()

```

l4\_msgtag\_t L4::Basic_registry::dispatch (
    l4\_msgtag\_t tag,
    l4\_umword\_t label,
    l4\_utcb\_t * utcb) [inline], [static]
  
```

The dispatch function called by the server loop.

This function forwards the message to the server object identified by the given *label*.

#### Parameters

<i>tag</i>	The message tag used for the invocation.
<i>label</i>	The label used to find the object including the rights bits of the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

**Returns**

The return code from the object's dispatch function or `-L4_ENOENT` if the object does not exist.

Definition at line 554 of file [ipc\\_epiface](#).

References [L4::Epiface::dispatch\(\)](#), and [find\(\)](#).

Here is the call graph for this function:

**15.77.2.2 find()**

```
Value * L4::Basic_registry::find (
    l4_umword_t label) [inline], [static]
```

Get the server object for an [lpc\\_gate](#) label.

**Parameters**

<i>label</i>	The label usually stored in an <a href="#">lpc_gate</a> .
--------------	---

**Returns**

A pointer to the [Epiface](#) identified by the given label.

Definition at line 538 of file [ipc\\_epiface](#).

Referenced by [dispatch\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

### 15.79.1 Detailed Description

```
template<typename T>
class L4::Cap< T >
```

C++ interface for capabilities.

#### Template Parameters

<a href="#">T</a>	Type of the object the capability points to.
-------------------	--

The C++ version of a capability is comparable to a pointer, in fact it is a kind of smart pointer for our kernel objects and the objects derived from the kernel objects ([L4::Kobject](#)).

Add

```
#include <l4/sys/capability>
```

to your code to use the capability interface.

#### Examples

[examples/clntsrv/src/client.cc](#), [examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), [examples/libs/l4re/streammap/client.cc](#), and [examples/sys/migrate/thread\\_migrate](#)

Definition at line 223 of file [capability.h](#).

## 15.79.2 Constructor & Destructor Documentation

### 15.79.2.1 Cap() [1/4]

```
template<typename T>
template<typename O>
L4::Cap< T >::Cap (
    Cap< O > const & o) [inline], [noexcept]
```

Create a copy from *o*, supporting implicit type casting.

#### Parameters

<i>o</i>	The source selector that shall be copied (and casted).
----------	--

Definition at line 275 of file [capability.h](#).

### 15.79.2.2 Cap() [2/4]

```
template<typename T>
L4::Cap< T >::Cap (
    Cap_type cap) [inline], [noexcept]
```

Constructor to create an invalid capability selector.

#### Parameters

<i>cap</i>	Capability selector.
------------	----------------------

Definition at line 282 of file [capability.h](#).

### 15.79.2.3 Cap() [3/4]

```
template<typename T>
L4::Cap< T >::Cap (
    l4_default_caps_t cap) [inline], [noexcept]
```

Initialize capability with one of the default capability selectors.

#### Parameters

<i>cap</i>	Capability selector.
------------	----------------------

Definition at line 288 of file [capability.h](#).

**15.79.2.4 Cap()** [4/4]

```
template<typename T>
L4::Cap< T >::Cap (
    l4_cap_idx_t idx = L4_INVALID_CAP) [inline], [explicit], [noexcept]
```

Initialize capability, defaults to the invalid capability selector.

**Parameters**

<i>idx</i>	Capability selector.
------------	----------------------

Definition at line 294 of file [capability.h](#).

**15.79.3 Member Function Documentation****15.79.3.1 check\_castable\_from()**

```
template<typename T>
template<typename From>
void L4::Cap< T >::check_castable_from () [inline], [static], [noexcept]
```

Perform the type conversion that needs to compile in order for a capability of type From to be castable (via the correct `cap_cast`) to one of type T.

**Template Parameters**

<i>From</i>	Type to convert from
-------------	----------------------

Definition at line 264 of file [capability.h](#).

**15.79.3.2 check\_convertible\_from()**

```
template<typename T>
template<typename From>
void L4::Cap< T >::check_convertible_from () [inline], [static], [noexcept]
```

Perform the type conversion that needs to compile in order for a capability of type From to be convertible to one of type T.

**Template Parameters**

<i>From</i>	Type to convert from
-------------	----------------------

Definition at line 251 of file [capability.h](#).

*The C representation of a capability selector.*

## 15.80.1 Detailed Description

Base class for all kinds of capabilities.

#### Attention

This class is not for direct use, use [L4::Cap](#) instead.

This class contains all the things that are independent of the type of the object referred by the capability.

#### See also

[L4::Cap](#) for typed capabilities.

Definition at line 25 of file [capability.h](#).

## 15.80.2 Member Enumeration Documentation

### 15.80.2.1 Cap\_type

enum [L4::Cap\\_base::Cap\\_type](#)

Invalid capability type.

#### Enumerator

Invalid	Invalid capability selector.
---------	------------------------------

Definition at line [40](#) of file [capability.h](#).

### 15.80.2.2 No\_init\_type

enum [L4::Cap\\_base::No\\_init\\_type](#)

Special value for uninitialized capability objects.

#### Enumerator

No_init	Special value for constructing uninitialized <a href="#">Cap</a> objects.
---------	---

Definition at line [29](#) of file [capability.h](#).

## 15.80.3 Constructor & Destructor Documentation

### 15.80.3.1 Cap\_base() [1/2]

```
L4::Cap_base::Cap_base (
    l4\_cap\_idx\_t c) [inline], [explicit], [protected], [noexcept]
```

Generate a capability from its C representation.

#### Parameters

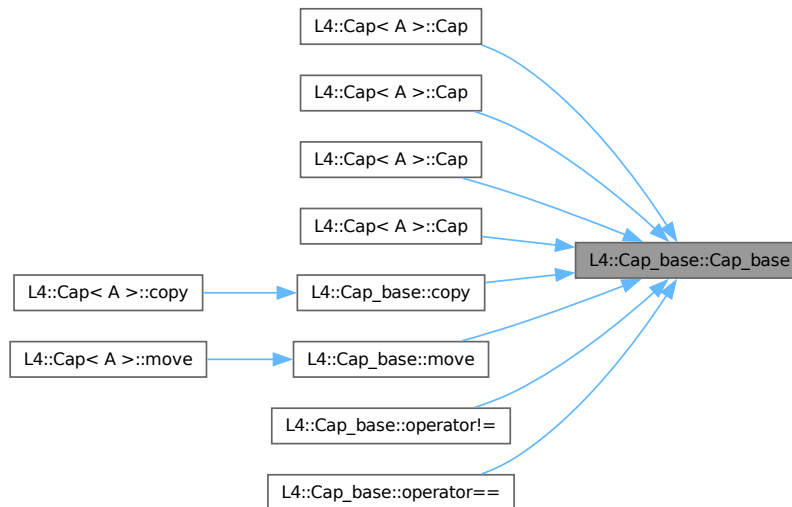

<i>c</i>	The C capability
----------	------------------

Definition at line [149](#) of file [capability.h](#).

References [\\_c](#).

Referenced by [L4::Cap< A >::Cap\(\)](#), [L4::Cap< A >::Cap\(\)](#), [L4::Cap< A >::Cap\(\)](#), [L4::Cap< A >::Cap\(\)](#), [copy\(\)](#), [move\(\)](#), [operator!=\(\)](#), and [operator==\(\)](#).

### 15.80.3.2 Cap\_base() [2/2]

```
L4::Cap_base::Cap_base (
    l4\_default\_caps\_t cap) [inline], [explicit], [protected], [noexcept]
```

Initialize capability with one of the default capabilities.

#### Parameters

<i>cap</i>	Capability.
------------	-------------

Definition at line [160](#) of file [capability.h](#).

References [\\_c](#), and [cap\(\)](#).

Here is the call graph for this function:

## 15.80.4 Member Function Documentation

### 15.80.4.1 cap()

```
l4_cap_idx_t L4::Cap_base::cap () const [inline], [noexcept]
```

Return capability selector.

#### Returns

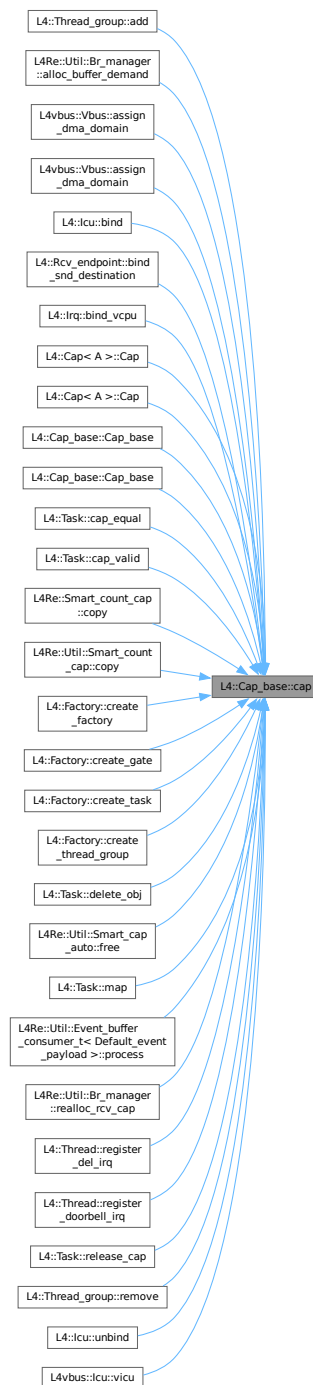

Capability selector.

Definition at line 49 of file [capability.h](#).

References [\\_c](#).

Referenced by [L4::Thread\\_group::add\(\)](#), [L4Re::Util::Br\\_manager::alloc\\_buffer\\_demand\(\)](#), [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), [L4::lcu::bind\(\)](#), [L4::Rcv\\_endpoint::bind\\_snd\\_destination\(\)](#), [L4::Irq::bind\\_vcpu\(\)](#), [L4::Cap< A >::Cap\(\)](#), [L4::Cap< A >::Cap\(\)](#), [Cap\\_base\(\)](#), [Cap\\_base\(\)](#), [L4::Task::cap\\_equal\(\)](#), [L4::Task::cap\\_valid\(\)](#), [L4Re::Smart\\_count\\_cap< Unmap\\_flags >::copy\(\)](#), [L4Re::Util::Smart\\_count\\_cap< Unmap\\_flags >::copy\(\)](#), [L4::Factory::create\\_factory\(\)](#), [L4::Factory::create\\_gate\(\)](#), [L4::Factory::create\\_task\(\)](#), [L4::Factory::create\\_thread\\_group\(\)](#), [L4::Task::delete\\_obj\(\)](#), [L4Re::Util::Smart\\_cap\\_auto< Unmap\\_flags >::free\(\)](#), [L4::Task::map\(\)](#), [L4Re::Util::Event\\_buffer\\_consumer\\_t< T >::map\(\)](#), [L4Re::Util::Br\\_manager::realloc\\_rcv\\_cap\(\)](#), [L4::Thread::register\\_del\\_irq\(\)](#), [L4::Thread::register\\_doorbell\\_irq\(\)](#), [L4::Task::release\\_cap\(\)](#), [L4::Thread\\_group::remove\(\)](#), [L4::lcu::unbind\(\)](#), and [L4vbus::lcu::vicu\(\)](#).

Here is the caller graph for this function:

### 15.80.4.2 copy()

```
void L4::Cap_base::copy (
    Cap_base const & src) const [inline], [protected]
```

Copy a capability.

**Parameters**

<i>src</i>	the source capability.
------------	------------------------

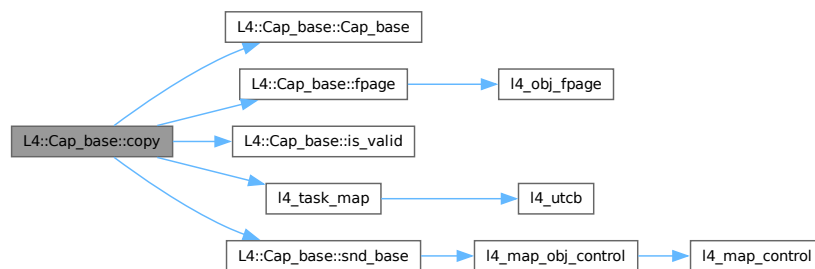

After this operation this capability refers to the same object as `src`.

Definition at line 192 of file `capability.h`.

References `Cap_base()`, `fpage()`, `is_valid()`, `L4_BASE_TASK_CAP`, `L4_CAP_FPAGE_RWSD`, `L4_FPAGE_C_OBJ_RIGHTS`, `l4_task_map()`, and `snd_base()`.

**15.80.4.7 validate() [1/2]**

```

l4_msgtag_t L4::Cap_base::validate (
    Cap< Task > task,
    l4_utcb_t * u = l4_utcb()) const [inline], [noexcept]
  
```

Check whether a capability is present (refers to an object).

**Parameters**

<i>task</i>	<a href="#">Task</a> to check the capability in.
<i>u</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Return values**

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
<i>l4_msgtag_t::label()</i> == 0	No capability present (void object or invalid capability slot).

A capability is considered present when it refers to an existing kernel object.

Definition at line 74 of file [capability](#).

- typedef [Debugger](#) **Class**  
*The target interface type (inheriting from [Kobject\\_t](#)).*
- typedef Typeid::Iface< [PROTO](#), [Debugger](#) > **\_\_Iface**  
*The interface description for the derived class.*
- typedef Typeid::Merge\_list< Typeid::Iface\_list< **\_\_Iface** >, typename [Kobject](#)::\_\_Iface\_list > **\_\_Iface\_list**  
*The list of all RPC interfaces provided directly or through inheritance.*

## Protected Member Functions inherited from

[L4::Kobject\\_t](#) < [Debugger](#), [Kobject](#), [L4\\_PROTO\\_DEBUGGER](#) >

- [L4::Cap](#) < **Class** > **c** () const noexcept  
*Get the capability to ourselves.*

## Protected Member Functions inherited from [L4::Kobject](#)

- [l4\\_cap\\_idx\\_t cap](#) () const noexcept  
*Return capability selector.*

## Static Protected Member Functions inherited from

[L4::Kobject\\_t](#) < [Debugger](#), [Kobject](#), [L4\\_PROTO\\_DEBUGGER](#) >

- static void **\_\_check\_protocols** () noexcept  
*Helper to check for protocol conflicts.*

### 15.82.1 Detailed Description

C++ kernel debugger API.

#### Attention

This API is subject to change! Do not rely on it in production code.

This API is to be used for debugging exclusively.

This is the API for accessing kernel-debugger functionality from user-level programs. Specifically, it provides functionality to enrich the kernel debugger with insights into the program. The purpose is to facilitate debugging with the kernel debugger. For instance, a developer might choose to name the threads of her program so that she can find them in the kernel debugger thread list.

This API interacts with a kernel object that interfaces with the kernel debugger, the jdb-kernel object. The jdb-kernel object is fix and only available when the kernel debugger is built into the microkernel. The developer needs to pass the capability through to her program.

#### Include File

```
#include <l4/sys/debugger>
```

Definition at line 42 of file [debugger](#).

### 15.82.2 Member Function Documentation

#### 15.82.2.1 add\_image\_info()

```
l4_msgtag_t L4::Debugger::add_image_info (
    l4_addr_t base,
    const char * name,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Add loaded image information for a task.

#### Parameters

<i>base</i>	Image load base address
<i>name</i>	Image name
<i>utcb</i>	The UTCB to use for the operation.

#### Returns

System call return tag.

Definition at line 175 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.82.2.2 get\_object\_name()

```
l4_msgtag_t L4::Debugger::get_object_name (
    char * name,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Get name of object.

#### Parameters

out	<i>name</i>	Buffer to copy the name into. The buffer must be allocated by the caller.
	<i>size</i>	Length of the <i>name</i> buffer.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Definition at line 162 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.82.2.3 global\_id()

```
unsigned long L4::Debugger::global_id (
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Get the globally unique ID of the object behind a capability.

#### Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

#### Return values

$\sim 0UL$	The capability is invalid.
$\geq 0$	The global debugger id.

Definition at line 71 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

#### 15.82.2.4 kobj\_to\_id()

```

unsigned long L4::Debugger::kobj_to_id (
    l4_addr_t kobjp,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Get the globally unique ID of the object behind the kobject pointer.

##### Parameters

<i>kobjp</i>	<a href="#">Kobject</a> pointer
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

##### Return values

$\sim 0UL$	The capability or the <a href="#">Kobject</a> pointer are invalid.
$\geq 0$	The globally unique id.

Definition at line 83 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.82.2.5 query\_log\_name()

```
l4_ret_t L4::Debugger::query_log_name (
    unsigned idx,
    char * name,
    unsigned namelen,
    char * shortname,
    unsigned shortnamelen,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Query the name of a log type given the ID.

#### Parameters

	<i>idx</i>	ID to query.
out	<i>name</i>	<a href="#">Buffer</a> to copy name to. The buffer must be allocated by the caller.
	<i>namelen</i>	<a href="#">Buffer</a> length of name.
out	<i>shortname</i>	<a href="#">Buffer</a> to copy shortname to. The buffer must be allocated by the caller.
	<i>shortnamelen</i>	<a href="#">Buffer</a> length of shortname.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Return values

0	Success
<0	Error

Definition at line 116 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.82.2.6 query\_log\_typeid()

```
l4_ret_t L4::Debugger::query_log_typeid (
    const char * name,
```

```

    unsigned idx,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]

```

Query the log-id for a log type.

#### Parameters

<i>name</i>	Name to query for.
<i>idx</i>	Idx to start searching, start with 0
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Return values

$\geq 0$	Id
$< 0$	Error

Definition at line 97 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

#### 15.82.2.7 query\_object\_name()

```

l4_msgtag_t L4::Debugger::query_object_name (
    unsigned id,
    char * name,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]

```

Get name of object with Id *id*.

#### Parameters

	<i>id</i>	Id of the object whose name is asked.
out	<i>name</i>	<a href="#">Buffer</a> to copy the name into. The buffer must be allocated by the caller.
	<i>size</i>	Length of the <i>name</i> buffer.

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
--	-------------	--

**Returns**

Syscall return tag

Definition at line 148 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.82.2.8 set\_object\_name()**

```

l4_msgtag_t L4::Debugger::set_object_name (
    const char * name,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Set the name of a kernel object.

**Parameters**

<i>name</i>	Name
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

System call return tag.

Definition at line 59 of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.82.2.9 switch\_log()

```
l4_msgtag_t L4::Debugger::switch_log (
    const char * name,
    unsigned on_off,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Set or unset log.

#### Parameters

<i>name</i>	Name of the log type.
<i>on_off</i>	1: turn log on, 0: turn log off
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Definition at line [133](#) of file [debugger](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

*Set server registration info for the object.*
- void `set_obj_cap (Cap< void > const &cap)`  
*Deprecated server registration function.*

### 15.85.1 Detailed Description

Base class for interface implementations.

An [Epiface](#) is the base interface of objects registered in the server loop. Incoming IPC gets dispatched to the appropriate [Epiface](#) object where the call is then handled appropriately.

#### Note

[Server](#) loops are allowed to internally keep raw pointers to [Epiface](#) objects for dispatching calls. Instances must therefore never be copied or moved.

Definition at line 145 of file [ipc\\_epiface](#).

### 15.85.2 Member Function Documentation

#### 15.85.2.1 dispatch()

```
virtual l4_msgtag_t L4::Epiface::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb) [pure virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.

<i>utcb</i>	The UTCB used for the invocation.
-------------	-----------------------------------

### Return values

<code>-L4_ENOREPLY</code>	No reply message is send.
<code>&lt;0</code>	Error, reply with error code.
<code>&gt;=0</code>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implemented in [L4::Epiface\\_t< Derived, IFACE, BASE, bool >](#), [L4::Epiface\\_t< Block\\_dev< Ds\\_data >, L4virtio::Device >](#), [L4::Epiface\\_t< Null\\_handler, L4::Kobject >](#), [L4::Epiface\\_t< Stats\\_reader, Virtio\\_net\\_switch::Statistics\\_if >](#), [L4::Epiface\\_t< Switch\\_factory, L4::Factory >](#), [L4::Epiface\\_t< Virtio\\_gpio< Request\\_handler, L4virtio::Device >, L4virtio::Device >](#), [L4::Epiface\\_t< Virtio\\_i2c< Request\\_handler, L4virtio::Device >, L4virtio::Device >](#), [L4::Epiface\\_t< Virtio\\_net, L4virtio::Device >](#), [L4::Epiface\\_t< Virtio\\_rng< Rnd\\_state >, L4virtio::Device >](#), [L4::Epiface\\_t< Virtio\\_spi< Spi\\_request\\_handler, L4virtio::Device >, L4virtio::Device >](#), [L4::Irqep\\_t< Derived, BASE, bool >](#), [L4::Irqep\\_t< Del\\_cap\\_irq >](#), [L4::Irqep\\_t< Host\\_irq >](#), [L4::Irqep\\_t< Irq\\_object >](#), [L4::Irqep\\_t< Kick\\_irq >](#), and [L4::Server\\_object](#).

Referenced by [L4::Basic\\_registry::dispatch\(\)](#).

Here is the caller graph for this function:

### 15.85.2.2 get\_buffer\_demand()

```
virtual Demand L4::Epiface::get_buffer_demand () const [pure virtual]
```

Get the server-side receive buffer demand for this object.

#### Note

This function is usually not implemented directly, but by using [Server\\_object\\_t](#) template with an IPC interface definition.

#### Returns

The needed server-side receive buffers for this object

Implemented in [L4::Epiface\\_t0< RPC\\_IFACE, BASE >](#), [L4::Epiface\\_t0< IFACE, L4::Epiface >](#), [L4::Epiface\\_t0< L4::Factory, L4::Epiface >](#), [L4::Epiface\\_t0< L4::Kobject, L4::Epiface >](#), [L4::Epiface\\_t0< L4virtio::Device, L4::Epiface >](#), [L4::Epiface\\_t0< Virtio\\_net\\_switch::Statistics\\_if, L4::Epiface >](#), [L4::Epiface\\_t0< void, Epiface >](#), [L4::Server\\_object\\_t< IFACE, BASE >](#), [L4::Server\\_object\\_t< IFACE, L4::Server\\_object >](#), and [L4::Server\\_object\\_t< Kobject >](#).

### 15.85.2.3 obj\_cap()

```
Stored_cap L4::Epiface::obj_cap () const [inline]
```

Get the capability to the kernel object belonging to this object.

#### Returns

Capability for the kernel object behind the server.

This is usually either an [lpc\\_gate](#) or an [lrc](#).

Definition at line 206 of file [ipc\\_epiface](#).

Referenced by [L4Re::Util::Object\\_registry::unregister\\_obj\(\)](#).

Here is the caller graph for this function:

### 15.85.2.4 server\_iface()

```
Server_iface * L4::Epiface::server_iface () const [inline]
```

Get pointer to server interface at which the object is currently registered.

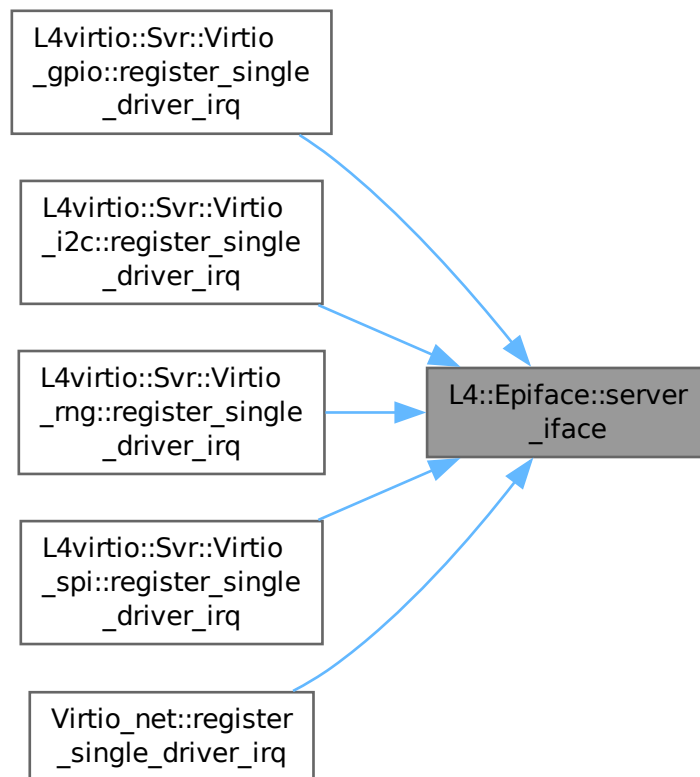

#### Returns

Pointer to the server at which the object is currently registered, NULL if the object is not registered at any server.

Definition at line 213 of file [ipc\\_epiface](#).

Referenced by [L4virtio::Svr::Virtio\\_gpio< Request\\_handler, Epiface >::register\\_single\\_driver\\_irq\(\)](#), [L4virtio::Svr::Virtio\\_i2c< Request\\_handler, Epiface >::register\\_single\\_driver\\_irq\(\)](#), [L4virtio::Svr::Virtio\\_rng< Rnd\\_state, Epiface >::register\\_single\\_driver\\_irq\(\)](#), [L4virtio::Svr::Virtio\\_spi< Spi\\_request\\_handler, Epiface >::register\\_single\\_driver\\_irq\(\)](#), and [Virtio\\_net::register\\_single\\_driver\\_irq\(\)](#).

Here is the caller graph for this function:

### 15.85.2.5 set\_server()

```
int L4::Epiface::set_server (
    Server_iface * srv,
    Cap< void > cap,
    bool managed = false) [inline]
```

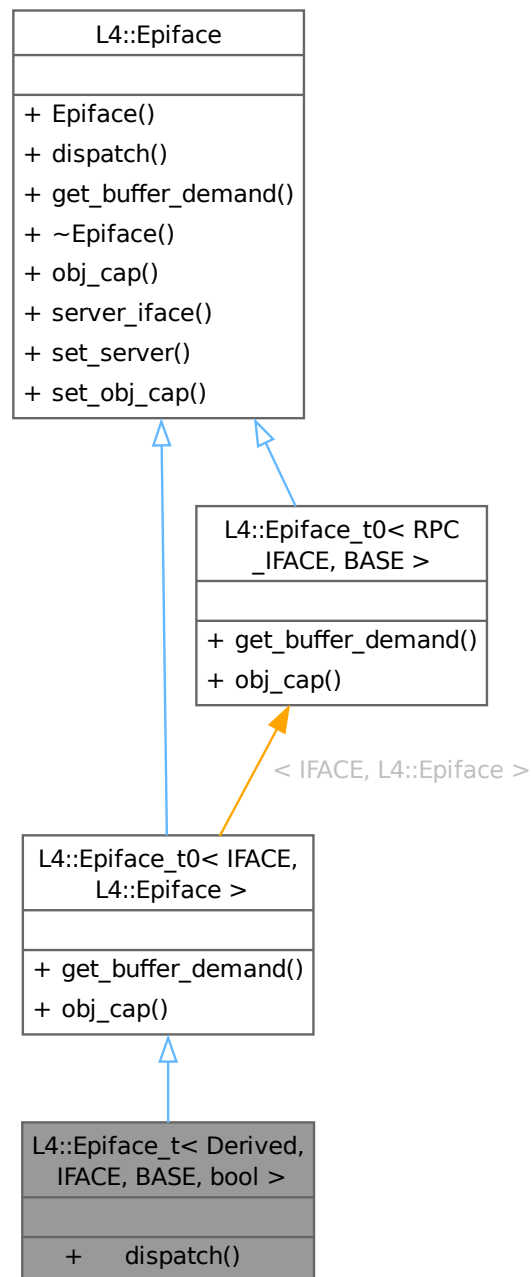

Set server registration info for the object.

#### Parameters

<i>srv</i>	The server to register at
<i>cap</i>	The capability that connects the object.
<i>managed</i>	Mark the capability as managed or unmanaged. Typical server implementations use this flag to remember whether the capability was internally allocated or not.

Collaboration diagram for L4::Epiface\_t< Derived, IFACE, BASE, bool >:

## 15.86.1 Detailed Description

```
template<typename Derived, typename IFACE, typename BASE = L4::Epiface, bool = cxx::is_↵
polymorphic<BASE>::value>
struct L4::Epiface_t< Derived, IFACE, BASE, bool >
```

[Epiface](#) implementation for Kobject-based interface implementations.

### Template Parameters

<i>Derived</i>	Class providing the interface implementations.
<i>BASE</i>	<a href="#">Epiface</a> base class.

### Examples

[examples/clntsrv/src/server.cc](#).

Definition at line 503 of file [ipc\\_epiface](#).

## 15.86.2 Member Function Documentation

### 15.86.2.1 dispatch()

```
template<typename Derived, typename IFACE, typename BASE = L4::Epiface, bool = cxx::is_↵
polymorphic<BASE>::value>
l4_msgtag_t L4::Epiface_t< Derived, IFACE, BASE, bool >::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb) [inline], [final], [virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

#### Return values

<code>-L4_ENOREPLY</code>	No reply message is send.
<code>&lt; 0</code>	Error, reply with error code.
<code>&gt;= 0</code>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implements [L4::Epiface](#).

Definition at line [506](#) of file [ipc\\_epiface](#).

The documentation for this struct was generated from the following file:

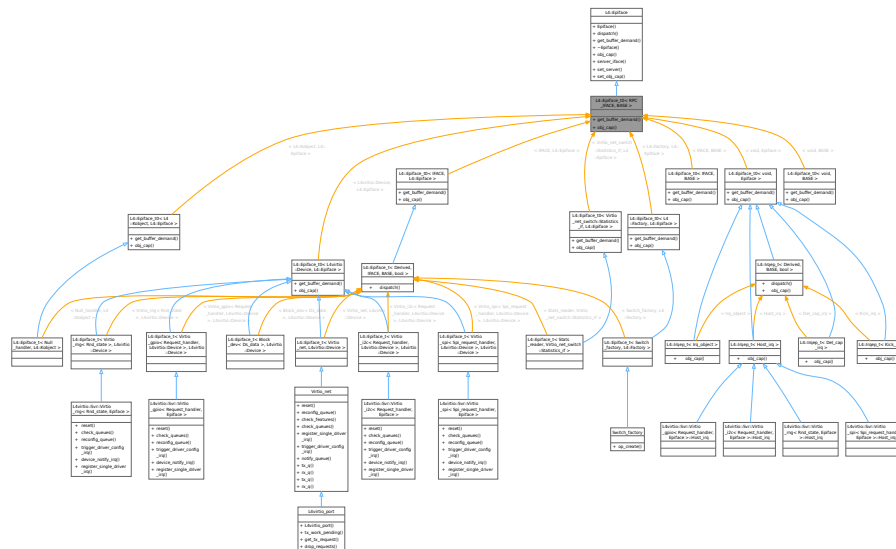

- `l4/sys/cxx/ipc_epiface`

## 15.87 L4::Epiface\_t0< RPC\_IFACE, BASE > Struct Template Reference

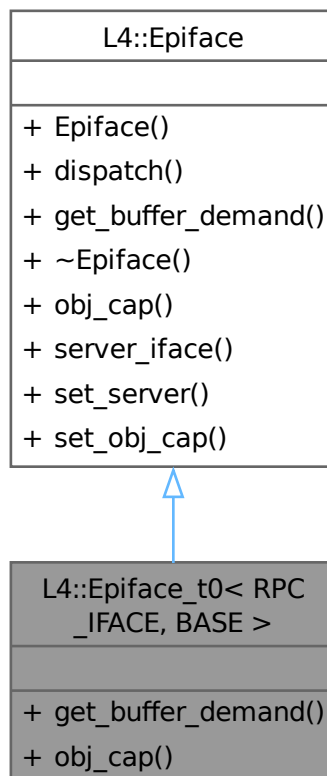

[Epiface](#) mixin for generic Kobject-based interfaces.

```
#include <ipc_epiface>
```

Inheritance diagram for L4::Epiface\_t0< RPC\_IFACE, BASE >:

Collaboration diagram for L4::Epiface\_t0< RPC\_IFACE, BASE >:

## Public Types

*Deprecated server registration function.*

### 15.87.1 Detailed Description

```
template<typename RPC_IFACE, typename BASE = Epiface>
struct L4::Epiface_t0< RPC_IFACE, BASE >
```

[Epiface](#) mixin for generic Kobject-based interfaces.

#### Template Parameters

<code>RPC_IFACE</code>	Data type of the IPC interface definition.
------------------------	--

<i>BASE</i>	Base <a href="#">Epiface</a> class.
-------------	-------------------------------------

Definition at line 256 of file [ipc\\_epiface](#).

## 15.87.2 Member Function Documentation

### 15.87.2.1 `obj_cap()`

```
template<typename RPC_IFACE, typename BASE = Epiface>
Cap< RPC_IFACE > L4::Epiface_t0< RPC_IFACE, BASE >::obj_cap () const [inline]
```

Get the (typed) capability to this object.

#### Returns

Capability for the kernel object behind the server.

Definition at line 269 of file [ipc\\_epiface](#).

References [L4::cap\\_cast\(\)](#).

Here is the call graph for this function:

The documentation for this struct was generated from the following file:

- `l4/sys/cxx/ipc_epiface`

## 15.88 L4::Exception Class Reference

[Exception](#) interface.

```
#include <exception>
```

Collaboration diagram for `L4::Exception`:

## Public Member Functions

- [l4\\_msgtag\\_t exception](#) ([L4::lpc::In\\_out](#)< [l4\\_exc\\_regs\\_t](#) \* > *regs*, [L4::lpc::Rcv\\_fpage](#) *rwin*, [L4::lpc::Opt](#)< [L4::lpc::Snd\\_fpage](#) & > *fp*)  
*Exception call.*

### 15.88.1 Detailed Description

[Exception](#) interface.

This class defines the interface for handling exception IPC. When an exception occurs during program execution, for example due to a division by zero, the kernel will synthesise an exception IPC and send it to the thread's exception handler, who can then handle it.

The exception handler is set with the [L4::Thread::control](#) interface.

Definition at line 31 of file [exception](#).

### 15.88.2 Member Function Documentation

#### 15.88.2.1 exception()

```
l4\_msgtag\_t L4::Exception::exception (
    L4::Ipc::In\_out< l4\_exc\_regs\_t * > regs,
    L4::Ipc::Rcv\_fpage rwin,
    L4::Ipc::Opt< L4::Ipc::Snd\_fpage & > fp)
```

[Exception](#) call.

#### Parameters

	<i>regs</i>	Register state of the faulting thread.
	<i>rwin</i>	Receive window in the address space.
out	<i>fp</i>	Optional flexpage to resolve the exception.

#### Returns

Message tag containing error code.

The documentation for this class was generated from the following file:

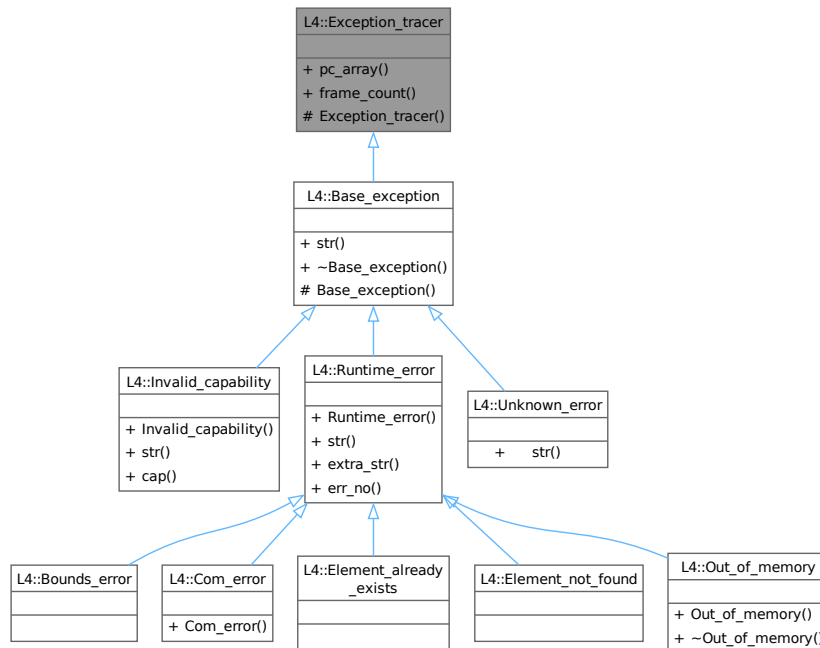

- [l4/sys/exception](#)

## 15.89 L4::Exception\_tracer Class Reference

Back-trace support for exceptions.

```
#include <l4/cxx/exceptions>
```

Inheritance diagram for L4::Exception\_tracer:

Collaboration diagram for L4::Exception\_tracer:

### Public Member Functions

- void const \*const \* **pc\_array** () const noexcept  
*Get the array containing the call trace.*
- int **frame\_count** () const noexcept  
*Get the number of entries that are valid in the call trace.*

### Protected Member Functions

- **Exception\_tracer** () noexcept  
*Create a back trace.*

## 15.89.1 Detailed Description

Back-trace support for exceptions.

This class holds an array of at most [L4\\_CXX\\_EXCEPTION\\_BACKTRACE](#) instruction pointers containing the call trace at the instant when an exception was thrown.

Definition at line 51 of file [exceptions](#).

The documentation for this class was generated from the following file:

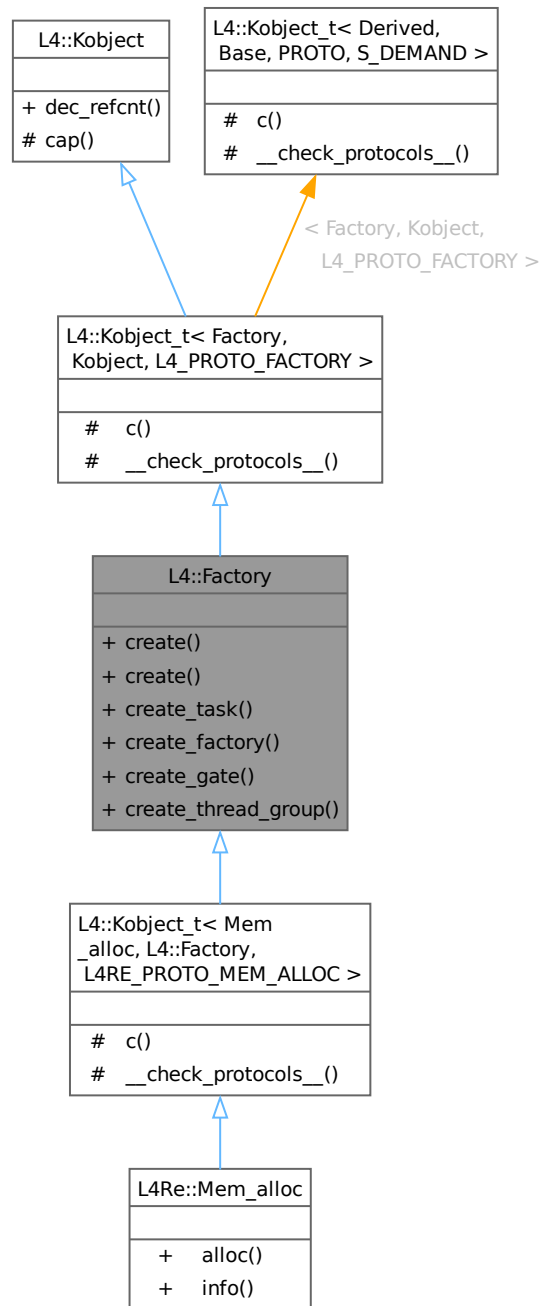

- [l4/cxx/exceptions](#)

## 15.90 L4::Factory Class Reference

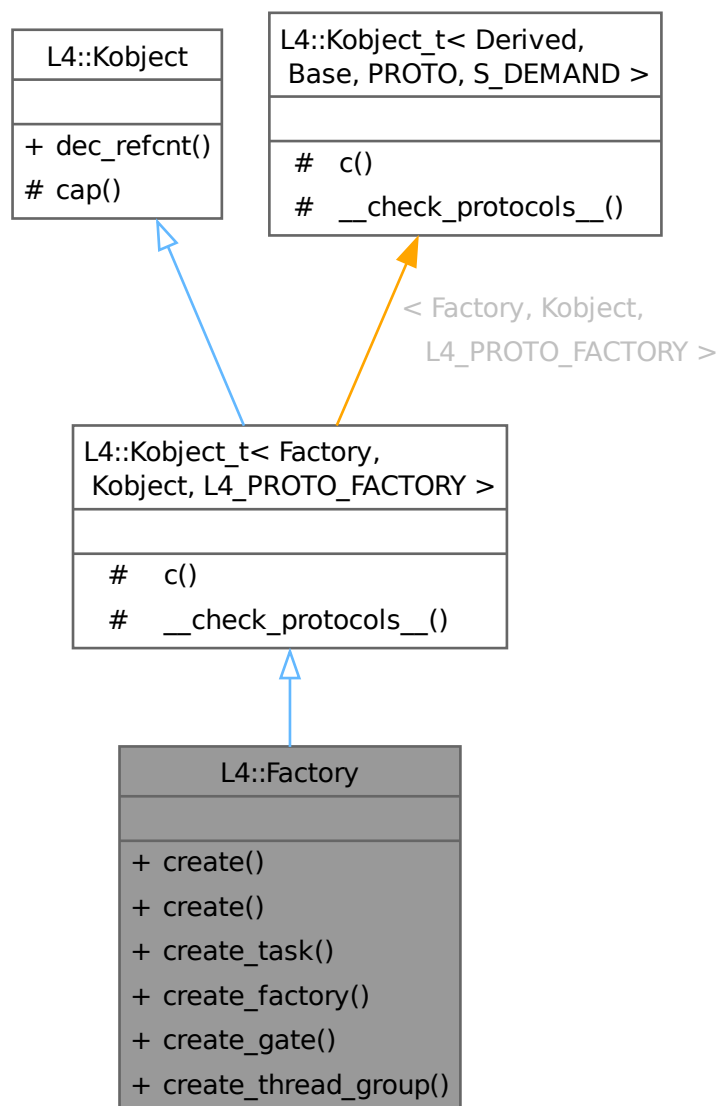

C++ Factory interface, see [Factory](#) for the C interface.

```
#include <factory>
```

- static void `__check_protocols__()` noexcept  
*Helper to check for protocol conflicts.*

### 15.90.1 Detailed Description

C++ Factory interface, see [Factory](#) for the C interface.

Factories provide an interface to create objects which are accessed via capabilities.

For additional information about which objects can be created via this interface, see server-specific information in [Kernel Factory](#) and [L4Re Servers](#).

#### Include File

```
#include <l4/sys/factory>
```

For the C interface refer to [Factory](#).

Definition at line 38 of file [factory](#).

### 15.90.2 Member Function Documentation

#### 15.90.2.1 `create()` [1/2]

```
template<typename OBJ>
S L4::Factory::create (
    Cap< OBJ > target,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Create call for typed capabilities.

#### Template Parameters

<i>OBJ</i>	Capability type of the object to be created.
------------	--

#### Parameters

out	<i>target</i>	Capability of type OBJ.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

A create stream that allows additional arguments to be passed to the `create()` call via the left-shift (`<<`) operator (see [S::operator <<](#)).

This method does not directly invoke the factory. The factory is invoked when the create stream returned by this method is converted to an [l4\\_msgtag\\_t](#) (see [S::operator l4\\_msgtag\\_t\(\)](#)), or otherwise when the stream goes out of scope (not recommended; see [S::~~S\(\)](#)).

**Precondition**

The invoked [Factory](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#), otherwise the later factory IPC will fail with [L4\\_EPERM](#) (see [S::operator l4\\_msgtag\\_t\(\)](#)).

**Note**

The create stream uses the UTCB to store parameters for the service call. During the lifetime of a create stream or, until it is converted to an [l4\\_msgtag\\_t](#), other UTCB-using operations must not be used.

**Usage:**

```
L4::Cap<L4Re::Dataspace> ds = L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>();
factory->create(ds) << l4_mword_t(size_in_bytes);
```

Definition at line 329 of file [factory](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.90.2.2 create() [2/2]**

```
S L4::Factory::create (
    Cap< void > target,
    long obj,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Generic create call to the factory.

**Parameters**

out	<i>target</i>	Capability selector for the new object. The caller must allocate the capability slot. The kernel stores the new objects's capability into this slot.
-----	---------------	--

<i>obj</i>	The protocol ID that specifies which kind of object shall be created.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

### Returns

A create stream that allows additional arguments to be passed to the `create()` call via the left-shift (`<<`) operator (see [S::operator <<](#)).

This method does not directly invoke the factory. The factory is invoked when the create stream returned by this method is converted to an [l4\\_msgtag\\_t](#) (see [S::operator l4\\_msgtag\\_t\(\)](#)), or otherwise when the stream goes out of scope (not recommended; see [S::~S\(\)](#)).

### Precondition

The invoked [Factory](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#), otherwise the later factory IPC will fail with [L4\\_EPERM](#) (see [S::operator l4\\_msgtag\\_t\(\)](#)).

### Note

The create stream uses the UTCB to store parameters for the service call. During the lifetime of a create stream or, until it is converted to an [l4\\_msgtag\\_t](#), other UTCB-using operations must not be used.

### See also

[create\(Cap<OBJ>, l4\\_utcb\\_t \\*\)](#)

Definition at line 292 of file [factory](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.90.2.3 create\_factory()

```
l4_msgtag_t L4::Factory::create_factory (
    Cap< Factory > const & target_cap,
    unsigned long limit,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Create a new factory.

#### Parameters

out	<i>target_cap</i>	The kernel stores the new factory's capability into this slot.
	<i>limit</i>	Limit for the new factory in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

#### Precondition

The invoked [Factory](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

#### Note

In addition to memory needed for internal data structures, the *limit* (quota) of the new factory is counted towards the quota of the creating factory. The *limit* must be within  $1 \leq \text{limit} \leq 2^{(8 * \text{sizeof}(\text{l4\_umword\_t}) - 1) - 2}$  otherwise the behavior is undefined.

This method is only guaranteed to work with the [Kernel Factory](#). For other services, use the generic [create\(\)](#) method and consult the service documentation for information on the arguments that need to be passed to the create stream.

Definition at line [404](#) of file [factory](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.90.2.4 create\_gate()

```
l4_msgtag_t L4::Factory::create_gate (
    Cap< void > const & target_cap,
    Cap< Snd_destination > const & snd_dst_cap,
    l4_umword_t label,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Create a new IPC gate, optionally bound to a send destination (a thread or thread group).

#### Parameters

out	<i>target_cap</i>	The kernel stores the new IPC gate's capability into this slot.
	<i>snd_dst_cap</i>	Optional capability selector of a thread or thread group to bind the gate to. Use <a href="#">L4_INVALID_CAP</a> to create an unbound IPC gate.
	<i>label</i>	Optional label of the gate (precisely used if <i>snd_dst_cap</i> is valid). If <i>snd_dst_cap</i> is valid, <i>label</i> must be present.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag containing one of the following return codes.

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_ENOMEM</i>	Out-of-memory during allocation of the <a href="#">lpc_gate</a> object.
<i>-L4_EINVAL</i>	<i>snd_dst_cap</i> is void or points to something that is not a thread or thread group.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.

#### Precondition

The invoked [Factory](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#). Also *snd\_dst\_cap* (if *valid*) must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

An unbound IPC gate can be bound to a thread or thread group using [L4::lpc\\_gate::bind\\_thread\(\)](#) or [bind\\_snd\\_destination\(\)](#).

#### See also

[L4::lpc\\_gate](#)

Definition at line 440 of file [factory](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.90.2.5 create\_task()

```

l4_msgtag_t L4::Factory::create_task (
    Cap< Task > const & target_cap,
    l4_fpage_t * utcb_area,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Create a new task.

#### Parameters

out	<i>target_cap</i>	The kernel stores the new task's capability into this slot.
in, out	<i>utcb_area</i>	Flexpage that describes an area in the address space of the new task, where the kernel should map the kernel-allocated kernel-user memory to. The kernel uses the kernel-user memory to store UTCBs and vCPU state-save-areas of the new task.

On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.

#### Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

#### Returns

Syscall return tag

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

**Precondition**

The invoked [Factory](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

**Note**

The size of the UTCB area specifies indirectly the number of UTCBs available for this task. Refer to [L4::Task::add\\_ku\\_mem](#) for adding more of this type of memory.

**See also**

[L4::Task](#)

Definition at line 370 of file [factory](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.90.2.6 create\_thread\_group()**

```

l4_msgtag_t L4::Factory::create_thread_group (
    Cap< Thread_group > const & target_cap,
    unsigned policy,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Create a new thread group.

An IPC endpoint can be bound to a thread group. When a message arrives at the IPC endpoint, a specific thread of the thread group is selected to actually receive the message. A thread group is a send destination for an IPC endpoint.

**Parameters**

out	<i>target_cap</i>	The kernel stores the new thread group's capability into this slot.
	<i>policy</i>	Policy parameter for the thread group. See <code>L4_thread_group_policy</code> for a list of supported values.

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
--	-------------	--

### Returns

Syscall return tag containing one of the following return codes.

### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_ENOMEM</i>	Out-of-memory during allocation of the <a href="#">Thread_group</a> object.
<i>-L4_EINVAL</i>	Invalid policy parameter.
<i>-L4_EPERM</i>	The factory instance requires <a href="#">L4_CAP_FPAGE_S</a> rights on the invoked capability and <a href="#">L4_CAP_FPAGE_S</a> is not present.

Definition at line [475](#) of file [factory](#).

*Add next argument.*

### 15.93.1 Detailed Description

Stream class for the `create()` argument stream.

This stream allows a variable number of arguments to be added to a `create()` call.

Definition at line 79 of file `factory`.

### 15.93.2 Constructor & Destructor Documentation

#### 15.93.2.1 `S()` [1/2]

```
L4::Factory::S::S (
    S && o) [inline], [noexcept]
```

Move constructor.

#### Parameters

<i>o</i>	Instance of <code>S</code> to move.
----------	-------------------------------------

Definition at line 98 of file `factory`.

#### 15.93.2.2 `S()` [2/2]

```
L4::Factory::S::S (
    l4_cap_idx_t f,
    long obj,
    L4::Cap< void > target,
    l4_utcb_t * utcb) [inline], [noexcept]
```

Create a stream for a specific `create()` call.

#### Parameters

	<i>f</i>	The capability for the factory object ( <code>L4::Factory</code> ).
	<i>obj</i>	The protocol ID to describe the type of the object that shall be created.
out	<i>target</i>	The capability selector for the new object. The caller must allocate the capability slot. The kernel stores the new object's capability into this slot.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <code>l4_utcb</code> .

#### Precondition

The capability `f` must have the permission `L4_CAP_FPAGE_S`, otherwise the later factory IPC will fail with `L4_EPERM`.

Definition at line 125 of file `factory`.

### 15.93.2.3 ~S()

```
L4::Factory::S::~~S () [inline], [noexcept]
```

Commit the [create\(\)](#) operation if not already done explicitly via [operator l4\\_msgtag\\_t\(\)](#).

#### Warning

If the commit is deferred until destruction, potential errors are silently ignored. It is therefore recommended to commit explicitly via [operator l4\\_msgtag\\_t\(\)](#) and check the return value.

Definition at line 139 of file [factory](#).

## 15.93.3 Member Function Documentation

### 15.93.3.1 operator l4\_msgtag\_t()

```
L4::Factory::S::operator l4_msgtag_t () [inline], [noexcept]
```

Explicitly commits the operation and returns the result.

#### Returns

The result of the [create\(\)](#) operation.

#### Return values

<i>L4_EOK</i>	No error occurred.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>&lt;0</i>	Error code.

#### Precondition

The invoked [Factory](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line 157 of file [factory](#).

**15.93.3.2 operator<<() [1/2]**

```
template<typename T>
S && L4::Factory::S::operator<< (
    T const & d) && [inline], [noexcept]
```

Add next argument.

**Template Parameters**

<i>T</i>	The argument type. Compilation succeeds only if it is a possible argument type for <code>S::put()</code> .
----------	--

**Parameters**

<i>d</i>	The value to add as next argument.
----------	------------------------------------

Definition at line [252](#) of file [factory](#).

References [put\(\)](#).

Here is the call graph for this function:

**15.93.3.3 operator<<() [2/2]**

```
template<typename T>
S & L4::Factory::S::operator<< (
    T const & d) & [inline], [noexcept]
```

Add next argument.

**Template Parameters**

<i>T</i>	The argument type. Compilation succeeds only if it is a possible argument type for <code>S::put()</code> .
----------	--

**Parameters**

<i>d</i>	The value to add as next argument.
----------	------------------------------------

Definition at line 237 of file [factory](#).

References [put\(\)](#).

Here is the call graph for this function:

#### 15.93.3.4 [put\(\)](#) [1/5]

```
void L4::Factory::S::put (
    char const * s) & [inline], [noexcept]
```

Add a zero-terminated string as next argument.

##### Parameters

<i>s</i>	The string to add as next argument.
----------	-------------------------------------

The string will be added with the zero-terminator.

Definition at line 191 of file [factory](#).

#### 15.93.3.5 [put\(\)](#) [2/5]

```
void L4::Factory::S::put (
    l4_fpage_t d) & [inline], [noexcept]
```

Add a flexpage as next argument.

##### Parameters

<i>d</i>	The flexpage to add (there will be no map operation).
----------	---

Definition at line 223 of file [factory](#).

**15.93.3.6 put()** [3/5]

```
void L4::Factory::S::put (
    l4_mword_t i) [inline], [noexcept]
```

Put a single [l4\\_mword\\_t](#) as next argument.

**Parameters**

<i>i</i>	The value to add as next argument.
----------	------------------------------------

Definition at line [169](#) of file [factory](#).

Referenced by [operator<<\(\)](#), and [operator<<\(\)](#).

Here is the caller graph for this function:

**15.93.3.7 put()** [4/5]

```
void L4::Factory::S::put (
    l4_umword_t i) [inline], [noexcept]
```

Put a single [l4\\_umword\\_t](#) as next argument.

**Parameters**

<i>i</i>	The value to add as next argument.
----------	------------------------------------

Definition at line [179](#) of file [factory](#).

### 15.93.3.8 put() [5/5]

```
void L4::Factory::S::put (  
    Lstr const & s) & [inline], [noexcept]
```

Add a pascal string as next argument.

#### Parameters

s	The string to add as next argument.
---	-------------------------------------

The string will be added with the exact length given. It is the responsibility of the caller to make sure that the string is zero- terminated when that is required by the server.

Definition at line [205](#) of file [factory](#).

## 15.94.1 Detailed Description

C++ [Icu](#) interface, see [Interrupt controller](#) for the C interface.

### Note

"ICU" is short for "interrupt control unit".

This class defines the interface for interrupt controllers. It defines functions for binding [L4::Irq](#) objects to interrupt lines and other interrupt sources, as well as functions for masking and unmasking of interrupts.

To setup an interrupt line the following steps are required:

1. [set\\_mode\(\)](#) (optional if interrupt has a default mode)
2. [L4::Rcv\\_endpoint::bind\\_thread\(\)](#) or [L4::Rcv\\_endpoint::bind\\_snd\\_destination\(\)](#) to attach the [L4::Irq](#) object to a send destination.
3. [bind\(\)](#)
4. [unmask\(\)](#) to receive the first interrupt

For certain interrupt sources only some of these steps are necessary and supported, see [L4::Scheduler](#) and [L4::Vcon](#).

At most one [L4::Irq](#) object can be bound to a certain interrupt source and a certain [L4::Irq](#) object can be bound to at most one interrupt source.

### Include File

```
#include <l4/sys/icu>
```

Definition at line 250 of file [irq](#).

## 15.94.2 Member Function Documentation

### 15.94.2.1 bind()

```
l4_msgtag_t L4::Icu::bind (
    unsigned irqnum,
    L4::Cap< Triggerable > irq,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Bind an interrupt line of an interrupt controller to an interrupt object.

### Parameters

<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object for the given IRQ line to bind to this ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

## Returns

Syscall return tag. The caller should check the return value using [l4\\_error\(\)](#) to check for errors and to identify the correct method for unmasking the interrupt. Return values  $< 0$  indicate an error. A return value of 0 means a direct unmask via the IRQ object using [L4::irq::unmask](#). A return value of 1 means that the interrupt has to be unmasked via the ICU using [L4::icu::unmask](#).

## Return values

<a href="#">-L4_EINVAL</a>	<code>irq</code> is bound to an interrupt source.
<a href="#">-L4_EPERM</a>	Insufficient permissions; see precondition.

## Precondition

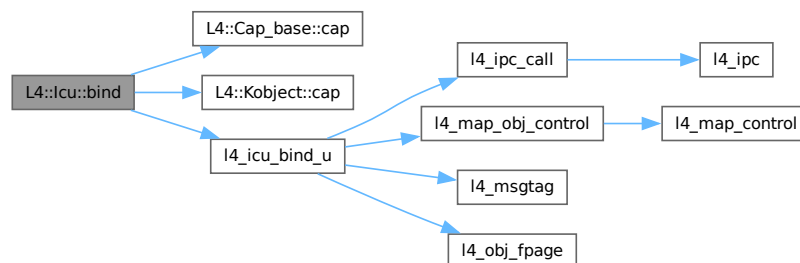

The capability `irq` must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

In case the `irq` is already bound to an interrupt source, it is unbound first. In case the `irq` is bound and the interrupt source is bound to a different [L4::irq](#) object, only the unbinding happens. An [L4::irq](#) object that is bound to an interrupt source will get unbound if the [L4::irq](#) object is deleted.

Definition at line 310 of file [irq](#).

References [L4::Cap\\_base::cap\(\)](#), [L4::Kobject::cap\(\)](#), and [l4\\_icu\\_bind\\_u\(\)](#).

Here is the call graph for this function:

## 15.94.2.2 info()

```

l4_msgtag_t L4::Icu::info (
    l4_icu_info_t * info,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]

```

Get information about the ICU features.

## Parameters

out	info	<a href="#">Info</a> structure to be filled with information.
-----	------	---

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
--	-------------	--

### Returns

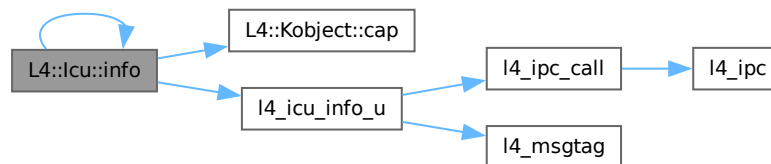

Syscall return tag

Definition at line 345 of file [irq](#).

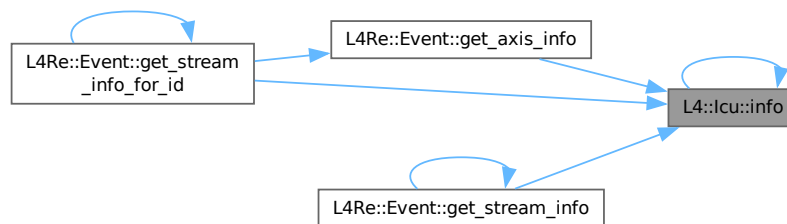

References [L4::Kobject::cap\(\)](#), [info\(\)](#), and [l4\\_icu\\_info\\_u\(\)](#).

Referenced by [L4Re::Event::get\\_axis\\_info\(\)](#), [L4Re::Event::get\\_stream\\_info\(\)](#), [L4Re::Event::get\\_stream\\_info\\_for\\_id\(\)](#), and [info\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.94.2.3 mask()

```

l4_msgtag_t L4::Icu::mask (
    unsigned irqnum,
    l4_umword_t * label = 0,
    l4_timeout_t to = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]

```

Mask an IRQ line.

**Parameters**

<i>irqnum</i>	IRQ line at the ICU.
<i>label</i>	If NULL, this function is a send-only message to the ICU. If not NULL, this function will enter an open wait after sending the mask message and the received label is returned here.
<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL <i>label</i> only.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag. If *label* is NULL, this function performs an IPC send-only operation and there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. In this case use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 393 of file [irq](#).

References [L4::Kobject::cap\(\)](#), [l4\\_icu\\_mask\\_u\(\)](#), and [L4\\_IPC\\_NEVER](#).

Here is the call graph for this function:

**15.94.2.4 msi\_info()**

```

l4_msgtag_t L4::Icu::msi_info (
    l4_umword_t irqnum,
    l4_uint64_t source,
    l4_icu_msi_info_t * msi_info)
  
```

Get MSI info about IRQ.

**Parameters**

	<i>irqnum</i>	IRQ line at the ICU.
	<i>source</i>	Platform dependent requester ID for MSIs. On IA32 we use a 20bit source filter value as described in the Intel IRQ remapping specification.
out	<i>msi_info</i>	A <a href="#">l4_icu_msi_info_t</a> structure receiving the address and the data value to trigger this MSI.

**Returns**

Syscall return tag

References [msi\\_info\(\)](#).

Referenced by [msi\\_info\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**15.94.2.5 set\_mode()**

```

l4_msgtag_t L4::Icu::set_mode (
    unsigned irqnum,
    l4_umword_t mode,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Set interrupt mode.

**Parameters**

<i>irqnum</i>	IRQ line at the ICU.
<i>mode</i>	Mode, see <a href="#">L4_irq_mode</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

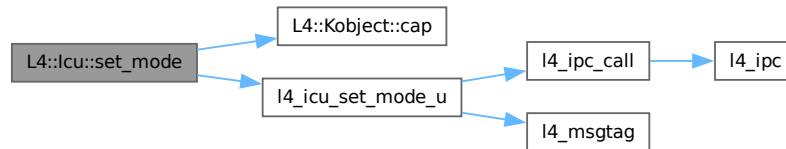

**Returns**

Syscall return tag

Definition at line 421 of file [irq](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_icu\\_set\\_mode\\_u\(\)](#).

Here is the call graph for this function:

**15.94.2.6 unbind()**

```

l4_msgtag_t L4::Icu::unbind (
    unsigned irqnum,
    L4::Cap< Triggerable > irq,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Remove binding of an interrupt line from the interrupt controller object.

**Parameters**

<i>irqnum</i>	IRQ line at the ICU.
<i>irq</i>	IRQ object to remove from the ICU.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

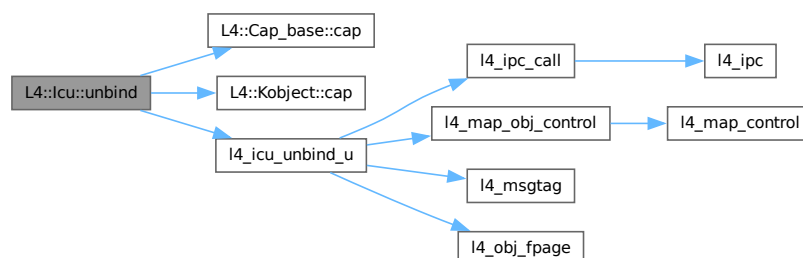

**Returns**

Syscall return tag

Definition at line 328 of file [irq](#).

References [L4::Cap\\_base::cap\(\)](#), [L4::Kobject::cap\(\)](#), and [l4\\_icu\\_unbind\\_u\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

*Create a base exception.*

## Protected Member Functions inherited from L4::Exception\_tracer

- **Exception\_tracer** () noexcept  
*Create a back trace.*

## 15.96.1 Detailed Description

Indicates that an invalid object was invoked.

An Object is invalid if it has L4\_INVALID\_ID as server L4 UID, or if the server does not know the object ID.

Definition at line 234 of file [exceptions](#).

## 15.96.2 Constructor & Destructor Documentation

### 15.96.2.1 Invalid\_capability()

```
L4::Invalid_capability::Invalid_capability (
    Cap< void > const & o) [inline], [explicit], [noexcept]
```

Create an Invalid\_object exception for the Object o.

#### Parameters

<b>o</b>	The object that caused the server side error.
----------	---

Definition at line 244 of file [exceptions](#).

### 15.96.3 Member Function Documentation

#### 15.96.3.1 cap()

```
Cap< void > const & L4::Invalid_capability::cap () const [inline], [noexcept]
```

Get the object that caused the error.

##### Returns

The object that caused the error on invocation.

Definition at line 253 of file [exceptions](#).

The documentation for this class was generated from the following file:

- [l4/cxx/exceptions](#)

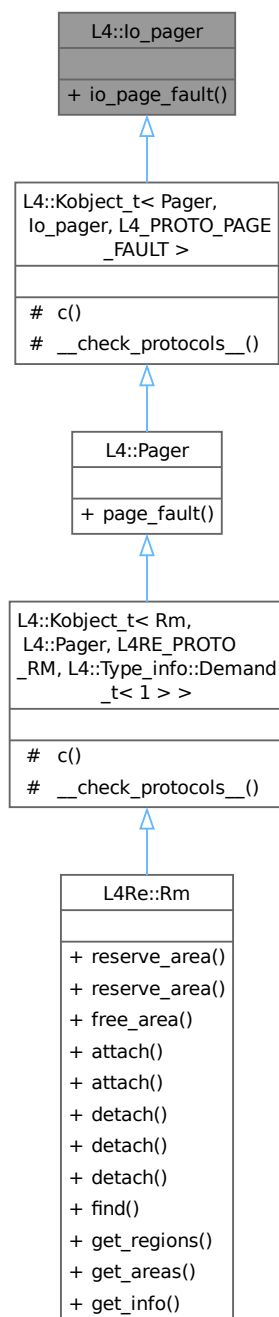

## 15.97 L4::lo\_pager Class Reference

[lo\\_pager](#) interface.

```
#include <pager>
```

Inheritance diagram for L4::lo\_pager:

Collaboration diagram for L4::io\_pager:

### Public Member Functions

- [l4\\_msgtag\\_t](#) [io\\_page\\_fault](#) ([l4\\_fpage\\_t](#) io\_pfa, [l4\\_umword\\_t](#) pc, [L4::lpc::Rcv\\_fpage](#) rwin, [L4::lpc::Opt<L4::lpc::Snd\\_fpage & >](#) fp)  
*IO page fault protocol message.*

## 15.97.1 Detailed Description

[io\\_pager](#) interface.

### Note

This interface is IA32 specific.

This class defines the interface for handling IO page faults. IO page faults happen when a thread tries to access an IO port that it does not currently have access to.

Depending on the microkernel's implementation, IO page faults can be handled in two ways.

If the microkernel does not support IO page faults, this IO pagefault interface is not used. Instead, the microkernel sends an exception IPC to the thread's exception handler ([L4::Exception](#)), indicating a `GP` (exception number 13). The exception handler must consult the faulting instruction to determine the cause of the exception. This is the default in Fiasco.OC.

In contrast, if the microkernel supports IO page faults, the microkernel will generate an IO page fault message and send it to the thread's page fault handler (pager). The page fault handler can implement this interface to handle the IO page faults.

### Note

A program may use this mechanism to implement a lazy IO port access scheme.

The page fault and exception handlers are set with the [L4::Thread::control](#) interface.

Definition at line 50 of file [pager](#).

## 15.97.2 Member Function Documentation

### 15.97.2.1 io\_page\_fault()

```
l4_msgtag_t L4::Io_pager::io_page_fault (
    l4_fpage_t io_pfa,
    l4_umword_t pc,
    L4::Ipc::Rcv_fpage rwin,
    L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)
```

IO page fault protocol message.

#### Parameters

	<i>io_pfa</i>	Flexpage describing the faulting IO-port.
	<i>pc</i>	Faulting program counter.
	<i>rwin</i>	The receive window for a flexpage mapping.
out	<i>fp</i>	Optional: flexpage descriptor to send to the task raising the page fault.

#### Returns

System call message tag; use [l4\\_error\(\)](#) to check for errors.

IO-port fault messages are usually generated by the kernel and an IO-page-fault handler needs to be in place to handle such faults and generate a reply, potentially filling in *fp*.

The documentation for this class was generated from the following file:

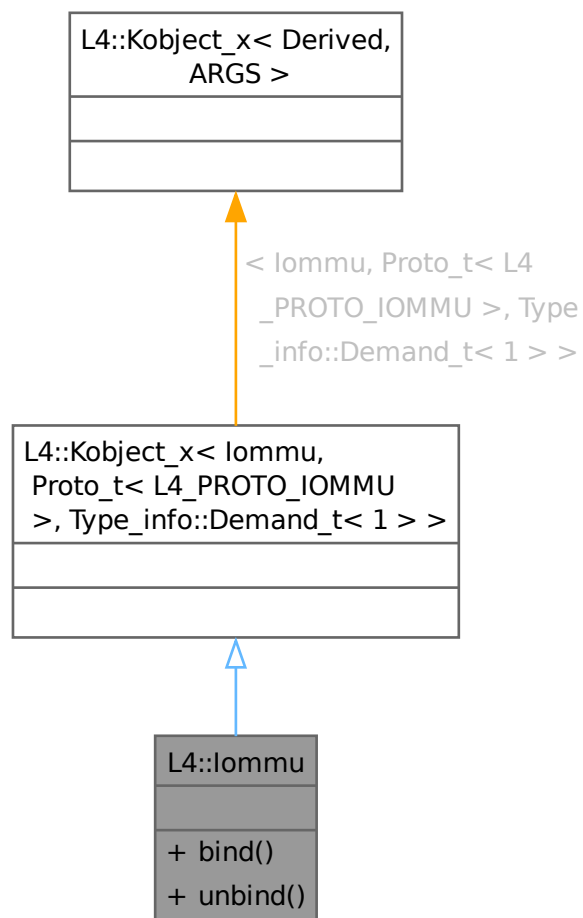

- [l4/sys/pager](#)

## 15.98 L4::lomu Class Reference

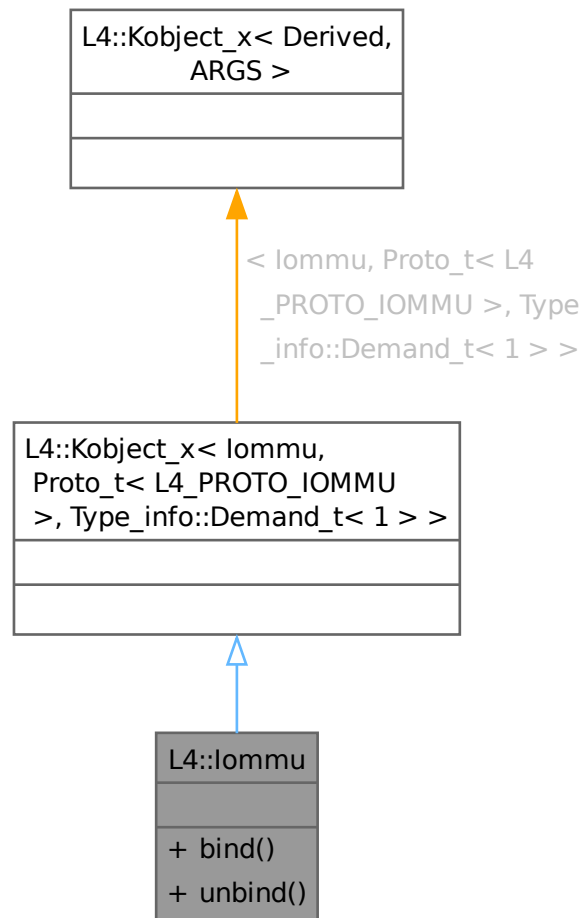

Interface for IO-MMUs used for DMA remapping.

```
#include <iommu>
```

Inheritance diagram for L4::lommu:

Collaboration diagram for L4::lomu:

### Public Member Functions

- `l4_msgtag_t bind (l4_uint64_t src_id, lpc::Cap< Task > dma_space)`  
Associate *dma\_space* with the set of device(s) specified by *src\_id*.
- `l4_msgtag_t unbind (l4_uint64_t src_id, lpc::Cap< Task > dma_space)`  
Remove the association of the given DMA address space from the device(s) specified by *src\_id*.

### 15.98.1 Detailed Description

Interface for IO-MMUs used for DMA remapping.

#### Note

This interface is only present in the kernel if the kernel detected an IOMMU during boot.

This interface allows to associate a DMA address space with a platform dependent set of devices. The kernel automatically keeps the memory spaces of associated DMA spaces in sync with the respective page table structures in the IOMMU.

Definition at line 21 of file [lomu](#).

## 15.98.2 Member Function Documentation

### 15.98.2.1 bind()

```
l4_msgtag_t L4::Iommu::bind (
    l4_uint64_t src_id,
    Ipc::Cap< Task > dma_space)
```

Associate `dma_space` with the set of device(s) specified by `src_id`.

Updates the respective page table structures in the IOMMU and keeps them in sync when memory is mapped to the `dma_space` or revoked from it.

#### Parameters

<i>src_id</i>	Platform dependent source ID specifying the set of devices that shall use <code>dma_space</code> for DMA remapping.
<i>dma_space</i>	The DMA space ( <a href="#">L4::Task</a> created with <code>L4_PROTO_DMA_SPACE</code> ) providing the mappings that shall be used for the device(s).

References [bind\(\)](#).

Referenced by [bind\(\)](#).

Here is the caller graph for this function:

### 15.98.2.2 unbind()

```
l4_msgtag_t L4::Iommu::unbind (
    l4_uint64_t src_id,
    Ipc::Cap< Task > dma_space)
```

Remove the association of the given DMA address space from the device(s) specified by `src_id`.

Clear the respective page stable structures in the IOMMU.

#### Parameters

<i>src_id</i>	Platform dependent source ID specifying the set of devices that shall no longer use <code>dma_space</code> for DMA remapping.
<i>dma_space</i>	The DMA space formerly associated with <a href="#">bind()</a> .

References [unbind\(\)](#).

Referenced by [unbind\(\)](#).

## 15.99 L4::IOModifier Class Reference

Modifier class for the IO stream.

```
#include <basic_ostream>
```

Collaboration diagram for L4::IOModifier:

### 15.99.1 Detailed Description

Modifier class for the IO stream.

An IO Modifier can be used to change properties of an IO stream for example the number format.

Definition at line 22 of file [basic\\_ostream](#).

The documentation for this class was generated from the following file:

- [l4/cxx/basic\\_ostream](#)

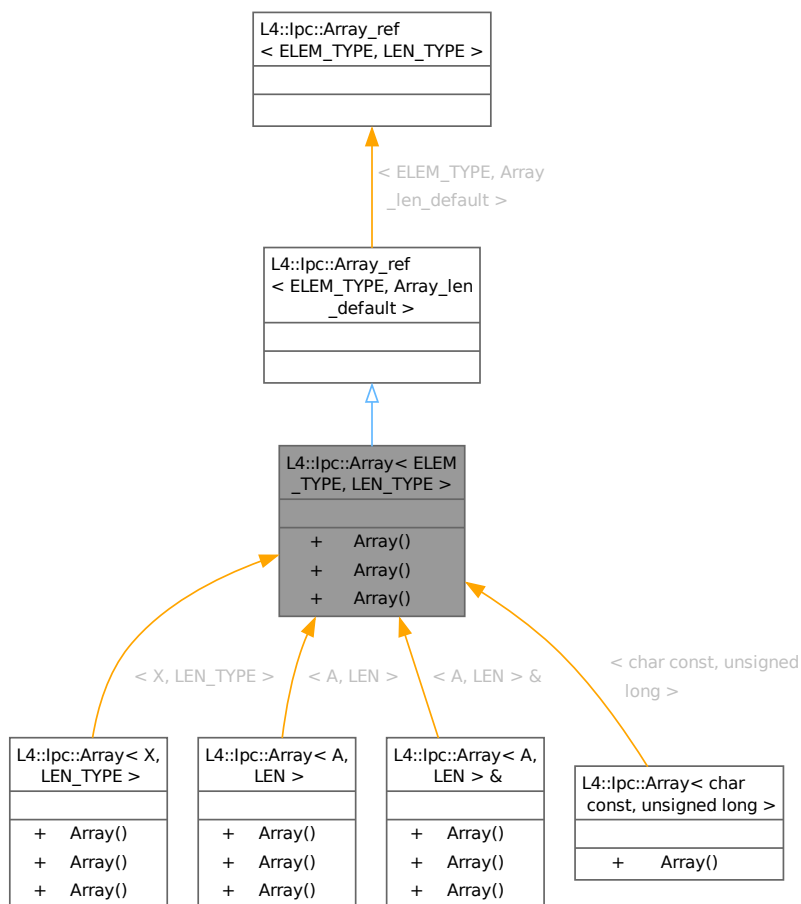

## 15.100 L4::lpc::Array< ELEM\_TYPE, LEN\_TYPE > Struct Template Reference

[Array](#) data type for dynamically sized arrays in RPCs.

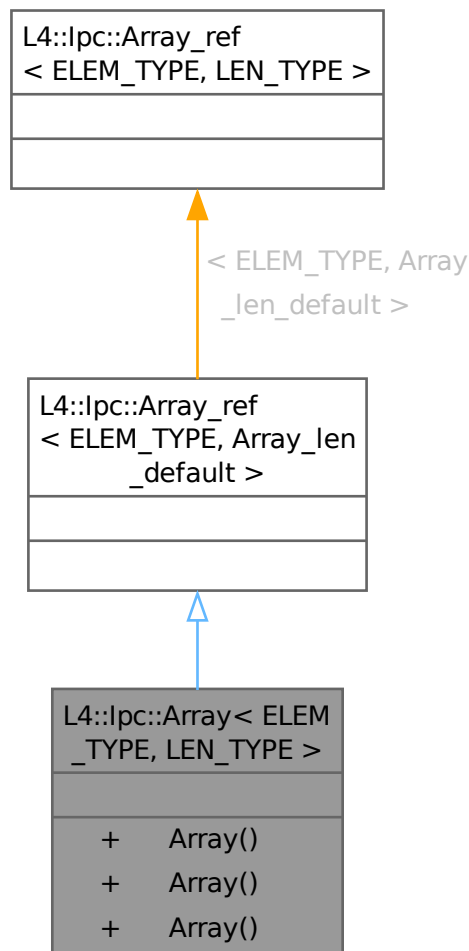

```
#include <ipc_array>
```

Inheritance diagram for L4::lpc::Array< ELEM\_TYPE, LEN\_TYPE >:

Collaboration diagram for L4::lpc::Array< ELEM\_TYPE, LEN\_TYPE >:

## Public Member Functions

- **Array** ()  
*Make array.*
- **Array** (LEN\_TYPE length, ELEM\_TYPE \*data)  
*Make array from length and data pointer.*
- **Array** (typename Non\_const< ELEM\_TYPE >::type const &other)  
*Make a const array from a non-const array.*

### 15.100.1 Detailed Description

```
template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default>
struct L4::lpc::Array< ELEM_TYPE, LEN_TYPE >
```

[Array](#) data type for dynamically sized arrays in RPCs.

### Template Parameters

<i>ELEM_TYPE</i>	The data type of an array element, should be 'const' when used as input.
<i>LEN_TYPE</i>	Data type used to store the number of elements in the array.

An [Array](#) generally encapsulates a data pointer and a length (number of elements). [Array](#) does *not* provide any storage for the data itself. The storage is either provided by a client-side caller or in the case of [Array\\_ref](#) is the message itself.

Arrays can be used as input or as output arguments, when used as input *ELEM\_TYPE* should be qualified *const*, when used as output a reference to an array must be used and the *ELEM\_TYPE* must *not* be qualified *const*. It is the caller's responsibility to provide an array buffer of sufficient length. If a message from the server is too large it will be silently truncated.

If backward compatibility with `lpc::Stream` is required, then *LEN\_TYPE* must be `unsigned long`.

Definition at line 81 of file [ipc\\_array](#).

The documentation for this struct was generated from the following file:

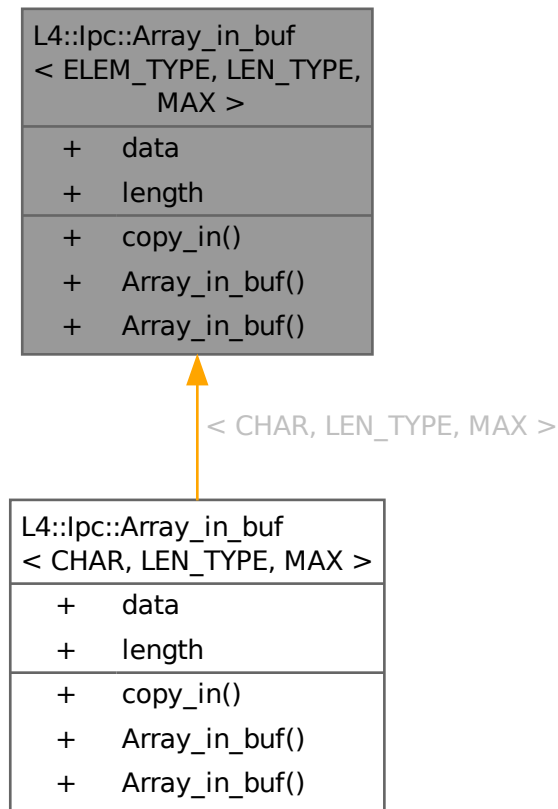

- `l4/sys/cxx/ipc_array`

## 15.101 L4::lpc::Array\_in\_buf< ELEM\_TYPE, LEN\_TYPE, MAX > Struct Template Reference

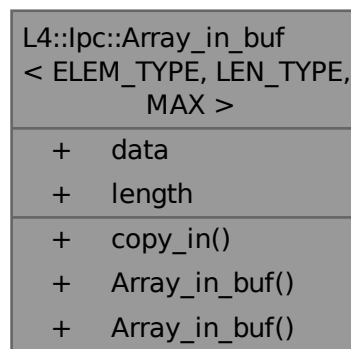

Server-side copy in buffer for [Array](#).

```
#include <ipc_array>
```

Inheritance diagram for L4::lpc::Array\_in\_buf< ELEM\_TYPE, LEN\_TYPE, MAX >:

Collaboration diagram for L4::lpc::Array\_in\_buf< ELEM\_TYPE, LEN\_TYPE, MAX >:

## Public Member Functions

- void **copy\_in** (const\_array a)  
*copy in data from a source array*
- **Array\_in\_buf** (const\_array a)  
*Make [Array\\_in\\_buf](#) from a const array.*
- **Array\_in\_buf** (array a)  
*Make [Array\\_in\\_buf](#) from a non-const array.*

## Data Fields

- ELEM\_TYPE **data** [MAX]  
*The data elements.*
- LEN\_TYPE **length**  
*The length of the array.*

### 15.101.1 Detailed Description

```
template<typename ELEM_TYPE, typename LEN_TYPE = Array_len_default, LEN_TYPE MAX = (L4_↔
UTCB_GENERIC_DATA_SIZE * sizeof(I4_umword_t)) / sizeof(ELEM_TYPE)>
struct L4::lpc::Array_in_buf< ELEM_TYPE, LEN_TYPE, MAX >
```

Server-side copy in buffer for [Array](#).

## Template Parameters

<i>ELEM_TYPE</i>	Data type of an array element.
<i>LEN_TYPE</i>	Data type for the number of elements in the array.
<i>MAX</i>	The maximum number of elements in the buffer. If the actual message is longer than the buffer, it will be silently truncated.

This type is assignment compatible to [Array\\_ref<ELEM\\_TYPE, LEN\\_TYPE>](#) and provides a transparent server-side copy-in mechanism for array parameters. The [Array\\_in\\_buf](#) provides the storage for the array data and receives a copy of the data passed to the server-function.

Definition at line 126 of file [ipc\\_array](#).

The documentation for this struct was generated from the following file:

- I4/sys/cxx/ipc\_array

**Note**

Use [Array](#) for normal RPC interfaces, [Array\\_ref](#) is usually used as server-side argument, see [Array](#).

**Template Parameters**

<i>ELEM_TYPE</i>	The data type of an array element, should be 'const' when used as input.
<i>LEN_TYPE</i>	Data type used to store the number of elements in the array.

Definition at line 28 of file [ipc\\_array](#).

The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc\_array

## 15.103 L4::lpc::As\_value< T > Struct Template Reference

Pass the argument as plain data value.

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::As\_value< T >:

### 15.103.1 Detailed Description

```
template<typename T>
struct L4::lpc::As_value< T >
```

Pass the argument as plain data value.

**Template Parameters**

<i>T</i>	The type of the original argument.
----------	------------------------------------

[As\\_value<T>](#) is used when *T* would be otherwise interpreted specially, for example as flexpage. When using [As\\_value<>](#) then the argument is transmitted as plain data element.

Definition at line 116 of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc\_types

## 15.104 L4::lpc::Call Struct Reference

RPC attribute for a standard RPC call.

```
#include <ipc_iface>
```

Inheritance diagram for L4::lpc::Call:

Collaboration diagram for L4::lpc::Call:

### 15.104.1 Detailed Description

RPC attribute for a standard RPC call.

This is the default for the *FLAGS* parameter for L4::lpc::Msg::Rpc\_call L4::lpc::Msg::Rpc\_inline\_call templates and declares the RPC to have default call semantics and timeouts.

Examples:

```
L4_RPC(l4_ret_t, send, (unsigned value), L4::lpc::Call);
```

which is equivalent to:

```
L4_RPC(l4_ret_t, send, (unsigned value));
```

Definition at line 239 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.105 L4::lpc::Call\_t< RIGHTS > Struct Template Reference

RPC attribute for an RPC call with required rights.

```
#include <ipc_iface>
```

Inheritance diagram for L4::lpc::Call\_t< RIGHTS >:

Collaboration diagram for L4::lpc::Call\_t< RIGHTS >:

### 15.105.1 Detailed Description

```
template<unsigned RIGHTS>
struct L4::lpc::Call_t< RIGHTS >
```

RPC attribute for an RPC call with required rights.

#### Template Parameters

<i>RIGHTS</i>	The capability rights required for this call. <a href="#">L4_CAP_FPAGE_W</a> and <a href="#">L4_CAP_FPAGE_S</a> are checked within the server (and <a href="#">-L4_EPERM</a> shall be returned if the caller has insufficient rights). <a href="#">L4_CAP_FPAGE_R</a> is always on but might be specified for documentation purposes. Other rights cannot be used in this context, because they cannot be checked at the server side.
---------------	---

Examples:

```
L4_RPC(l4_ret_t, func, (unsigned value), L4::lpc::Call_t<L4_CAP_FPAGE_RW>);
```

Definition at line 270 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.106 L4::lpc::Call\_zero\_send\_timeout Struct Reference

RPC attribute for an RPC call, with zero send timeout.

```
#include <ipc_iface>
```

Inheritance diagram for L4::lpc::Call\_zero\_send\_timeout:

Collaboration diagram for L4::lpc::Call\_zero\_send\_timeout:

### 15.106.1 Detailed Description

RPC attribute for an RPC call, with zero send timeout.

Definition at line 249 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.107 L4::lpc::Cap< T > Class Template Reference

Capability type for RPC interfaces (see [L4::Cap<T>](#)).

```
#include <ipc_types>
```

*Return the send flexpage for this [Cap](#) (see [l4\\_fpage\\_t](#)).*
- bool **is\_valid** () const noexcept  
*Return true if this [Cap](#) is valid.*

## Static Public Member Functions

- static Cap [from\\_ci](#) ([l4\\_cap\\_idx\\_t](#) c) noexcept  
*Create an IPC capability from a C capability index plus rights.*

### 15.107.1 Detailed Description

```
template<typename T>
class L4::lpc::Cap< T >
```

Capability type for RPC interfaces (see [L4::Cap<T>](#)).

#### Template Parameters

<i>T</i>	type of the interface referenced by the capability.
----------	---

In contrast to [L4::Cap<T>](#) this type additionally stores a rights mask that shall be used when the capability is transferred to the receiver. This allows to apply restrictions to the transferred capability in the form of a subset of the rights possessed by the sender.

See also

[L4::lpc::make\\_cap\(\)](#)

Definition at line 698 of file [ipc\\_types](#).

### 15.107.2 Member Enumeration Documentation

#### 15.107.2.1 anonymous enum

```
template<typename T>
anonymous enum
```

#### Enumerator

Rights_mask	Mask for rights bits stored internally. <a href="#">L4_FPAGE_RIGHTS_MASK</a>   <a href="#">L4_FPAGE_C_NO_REF_CNT</a>   <a href="#">L4_FPAGE_C_OBJ_RIGHTS</a> ).
Cap_mask	Mask for significant capability bits. (incl. the invalid bit to support invalid caps)

Definition at line 704 of file [ipc\\_types](#).

### 15.107.3 Constructor & Destructor Documentation

#### 15.107.3.1 Cap()

```
template<typename T>
L4::Ipc::Cap< T >::Cap (
    L4::Cap< T > cap,
    unsigned char rights) [inline], [noexcept]
```

Make a [Cap](#) from [L4::Cap<T>](#) with the given rights.

##### Parameters

<i>cap</i>	Capability to be sent.
<i>rights</i>	Rights to be sent. Consists of <a href="#">L4_fpage_rights</a> and <a href="#">Attributes and additional permissions for object send items</a> .

Definition at line 750 of file [ipc\\_types](#).

### 15.107.4 Member Function Documentation

#### 15.107.4.1 from\_ci()

```
template<typename T>
Cap L4::Ipc::Cap< T >::from_ci (
    l4_cap_idx_t c) [inline], [static], [noexcept]
```

Create an IPC capability from a C capability index plus rights.

##### Parameters

<i>c</i>	C capability index with the lowest 8 bits used as rights for the map operation (see <a href="#">L4_fpage_rights</a> ).
----------	--

Definition at line 758 of file [ipc\\_types](#).

The documentation for this class was generated from the following file:

*Return the raw flexpage descriptor.*
- [l4\\_umword\\_t](#) **base\_x** () const noexcept  
*Return the raw base descriptor.*

## 15.108.1 Detailed Description

Generic RPC base for typed message items.

Definition at line 286 of file [ipc\\_types](#).

## 15.108.2 Member Enumeration Documentation

### 15.108.2.1 Type

enum [L4::lpc::Gen\\_fpage::Type](#)

[Type](#) of mapping object, see [L4\\_fpage\\_type](#).

**Enumerator**

Special	Special flexpage, either <a href="#">l4_fpage_invalid()</a> or <a href="#">l4_fpage_all()</a> ; only supported by selected interfaces.
Memory	Flexpage for memory spaces.
Io	Flexpage for I/O port spaces.
Obj	Flexpage for object spaces.

Definition at line [290](#) of file [ipc\\_types](#).

The documentation for this class was generated from the following file:

- [l4/sys/cxx/ipc\\_types](#)

**15.109 L4::lpc::ln\_out< T > Struct Template Reference**

Mark an argument as in-out argument.

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::ln\_out< T >:

**15.109.1 Detailed Description**

```
template<typename T>
struct L4::lpc::ln_out< T >
```

Mark an argument as in-out argument.

**Template Parameters**

<i>T</i>	The original argument type, usually a pointer or a reference.
----------	---

[ln\\_out<>](#) is used when an otherwise output-only value shall also be used as input value.

Definition at line [41](#) of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

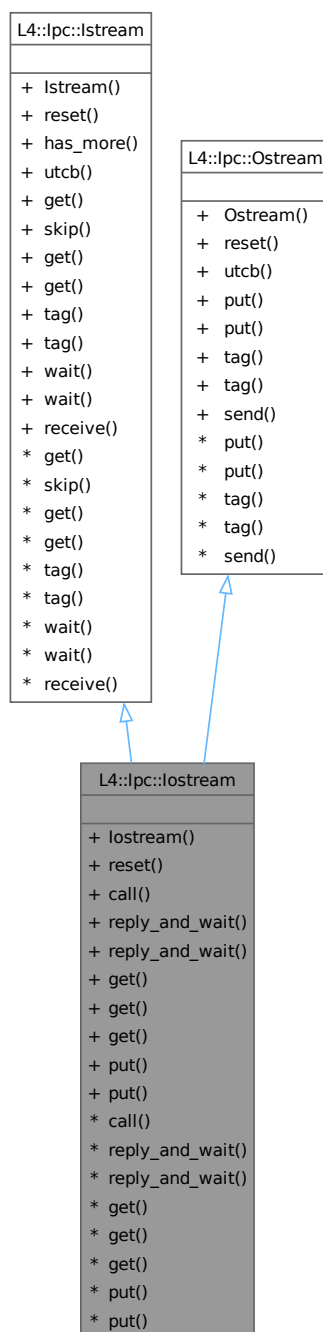

- [l4/sys/cxx/ipc\\_types](#)

## 15.110 L4::lpc::lostream Class Reference

Input/Output stream for IPC [un]marshalling.

```
#include <ipc_stream>
```

Inheritance diagram for L4::lpc::lostream:

Collaboration diagram for L4::ipc::lostream:

## Public Member Functions

- `lostream (l4_utcb_t *utcb)`  
Create an IPC IO stream with a single message buffer.
- `void reset ()`  
Reset the stream to its initial state.

**IPC operations.**

- `l4_msgtag_t` call (`l4_cap_idx_t` dst, `l4_timeout_t` timeout, long proto=0)  
*Do an IPC call using the message in the output stream and receive the reply in the input stream.*
- `l4_msgtag_t` reply\_and\_wait (`l4_umword_t` \*src\_dst, long proto=0)  
*Do an IPC reply and wait.*
- `l4_msgtag_t` reply\_and\_wait (`l4_umword_t` \*src\_dst, `l4_timeout_t` timeout, long proto=0)  
*Do an IPC reply and wait.*

**Get/Put functions.**

These functions are basically used to implement the insertion operators (<<) and should not be called directly.

- template<typename T>  
unsigned long `get` (T \*buf, unsigned long elems)  
*Copy out an array of type T with size elements.*
- template<typename T>  
unsigned long `get` (Msg\_ptr< T > const &buf, unsigned long elems=1)  
*Read one size elements of type T from the stream and return a pointer.*
- template<typename T>  
bool `get` (T &v)  
*Extract a single element of type T from the stream.*
- template<typename T>  
bool `put` (T \*buf, unsigned long size)  
*Put an array with size elements of type T into the stream.*
- template<typename T>  
bool `put` (T const &v)  
*Insert an element of type T into the stream.*

**Public Member Functions inherited from L4::lpc::lstream**

- `lstream` (`l4_utcb_t` \*utcb)  
*Create an input stream for the given message buffer.*
- void `reset` ()  
*Reset the stream to empty, and ready for `receive()`/`wait()`.*
- template<typename T>  
bool `has_more` (unsigned long count=1)  
*Check whether a value of type T can be obtained from the stream.*
- `l4_utcb_t` \* `utcb` () const  
*Return utcb pointer.*
- template<typename T>  
unsigned long `get` (T \*buf, unsigned long elems)  
*Copy out an array of type T with size elements.*
- template<typename T>  
void `skip` (unsigned long elems)  
*Skip size elements of type T in the stream.*
- template<typename T>  
unsigned long `get` (Msg\_ptr< T > const &buf, unsigned long elems=1)  
*Read one size elements of type T from the stream and return a pointer.*
- template<typename T>  
bool `get` (T &v)  
*Extract a single element of type T from the stream.*
- `l4_msgtag_t` tag () const

*Get the message tag of a received IPC.*

- [l4\\_msgtag\\_t](#) & [tag](#) ()

*Get the message tag of a received IPC.*

- [l4\\_msgtag\\_t](#) wait ([l4\\_umword\\_t](#) \*src)

*Wait for an incoming message from any sender.*

- [l4\\_msgtag\\_t](#) wait ([l4\\_umword\\_t](#) \*src, [l4\\_timeout\\_t](#) timeout)

*Wait for an incoming message from any sender.*

- [l4\\_msgtag\\_t](#) receive ([l4\\_cap\\_idx\\_t](#) src)

*Wait for a message from the specified sender.*

## Public Member Functions inherited from [L4::lpc::Ostream](#)

- **Ostream** ([l4\\_utcb\\_t](#) \*utcb)

*Create an IPC output stream using the given message buffer [utcb](#).*

- void **reset** ()

*Reset the stream to empty, same state as a newly created stream.*

- [l4\\_utcb\\_t](#) \* **utcb** () const

*Return utcb pointer.*

- template<typename T>

bool **put** (T \*buf, unsigned long size)

*Put an array with *size* elements of type *T* into the stream.*

- template<typename T>

bool **put** (T const &v)

*Insert an element of type *T* into the stream.*

- [l4\\_msgtag\\_t](#) **tag** () const

*Extract the [L4](#) message tag from the stream.*

- [l4\\_msgtag\\_t](#) & **tag** ()

*Extract a reference to the [L4](#) message tag from the stream.*

- [l4\\_msgtag\\_t](#) **send** ([l4\\_cap\\_idx\\_t](#) dst, long proto=0, unsigned flags=0)

*Send the message via IPC to the given receiver.*

### 15.110.1 Detailed Description

Input/Output stream for IPC [un]marshalling.

The [lpc::lostream](#) is part of the AW Env IPC framework as well as [lpc::lstream](#) and [lpc::Ostream](#). In particular an [lpc::lostream](#) is a combination of an [lpc::lstream](#) and an [lpc::Ostream](#). It can use either a single message buffer for receiving and sending messages or a pair of a receive and a send buffer. The stream also supports combined IPC operations such as [call\(\)](#) and [reply\\_and\\_wait\(\)](#), which can be used to implement RPC functionality.

#### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), [examples/libs/l4re/streammap/client.cc](#), and [examples/libs/l4re/streammap/server.cc](#).

Definition at line 789 of file [ipc\\_stream](#).

## 15.110.2 Constructor & Destructor Documentation

### 15.110.2.1 Iostream()

```
L4::Ipc::Iostream::Iostream (
    l4_utcb_t * utcb) [inline], [explicit]
```

Create an IPC IO stream with a single message buffer.

#### Parameters

<i>utcb</i>	The message buffer used as backing store.
-------------	---

The created IO stream uses the same message buffer for sending and receiving IPC messages.

Definition at line 801 of file [ipc\\_stream](#).

References [L4::Ipc::Istream::Istream\(\)](#), and [L4::Ipc::Ostream::Ostream\(\)](#).

Here is the call graph for this function:

## 15.110.3 Member Function Documentation

### 15.110.3.1 call()

```
l4_msgtag_t L4::Ipc::Iostream::call (
    l4_cap_idx_t dst,
    l4_timeout_t timeout,
    long proto = 0) [inline]
```

Do an IPC call using the message in the output stream and receive the reply in the input stream.

#### Parameters

<i>dst</i>	The destination to call.
<i>timeout</i>	The IPC timeout for the call.
<i>proto</i>	The protocol value to use in the message tag.

**Returns**

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send and a receive to/from the given destination `dst`.

A call is usually used by clients for RPCs to a server.

**Examples**

[examples/libs/l4re/streammap/client.cc](#).

Definition at line 966 of file [ipc\\_stream](#).

References [l4\\_ipc\\_call\(\)](#), and [L4::lpc::lstream::tag\(\)](#).

Here is the call graph for this function:

**15.110.3.2 get() [1/3]**

```

template<typename T>
unsigned long L4::lpc::lstream::get (
    Msg_ptr< T > const & buf,
    unsigned long elems = 1) [inline]
  
```

Read one size elements of type T from the stream and return a pointer.

**Parameters**

<i>buf</i>	A <a href="#">Msg_ptr</a> that is actually set to point to the element in the stream.
<i>elems</i>	Number of elements to extract (default is 1).

**Returns**

The number of elements extracted.

In contrast to a normal get, this version does actually not copy the data but returns a pointer to the data.

See [operator>>\(\)](#)

Definition at line 439 of file [ipc\\_stream](#).

### 15.110.3.3 `get()` [2/3]

```
template<typename T>
bool L4::Ipc::Istream::get (
    T & v) [inline]
```

Extract a single element of type T from the stream.

#### Parameters

<i>out</i>	<i>v</i>	The element.
------------	----------	--------------

#### Return values

<i>true</i>	An element was successfully extracted.
<i>false</i>	An element could not be extracted.

See [operator>>\(\)](#)

Definition at line 464 of file [ipc\\_stream](#).

### 15.110.3.4 `get()` [3/3]

```
template<typename T>
unsigned long L4::Ipc::Istream::get (
    T * buf,
    unsigned long elems) [inline]
```

Copy out an array of type T with *size* elements.

#### Parameters

<i>buf</i>	Pointer to a buffer for size elements of type T.
<i>elems</i>	Number of elements of type T to copy out.

#### Returns

The number of elements copied out.

See [operator>>\(\)](#)

Definition at line 394 of file [ipc\\_stream](#).

**15.110.3.5 put()** [1/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
    T * buf,
    unsigned long size) [inline]
```

Put an array with *size* elements of type *T* into the stream.

**Parameters**

<i>buf</i>	A pointer to the array to insert into the buffer.
<i>size</i>	The number of elements in the array.

Definition at line 660 of file [ipc\\_stream](#).

**15.110.3.6 put()** [2/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
    T const & v) [inline]
```

Insert an element of type *T* into the stream.

**Parameters**

<i>v</i>	The element to insert.
----------	------------------------

Definition at line 678 of file [ipc\\_stream](#).

**15.110.3.7 reply\_and\_wait()** [1/2]

```
l4_msgtag_t L4::Ipc::Iostream::reply_and_wait (
    l4_umword_t * src_dst,
    l4_timeout_t timeout,
    long proto = 0) [inline]
```

Do an IPC reply and wait.

**Parameters**

<i>in, out</i>	<i>src_dst</i>	Input: the destination for the send operation. Output: the source of the received message.
	<i>timeout</i>	Timeout used for IPC.
	<i>proto</i>	Protocol to use.

**Returns**

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send operation and an open wait for any message.

A reply and wait is usually used by servers that reply to a client and wait for the next request by any other client.

Definition at line 981 of file [ipc\\_stream](#).

References [l4\\_ipc\\_reply\\_and\\_wait\(\)](#), and [L4::lpc::lstream::tag\(\)](#).

Here is the call graph for this function:

**15.110.3.8 reply\_and\_wait() [2/2]**

```

l4_msgtag_t L4::lpc::lstream::reply_and_wait (
    l4_umword_t * src_dst,
    long proto = 0) [inline]
  
```

Do an IPC reply and wait.

**Parameters**

<i>in, out</i>	<i>src_dst</i>	Input: the destination for the send operation. Output: the source of the received message.
	<i>proto</i>	Protocol to use.

**Returns**

The result tag of the IPC operation.

This is a combined IPC operation consisting of a send operation and an open wait for any message.

A reply and wait is usually used by servers that reply to a client and wait for the next request by any other client.

Definition at line 874 of file [ipc\\_stream](#).

## 15.111 L4::lpc::Istream Class Reference

Input stream for IPC unmarshalling.

```
#include <ipc_stream>
```

Inheritance diagram for L4::lpc::Istream:

Collaboration diagram for L4::lpc::Istream:

## Public Member Functions

- `Istream (l4_utcb_t *utcb)`  
Create an input stream for the given message buffer.
- `void reset ()`  
Reset the stream to empty, and ready for `receive()/wait()`.

- `template<typename T>`  
`bool has_more (unsigned long count=1)`  
*Check whether a value of type T can be obtained from the stream.*
- `l4_utcb_t * utcb () const`  
*Return utcb pointer.*

#### Get/Put Functions.

- `template<typename T>`  
`unsigned long get (T *buf, unsigned long elems)`  
*Copy out an array of type T with size elements.*
- `template<typename T>`  
`void skip (unsigned long elems)`  
*Skip size elements of type T in the stream.*
- `template<typename T>`  
`unsigned long get (Msg_ptr< T > const &buf, unsigned long elems=1)`  
*Read one size elements of type T from the stream and return a pointer.*
- `template<typename T>`  
`bool get (T &v)`  
*Extract a single element of type T from the stream.*
- `l4_msgtag_t tag () const`  
*Get the message tag of a received IPC.*
- `l4_msgtag_t & tag ()`  
*Get the message tag of a received IPC.*

#### IPC operations.

- `l4_msgtag_t wait (l4_umword_t *src)`  
*Wait for an incoming message from any sender.*
- `l4_msgtag_t wait (l4_umword_t *src, l4_timeout_t timeout)`  
*Wait for an incoming message from any sender.*
- `l4_msgtag_t receive (l4_cap_idx_t src)`  
*Wait for a message from the specified sender.*

### 15.111.1 Detailed Description

Input stream for IPC unmarshalling.

`lpc::lstream` is part of the dynamic IPC marshalling infrastructure, as well as `lpc::Ostream` and `lpc::lostream`.

`lpc::lstream` is an input stream supporting extraction of values from an IPC message buffer. A received IPC message can be unmarshalled using the usual extraction operator (>>).

There exist some special wrapper classes to extract arrays (see `lpc_buf_cp_in` and `lpc_buf_in`) and indirect strings (see `Msg_in_buffer` and `Msg_io_buffer`).

Definition at line 334 of file `ipc_stream`.

## 15.111.2 Constructor & Destructor Documentation

### 15.111.2.1 Istream()

```
L4::Ipc::Istream::Istream (
    l4_utcb_t * utcb) [inline]
```

Create an input stream for the given message buffer.

The given message buffer is used for IPC operations [wait\(\)](#)/[receive\(\)](#) and received data can be extracted using the `>>` operator afterwards. In the case of indirect message parts a buffer of type `Msg_in_buffer` must be inserted into the stream before the IPC operation and contains received data afterwards.

#### Parameters

<i>utcb</i>	The message buffer to receive IPC messages.
-------------	---

Definition at line [348](#) of file [ipc\\_stream](#).

References [utcb\(\)](#).

Referenced by [L4::Ipc::lostream::lostream\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.111.3 Member Function Documentation

#### 15.111.3.1 `get()` [1/3]

```
template<typename T>
unsigned long L4::lpc::Istream::get (
    Msg_ptr< T > const & buf,
    unsigned long elems = 1) [inline]
```

Read one size elements of type T from the stream and return a pointer.

##### Parameters

<i>buf</i>	A <a href="#">Msg_ptr</a> that is actually set to point to the element in the stream.
<i>elems</i>	Number of elements to extract (default is 1).

##### Returns

The number of elements extracted.

In contrast to a normal `get`, this version does actually not copy the data but returns a pointer to the data.

See [operator>>\(\)](#)

Definition at line 439 of file [ipc\\_stream](#).

References [has\\_more\(\)](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

#### 15.111.3.2 `get()` [2/3]

```
template<typename T>
bool L4::lpc::Istream::get (
    T & v) [inline]
```

Extract a single element of type T from the stream.

##### Parameters

out	v	The element.
-----	---	--------------

### Return values

<i>true</i>	An element was successfully extracted.
<i>false</i>	An element could not be extracted.

See [operator>>\(\)](#)

Definition at line 464 of file [ipc\\_stream](#).

References [has\\_more\(\)](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

### 15.111.3.3 get() [3/3]

```

template<typename T>
unsigned long L4::Ipc::Istream::get (
    T * buf,
    unsigned long elems) [inline]
  
```

Copy out an array of type T with `size` elements.

### Parameters

<i>buf</i>	Pointer to a buffer for <code>size</code> elements of type T.
<i>elems</i>	Number of elements of type T to copy out.

### Returns

The number of elements copied out.

See [operator>>\(\)](#)

Definition at line 394 of file [ipc\\_stream](#).

References [has\\_more\(\)](#), and [L4\\_UNLIKELY](#).

Referenced by [operator>>\(\)](#), [operator>>\(\)](#), [operator>>\(\)](#), [operator>>\(\)](#), and [operator>>\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.111.3.4 receive()

```
l4_msgtag_t L4::Ipc::Istream::receive (  
    l4_cap_idx_t src) [inline]
```

Wait for a message from the specified sender.

##### Parameters

<i>src</i>	The sender id to receive from.
------------	--------------------------------

#### Returns

The IPC result tag ([l4\\_msgtag\\_t](#)).

This is commonly known as 'closed wait'.

Definition at line [572](#) of file [ipc\\_stream](#).

References [L4\\_IPC\\_NEVER](#), and [receive\(\)](#).

Referenced by [receive\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.111.3.5 reset()

```
void L4::Ipc::Istream::reset () [inline]
```

Reset the stream to empty, and ready for [receive\(\)/wait\(\)](#).

The stream is reset to the same state as on its creation.

Definition at line [358](#) of file [ipc\\_stream](#).

Referenced by [L4::Ipc::Istream::reset\(\)](#).

Here is the caller graph for this function:

### 15.111.3.6 skip()

```
template<typename T>
void L4::Ipc::Istream::skip (
    unsigned long elems) [inline]
```

Skip size elements of type T in the stream.

#### Parameters

<i>elems</i>	Number of elements to skip.
--------------	-----------------------------

Definition at line 414 of file [ipc\\_stream](#).

References [has\\_more\(\)](#), and [L4\\_UNLIKELY](#).

Here is the call graph for this function:

### 15.111.3.7 tag() [1/2]

```
l4\_msgtag\_t & L4::Ipc::Istream::tag () [inline]
```

Get the message tag of a received IPC.

#### Returns

A reference to the [L4](#) message tag for the received IPC.

This is in particular useful for handling page faults or exceptions.

See [operator>>\(\)](#)

Definition at line 517 of file [ipc\\_stream](#).

**15.111.3.8 tag()** [2/2]

```
l4_msgtag_t L4::Ipc::Istream::tag () const [inline]
```

Get the message tag of a received IPC.

**Returns**

The [L4](#) message tag for the received IPC.

This is in particular useful for handling page faults or exceptions.

See [operator>>\(\)](#)

Definition at line [505](#) of file [ipc\\_stream](#).

Referenced by [L4::lpc::lostream::call\(\)](#), [operator>>\(\)](#), [L4::lpc::lostream::reply\\_and\\_wait\(\)](#), and [wait\(\)](#).

Here is the caller graph for this function:

**15.111.3.9 wait()** [1/2]

```
l4_msgtag_t L4::Ipc::Istream::wait (
    l4_umword_t * src) [inline]
```

Wait for an incoming message from any sender.

**Parameters**

out	src	Contains the sender after a successful IPC operation.
-----	-----	---

### Returns

Syscall return tag.

This wait is actually known as 'open wait'.

Definition at line 548 of file [ipc\\_stream](#).

References [L4\\_IPC\\_NEVER](#), and [wait\(\)](#).

Referenced by [wait\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.111.3.10 wait() [2/2]

```
l4_msgtag_t L4::Ipc::Istream::wait (  
    l4_unword_t * src,  
    l4_timeout_t timeout) [inline]
```

Wait for an incoming message from any sender.

### Parameters

out	src	Contains the sender after a successful IPC operation.
	timeout	Timeout used for IPC.

## Returns

The IPC result tag ([l4\\_msgtag\\_t](#)).

This wait is actually known as 'open wait'.

Definition at line 1013 of file [ipc\\_stream](#).

References [l4\\_ipc\\_wait\(\)](#), and [tag\(\)](#).

Here is the call graph for this function:

Collaboration diagram for L4::lpc::Msg::ls\_valid\_rpc\_type< T >:

#### Additional Inherited Members

#### Public Types inherited from `L4::Types::Bool< true >`

- typedef `Bool< V > type`  
The meta type itself.

#### 15.127.1 Detailed Description

```
template<typename T>
struct L4::lpc::Msg::ls_valid_rpc_type< T >
```

Type trait defining a valid RPC parameter type.

Definition at line 339 of file `ipc_basics`.

The documentation for this struct was generated from the following file:

- `l4/sys/cxx/ipc_basics`

## 15.128 L4::lpc::Msg::Svr\_arg\_pack< IPC\_TYPE > Struct Template Reference

Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function.

Collaboration diagram for L4::lpc::Msg::Svr\_arg\_pack< IPC\_TYPE >:

### 15.128.1 Detailed Description

```
template<typename IPC_TYPE>
struct L4::lpc::Msg::Svr_arg_pack< IPC_TYPE >
```

Server-side RPC arguments data structure used to provide arguments to the server-side implementation of an RPC function.

Definition at line 183 of file [ipc\\_server](#).

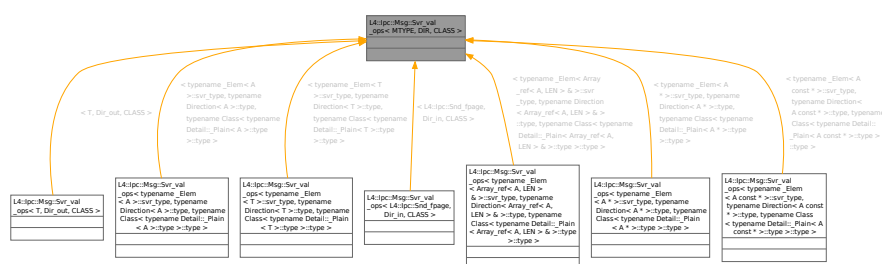

The documentation for this struct was generated from the following file:

- l4/sys/cxx/ipc\_server

## 15.129 L4::lpc::Msg::Svr\_val\_ops< MTYPE, DIR, CLASS > Struct Template Reference

Defines server-side handling for MTYPE server arguments.

Inheritance diagram for L4::lpc::Msg::Svr\_val\_ops< MTYPE, DIR, CLASS >:

Collaboration diagram for L4::lpc::Msg::Svr\_val\_ops< MTYPE, DIR, CLASS >:

### 15.129.1 Detailed Description

```
template<typename MTYPE, typename DIR, typename CLASS>
struct L4::lpc::Msg::Svr_val_ops< MTYPE, DIR, CLASS >
```

Defines server-side handling for `MTYPE` server arguments.

#### Template Parameters

<i>MTYPE</i>	Elem<T>::svr_type (where T is the type used in the RPC definition)
<i>DIR</i>	<a href="#">Dir_in</a> (client -> server), or <a href="#">Dir_out</a> (server -> client)
<i>CLASS</i>	<a href="#">Cls_data</a> , <a href="#">Cls_item</a> , or <a href="#">Cls_buffer</a>

Definition at line [264](#) of file [ipc\\_basics](#).

The documentation for this struct was generated from the following file:

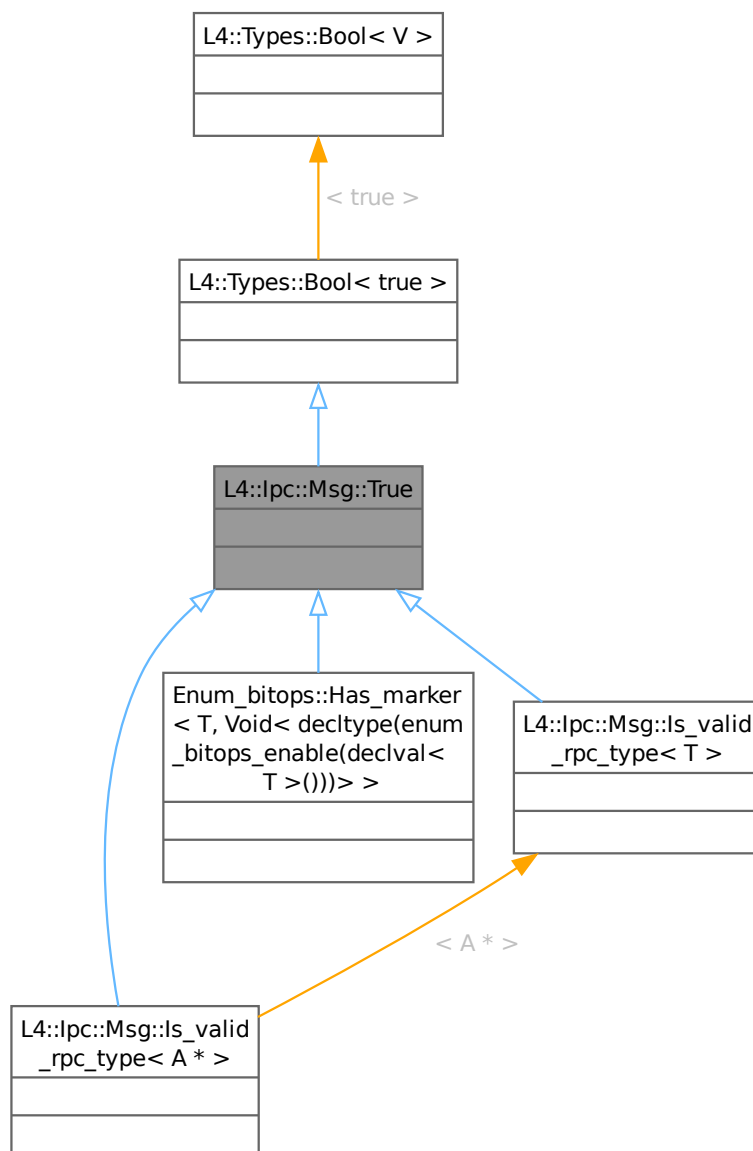

- `I4/sys/cxx/ipc_basics`

## 15.130 L4::lpc::Msg::True Struct Reference

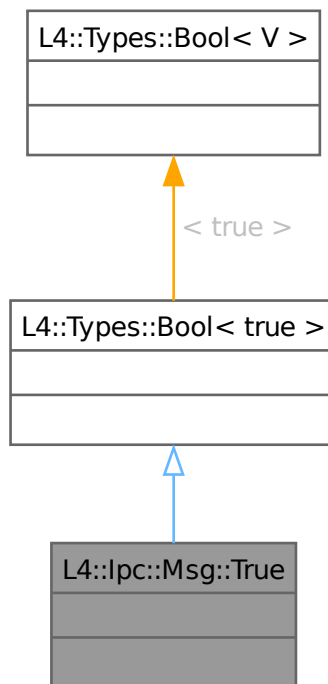

[True](#) meta value.

```
#include <types>
```

Inheritance diagram for L4::lpc::Msg::True:

Collaboration diagram for L4::lpc::Msg::True:

#### Additional Inherited Members

#### Public Types inherited from `L4::Types::Bool< true >`

- typedef `Bool< V >` **type**  
*The meta type itself.*

#### 15.130.1 Detailed Description

`True` meta value.

Definition at line 321 of file `types`.

The documentation for this struct was generated from the following file:

- `l4/sys/cxx/types`

## 15.131 L4::lpc::Msg\_ptr< T > Class Template Reference

Pointer to an element of type T in an [lpc::lstream](#).

```
#include <ipc_stream>
```

Collaboration diagram for L4::lpc::Msg\_ptr< T >:

### Public Member Functions

- [Msg\\_ptr](#) (T \*&p)

Create a [Msg\\_ptr](#) object that set pointer *p* to point into the message buffer.

### 15.131.1 Detailed Description

```
template<typename T>
class L4::lpc::Msg_ptr< T >
```

Pointer to an element of type T in an [lpc::lstream](#).

This wrapper can be used to extract an element of type T from an [lpc::lstream](#), whereas the data is not copied out, but a pointer into the message buffer itself is returned. With is mechanism it is possible to avoid an extra copy of large data structures from a received IPC message, instead the returned pointer gives direct access to the data in the message.

See [msg\\_ptr\(\)](#).

Definition at line 229 of file [ipc\\_stream](#).

## 15.131.2 Constructor & Destructor Documentation

### 15.131.2.1 Msg\_ptr()

```
template<typename T>
L4::lpc::Msg_ptr< T >::Msg_ptr (
    T *& p) [inline], [explicit]
```

Create a [Msg\\_ptr](#) object that set pointer p to point into the message buffer.

#### Parameters

<i>p</i>	The pointer that is adjusted to point into the message buffer.
----------	--

Definition at line 240 of file [ipc\\_stream](#).

The documentation for this class was generated from the following file:

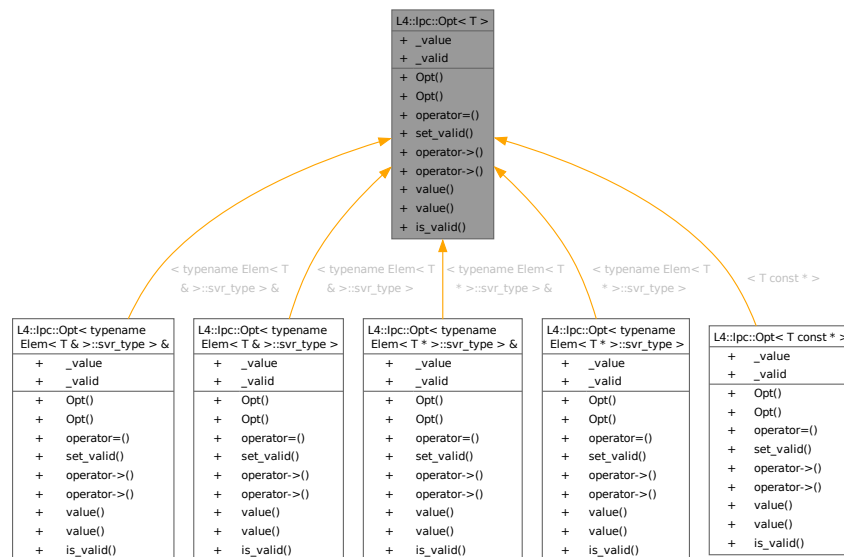

- [l4/cxx/ipc\\_stream](#)

## 15.132 L4::lpc::Opt< T > Struct Template Reference

Attribute for defining an optional RPC argument.

```
#include <ipc_types>
```

Inheritance diagram for L4::lpc::Opt< T >:

Collaboration diagram for L4::lpc::Opt< T >:

L4::lpc::Opt< T >
+ _value
+ _valid
+ Opt()
+ Opt()
+ operator=()
+ set_valid()
+ operator->()
+ operator->()
+ value()
+ value()
+ is_valid()

## Public Member Functions

- **Opt** () noexcept  
*Make an absent optional argument.*
- **Opt** (T [value](#)) noexcept  
*Make a present optional argument with the given value.*
- **Opt** & **operator=** (T [value](#)) noexcept  
*Assign a value to the optional argument (makes the argument present).*
- void **set\_valid** (bool valid=true) noexcept  
*Set the argument to present or absent.*

*Get the pointer to the value.*
- T const \* **operator->** () const noexcept  
*Get the const pointer to the value.*
- T **value** () const noexcept  
*Get the value.*
- T & **value** () noexcept  
*Get the value.*
- bool **is\_valid** () const noexcept  
*Get true if present, false if not.*

## Data Fields

- T **\_value**  
*The value.*
- bool **\_valid**  
*True if the optional argument is present, false else.*

### 15.132.1 Detailed Description

```
template<typename T>  
struct L4::lpc::Opt< T >
```

Attribute for defining an optional RPC argument.

Definition at line 136 of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_types](#)

## 15.133 L4::lpc::Ostream Class Reference

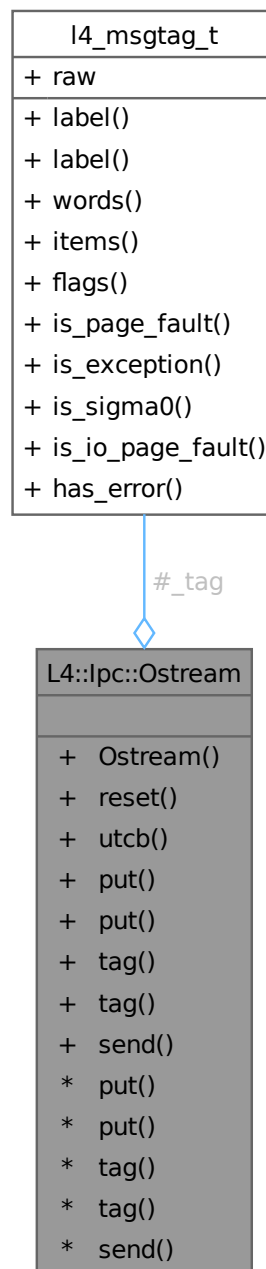

Output stream for IPC marshalling.

```
#include <ipc_stream>
```

Inheritance diagram for L4::lpc::Ostream:

Collaboration diagram for L4::lpc::Ostream:

## Public Member Functions

- **Ostream** ([l4\\_utcb\\_t](#) \*[utcb](#))  
Create an IPC output stream using the given message buffer [utcb](#).
- void **reset** ()  
Reset the stream to empty, same state as a newly created stream.
- [l4\\_utcb\\_t](#) \* **utcb** () const

*Return utcb pointer.*

### Get/Put functions.

*These functions are basically used to implement the insertion operators (<<) and should not be called directly.*

- `template<typename T>`  
`bool put (T *buf, unsigned long size)`  
*Put an array with `size` elements of type `T` into the stream.*
- `template<typename T>`  
`bool put (T const &v)`  
*Insert an element of type `T` into the stream.*
- `l4_msgtag_t tag () const`  
*Extract the `L4` message tag from the stream.*
- `l4_msgtag_t & tag ()`  
*Extract a reference to the `L4` message tag from the stream.*

### IPC operations.

- `l4_msgtag_t send (l4_cap_idx_t dst, long proto=0, unsigned flags=0)`  
*Send the message via IPC to the given receiver.*

## 15.133.1 Detailed Description

Output stream for IPC marshalling.

`lpc::Ostream` is part of the dynamic IPC marshalling infrastructure, as well as `lpc::Istream` and `lpc::lostream`.

`lpc::Ostream` is an output stream supporting insertion of values into an IPC message buffer. A IPC message can be marshalled using the usual insertion operator <<, see [IPC stream operators](#) .

There exist some special wrapper classes to insert arrays (see `lpc::Buf_cp_out`) and indirect strings (see `Msg_↔out_buffer` and `Msg_io_buffer`).

Definition at line 623 of file [ipc\\_stream](#).

## 15.133.2 Member Function Documentation

### 15.133.2.1 put() [1/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
    T * buf,
    unsigned long size) [inline]
```

Put an array with `size` elements of type `T` into the stream.

#### Parameters

<i>buf</i>	A pointer to the array to insert into the buffer.
<i>size</i>	The number of elements in the array.

Definition at line 660 of file [ipc\\_stream](#).

Referenced by [operator<<\(\)](#), [operator<<\(\)](#), and [operator<<\(\)](#).

Here is the caller graph for this function:

### 15.133.2.2 put() [2/2]

```
template<typename T>
bool L4::Ipc::Ostream::put (
    T const & v) [inline]
```

Insert an element of type T into the stream.

#### Parameters

<i>v</i>	The element to insert.
----------	------------------------

Definition at line 678 of file [ipc\\_stream](#).

### 15.133.2.3 send()

```
l4_msgtag_t L4::Ipc::Ostream::send (
    l4_cap_idx_t dst,
    long proto = 0,
    unsigned flags = 0) [inline]
```

Send the message via IPC to the given receiver.

#### Parameters

<i>dst</i>	The destination for the message.
<i>proto</i>	Protocol to use.

<i>flags</i>	Flags to use.
--------------	---------------

#### Returns

The syscall return tag.

Definition at line 959 of file [ipc\\_stream](#).

References [L4\\_IPC\\_NEVER](#), [l4\\_ipc\\_send\(\)](#), [L4\\_MSGTAG\\_FLAGS](#), and [tag\(\)](#).

Here is the call graph for this function:

#### 15.133.2.4 `tag()` [1/2]

```
l4_msgtag_t & L4::Ipcc::Ostream::tag () [inline]
```

Extract a reference to the [L4](#) message tag from the stream.

#### Returns

A reference to the [L4](#) message tag.

Definition at line 713 of file [ipc\\_stream](#).

#### 15.133.2.5 `tag()` [2/2]

```
l4_msgtag_t L4::Ipcc::Ostream::tag () const [inline]
```

Extract the [L4](#) message tag from the stream.

**Returns**

The extracted [L4](#) message tag.

Definition at line [706](#) of file [ipc\\_stream](#).

Referenced by [operator<<\(\)](#), and [send\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

## 15.134 L4::lpc::Out< T > Struct Template Reference

Mark an argument as a output value in an RPC signature.

Collaboration diagram for L4::lpc::Out< T >:

### 15.134.1 Detailed Description

```
template<typename T>  
struct L4::lpc::Out< T >
```

Mark an argument as a output value in an RPC signature.

#### Template Parameters

<i>T</i>	The original type of the argument.
----------	------------------------------------

#### Note

The use of [Out<>](#) is usually not needed, because typical out-put data types in C++ (pointers to non-const objects or non-const references are interpreted as output values anyway. However, there are some data types, such as returned capabilities that can be marked as such by using [Out<>](#).

Definition at line 31 of file [ipc\\_types](#).

The documentation for this struct was generated from the following file:

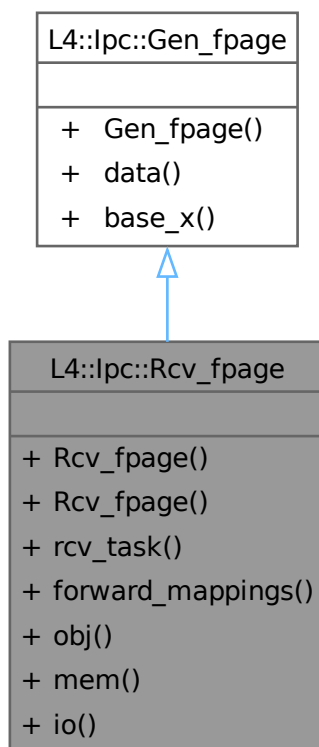

- [l4/sys/cxx/ipc\\_types](#)

## 15.135 L4::lpc::Rcv\_fpage Class Reference

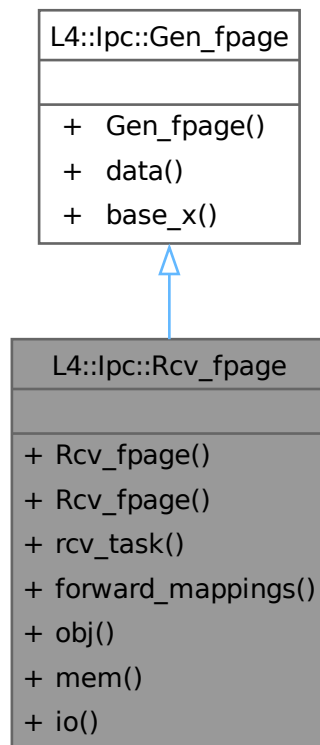

Non-small receive item.

```
#include <ipc_types>
```

### 15.135.1 Detailed Description

Non-small receive item.

This class represents a non-small receive item. A receive item is a message item in the buffer registers of the UTCB of the receiver (see [l4\\_utcb\\_br\(\)](#)).

Definition at line 544 of file [ipc\\_types](#).

### 15.135.2 Constructor & Destructor Documentation

#### 15.135.2.1 [Rcv\\_fpage\(\)](#)

```
L4::Ipc::Rcv_fpage::Rcv_fpage (
    l4\_fpage\_t const & fp,
    l4\_addr\_t snd_base = 0,
    l4\_cap\_idx\_t rcv_task = L4_INVALID_CAP) [inline], [noexcept]
```

Construct a non-small receive item.

#### Parameters

<i>fp</i>	Flexpage defining where and which kind of capabilities may be received.
<i>snd_base</i>	Reserved; should be zero.
<i>rcv_task</i>	Optional destination task for received capabilities. If invalid, capabilities are received in the invoking task.

Definition at line 561 of file [ipc\\_types](#).

References [L4\\_INVALID\\_CAP](#), [L4\\_ITEM\\_MAP](#), [L4\\_RCV\\_ITEM\\_FORWARD\\_MAPPINGS](#), and [rcv\\_task\(\)](#).

Here is the call graph for this function:

### 15.135.3 Member Function Documentation

#### 15.135.3.1 io()

```

Rcv_fpage L4::Ipc::Rcv_fpage::io (
    unsigned long base,
    int order,
    l4_addr_t snd_base = 0,
    L4::Cap< void > rcv_task = L4::Cap<void>::Invalid) [inline], [static], [noexcept]
  
```

Construct a receive item for the I/O port space.

#### Parameters

<i>base</i>	Start of flexpage (see <a href="#">l4_iofpage()</a> ).
<i>order</i>	Log <sub>2</sub> size of flexpage (see <a href="#">l4_iofpage()</a> ).
<i>snd_base</i>	Reserved; should be zero.
<i>rcv_task</i>	Optional destination task for received capabilities. If invalid, capabilities are received in the invoking task.

Definition at line 609 of file [ipc\\_types](#).

References [L4::Cap\\_base::Invalid](#), [l4\\_iofpage\(\)](#), [Rcv\\_fpage\(\)](#), and [rcv\\_task\(\)](#).

Here is the call graph for this function:

### 15.135.3.2 mem()

```
Rcv_fpage L4::Ipc::Rcv_fpage::mem (
    l4_addr_t base,
    int order,
    l4_addr_t snd_base = 0,
    L4::Cap< void > rcv_task = L4::Cap<void>::Invalid) [inline], [static], [noexcept]
```

Construct a receive item for the memory space.

#### Parameters

<i>base</i>	Start of flexpage (see <a href="#">l4_fpage()</a> ).
<i>order</i>	Log <sub>2</sub> size of flexpage (see <a href="#">l4_fpage()</a> ).
<i>snd_base</i>	Reserved; should be zero.
<i>rcv_task</i>	Optional destination task for received capabilities. If invalid, capabilities are received in the invoking task.

#### Examples

[examples/libs/l4re/streammap/client.cc](#).

Definition at line 594 of file [ipc\\_types](#).

References [L4::Cap\\_base::Invalid](#), [l4\\_fpage\(\)](#), [Rcv\\_fpage\(\)](#), and [rcv\\_task\(\)](#).

Here is the call graph for this function:

### 15.135.3.3 obj()

```
Rcv_fpage L4::Ipc::Rcv_fpage::obj (
    l4_cap_idx_t base,
    int order,
    l4_addr_t snd_base = 0,
    L4::Cap< void > rcv_task = L4::Cap<void>::Invalid) [inline], [static], [noexcept]
```

Construct a non-small receive item for the object space.

#### Parameters

<i>base</i>	Start of flexpage (see <a href="#">l4_obj_fpage()</a> ).
<i>order</i>	$\log_2$ size of flexpage (see <a href="#">l4_obj_fpage()</a> ).
<i>snd_base</i>	Reserved; should be zero.
<i>rcv_task</i>	Optional destination task for received capabilities. If invalid, capabilities are received in the invoking task.

Definition at line 578 of file [ipc\\_types](#).

References [L4::Cap\\_base::Invalid](#), [l4\\_obj\\_fpage\(\)](#), [Rcv\\_fpage\(\)](#), and [rcv\\_task\(\)](#).

## 15.137 L4::lpc::Send\_only Struct Reference

RPC attribute for a send-only RPC.

```
#include <ipc_iface>
```

Collaboration diagram for L4::lpc::Send\_only:

### 15.137.1 Detailed Description

RPC attribute for a send-only RPC.

This class can be used as FLAGS parameter to [L4::lpc::Msg::Rpc\\_call](#) and [L4::lpc::Msg::Rpc\\_inline\\_call](#) templates and declares the RPC to use send-only semantics and timeouts.

Examples:

```
L4\_RPC\(l4\_ret\_t, send, \(unsigned value\), L4::lpc::Send\_only\);
```

Definition at line 287 of file [ipc\\_iface](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/ipc\\_iface](#)

## 15.138 L4::lpc::Small\_buf Class Reference

A receive item for receiving a single object capability.

```
#include <ipc_types>
```

Collaboration diagram for L4::lpc::Small\_buf:

### Public Member Functions

- [Small\\_buf](#) ([L4::Cap](#)< void > cap, unsigned long flags=0) noexcept  
*Create a receive item from a C++ cap.*
- [Small\\_buf](#) ([l4\\_cap\\_idx\\_t](#) cap, unsigned long flags=0) noexcept  
*Create a receive item from a C cap.*
- [l4\\_umword\\_t raw](#) () const noexcept  
*Return the raw data.*

### 15.138.1 Detailed Description

A receive item for receiving a single object capability.

This class is the main abstraction for receiving object capabilities via [lpc::lstream](#). To receive an object capability, an instance of [Small\\_buf](#) that refers to an empty capability slot must be inserted into the [lpc::lstream](#) before the receive operation.

Definition at line 257 of file [ipc\\_types](#).

## 15.138.2 Constructor & Destructor Documentation

### 15.138.2.1 Small\_buf() [1/2]

```
L4::Ipc::Small_buf::Small_buf (
    L4::Cap< void > cap,
    unsigned long flags = 0) [inline], [explicit], [noexcept]
```

Create a receive item from a C++ cap.

#### Parameters

<i>cap</i>	Capability slot where to save the capability.
<i>flags</i>	Receive buffer flags, see <a href="#">l4_msg_item_consts_t</a> . <a href="#">L4_RCV_ITEM_SINGLE_CAP</a> will always be set.

Definition at line 267 of file [ipc\\_types](#).

References [L4\\_RCV\\_ITEM\\_SINGLE\\_CAP](#).

### 15.138.2.2 Small\_buf() [2/2]

```
L4::Ipc::Small_buf::Small_buf (
    l4_cap_idx_t cap,
    unsigned long flags = 0) [inline], [explicit], [noexcept]
```

Create a receive item from a C cap.

#### Parameters

<i>cap</i>	Capability slot where to save the capability.
<i>flags</i>	Receive buffer flags, see <a href="#">l4_msg_item_consts_t</a> . <a href="#">L4_RCV_ITEM_SINGLE_CAP</a> will always be set.

Definition at line 274 of file [ipc\\_types](#).

References [L4\\_RCV\\_ITEM\\_SINGLE\\_CAP](#).

The documentation for this class was generated from the following file:

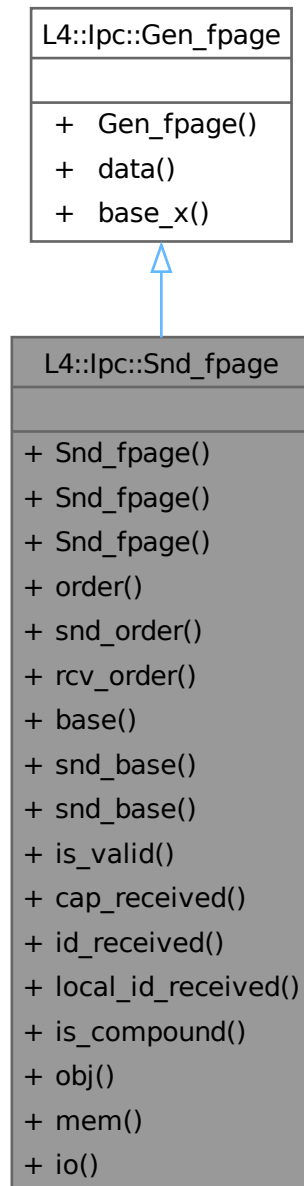

- [l4/sys/cxx/ipc\\_types](#)

## 15.139 L4::lpc::Snd\_fpage Class Reference

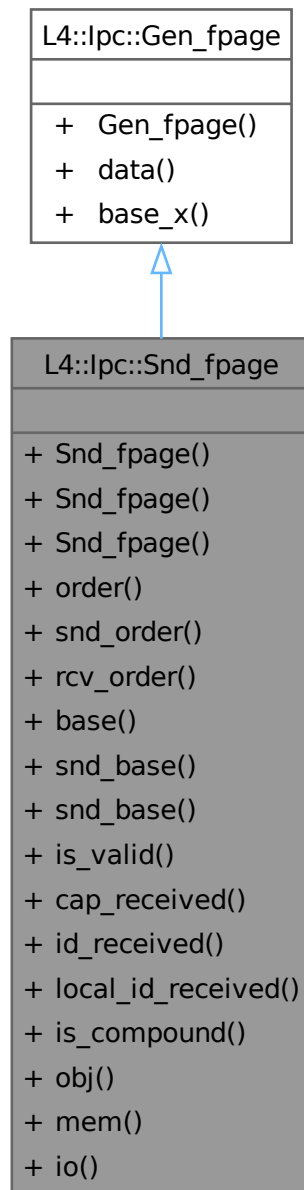

Send item or return item.

```
#include <ipc_types>
```

Construct a send item for the object space.
- static [Snd\\_fpage mem](#) ([l4\\_addr\\_t](#) base, int [order](#), unsigned char rights, [l4\\_addr\\_t](#) snd\_base=0, [Map\\_type](#) map\_type=[Map](#), [Cacheopt](#) cache=[None](#), [Continue](#) cont=[Last](#)) noexcept  
Construct a send item for the memory space.
- static [Snd\\_fpage io](#) (unsigned long base, int [order](#), unsigned char rights, [l4\\_addr\\_t](#) snd\_base=0, [Map\\_type](#) map\_type=[Map](#), [Continue](#) cont=[Last](#)) noexcept  
Construct a send item for the I/O port space.

### 15.139.1 Detailed Description

Send item or return item.

This class represents a typed message item in the message registers of the UTCB. If it is provided by the sender, then it is a *send item*. If it is provided by the kernel during IPC, it is a *return item*.

Note that some members are dedicated for send items only or return items only.

Definition at line 323 of file [ipc\\_types](#).

### 15.139.2 Member Enumeration Documentation

#### 15.139.2.1 Cacheopt

enum [L4::Ipc::Snd\\_fpage::Cacheopt](#)

(Defined for memory send items only.) Caching options, see [l4\\_fpage\\_cacheability\\_opt\\_t](#).

#### Enumerator

None	Copy options from sender.
Cached	Cacheability option to enable caches for the mapping.
Buffered	Cacheability option to enable buffered writes for the mapping.
Uncached	Cacheability option to disable caching for the mapping.

Definition at line 336 of file [ipc\\_types](#).

### 15.139.2.2 Continue

```
enum L4::Ipc::Snd_fpage::Continue
```

Specify if the following item is associated with the same receive item as this one, see [L4\\_ITEM\\_CONT](#).

#### Enumerator

Single	Inverse of <a href="#">Compound</a> .
Last	Inverse of <a href="#">More</a> .
More	Alias for <a href="#">Compound</a> .
Compound	Denote that the following item shall be put into the same receive item as this one.

Definition at line 346 of file [ipc\\_types](#).

### 15.139.2.3 Map\_type

```
enum L4::Ipc::Snd_fpage::Map_type
```

(Defined for send items only.) Kind of mapping.

#### Enumerator

Map	Flag as usual <i>map</i> operation.
Grant	<p>Flag as <i>grant</i> instead of <i>map</i> operation. This means, the sender delegates access to the receiver and the kernel removes the rights from the sender (basically a move operation). The mapping in the receiver gets the new parent of any child mappings of the mapping of the sender. Rights revocation via send item/flexpage is <i>not</i> guaranteed to be applied to descendant mappings in case of grant. See <a href="#">Spaces and Mappings</a> for more details on map/grant.</p> <p><b>Note</b></p> <p>The grant operation is not performed if the resulting rights of the receiver mapping would not contain the <a href="#">L4_CAP_FPAGE_R</a> bit (for object capabilities) or none of the <a href="#">L4_FPAGE_RWX</a> bits (memory and IO ports). In that case, the mapping is not created in the receiver space and not removed from the sender space.</p> <p>If the removal of the whole mapping from the sender is not possible because the size of the mapped frame at the sender exceeds the size defined by the send or receive flexpage, the grant operation is turned into a regular map operation and the mapping is <i>not</i> removed from the sender. This would happen if, for example, a smaller part of an <a href="#">L4</a> superpage mapping shall be granted.</p>

Definition at line 328 of file [ipc\\_types](#).

## 15.139.3 Constructor & Destructor Documentation

### 15.139.3.1 Snd\_fpage() [1/2]

```
L4::Ipc::Snd_fpage::Snd_fpage (
    l4_fpage_t const & fp,
```

```

l4_addr_t snd_base = 0,
Map_type map_type = Map,
Cacheopt cache = None,
Continue cont = Last) [inline], [noexcept]

```

Construct a send item for the memory space.

#### Parameters

<i>fp</i>	Memory flexpage defining which range and kind of capabilities shall be sent (see <a href="#">l4_fpage()</a> ).
<i>snd_base</i>	Position in receive window in case it has a different size than <i>fp</i> .
<i>map_type</i>	See <a href="#">Map_type</a> .
<i>cache</i>	See <a href="#">Cacheopt</a> .
<i>cont</i>	See <a href="#">Continue</a> .

Definition at line 370 of file [ipc\\_types](#).

References [L4\\_ITEM\\_MAP](#), [Last](#), [Map](#), [None](#), and [snd\\_base\(\)](#).

Here is the call graph for this function:

#### 15.139.3.2 Snd\_fpage() [2/2]

```

L4::Ipc::Snd_fpage::Snd_fpage (
    L4::Cap< void > cap,
    unsigned rights,
    Map_type map_type = Map) [inline], [noexcept]

```

Construct a send item for the object space.

#### Parameters

<i>cap</i>	Capability to be sent.
<i>rights</i>	Permissions to be transferred. See <a href="#">L4_cap_fpage_rights</a> and <a href="#">Attributes and additional permissions for object send items</a> .
<i>map_type</i>	See <a href="#">Map_type</a> .

Definition at line 386 of file [ipc\\_types](#).

References [L4\\_ITEM\\_MAP](#), and [Map](#).

## 15.139.4 Member Function Documentation

### 15.139.4.1 cap\_received()

```
bool L4::Ipc::Snd_fpage::cap_received () const [inline], [noexcept]
```

(*Defined for return items only.*) Check if at least one object capability has been mapped for this item.

The capabilities themselves can then be retrieved from the cap slots that have been provided in the receive operation.

#### Note

If this function returns `true` and the receive window covers more than one capability slot, then it is not possible to determine which slots actually got capabilities mapped from the sender.

If the received capabilities do not have type object (see [L4\\_FPAGE\\_OBJ](#)), then this function returns `false`.

Definition at line 496 of file [ipc\\_types](#).

### 15.139.4.2 id\_received()

```
bool L4::Ipc::Snd_fpage::id_received () const [inline], [noexcept]
```

(*Defined for return items only.*) Check if an IPC gate label has been received instead of a mapping.

If the [L4\\_RCV\\_ITEM\\_LOCAL\\_ID](#) flag has been set by the receiver, the conditions for [local\\_id\\_received\(\)](#) do not apply, the sender sent an IPC gate capability, and the receiving thread is in the same task as the thread that is attached to the IPC gate, then no mapping is done for this item and only the bitwise OR (`|`) of the label of the IPC gate and the special and write permission ([L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#)) that would have been mapped is received.

The bitwise OR of the label and the permissions can be retrieved with [Gen\\_fpage::data\(\)](#).

Definition at line 512 of file [ipc\\_types](#).

### 15.139.4.3 io()

```
Snd_fpage L4::Ipc::Snd_fpage::io (
    unsigned long base,
    int order,
    unsigned char rights,
    l4_addr_t snd_base = 0,
    Map_type map_type = Map,
    Continue cont = Last) [inline], [static], [noexcept]
```

Construct a send item for the I/O port space.

#### Parameters

<i>base</i>	Start of flexpage (see <a href="#">l4_iofpage()</a> ).
-------------	--

<i>order</i>	Log <sub>2</sub> size of flexpage (see <a href="#">l4_iofpage()</a> ).
<i>rights</i>	Permissions of flexpage (see <a href="#">L4_fpage_rights</a> ).
<i>snd_base</i>	Position in receive window in case it has a different size than 1 << <a href="#">order</a> .
<i>map_type</i>	See <a href="#">Map_type</a> .
<i>cont</i>	See <a href="#">Continue</a> .

Definition at line 445 of file [ipc\\_types](#).

References [base\(\)](#), [l4\\_fpage\\_set\\_rights\(\)](#), [l4\\_iofpage\(\)](#), [Last](#), [Map](#), [None](#), [order\(\)](#), [snd\\_base\(\)](#), and [Snd\\_fpage\(\)](#).

Here is the call graph for this function:

#### 15.139.4.4 is\_compound()

```
bool L4::Ipc::Snd_fpage::is_compound () const [inline], [noexcept]
```

Check if the item has the compound bit set, see [Continue](#).

A set compound bit means the next message item of the same type will be mapped to the same receive buffer as this message item.

Definition at line 535 of file [ipc\\_types](#).

#### 15.139.4.5 local\_id\_received()

```
bool L4::Ipc::Snd_fpage::local_id_received () const [inline], [noexcept]
```

(Defined for return items only.) Check if a raw object flexpage has been received instead of a mapping.

If the [L4\\_RCV\\_ITEM\\_LOCAL\\_ID](#) flag has been set by the receiver, and sender and receiver are in the same task, then no mapping is done for this item and only the raw flexpage ([l4\\_fpage\\_t](#)) is received.

This function checks if this is the case and if it is an object flexpage.

The flexpage can be retrieved with [Gen\\_fpage::data\(\)](#).

#### Note

If a raw flexpage was received, but it does not have type object (see [L4\\_FPAGE\\_OBJ](#)), then this function returns `false`.

Definition at line 528 of file [ipc\\_types](#).

## 15.139.4.6 mem()

```
Snd_fpage L4::Ipc::Snd_fpage::mem (
    l4_addr_t base,
    int order,
    unsigned char rights,
    l4_addr_t snd_base = 0,
    Map_type map_type = Map,
    Cacheopt cache = None,
    Continue cont = Last) [inline], [static], [noexcept]
```

Construct a send item for the memory space.

## Parameters

<i>base</i>	Start of flexpage (see <a href="#">l4_fpage()</a> ).
<i>order</i>	Log <sub>2</sub> size of flexpage (see <a href="#">l4_fpage()</a> ).
<i>rights</i>	Permissions of flexpage (see <a href="#">l4_fpage()</a> ).
<i>snd_base</i>	Position in receive window in case it has a different size than 1 << <a href="#">order</a> .
<i>map_type</i>	See <a href="#">Map_type</a> .
<i>cache</i>	See <a href="#">Cacheopt</a> .
<i>cont</i>	See <a href="#">Continue</a> .

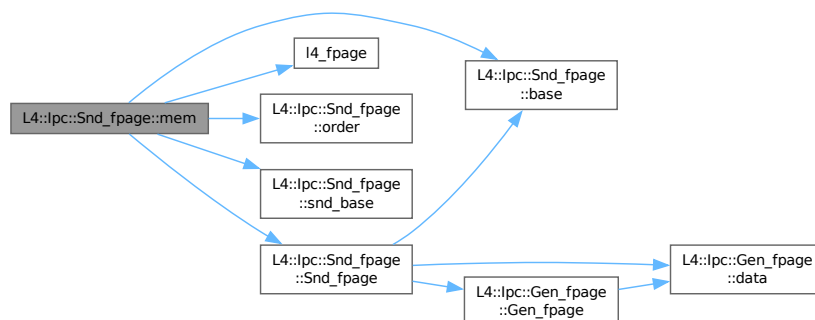

## Examples

[examples/libs/l4re/streammap/server.cc](#).

Definition at line 424 of file [ipc\\_types](#).

References [base\(\)](#), [l4\\_fpage\(\)](#), [Last](#), [Map](#), [None](#), [order\(\)](#), [snd\\_base\(\)](#), and [Snd\\_fpage\(\)](#).

Here is the call graph for this function:

### 15.139.4.7 obj()

```
Snd_fpage L4::Ipc::Snd_fpage::obj (
    l4_cap_idx_t base,
    int order,
    unsigned char rights,
    l4_addr_t snd_base = 0,
    Map_type map_type = Map,
    Continue cont = Last) [inline], [static], [noexcept]
```

Construct a send item for the object space.

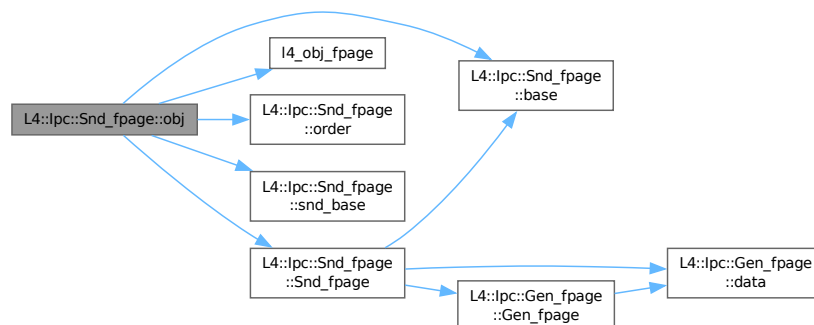

#### Parameters

<i>base</i>	Start of flexpage (see <a href="#">l4_obj_fpage()</a> ).
<i>order</i>	$\log_2$ size of flexpage (see <a href="#">l4_obj_fpage()</a> ).
<i>rights</i>	Permissions of flexpage (see <a href="#">l4_obj_fpage()</a> ).
<i>snd_base</i>	Position in receive window in case it has a different size than $1 \ll order$ .
<i>map_type</i>	See <a href="#">Map_type</a> .
<i>cont</i>	See <a href="#">Continue</a> .

Definition at line 402 of file [ipc\\_types](#).

References [base\(\)](#), [l4\\_obj\\_fpage\(\)](#), [Last](#), [Map](#), [None](#), [order\(\)](#), [snd\\_base\(\)](#), and [Snd\\_fpage\(\)](#).

## 15.140 L4::lpc::Str\_cp\_in< T > Class Template Reference

Abstraction for extracting a zero-terminated string from an [lpc::lstream](#).

```
#include <ipc_stream>
```

Collaboration diagram for L4::lpc::Str\_cp\_in< T >:

### Public Member Functions

- [Str\\_cp\\_in](#) (T \*v, unsigned long &size)  
Create a buffer for extracting an array from an [lpc::lstream](#).

### 15.140.1 Detailed Description

```
template<typename T>
class L4::lpc::Str_cp_in< T >
```

Abstraction for extracting a zero-terminated string from an [lpc::lstream](#).

An instance of [Str\\_cp\\_in](#) can be used to extract a zero-terminated string an [lpc::lstream](#). The data from the received message is thereby copied to the given buffer and size is set to the number of characters found in the stream. The string is zero terminated in any circumstances. When the given buffer is smaller than the received string the last byte in the buffer will be the zero terminator. In the case the received string is shorter than the given buffer the zero termination will be placed behind the received data. This provides a zero-terminated result even in cases where the sender did not provide proper termination or in cases of too small receiver buffers.

*Returns an iterator to the first Varg.*
- **Iterator end** () const  
*Returns the end of the list.*

### 15.143.1 Detailed Description

List of variable-sized RPC parameters as received by the server.

The list can be traversed exactly once using [next\(\)](#).

This is a reference list, where the returned [Varg](#) point to data in the underlying storage, conventionally the UTCB. This type should only be used in server functions when the implementation can ensure that all content is read before the UTCB is reused (e.g. for IPC), otherwise use [Varg\\_list](#).

Definition at line 253 of file [ipc\\_varg](#).

## 15.143.2 Constructor & Destructor Documentation

### 15.143.2.1 Varg\_list\_ref()

```
L4::Ipc::Varg_list_ref::Varg_list_ref (
    void const * start,
    void const * end) [inline]
```

Create a parameter list over a given memory region.

#### Parameters

<i>start</i>	Pointer to start of the parameter list.
<i>end</i>	Pointer to end of the list (inclusive).

Definition at line [332](#) of file [ipc\\_varg](#).

References [end\(\)](#).

Here is the call graph for this function:

### 15.145.1 Detailed Description

The C++ IPC gate interface, see [IPC-Gate API](#) for the C interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [L4::Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [L4::Thread](#) or [L4::Thread\\_group](#) the IPC gate is *bound* to (cf. [bind\\_thread\(\)](#) and [bind\\_snd\\_destination\(\)](#)). If the capability has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, only IPC using a protocol different from the [L4\\_PROTO\\_KOBJECT](#) protocol is forwarded. Without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.

Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the [L4::Thread](#) interface of that thread is not accessible via an IPC gate. The [L4::lpc\\_gate](#) interface of an IPC gate is only accessible if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, [L4::lpc\\_gate](#) interface calls are forwarded to the thread or thread group the IPC gate is bound to instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. [bind\\_thread\(\)](#) and [bind\\_snd\\_destination\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the [L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#) permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to (or to the selected thread of the thread group the IPC gate is bound to) upon receive. However, the configured label of an IPC gate can also be queried via [get\\_infos\(\)](#) if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [L4::Thread::modify\\_senders\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.

When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

**Include File**

```
#include <l4/sys/ipc_gate>
```

For the C interface refer to the C [IPC-Gate API](#).

**See also**

[Object Invocation](#)

Definition at line 85 of file [ipc\\_gate](#).

**15.145.2 Member Function Documentation****15.145.2.1 get\_infos()**

```
l4_msgtag_t L4::Ipc_gate::get_infos (
    l4_umword_t * label)
```

Get information about the IPC-gate.

**Parameters**

out	<i>label</i>	The label of the IPC gate is returned here.
-----	--------------	---

**Returns**

System call return tag.

**Precondition**

If the IPC gate capability used to invoke this operation does not possess the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread or thread group the IPC gate is bound to, blocking the caller if the IPC gate is not bound yet.

### 15.146.1 Detailed Description

Empty implementation of [Server\\_iface](#).

This implementation of [Server\\_iface](#) provides no buffer or timeout management at all it just returns errors for all calls that express other than empty demands. However, this may be useful for very simple servers that serve simple server objects only.

Definition at line 233 of file [ipc\\_server\\_loop](#).

### 15.146.2 Member Function Documentation

#### 15.146.2.1 alloc\_buffer\_demand()

```
int L4::lpc_svr::Br_manager_no_buffers::alloc_buffer_demand (
    Demand const & demand) [inline], [override], [virtual]
```

Tells the server to allocate buffers for the given demand.

#### Parameters

<i>demand</i>	The total server-side demand of receive buffers needed for a given interface, see <a href="#">Demand</a> .
---------------	--

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.

**Returns**

success (0) if demand is empty, -L4\_ENOMEM else.

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 240 of file [ipc\\_server\\_loop](#).

References [L4\\_ENOMEM](#), [L4\\_EOK](#), and [L4::Type\\_info::Demand::no\\_demand\(\)](#).

## 15.148 L4::lpc\_svr::Dbg\_dispatch< R, Exc, Printer > Struct Template Reference

Dispatch helper that, in addition to what [Exc\\_dispatch](#) does, prints exception messages.

```
#include <ipc_server_loop>
```

Inheritance diagram for L4::lpc\_svr::Dbg\_dispatch< R, Exc, Printer >:

Collaboration diagram for L4::lpc\_svr::Dbg\_dispatch< R, Exc, Printer >:

#### Public Member Functions

- **Dbg\_dispatch** (R [r](#), Printer p)

*Make an exception handling dispatcher.*

- `l4_msgtag_t operator()` (`l4_msgtag_t` tag, `l4_umword_t` obj, `l4_utcb_t *utcb`)

*Dispatch the call via `Direct_dispatch<R>()`, handle exceptions, and print the exception message.*

### 15.148.1 Detailed Description

```
template<typename R, typename Exc, typename Printer>
struct L4::lpc_svr::Dbg_dispatch< R, Exc, Printer >
```

Dispatch helper that, in addition to what `Exc_dispatch` does, prints exception messages.

#### Template Parameters

<i>R</i>	Data type of the registry used for dispatching to objects.
<i>Exc</i>	Data type of the exceptions that shall be caught. This data type must provide a member <code>err_no()</code> that returns the negative integer (int) error code for the exception. In addition, methods <code>str()</code> and <code>extra_str()</code> are required that return a c-string describing the error.
<i>Printer</i>	A type that provides a <code>printf()</code> member that is used (with the usual format string syntax) to print error messages.

This dispatcher wraps `Direct_dispatch<R>` with a try-catch (Exc).

Definition at line 184 of file `ipc_server_loop`.

The documentation for this struct was generated from the following file:

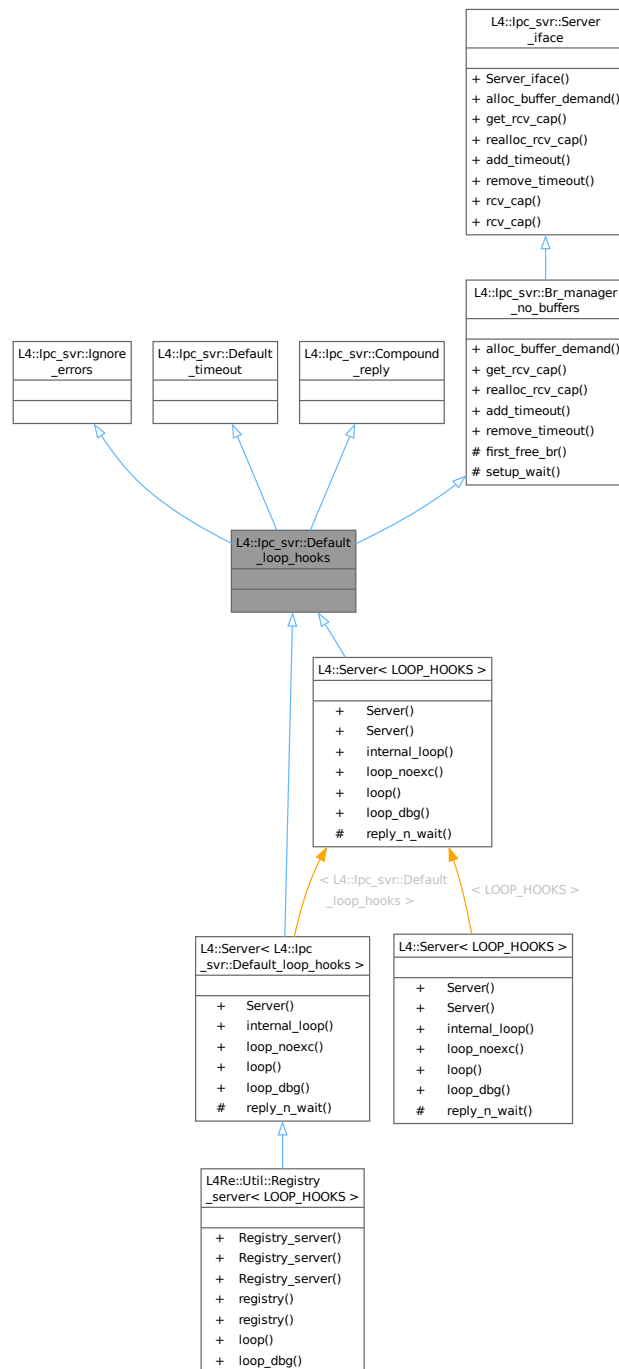

- `l4/sys/cxx/ipc_server_loop`

## 15.149 L4::lpc\_svr::Default\_loop\_hooks Struct Reference

### 15.156.1 Detailed Description

Interface for server-loop related functions.

This interface provides access to high-level server-loop related functions, such as management of receive buffers and timeouts.

Definition at line 36 of file [ipc\\_epiface](#).

### 15.156.2 Member Function Documentation

#### 15.156.2.1 add\_timeout()

```
virtual int L4::Ipc_svr::Server_iface::add_timeout (
    Timeout * timeout,
    l4_kernel_clock_t time) [pure virtual]
```

Add a timeout to the server internal timeout queue.

##### Parameters

<i>timeout</i>	The timeout object to register.
<i>time</i>	The time (absolute) at which the timeout shall expire.

##### Precondition

timeout must not be in any queue.

##### Returns

0 on success, 1 if timeout is already expired, < 0 on error.

Implemented in [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< Br\\_manager\\_timeout\\_hooks, Br\\_manager >](#), and [L4Re::Util::Br\\_manager](#).

#### 15.156.2.2 alloc\_buffer\_demand()

```
virtual int L4::Ipc_svr::Server_iface::alloc_buffer_demand (
    Demand const & demand) [pure virtual]
```

Tells the server to allocate buffers for the given demand.

##### Parameters

<i>demand</i>	The total server-side demand of receive buffers needed for a given interface, see <a href="#">Demand</a> .
---------------	--

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.

Implemented in [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), and [L4Re::Util::Br\\_manager](#).

**15.156.2.3 get\_rcv\_cap()**

```
virtual L4::Cap< void > L4::Ipc_svr::Server_iface::get_rcv_cap (
    int index) const [pure virtual]
```

Get capability slot allocated to the given receive buffer.

**Parameters**

<i>index</i>	The receive buffer index of the expected capability argument ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> ).
--------------	---

**Precondition**

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

**Returns**

Capability slot currently allocated to the given receive buffer.

Implemented in [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), and [L4Re::Util::Br\\_manager](#).

Referenced by [rcv\\_cap\(\)](#).

Here is the caller graph for this function:

**15.156.2.4 rcv\_cap()** [1/2]

```
L4::Cap< void > L4::Ipc_svr::Server_iface::rcv_cap (
    int index) const [inline]
```

Get receive cap with the given index as generic (void) type.

**Parameters**

<i>index</i>	The index of the cap receive buffer of the expected capability. ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> .)
--------------	--

**Returns**

Capability slot currently allocated to the given capability buffer.

**Note**

This is a convenience wrapper for [get\\_rcv\\_cap\(\)](#).

Definition at line 126 of file [ipc\\_epiface](#).

References [get\\_rcv\\_cap\(\)](#).

Here is the call graph for this function:

**15.156.2.5 rcv\_cap() [2/2]**

```

template<typename T>
L4::Cap< T > L4::lpc_svr::Server_iface::rcv_cap (
    int index) const [inline]
  
```

Get given receive buffer as typed capability.

**See also**

[get\\_rcv\\_cap\(\)](#)

**Parameters**

<i>index</i>	The receive buffer index of the expected capability argument. ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> .)
--------------	--

**Precondition**

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

**Returns**

Capability slot currently allocated to the given receive buffer.

**Note**

This is a convenience wrapper for [get\\_rcv\\_cap\(\)](#) to avoid [L4::cap\\_cast<>\(\)](#).

Definition at line 114 of file [ipc\\_epiface](#).

References [L4::cap\\_cast\(\)](#), and [get\\_rcv\\_cap\(\)](#).

Here is the call graph for this function:

**15.156.2.6 realloc\_rcv\_cap()**

```
virtual int L4::Ipc_svr::Server_iface::realloc_rcv_cap (
    int index) [pure virtual]
```

Allocate a new capability for the given receive buffer.

**Parameters**

<i>index</i>	The receive buffer index of the expected capability argument ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> ).
--------------	---

**Precondition**

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

**Returns**

0 on success, < 0 on error.

Implemented in [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), and [L4Re::Util::Br\\_manager](#).

### 15.156.2.7 remove\_timeout()

```
virtual int L4::Ipc_svr::Server_iface::remove_timeout (
    Timeout * timeout) [pure virtual]
```

Remove the given timeout from the timer queue.

#### Parameters

<i>timeout</i>	The timeout object to remove.
----------------	-------------------------------

#### Returns

0 on success, < 0 on error.

Implemented in [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< HOOKS, BR\\_MAN >](#), [L4::lpc\\_svr::Timeout\\_queue\\_hooks< Br\\_manager\\_timeout\\_hooks, Br\\_manager >](#), and [L4Re::Util::Br\\_manager](#).

### 15.157.1 Detailed Description

Callback interface for [Timeout\\_queue](#).

Definition at line 18 of file [ipc\\_timeout\\_queue](#).

### 15.157.2 Member Function Documentation

#### 15.157.2.1 expired()

```
virtual void L4::lpc_svr::Timeout::expired () [pure virtual]
```

callback function to be called when timeout happened

##### Note

The timeout object is already dequeued when this function is called, this means the timeout may be safely queued again within the [expired\(\)](#) function.

Referenced by [L4::lpc\\_svr::Timeout\\_queue::handle\\_expired\\_timeouts\(\)](#).

Here is the caller graph for this function:

#### 15.157.2.2 timeout()

```
l4_kernel_clock_t L4::lpc_svr::Timeout::timeout () const [inline]
```

return absolute timeout of this callback.

##### Returns

absolute timeout for this instance of the timeout.

##### Precondition

The timeout object must have been in a queue before, otherwise the timeout is not set.

Definition at line 42 of file [ipc\\_timeout\\_queue](#).

The documentation for this class was generated from the following file:

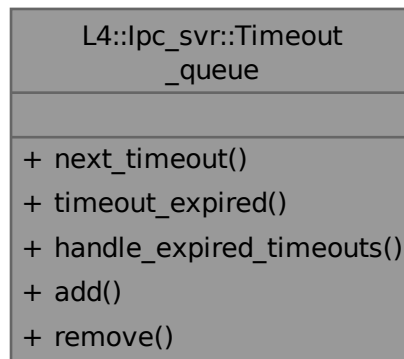

- `l4/cxx/ipc_timeout_queue`

## 15.158 L4::lpc\_svr::Timeout\_queue Class Reference

[Timeout](#) queue to be used in l4re server loop.

```
#include <ipc_timeout_queue>
```

Collaboration diagram for L4::lpc\_svr::Timeout\_queue:

### Public Types

- typedef [L4::lpc\\_svr::Timeout](#) **Timeout**  
Provide a local definition of [Timeout](#) for backward compatibility.

### Public Member Functions

- [l4\\_kernel\\_clock\\_t](#) [next\\_timeout](#) () const  
Get the time for the next timeout.
- bool [timeout\\_expired](#) ([l4\\_kernel\\_clock\\_t](#) now) const  
Determine if a timeout has happened.
- void [handle\\_expired\\_timeouts](#) ([l4\\_kernel\\_clock\\_t](#) now)  
run the callbacks of expired timeouts
- void [add](#) ([Timeout](#) \*timeout, [l4\\_kernel\\_clock\\_t](#) time)  
Add a timeout to the queue.
- void [remove](#) ([Timeout](#) \*timeout)  
Remove timeout from the queue.

### 15.158.1 Detailed Description

[Timeout](#) queue to be used in l4re server loop.

Definition at line 55 of file [ipc\\_timeout\\_queue](#).

## 15.158.2 Member Function Documentation

### 15.158.2.1 add()

```
void L4::Ipc_svr::Timeout_queue::add (
    Timeout * timeout,
    l4_kernel_clock_t time) [inline]
```

Add a timeout to the queue.

#### Parameters

<i>timeout</i>	timeout object to add
<i>time</i>	the time when the timeout expires

#### Precondition

*timeout* must not be in any queue already

Definition at line 111 of file [ipc\\_timeout\\_queue](#).

### 15.158.2.2 handle\_expired\_timeouts()

```
void L4::Ipc_svr::Timeout_queue::handle_expired_timeouts (
    l4_kernel_clock_t now) [inline]
```

run the callbacks of expired timeouts

#### Parameters

<i>now</i>	the current time.
------------	-------------------

Definition at line 91 of file [ipc\\_timeout\\_queue](#).

References [L4::lpc\\_svr::Timeout::expired\(\)](#).

Here is the call graph for this function:

### 15.158.2.3 next\_timeout()

```
l4_kernel_clock_t L4::Ipc_svr::Timeout_queue::next_timeout () const [inline]
```

Get the time for the next timeout.

#### Returns

the time for the next timeout or 0 if there is none

Definition at line 65 of file [ipc\\_timeout\\_queue](#).

Referenced by [timeout\\_expired\(\)](#).

Here is the caller graph for this function:

### 15.158.2.4 remove()

```
void L4::Ipc_svr::Timeout_queue::remove (
    Timeout * timeout) [inline]
```

Remove *timeout* from the queue.

#### Parameters

<i>timeout</i>	timeout to remove from timeout queue
----------------	--------------------------------------

#### Precondition

### 15.159.1 Detailed Description

```
template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
class L4::lpc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >
```

Loop hooks mixin for integrating a timeout queue into the server loop.

#### Template Parameters

<i>HOOKS</i>	has to inherit from <a href="#">Timeout_queue_hooks&lt;&gt;</a> and provide the functions <code>now()</code> that has to return the current time.
<i>BR_MAN</i>	This used as a base class for and provides the API for selecting the buffer register (BR) that is used to store the timeout value. This is usually <a href="#">L4Re::Util::Br_manager</a> or <a href="#">L4::lpc_svr::Br_manager_no_buffers</a> .

Definition at line 150 of file [ipc\\_timeout\\_queue](#).

### 15.159.2 Member Function Documentation

#### 15.159.2.1 add\_timeout()

```
template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
int L4::lpc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::add_timeout (
    Timeout * timeout,
    l4_kernel_clock_t time) [inline], [override], [virtual]
```

Add a timeout to the queue for time *time*.

#### Parameters

<i>timeout</i>	The timeout object to add into the queue (must not be in any queue currently).
<i>time</i>	The time when the timeout shall expire.

#### Precondition

`timeout` must not be in any queue.

#### Note

The timeout is automatically dequeued before the [Timeout::expired\(\)](#) function is called

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 202 of file [ipc\\_timeout\\_queue](#).

References [queue](#), and [timeout\(\)](#).

Here is the call graph for this function:

### 15.159.2.2 remove\_timeout()

```
template<typename HOOKS, typename BR_MAN = Br_manager_no_buffers>
int L4::Ipc_svr::Timeout_queue_hooks< HOOKS, BR_MAN >::remove_timeout (
    Timeout * timeout) [inline], [override], [virtual]
```

Remove timeout from the queue.

#### Parameters

<i>timeout</i>	The timeout object to be removed from the queue.
----------------	--

#### Note

This function may be safely called even if the timeout is not currently enqueued.  
in [Timeout::expired\(\)](#) the timeout is already dequeued!

Implements [L4::Ipc\\_svr::Server\\_iface](#).

Definition at line 215 of file [ipc\\_timeout\\_queue](#).

References [queue](#), and [timeout\(\)](#).

Here is the call graph for this function:

### 15.160.1 Detailed Description

C++ [Irq](#) interface, see [IRQs](#) for the C interface.

#### Note

"IRQ" is short for "interrupt request". This is often used interchangeably for "interrupt"

The [Irq](#) class provides access to abstract interrupts provided by the microkernel. Interrupts may be

- hardware interrupts provided by the platform interrupt controller,
- virtual device interrupts provided by the microkernel's virtual devices (virtual serial or trace buffer) or
- virtual interrupts that can be triggered by user programs (IRQs) via the inherited method [L4::Triggerable::trigger\(\)](#).

For hardware and virtual device interrupts the [Irq](#) object must be bound to an interrupt source, see [L4::Icu](#). To receive interrupts, the [Irq](#) object must be bound to a thread, see [L4::Rcv\\_endpoint](#).

[Irq](#) objects can be created using a factory, see the [L4::Factory](#) API ([L4::Factory::create\(\)](#)).

#### Include File

```
#include <l4/sys/irq>
```

For the C interface refer to the [IRQs](#) API for an overview.

#### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#).

Definition at line 120 of file [irq](#).

## 15.160.2 Member Function Documentation

### 15.160.2.1 bind\_vcpu()

```
l4_msgtag_t L4::Irq::bind_vcpu (
    L4::Cap< Thread > const & thread,
    l4_umword_t cfg,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Bind a thread to this [lrq](#) for vCPU interrupt forwarding.

If the interrupt is triggered, the kernel will directly inject the interrupt into the guest. This requires that the thread is currently in extended vCPU user mode. Otherwise the interrupt will stay pending and gets injected on the next vCPU user mode transition. Optionally a doorbell [lrq](#) can be registered on the thread (see [Thread::register\\_doorbell\\_irq\(\)](#)) that is triggered in this case.

If a guest has acknowledged the interrupt but has not yet issued an EOI (i.e. the interrupt is in "active" state), it is not possible to bind the [lrq](#) to a new thread object. Either wait for the guest to issue the EOI or [detach\(\)](#) from the current thread. In this case the interrupt will stay active in the guest and it is the responsibility of the VMM to handle the eventual EOI of the guest.

#### Parameters

<i>thread</i>	<a href="#">Thread</a> object this <a href="#">lrq</a> shall be bound to.
<i>cfg</i>	Architecture specific interrupt configuration.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

#### Return values

<a href="#">-L4_EPERM</a>	Insufficient permissions; see precondition.
<a href="#">-L4_EBUSY</a>	Cannot bind to the new thread because interrupt is active on previous thread and guest has to issue end-of-interrupt first.
<a href="#">-L4_ENOSYS</a>	The kernel does not support direct interrupt forwarding.

#### Precondition

The invoked [lrq](#) capability and the capability `thread` both must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line [158](#) of file [irq](#).

References [L4::Cap\\_base::cap\(\)](#), [L4::Kobject::cap\(\)](#), and [l4\\_irq\\_bind\\_vcpu\\_u\(\)](#).

Here is the call graph for this function:

### 15.160.2.2 detach()

```
l4_msgtag_t L4::Irq::detach (
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Detach from this interrupt.

#### Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
-------------	--

#### Returns

Syscall return tag

#### Return values

0	Successfully detached, there was no interrupt pending.
1	Successfully detached, there was an interrupt pending.
2	Successfully detached, an active vIRQ was abandoned.
-L4_EPERM	Insufficient permissions; see precondition.

#### Precondition

The invoked [irq](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line 176 of file [irq](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_irq\\_detach\\_u\(\)](#).

Here is the call graph for this function:

### 15.160.2.3 receive()

```

l4_msgtag_t L4::Irq::receive (
    l4_timeout_t timeout = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Unmask and wait for this IRQ.

#### Parameters

<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

#### Note

If this is the function normally used for your IRQs consider using [L4::Semaphore](#) instead of [L4::Irq](#).

Definition at line 191 of file [irq](#).

References [L4::Kobject::cap\(\)](#), [L4\\_IPC\\_NEVER](#), and [I4\\_irq\\_receive\\_u\(\)](#).

Here is the call graph for this function:

## 15.160.2.4 unmask()

```
l4_msgtag_t L4::Irq::unmask (
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Unmask this IRQ.

## Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
-------------	--

## Returns

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

[Irq::wait\(\)](#) and [Irq::receive\(\)](#) operations already include an [unmask\(\)](#), do not use an extra [unmask\(\)](#) in these cases.

Definition at line 221 of file [irq](#).

References [L4\\_IPC\\_NEVER](#), and [unmask\(\)](#).

Referenced by [unmask\(\)](#), and [wait\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.160.2.5 wait()

```
l4_msgtag_t L4::Irq::wait (
    l4_umword_t * label,
    l4_timeout_t timeout = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Unmask IRQ and (open) wait for any message.

#### Parameters

<i>label</i>	The <i>protected label</i> shall be received here.
<i>timeout</i>	Timeout.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Definition at line [204](#) of file [irq](#).

References [L4\\_IPC\\_NEVER](#), and [unmask\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

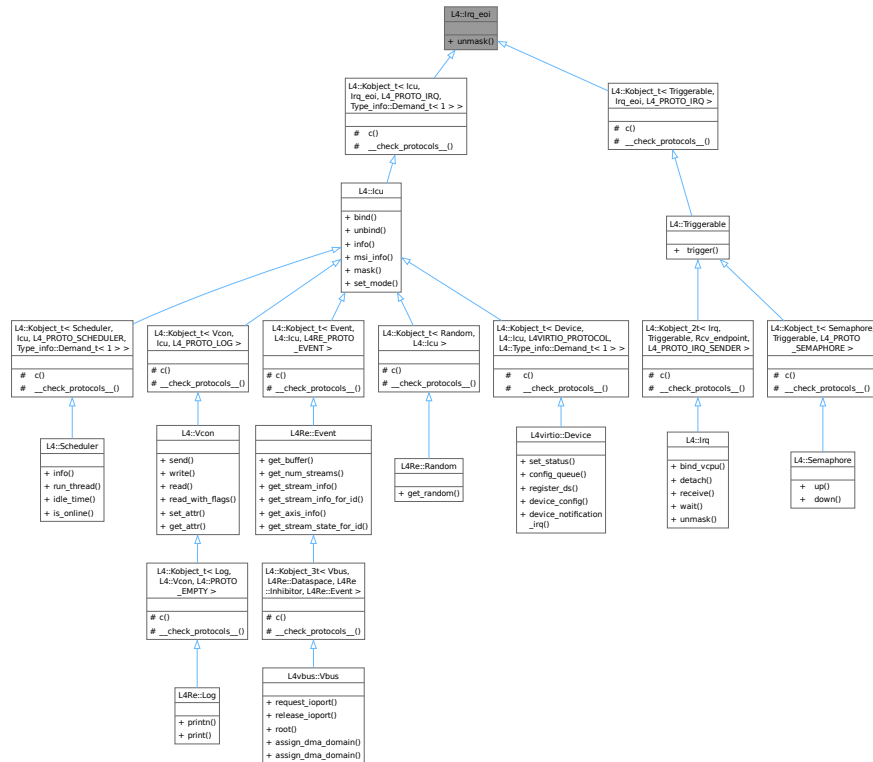

- [l4/sys/irq](#)

## 15.161 L4::Irq\_eoi Class Reference

Interface for sending an unmask message to an object.

```
#include <irq>
```

Inheritance diagram for L4::Irq\_eoi:

Collaboration diagram for L4::Irq\_eoi:

## Public Member Functions

- [l4\\_msgtag\\_t unmask](#) (unsigned irqnum, [l4\\_umword\\_t](#) \*label=0, [l4\\_timeout\\_t](#) to=L4\_IPC\_NEVER, [l4\\_utcb\\_t](#) \*utcb=[l4\\_utcb\(\)](#)) noexcept  
*Unmask the given interrupt line.*

## 15.161.1 Detailed Description

Interface for sending an unmask message to an object.

The object is usually an ICU or an IRQ.

When the kernel receives an IRQ, it masks the interrupt line at the interrupt controller and immediately acknowledges the interrupt. This interface is used to let the kernel know that userspace has dealt with the IRQ. The kernel will unmask the interrupt line and further IRQs can then be delivered.

See also

[L4::lcu](#), [L4::irq](#)

Definition at line 37 of file [irq](#).

## 15.161.2 Member Function Documentation

### 15.161.2.1 unmask()

```
l4_msgtag_t L4::Irq_eoi::unmask (
    unsigned irqnum,
    l4_umword_t * label = 0,
    l4_timeout_t to = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Unmask the given interrupt line.

When the object is an IRQ, the given interrupt line is ignored and instead the line which the IRQ is bound to (if any) is unmasked.

Its counterpart for explicitly masking an interrupt line is [L4::lcu::mask\(\)](#).

#### Parameters

	<i>irqnum</i>	The interrupt line that shall be unmasked. Ignored if the object is an IRQ.
out	<i>label</i>	If NULL, this is a send-only unmask. If not NULL, this operation enters an open wait and the <i>protected label</i> shall be received here.
	<i>to</i>	The timeout-pair (send and receive) that shall be used for this operation. The receive timeout is used with a non-NULL <i>label</i> only.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag. If *label* is NULL, this function performs an IPC send-only operation and there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. In this case use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Definition at line 64 of file [irq](#).

References [L4::Kobject::cap\(\)](#), and [L4\\_IPC\\_NEVER](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

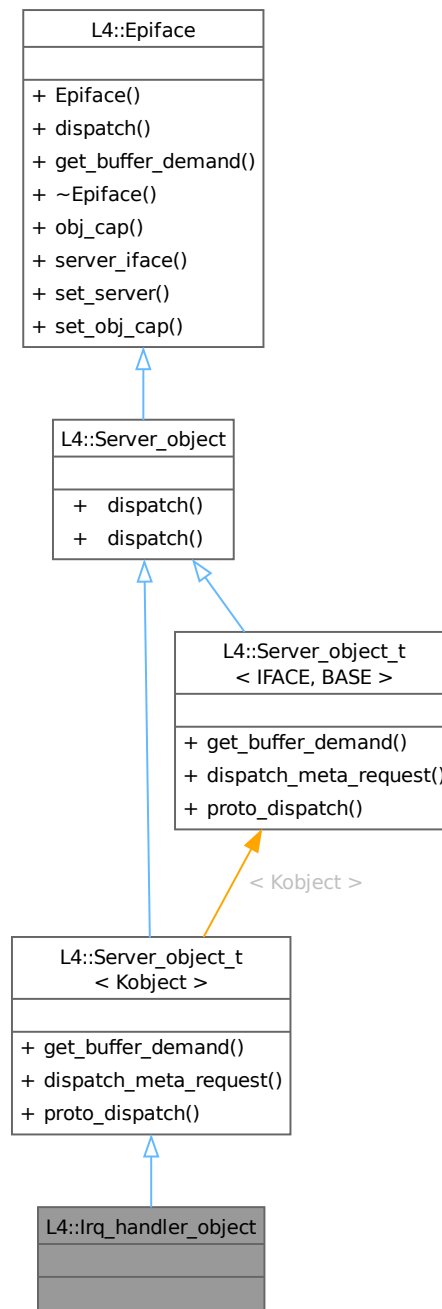

- `l4/sys/irq`

- typedef [lpc\\_svr::Server\\_iface](#) **Server\_iface**  
*Type for abstract server interface.*
- typedef [lpc\\_svr::Server\\_iface::Demand](#) **Demand**  
*Type for server-side receive buffer demand.*

**15.163.1 Detailed Description**

```
template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
struct L4::Irqp_t< Derived, BASE, bool >
```

[Epiface](#) implementation for interrupt handlers.

**Template Parameters**

<i>Derived</i>	<a href="#">Irq</a> handler implementation class. The class must provide a single function <code>handle_irq()</code> .
----------------	--

<i>BASE</i>	Base <a href="#">Epiface</a> class.
-------------	-------------------------------------

Definition at line [282](#) of file [ipc\\_epiface](#).

## 15.163.2 Member Function Documentation

### 15.163.2.1 dispatch()

```
template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>
l4_msgtag_t L4::Irqep_t< Derived, BASE, bool >::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb) [inline], [final], [virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

#### Return values

<i>-L4_ENOREPLY</i>	No reply message is send.
<i>&lt;0</i>	Error, reply with error code.
<i>&gt;=0</i>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implements [L4::Epiface](#).

Definition at line [284](#) of file [ipc\\_epiface](#).

References [L4\\_ENOREPLY](#), and [l4\\_msgtag\(\)](#).

Here is the call graph for this function:

### 15.163.2.2 obj\_cap()

```
template<typename Derived, typename BASE = Epiface, bool = cxx::is_polymorphic<BASE>::value>  
Cap< L4::Irq > L4::Irqep_t< Derived, BASE, bool >::obj_cap () const [inline]
```

Get the (typed) capability to this object.

#### Returns

[Irq](#) capability for the kernel object behind the server.

Definition at line 294 of file [ipc\\_epiface](#).

References [L4::cap\\_cast\(\)](#).

Here is the call graph for this function:

The documentation for this struct was generated from the following file:

## 15.164.1 Detailed Description

Memory descriptors stored in the kernel interface page.

### Include File

```
#include <l4/sys/kip>
```

Definition at line 42 of file [kip](#).

## 15.164.2 Member Enumeration Documentation

### 15.164.2.1 Arch\_sub\_type\_common

```
enum L4::Kip::Mem_desc::Arch_sub_type_common
```

Common sub types across all architectures for the [Mem\\_type::Arch](#) type.

### Enumerator

---

Arch_acpi_tables	Firmware ACPI tables.
Arch_acpi_nvs	Firmware reserved address space.

Definition at line 76 of file [kip](#).

### 15.164.2.2 Info\_sub\_type

```
enum L4::Kip::Mem_desc::Info_sub_type
```

Memory sub types for the [Mem\\_type::Info](#) type.

#### Enumerator

Info_acpi_rsdp	Physical address of the ACPI root pointer.
Reserved_kernel	Kernel image.
Reserved_heap	Kernel heap.
Reserved_mmio	MMIO range reserved by kernel.

Definition at line 64 of file [kip](#).

### 15.164.2.3 Mem\_type

```
enum L4::Kip::Mem_desc::Mem_type
```

Memory types.

#### Enumerator

Undefined	Undefined memory.
Conventional	Conventional memory.
Reserved	Reserved region, do not use this memory.
Dedicated	Dedicated.
Shared	Shared.
Info	Info by boot loader.
Bootloader	Memory belongs to the boot loader.
Arch	Architecture specific memory.

Definition at line 48 of file [kip](#).

### 15.164.3 Constructor & Destructor Documentation

#### 15.164.3.1 Mem\_desc()

```
L4::Kip::Mem_desc::Mem_desc (
    unsigned long start,
    unsigned long end,
    Mem_type t,
    unsigned char st = 0,
    bool virt = false,
    bool eager = false) [inline], [noexcept]
```

Initialize memory descriptor.

#### Parameters

<i>start</i>	Start address
<i>end</i>	End address
<i>t</i>	Memory type
<i>st</i>	Memory subtype, defaults to 0
<i>virt</i>	True for virtual memory, false for physical memory, defaults to physical
<i>eager</i>	The region shall be eligible for eager mapping in sigma0 or the root task. This is just an optimization to prevent on-demand paging.

Definition at line 162 of file [kip](#).

References [end\(\)](#), and [start\(\)](#).

## 15.164.4 Member Function Documentation

### 15.164.4.1 `all()` [1/2]

```
cxx::static_vector< Mem_desc > L4::Kip::Mem_desc::all (
    l4_kernel_info_t * kip) [inline], [static]
```

Return enumerable list of memory descriptors.

#### Parameters

<i>kip</i>	Pointer to the kernel info page.
------------	----------------------------------

Definition at line 143 of file `kip`.

References `count()`, and `first()`.

Here is the call graph for this function:

### 15.164.4.2 `all()` [2/2]

```
cxx::static_vector< Mem_desc const > L4::Kip::Mem_desc::all (
    l4_kernel_info_t const * kip) [inline], [static]
```

Return enumerable list of memory descriptors.

#### Parameters

<i>kip</i>	Pointer to the kernel info page.
------------	----------------------------------

Definition at line 132 of file `kip`.

References `count()`, and `first()`.

Here is the call graph for this function:

### 15.164.4.3 count() [1/2]

```
void L4::Kip::Mem_desc::count (
    l4_kernel_info_t * kip,
    unsigned count) [inline], [static], [noexcept]
```

Set number of memory descriptors.

#### Parameters

<i>kip</i>	Pointer to the kernel info page
<i>count</i>	Number of memory descriptors

Definition at line 122 of file [kip](#).

References [count\(\)](#).

Here is the call graph for this function:

### 15.164.4.4 count() [2/2]

```
unsigned long L4::Kip::Mem_desc::count (
    l4_kernel_info_t const * kip) [inline], [static], [noexcept]
```

Return number of memory descriptors stored in the kernel info page.

#### Parameters

<i>kip</i>	Pointer to the kernel info page
------------	---------------------------------

**Returns**

Number of memory descriptors in the kernel info page.

Definition at line 111 of file [kip](#).

Referenced by [all\(\)](#), [all\(\)](#), and [count\(\)](#).

Here is the caller graph for this function:

**15.164.4.5 end()**

```
unsigned long L4::Kip::Mem_desc::end () const [inline], [noexcept]
```

Return end address of memory descriptor.

**Returns**

End address of memory descriptor

Definition at line 181 of file [kip](#).

Referenced by [Mem\\_desc\(\)](#), [set\(\)](#), and [size\(\)](#).

Here is the caller graph for this function:

#### 15.164.4.6 first()

```
Mem_desc * L4::Kip::Mem_desc::first (
    l4_kernel_info_t * kip) [inline], [static], [noexcept]
```

Get first memory descriptor.

##### Parameters

<i>kip</i>	Pointer to the kernel info page
------------	---------------------------------

##### Returns

First memory descriptor stored in the kernel info page

Definition at line 93 of file [kip](#).

References [Mem\\_desc\(\)](#).

Referenced by [all\(\)](#), and [all\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**15.164.4.7 is\_virtual()**

```
unsigned L4::Kip::Mem_desc::is_virtual () const [inline], [noexcept]
```

Return whether the memory descriptor describes a virtual or physical region.

**Returns**

True for virtual region, false for physical region.

Definition at line 213 of file [kip](#).

**15.164.4.8 set()**

```
void L4::Kip::Mem_desc::set (
    unsigned long start,
    unsigned long end,
    Mem_type t,
    unsigned char st = 0,
    bool virt = false,
    bool eager = false) [inline], [noexcept]
```

Set values of a memory descriptor.

**Parameters**

<i>start</i>	Start address
<i>end</i>	End address
<i>t</i>	Memory type
<i>st</i>	Sub-type, defaults to 0
<i>virt</i>	Virtual or physical memory region, defaults to physical
<i>eager</i>	The region shall be eligible for eager mapping in sigma0 or the root task. This is just an optimization to prevent on-demand paging.

Definition at line 233 of file [kip](#).

References [end\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

**15.164.4.9 size()**

```
unsigned long L4::Kip::Mem_desc::size () const [inline], [noexcept]
```

Return size of region described by the memory descriptor.

**Returns**

Size of the region described by the memory descriptor

Definition at line 188 of file [kip](#).

References [end\(\)](#), and [start\(\)](#).

Here is the call graph for this function:

**15.164.4.10 start()**

```
unsigned long L4::Kip::Mem_desc::start () const [inline], [noexcept]
```

Return start address of memory descriptor.

**Returns**

Start address of memory descriptor

Definition at line 174 of file [kip](#).

Referenced by [Mem\\_desc\(\)](#), [set\(\)](#), and [size\(\)](#).

Here is the caller graph for this function:

## Public Member Functions

- [l4\\_msgtag\\_t dec\\_refcnt](#) ([l4\\_mword\\_t diff](#), [l4\\_utcb\\_t \\*utcb=l4\\_utcb\(\)](#))  
*Decrement the in kernel reference counter for the object.*

## Protected Member Functions

- [l4\\_cap\\_idx\\_t cap](#) () const noexcept  
*Return capability selector.*

## 15.165.1 Detailed Description

Base class for all kinds of kernel objects and remote objects, referenced by capabilities.

### Include File

```
#include <l4/sys/capability>
```

This is the base class for all remote objects accessible using RPC. However, subclasses do not directly inherit from [L4::Kobject](#) but *must* use [L4::Kobject\\_t](#) ([L4::Kobject\\_0t](#), [L4::Kobject\\_2t](#), [L4::Kobject\\_3t](#), or [L4::Kobject\\_x](#)) for inheritance, otherwise these classes cannot be used as RPC interfaces.

### Attention

Objects derived from [Kobject](#) *must* never add any data to those objects. Kobjects can act only as proxy object for encapsulating object invocations.

Definition at line 36 of file [kobject](#).

## 15.165.2 Member Function Documentation

### 15.165.2.1 cap()

```
l4\_cap\_idx\_t L4::Kobject::cap () const [inline], [protected], [noexcept]
```

Return capability selector.

**Returns**

Capability selector.

This method is for derived classes to gain access to the actual capability selector.

Definition at line 69 of file [kobject](#).

Referenced by [L4::Thread\\_group::add\(\)](#), [L4::Debugger::add\\_image\\_info\(\)](#), [L4::Task::add\\_ku\\_mem\(\)](#), [L4Re::Mem\\_alloc::alloc\(\)](#), [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#), [L4::Icu::bind\(\)](#), [L4::Rcv\\_endpoint::bind\\_snd\\_destination\(\)](#), [L4::Irq::bind\\_vcpu\(\)](#), [L4::Task::cap\\_equal\(\)](#), [L4::Task::cap\\_valid\(\)](#), [L4::Thread::control\(\)](#), [L4::Factory::create\(\)](#), [L4::Factory::create\(\)](#), [L4::Factory::create\\_factory\(\)](#), [L4::Factory::create\\_gate\(\)](#), [L4::Factory::create\\_task\(\)](#), [L4::Factory::create\\_thread\\_group\(\)](#), [L4Re::Video::Goos::create\\_view\(\)](#), [dec\\_refcnt\(\)](#), [L4::Task::delete\\_obj\(\)](#), [L4::Irq::detach\(\)](#), [L4::Semaphore::down\(\)](#), [L4::Thread::ex\\_regs\(\)](#), [L4::Thread::ex\\_regs\(\)](#), [L4::Vcon::get\\_attr\(\)](#), [L4::Debugger::get\\_object\\_name\(\)](#), [L4::Debugger::global\\_id\(\)](#), [L4::Icu::info\(\)](#), [L4::Scheduler::is\\_online\(\)](#), [L4::Debugger::kobj\\_to\\_id\(\)](#), [L4::Task::map\(\)](#), [L4::Icu::mask\(\)](#), [L4::Thread::modify\\_senders\(\)](#), [L4::Debugger::query\\_log\\_name\(\)](#), [L4::Debugger::query\\_log\\_typeid\(\)](#), [L4::Debugger::query\\_object\\_name\(\)](#), [L4::Vcon::read\(\)](#), [L4::Vcon::read\\_with\\_flags\(\)](#), [L4::Irq::receive\(\)](#), [L4::Thread::register\\_del\\_irq\(\)](#), [L4::Thread::register\\_doorbell\\_irq\(\)](#), [L4::Task::release\\_cap\(\)](#), [L4vbus::Vbus::release\\_ioport\(\)](#), [L4::Thread\\_group::remove\(\)](#), [L4vbus::Vbus::request\\_ioport\(\)](#), [L4vbus::Vbus::root\(\)](#), [L4::Vcon::send\(\)](#), [L4::Vcon::set\\_attr\(\)](#), [L4::Icu::set\\_mode\(\)](#), [L4::Debugger::set\\_object\\_name\(\)](#), [L4::Thread::stats\\_time\(\)](#), [L4::Debugger::switch\\_log\(\)](#), [L4::Thread::switch\\_to\(\)](#), [L4::Triggerable::trigger\(\)](#), [L4::Icu::unbind\(\)](#), [L4::Task::unmap\(\)](#), [L4::Task::unmap\\_batch\(\)](#), [L4::Irq\\_eoi::unmask\(\)](#), [L4::Thread::vcpu\\_control\(\)](#), [L4::Thread::vcpu\\_control\\_ext\(\)](#), [L4::Thread::vcpu\\_resume\\_commit\(\)](#), [L4Re::Video::Goos::view\(\)](#), and [L4::Vcon::write\(\)](#).

[illegible]

```

14_msgtag_t L4::Kobject::dec_refcnt (
    14_mword_t diff,
    14_utcb_t * utcb = 14_utcb()) [inline]

```

Decrement the in kernel reference counter for the object.

#### Parameters

<i>diff</i>	The delta that shall be subtracted from the reference count.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

This function is intended for servers to be able to remove the servers own capability from the counted references. This leads to the semantics that the kernel will delete the object even if the capability of the server is valid. The server can detect the deletion by polling its capabilities or by using the IPC-gate deletion IRQs. And to cleanup if the clients dropped the last reference (capability) to the object.

This function only succeeds on a kernel object of type [L4::lpc\\_gate](#) which has the server right ([L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#)). For other kernel objects, -L4\_ENOSYS is returned.

Definition at line 100 of file [kobject](#).

References [cap\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

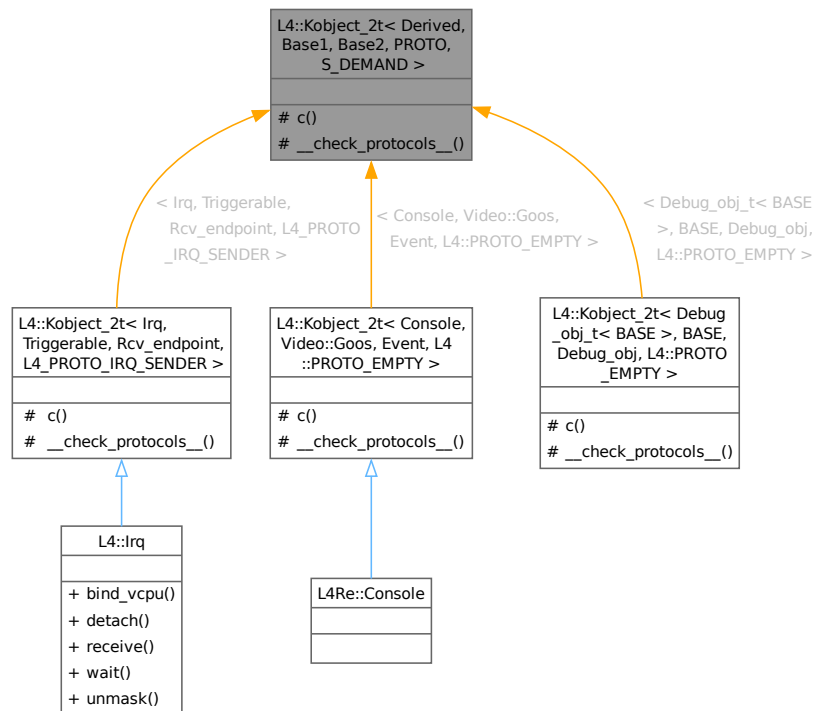

- `l4/sys/kobject`

## 15.166 L4::Kobject\_2t< Derived, Base1, Base2, PROTO, S\_DEMAND > Class Template Reference

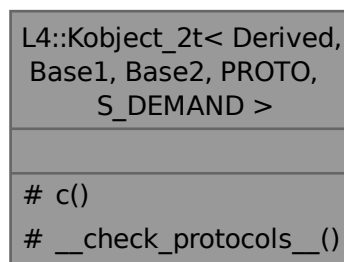

Helper class to create an [L4Re](#) interface class that is derived from two base classes (see [L4::Kobject\\_t](#)).

### 15.166.1 Detailed Description

```
template<typename Derived, typename Base1, typename Base2, l4\_proto\_t PROTO = PROTO_ANY, type-
name S_DEMAND = Type\_info::Demand\_t<>>
class L4::Kobject\_2t< Derived, Base1, Base2, PROTO, S_DEMAND >
```

Helper class to create an [L4Re](#) interface class that is derived from two base classes (see [L4::Kobject\\_t](#)).

#### Template Parameters

<i>Derived</i>	is the name of the new interface.
<i>Base1</i>	is the name of the interface's first base class.
<i>Base2</i>	is the name of the interface's second base class.
<i>PROTO</i>	may be set to the statically assigned protocol number used to communicate with this interface.
<i>S_DEMAND</i>	type defining the demand of server-side resources for this interface, usually a <a href="#">L4::Type_info::Demand_t</a> . This value must describe the server-side resources needed by the interface itself, the resource demand of the base interfaces (Base1 and Base2) are automatically included.

The typical usage pattern is shown in the following code snippet. The semantics of this example is an interface [My\\_iface](#) that is derived from [L4::Icu](#) and [L4Re::Dataspace](#).

```
class My\_iface : public L4::Kobject\_2t<My\_iface, L4::Icu, L4Re::Dataspace>
{
    ...
};
```

Definition at line [827](#) of file [\\_\\_typeinfo.h](#).

### 15.166.2 Member Typedef Documentation

#### 15.166.2.1 [\\_\\_Iface](#)

```
template<typename Derived, typename Base1, typename Base2, l4\_proto\_t PROTO = PROTO_ANY, typename
S_DEMAND = Type\_info::Demand\_t<>>
typedef Typeid::Iface<PROTO, Derived> L4::Kobject\_2t< Derived, Base1, Base2, PROTO, S_DEMAND
>::__Iface [protected]
```

The interface description for the derived class.

Definition at line [833](#) of file [\\_\\_typeinfo.h](#).

### 15.166.2.2 \_\_Iface\_list

```
template<typename Derived, typename Base1, typename Base2, l4_proto_t PROTO = PROTO_ANY, typename
S_DEMAND = Type_info::Demand_t<>>
typedef Typeid::Merge_list< Typeid::Iface_list<__Iface>, Typeid::Merge_list< typename Base1<
::__Iface_list, typename Base2::__Iface_list > > L4::Kobject_2t< Derived, Base1, Base2, PROTO,
S_DEMAND >::__Iface_list [protected]
```

The list of all RPC interfaces provided directly or through inheritance.

Definition at line 841 of file [\\_\\_typeinfo.h](#).

### 15.166.2.3 Class

```
template<typename Derived, typename Base1, typename Base2, l4_proto_t PROTO = PROTO_ANY, typename
S_DEMAND = Type_info::Demand_t<>>
typedef Derived L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >::Class [protected]
```

The target interface type (inheriting from [Kobject\\_t](#)).

Definition at line 831 of file [\\_\\_typeinfo.h](#).

## 15.166.3 Member Function Documentation

### 15.166.3.1 \_\_check\_protocols\_\_()

```
template<typename Derived, typename Base1, typename Base2, l4_proto_t PROTO = PROTO_ANY, typename
S_DEMAND = Type_info::Demand_t<>>
void L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >::__check_protocols__ () [inline],
[static], [protected], [noexcept]
```

Helper to check for protocol conflicts.

Definition at line 844 of file [\\_\\_typeinfo.h](#).

### 15.166.3.2 c()

```
template<typename Derived, typename Base1, typename Base2, l4_proto_t PROTO = PROTO_ANY, typename
S_DEMAND = Type_info::Demand_t<>>
L4::Cap< Class > L4::Kobject_2t< Derived, Base1, Base2, PROTO, S_DEMAND >::c () const [inline],
[protected], [noexcept]
```

Get the capability to ourselves.

Definition at line 863 of file [\\_\\_typeinfo.h](#).

The documentation for this class was generated from the following file:

*Helper to check for protocol conflicts.*

## 15.167.1 Detailed Description

```
template<typename Derived, typename Base1, typename Base2, typename Base3, l4\_proto\_t PROTO =
PROTO_ANY, typename S_DEMAND = Type_info::Demand_t<>>
struct L4::Kobject_3t< Derived, Base1, Base2, Base3, PROTO, S_DEMAND >
```

Helper class to create an [L4Re](#) interface class that is derived from three base classes (see [L4 : Kobject\\_t](#)).

### Template Parameters

<i>Derived</i>	is the name of the new interface.
<i>Base1</i>	is the name of the interface's first base class.
<i>Base2</i>	is the name of the interface's second base class.
<i>Base3</i>	is the name of the interfaces third base class.
<i>PROTO</i>	may be set to the statically assigned protocol number used to communicate with this interface.
<i>S_DEMAND</i>	type defining the demand on server-side resources for this interface, usually a <a href="#">L4::Type_info::Demand_t</a> . This value must describe the server-side resources needed by the interface itself, the resource demand of the base interfaces (Base1 and Base2) are automatically included.

Collaboration diagram for L4::Kobject\_demand< T >:

### 15.168.1 Detailed Description

```
template<typename ... T>
struct L4::Kobject_demand< T >
```

Get the combined server-side resource requirements for all type T...

#### Template Parameters

<i>T</i>	List of IPC interface types for which the combined server-side resource requirements shall be calculated.
----------	---

Definition at line 1031 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

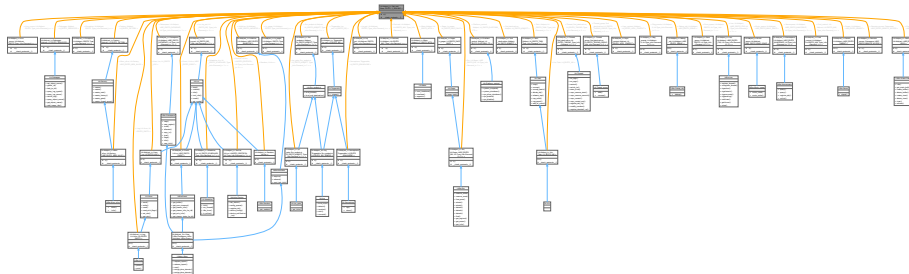

- [l4/sys/\\_\\_typeinfo.h](#)

### 15.169 L4::Kobject\_t< Derived, Base, PROTO, S\_DEMAND > Class Template Reference

Helper class to create an [L4Re](#) interface class that is derived from a single base class.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Kobject\_t< Derived, Base, PROTO, S\_DEMAND >:

Collaboration diagram for L4::Kobject\_t< Derived, Base, PROTO, S\_DEMAND >:

## Protected Types

- typedef **Derived Class**  
The target interface type (inheriting from [Kobject\\_t](#)).
- typedef Typeid::Iface< PROTO, Derived > **\_\_Iface**  
The interface description for the derived class.
- typedef Typeid::Merge\_list< Typeid::Iface\_list< **\_\_Iface** >, typename Base::\_\_Iface\_list > **\_\_Iface\_list**  
The list of all RPC interfaces provided directly or through inheritance.

## Protected Member Functions

- [L4::Cap](#)< **Class** > **c** () const noexcept  
Get the capability to ourselves.

## Static Protected Member Functions

- static void **\_\_check\_protocols** () noexcept  
Helper to check for protocol conflicts.

## 15.169.1 Detailed Description

```
template<typename Derived, typename Base, l4\_proto\_t PROTO = PROTO_ANY, typename S_DEMAND =
Type_info::Demand_t<>>
class L4::Kobject_t< Derived, Base, PROTO, S_DEMAND >
```

Helper class to create an [L4Re](#) interface class that is derived from a single base class.

## Template Parameters

<i>Derived</i>	is the name of the new interface.
<i>Base</i>	is the name of the interfaces single base class.
<i>PROTO</i>	may be set to the statically assigned protocol number used to communicate with this interface.
<i>S_DEMAND</i>	type defining the demand on server-side resources for this interface, usually a <a href="#">L4::Type_info::Demand_t</a> . This value must describe the server-side resources needed by the interface itself, the resource demand of the base interface <i>Base</i> is automatically included.

The typical usage pattern is shown in the following code snippet. The semantics of this example is an interface *My\_iface* that is derived from [L4::Kobject](#).

```
class My_iface : public L4::Kobject_t<My_iface, L4::Kobject>
{
    ...
};
```

## Examples

[examples/clntsrv/src/shared.h](#).

Definition at line 749 of file [\\_\\_typeinfo.h](#).

The documentation for this class was generated from the following file:

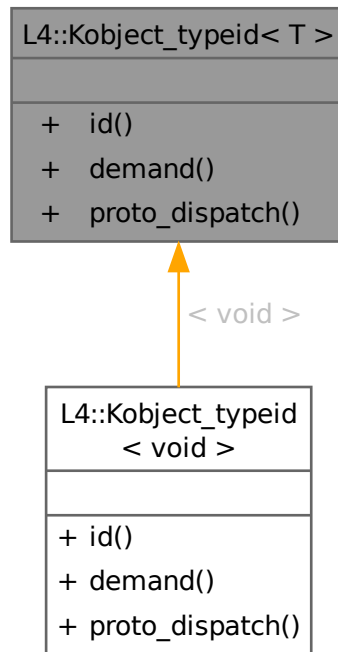

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.170 L4::Kobject\_typeid< T > Struct Template Reference

[Meta](#) object for handling access to type information of Kobjects.

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Kobject\_typeid< T >:

Collaboration diagram for L4::Kobject\_typeid< T >:

## Public Types

- typedef T::\_\_Kobject\_typeid::Demand [Demand](#)

*Data type expressing the static demand of receive buffers in a server.*

## Static Public Member Functions

- static [Type\\_info](#) const \* [id](#) () noexcept  
*Get a pointer to the [Kobject](#) type information of T.*
- static [Type\\_info::Demand](#) [demand](#) () noexcept  
*Get the receive-buffer demand for the server providing the interface T.*
- template<typename THIS, typename A1, typename A2>  
static int [proto\\_dispatch](#) (THIS \*self, [i4\\_proto\\_t](#) proto, A1 a1, A2 &a2)  
*Protocol based server-side dispatch function.*

## 15.170.1 Detailed Description

```
template<typename T>
struct L4::Kobject_typeid< T >
```

[Meta](#) object for handling access to type information of Kobjects.

### Template Parameters

<i>T</i>	The data type derived from <a href="#">Kobject</a> , usually using <a href="#">Kobject_t</a> .
----------	--

Definition at line 610 of file [\\_\\_typeinfo.h](#).

## 15.170.2 Member Typedef Documentation

### 15.170.2.1 Demand

```
template<typename T>
typedef T::__Kobject_typeid::Demand L4::Kobject\_typeid< T >::Demand
```

Data type expressing the static demand of receive buffers in a server.

This information is the combined demand of all base interfaces for T and the buffer demand of T itself. The buffer demand of T is usually specified as the S\_DEMAND argument of the [Kobject\\_t](#) or [Kobject\\_2t](#) inheritance helpers. S\_DEMAND is usually of type [L4::Type\\_info::Demand\\_t](#), or [L4::Type\\_info::Demand\\_union\\_t](#).

Definition at line 622 of file [\\_\\_typeinfo.h](#).

### 15.170.3 Member Function Documentation

#### 15.170.3.1 demand()

```
template<typename T>
Type_info::Demand L4::Kobject_typeid< T >::demand () [inline], [static], [noexcept]
```

Get the receive-buffer demand for the server providing the interface T.

##### Returns

A demand value describing the minimum receive buffers needed for handling server side requests for interface T.

Definition at line 639 of file [\\_\\_typeinfo.h](#).

#### 15.170.3.2 id()

```
template<typename T>
Type_info const * L4::Kobject_typeid< T >::id () [inline], [static], [noexcept]
```

Get a pointer to the [Kobject](#) type information of T.

##### Returns

a pointer to the [Kobject](#) typeinfo for of T.

Definition at line 630 of file [\\_\\_typeinfo.h](#).

Referenced by [L4::kobject\\_typeid\(\)](#).

Here is the caller graph for this function:

## 15.170.3.3 proto\_dispatch()

```

template<typename T>
template<typename THIS, typename A1, typename A2>
int L4::Kobject_typeid< T >::proto_dispatch (
    THIS * self,
    l4_proto_t proto,
    A1 a1,
    A2 & a2) [inline], [static]

```

Protocol based server-side dispatch function.

## Template Parameters

<i>THIS</i>	Data type of the server-side object implementing the interface T.
<i>A1</i>	Data type of second argument for p_dispatch()
<i>A2</i>	Data type of third argument for p_dispatch()

## Parameters

<i>self</i>	The pointer to the server object
<i>proto</i>	The protocol number used by the caller
<i>a1</i>	The second argument passed to self->p_dispatch()
<i>a2</i>	The third argument passed to self->p_dispatch()

This function forwards the call to the overloaded p\_dispatch() function of self. The data type of the first argument for p\_dispatch is determined by the given protocol number.

Definition at line 660 of file [\\_\\_typeinfo.h](#).

Referenced by [L4::Server\\_object\\_t< IFACE, BASE >::proto\\_dispatch\(\)](#).

Here is the caller graph for this function:

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.171 L4::Kobject\_typeid< void > Struct Reference

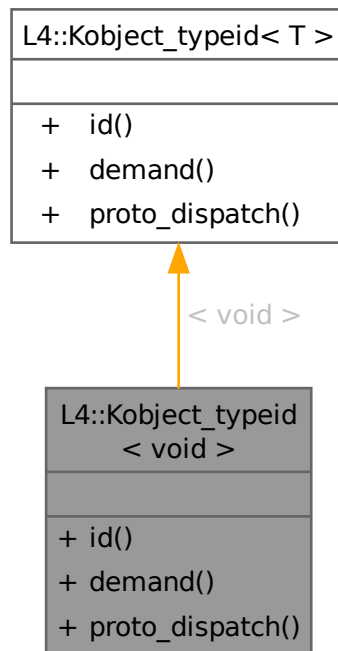

Minimalistic ID for void interface.

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Kobject\_typeid< void >:

Collaboration diagram for L4::Kobject\_typeid< void >:

### Static Public Member Functions

- static [Type\\_info](#) const \* [id](#) () noexcept  
*Get a pointer to the [Kobject](#) type information of T.*
- static [Type\\_info::Demand](#) [demand](#) () noexcept  
*Get the receive-buffer demand for the server providing the interface T.*
- static int [proto\\_dispatch](#) (THIS \*self, [l4\\_proto\\_t](#) proto, A1 a1, A2 &a2)  
*Protocol based server-side dispatch function.*

### 15.171.1 Detailed Description

Minimalistic ID for `void` interface.

Definition at line 667 of file [\\_\\_typeinfo.h](#).

### 15.171.2 Member Function Documentation

#### 15.171.2.1 demand()

```
Type_info::Demand L4::Kobject_typeid< void >::demand () [inline], [static], [noexcept]
```

Get the receive-buffer demand for the server providing the interface T.

**Returns**

A demand value describing the minimum receive buffers needed for handling server side requests for interface T.

Definition at line 639 of file [\\_\\_typeinfo.h](#).

**15.171.2.2 id()**

```
Type_info const * L4::Kobject_typeid< void >::id () [inline], [static], [noexcept]
```

Get a pointer to the [Kobject](#) type information of T.

**Returns**

a pointer to the [Kobject](#) typeinfo for of T.

Definition at line 630 of file [\\_\\_typeinfo.h](#).

**15.171.2.3 proto\_dispatch()**

```
int L4::Kobject_typeid< void >::proto_dispatch (
    THIS * self,
    l4_proto_t proto,
    A1 a1,
    A2 & a2) [inline], [static]
```

Protocol based server-side dispatch function.

**Template Parameters**

<i>THIS</i>	Data type of the server-side object implementing the interface T.
<i>A1</i>	Data type of second argument for p_dispatch()
<i>A2</i>	Data type of third argument for p_dispatch()

**Parameters**

<i>self</i>	The pointer to the server object
<i>proto</i>	The protocol number used by the caller
<i>a1</i>	The second argument passed to self->p_dispatch()
<i>a2</i>	The third argument passed to self->p_dispatch()

This function forwards the call to the overloaded p\_dispatch() function of self. The data type of the first argument for p\_dispatch is determined by the given protocol number.

Definition at line 660 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.172 L4::Kobject\_x< Derived, ARGS > Struct Template Reference

Generic [Kobject](#) inheritance template.

Inheritance diagram for L4::Kobject\_x< Derived, ARGS >:

Collaboration diagram for L4::Kobject\_x< Derived, ARGS >:

### 15.172.1 Detailed Description

```
template<typename Derived, typename ... ARGS>
struct L4::Kobject_x< Derived, ARGS >
```

Generic [Kobject](#) inheritance template.

#### Template Parameters

<i>Derived</i>	The class name that derives from <a href="#">Kobject_x</a> .
<i>ARGS</i>	An optional protocol number via <a href="#">L4::Proto_t</a> , followed by an optional server-side requirement passed as <a href="#">L4::Type_info::Demand_t</a> , followed by the list of base classes.

Definition at line [1197](#) of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.173 L4::Lock\_guard Class Reference

Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code.

```
#include <lock_guard.h>
```

Collaboration diagram for L4::Lock\_guard:

## Public Member Functions

- [Lock\\_guard](#) (pthread\_mutex\_t &lock)  
*Construct the lock guard and lock the associated mutex.*
- [Lock\\_guard](#) (Lock\_guard &&guard)  
*Move constructor from other lock guard.*
- Lock\_guard & [operator=](#) (Lock\_guard &&guard)  
*Move assignment from other lock guard.*
- int [status](#) () const  
*Return last lock/unlock operation error status.*
- [~Lock\\_guard](#) ()  
*Lock guard destructor.*

### 15.173.1 Detailed Description

Basic lock guard implementation that prevents forgotten unlocks on exit paths from a method or a block of code.

Targeting pthread\_mutex\_t.

An instance of lock guard cannot be copied, but it can be moved.

The typical usage pattern of the lock guard is:

```
pthread_mutex_t mtx = PTHREAD_MUTEX_INITIALIZER;

{
    auto guard = L4Re::Lock_guard(mtx);

    // Correctness check.
    assert(guard.status() == 0);

    // Critical section protected by mtx.

    // The mtx is automatically unlocked when guard goes out of scope.
}
```

Definition at line 44 of file [lock\\_guard.h](#).

### 15.173.2 Constructor & Destructor Documentation

#### 15.173.2.1 Lock\_guard() [1/2]

```
L4::Lock_guard::Lock_guard (
    pthread_mutex_t & lock) [inline], [explicit]
```

Construct the lock guard and lock the associated mutex.

The error condition of the locking operation can be checked by the [status\(\)](#) method.

#### Parameters

<i>lock</i>	Associated mutex to be locked.
-------------	--------------------------------

Definition at line 59 of file [lock\\_guard.h](#).

### 15.173.2.2 Lock\_guard() [2/2]

```
L4::Lock_guard::Lock_guard (
    Lock_guard && guard) [inline]
```

Move constructor from other lock guard.

The mutex associated with the other lock guard is kept locked.

#### Parameters

<i>guard</i>	Lock guard to be moved.
--------------	-------------------------

Definition at line 71 of file [lock\\_guard.h](#).

### 15.173.2.3 ~Lock\_guard()

```
L4::Lock_guard::~~Lock_guard () [inline]
```

Lock guard destructor.

The associated mutex (if any) is unlocked.

There is no mechanism for indicating any error conditions. However, if the mutex has been previously locked successfully by this class and if the implementation of the mutex behaves according to the POSIX specification, the construction of this class guarantees that the unlock operation does not fail.

Definition at line 126 of file [lock\\_guard.h](#).

## 15.173.3 Member Function Documentation

### 15.173.3.1 operator=()

```
Lock_guard & L4::Lock_guard::operator= (
    Lock_guard && guard) [inline]
```

Move assignment from other lock guard.

The mutex currently associated with this lock guard is unlocked. The mutex associated with the other lock guard is kept locked.

There is no mechanism for indicating any error conditions of the unlocking operation. However, if the mutex has been previously locked successfully by this class and if the implementation of the mutex behaves according to the POSIX specification, the construction of this class guarantees that the unlock operation does not fail.

#### Parameters

<i>guard</i>	Lock guard to be moved.
--------------	-------------------------

Definition at line 90 of file [lock\\_guard.h](#).

### 15.173.3.2 status()

```
int L4::Lock_guard::status () const [inline]
```

Return last lock/unlock operation error status.

#### Returns

Zero indicating no errors, any other value indicating an error.

Definition at line 110 of file [lock\\_guard.h](#).

The documentation for this class was generated from the following file:

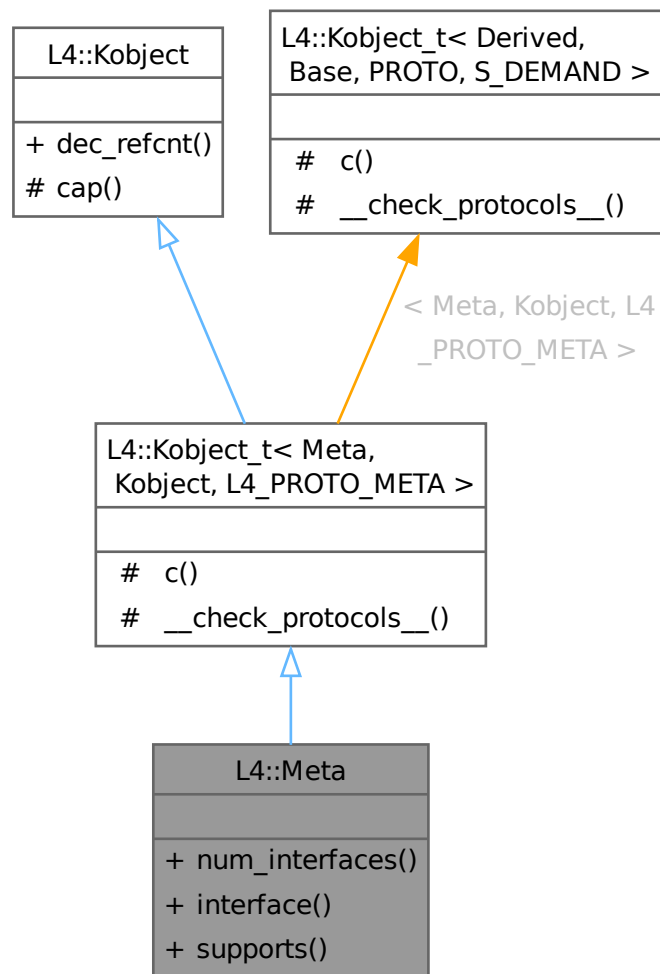

- [l4/cxx/lock\\_guard.h](#)

## 15.174 L4::Meta Class Reference

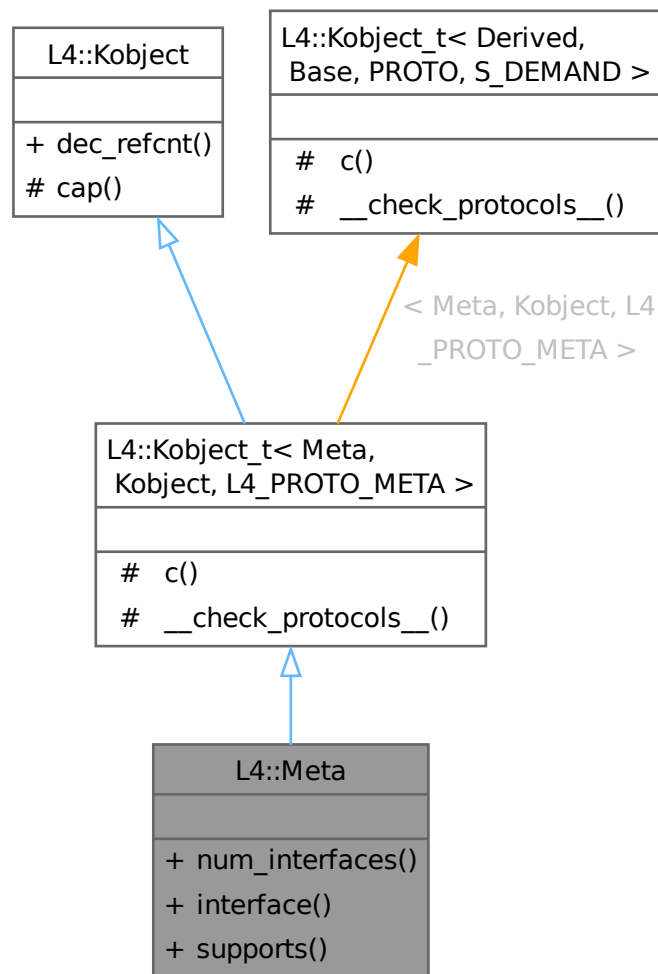

[Meta](#) interface that shall be implemented by each [L4Re](#) object and gives access to the dynamic type information for [L4Re](#) objects.

```
#include <meta>
```

Inheritance diagram for L4::Meta:

Collaboration diagram for L4::Meta:

## Public Member Functions

- [l4\\_msgtag\\_t num\\_interfaces \(\)](#)  
Get the number of interfaces implemented by this object.
- [l4\\_msgtag\\_t interface \(l4\\_umword\\_t idx, long \\*proto, L4::lpc::String< char > \\*name\)](#)  
Get the protocol number that must be used for the interface with the number *idx*.
- [l4\\_msgtag\\_t supports \(l4\\_mword\\_t protocol\)](#)  
Figure out if the object supports the given protocol (number).

## Public Member Functions inherited from [L4::Kobject](#)

## 15.174.1 Detailed Description

[Meta](#) interface that shall be implemented by each [L4Re](#) object and gives access to the dynamic type information for [L4Re](#) objects.

Definition at line 26 of file [meta](#).

## 15.174.2 Member Function Documentation

### 15.174.2.1 interface()

```
l4_msgtag_t L4::Meta::interface (
    l4_umword_t idx,
    long * proto,
    L4::Ipc::String< char > * name)
```

Get the protocol number that must be used for the interface with the number `idx`.

#### Parameters

	<i>idx</i>	The index of the interface to get the protocol number for. <code>idx</code> must be $\geq 0$ and $<$ the return value of <code>num_interfaces()</code> .
out	<i>proto</i>	The protocol number for interface <code>idx</code> .
out	<i>name</i>	The protocol name for interface <code>idx</code> .

#### Return values

<code>l4_msgtag_t::label() == 0</code>	Successful; see <code>`proto`</code> and <code>`name`</code> .
<code>l4_msgtag_t::label() &lt; 0</code>	Error code.

Referenced by `num_interfaces()`.

Here is the caller graph for this function:

### 15.174.2.2 num\_interfaces()

```
l4_msgtag_t L4::Meta::num_interfaces ()
```

Get the number of interfaces implemented by this object.

#### Return values

<code>l4_msgtag_t::label() &gt;= 0</code>	The number of supported interfaces.
---	-------------------------------------

<code>l4_msgtag_t::label() &lt; 0</code>	Error code of the occurred error.
--	-----------------------------------

References [interface\(\)](#), and [num\\_interfaces\(\)](#).

Referenced by [num\\_interfaces\(\)](#).

Here is the caller graph for this function:

### 15.174.2.3 supports()

```
l4_msgtag_t L4::Meta::supports (
    l4_mword_t protocol)
```

Figure out if the object supports the given protocol (number).

#### Parameters

<i>protocol</i>	The protocol number to check for.
-----------------	-----------------------------------

#### Return values

<code>l4_msgtag_t::label() == 1</code>	protocol is supported.
<code>l4_msgtag_t::label() == 0</code>	protocol is not supported.

This method is intended to be used for statically assigned protocol numbers.

- static void [\\_\\_check\\_protocols\\_\\_ \(\)](#) noexcept

Helper to check for protocol conflicts.

### 15.176.1 Detailed Description

[Pager](#) interface including the [lo\\_pager](#) interface.

This class defines the interface for handling page fault IPC. If a thread causes a page fault, the microkernel synthesises a page fault IPC message and sends it to the thread's page fault handler (pager). The pager can then handle the message, for example by establishing a suitable page mapping.

The page fault handler is set with the [L4::Thread::control](#) interface.

Definition at line 87 of file [pager](#).

### 15.176.2 Member Function Documentation

#### 15.176.2.1 [page\\_fault\(\)](#)

```
l4_msgtag_t L4::Pager::page_fault (
    l4_umword_t pfa,
    l4_umword_t pc,
    L4::Ipc::Rcv_fpage rwin,
    L4::Ipc::Opt< L4::Ipc::Snd_fpage & > fp)
```

Page-fault protocol message.

#### Parameters

<i>pfa</i>	Faulting address including failure reason: bits [0:2].
<i>pc</i>	Faulting program counter.
<i>rwin</i>	Receive window for a flexpage mapping resolving the page fault.

out	fp	Optional: flexpage descriptor to send to the task raising the page fault.
-----	----	---

### Returns

System call message tag; use [l4\\_error\(\)](#) to check for errors.

Page-fault messages are usually generated by the kernel and need to be handled by an appropriate handler function, potentially filling in `fp` for the reply.

`pfa` encoding is as shown:

[63/31 .. 3]	2	1	0
PFA	X	W	r

- **PFA** Bits 63/31..3 of `pfa` are the page fault address bits 63/31 to 3, bits 2..0 are masked.
- **X** Bit 2 of `pfa` if set, indicates a page fault during instruction fetch. Note, this bit is implementation-defined and might always be clear. Therefore, if this bit is clear it does not imply that the page fault is not due to an instruction fetch.
- **W** Bit 1 of `pfa` is set to 1 for a page fault due to a write operation.
- **r** Bit0: reserved, undefined.

The documentation for this class was generated from the following file:

### 15.177.1 Detailed Description

[L4](#) C++ interface for controlling platform-wide properties, see [Platform Control C API](#) for the C interface.

Add

```
#include <l4/sys/platform_control>
```

to your code to use the platform control functions. The API allows a client to suspend, reboot or shutdown the system.

For the C interface refer to the [Platform Control C API](#).

Definition at line 36 of file [platform\\_control](#).

## 15.177.2 Member Function Documentation

### 15.177.2.1 `cpu_allow_shutdown()`

```
l4_msgtag_t L4::Platform_control::cpu_allow_shutdown (
    l4_umword_t phys_id,
    l4_umword_t enable)
```

Allow CPU shutdown.

#### Parameters

<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to disable.
<i>enable</i>	Allow shutdown when 1, disallow when 0.

Sets or unsets a hint that a CPU that is not currently used may be powered down.

References [L4\\_PLATFORM\\_CTL\\_CPU\\_ENABLE\\_OP](#).

Referenced by [system\\_shutdown\(\)](#).

Here is the caller graph for this function:

### 15.177.2.2 `cpu_disable()`

```
l4_msgtag_t L4::Platform_control::cpu_disable (
    l4_umword_t phys_id)
```

Disable an online CPU.

#### Parameters

<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to disable.
----------------	---

**Returns**

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

References [cpu\\_disable\(\)](#).

Referenced by [cpu\\_disable\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**15.177.2.3 cpu\_enable()**

```
l4_msgtag_t L4::Platform_control::cpu_enable (  
    l4_umword_t phys_id)
```

Enable an offline CPU.

**Parameters**

<i>phys_id</i>	Physical CPU id of CPU (e.g. local APIC id) to enable.
----------------	--

**Returns**

System call message tag

This function is currently only supported on the ARM EXYNOS platform.

References [cpu\\_enable\(\)](#), and [L4\\_PLATFORM\\_CTL\\_CPU\\_DISABLE\\_OP](#).

**15.177.2.4 system\_shutdown()**

```
l4_msgtag_t L4::Platform_control::system_shutdown (
    l4_umword_t reboot)
```

Shutdown/Reboot the system.

**Parameters**

<i>reboot</i>	1 for reboot, 0 for power off
---------------	-------------------------------

References [cpu\\_allow\\_shutdown\(\)](#), [L4\\_PLATFORM\\_CTL\\_CPU\\_ALLOW\\_SHUTDOWN\\_OP](#), and [system\\_shutdown\(\)](#).

Referenced by [system\\_shutdown\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.177.2.5 system\_suspend()

```
l4_msgtag_t L4::Platform_control::system_suspend (
    l4_umword_t extras)
```

Enter suspend to RAM.

#### Precondition

Must only be invoked on the boot CPU. Furthermore it must be ensured that the invoking thread is not migrated to a different CPU during the suspend.

#### Parameters

<i>extras</i>	Some extra platform-specific information needed to enter suspend to RAM. On x86 platforms and when using the <a href="#">Platform_control</a> object provided by Fiasco, the value defines the sleep state. The sleep states are defined in the ACPI table. Other platforms as well as lo's <a href="#">Platform_control</a> object don't make use of this value at the moment.
---------------	---

References [L4\\_PLATFORM\\_CTL\\_SYS\\_SHUTDOWN\\_OP](#), and [system\\_suspend\(\)](#).

Referenced by [system\\_suspend\(\)](#).

## 15.178 L4::Poll\_timeout\_counter Class Reference

Evaluate an expression for a maximum number of times.

```
#include <poll_timeout_counter.h>
```

Collaboration diagram for L4::Poll\_timeout\_counter:

## Public Member Functions

- [Poll\\_timeout\\_counter](#) (unsigned counter\_val)  
*Constructor.*
- void [set](#) (unsigned counter\_val)  
*Set the counter to a certain value.*
- bool [test](#) (bool expression=true)  
*Evaluate the expression for a maximum number of times.*
- bool [timed\\_out](#) () const  
*Indicator if the maximum number of tests was required.*

### 15.178.1 Detailed Description

Evaluate an expression for a maximum number of times.

A typical use case is testing for a bit change in a hardware register for a maximum number of times (polling). For example:

```
Mmio_register_block regs;
Poll_timeout_counter i(3000000);
while (i.test(!(regs.read<l4_uint32_t>(0x04) & 1)))
;
```

The following usage is **wrong**:

```
...
Poll_timeout_counter i(3000000);
while (!i.test((regs.read<l4_uint32_t>(0x04) & 1)))
;
```

This loop would never terminate if the hardware register doesn't change!

Definition at line 34 of file [poll\\_timeout\\_counter.h](#).

## 15.178.2 Constructor & Destructor Documentation

### 15.178.2.1 Poll\_timeout\_counter()

```
L4::Poll_timeout_counter::Poll_timeout_counter (
    unsigned counter_val) [inline]
```

Constructor.

#### Parameters

<i>counter_val</i>	Maximum number of times to repeat the test.
--------------------	---

Definition at line 42 of file [poll\\_timeout\\_counter.h](#).

References [set\(\)](#).

Here is the call graph for this function:

## 15.178.3 Member Function Documentation

### 15.178.3.1 set()

```
void L4::Poll_timeout_counter::set (
    unsigned counter_val) [inline]
```

Set the counter to a certain value.

#### Parameters

<i>counter_val</i>	New counter value for maximum number of times to repeat the test.
--------------------	---

Definition at line 53 of file [poll\\_timeout\\_counter.h](#).

Referenced by [Poll\\_timeout\\_counter\(\)](#).

Here is the caller graph for this function:

### 15.178.3.2 timed\_out()

```
bool L4::Poll_timeout_counter::timed_out () const [inline]
```

Indicator if the maximum number of tests was required.

#### Return values

<i>true, if</i>	the maximum number of tests was required or if the counter was initialized to zero.
-----------------	---

Definition at line 81 of file [poll\\_timeout\\_counter.h](#).

The documentation for this class was generated from the following file:

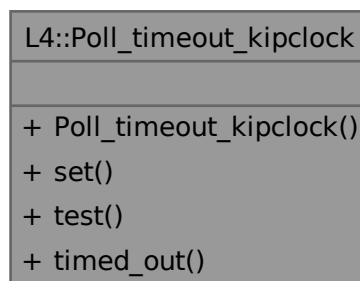

- [pkg/drivers-frst/include/poll\\_timeout\\_counter.h](#)

## 15.179 L4::Poll\_timeout\_kipclock Class Reference

A polling timeout based on the [L4Re](#) clock.

```
#include <poll_timeout_kipclock>
```

Collaboration diagram for L4::Poll\_timeout\_kipclock:

#### Public Member Functions

- [Poll\\_timeout\\_kipclock](#) (unsigned poll\_time\_us)  
*Initialise relative timeout in microseconds.*
- void [set](#) (unsigned poll\_time\_us)  
*(Re-)Set relative timeout in microseconds*
- bool [test](#) (bool expression=true)  
*Test whether timeout has expired.*
- bool [timed\\_out](#) () const  
*Query whether timeout has expired.*

### 15.179.1 Detailed Description

A polling timeout based on the [L4Re](#) clock.

This class allows to conveniently add a timeout to a polling loop.

The original

```
while (device.read(State) & Busy)
;
```

is converted to

```
Poll_timeout_kipclock timeout(10000);
while (timeout.test(device.read(State) & Busy))
;
if (timeout.timed_out())
    printf("ERROR: Device does not respond.\n");
```

Definition at line 35 of file [poll\\_timeout\\_kipclock](#).

### 15.179.2 Constructor & Destructor Documentation

#### 15.179.2.1 Poll\_timeout\_kipclock()

```
L4::Poll_timeout_kipclock::Poll_timeout_kipclock (
    unsigned poll_time_us) [inline]
```

Initialise relative timeout in microseconds.

#### Parameters

<i>poll_time_us</i>	Polling timeout in microseconds.
---------------------	----------------------------------

Definition at line 42 of file [poll\\_timeout\\_kipclock](#).

References [set\(\)](#).

Here is the call graph for this function:

### 15.179.3 Member Function Documentation

#### 15.179.3.1 set()

```
void L4::Poll_timeout_kipclock::set (
    unsigned poll_time_us) [inline]
```

(Re-)Set relative timeout in microseconds

##### Parameters

<i>poll_time_us</i>	Polling timeout in microseconds.
---------------------	----------------------------------

Definition at line 51 of file [poll\\_timeout\\_kipclock](#).

References [l4\\_kip\\_clock\(\)](#), and [l4re\\_kip\(\)](#).

Referenced by [Poll\\_timeout\\_kipclock\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 15.179.3.2 test()

```
bool L4::Poll_timeout_kipclock::test (
    bool expression = true) [inline]
```

Test whether timeout has expired.

### Parameters

<i>expression</i>	Optional expression.
-------------------	----------------------

### Return values

<i>false</i>	The timeout has expired or the given expression returned false.
<i>true</i>	The timeout has not expired and the optionally given expression returns true.

Definition at line 65 of file [poll\\_timeout\\_kipclock](#).

References [l4\\_kip\\_clock\(\)](#), and [l4re\\_kip\(\)](#).

Here is the call graph for this function:

### 15.179.3.3 timed\_out()

```
bool L4::Poll_timeout_kipclock::timed_out () const [inline]
```

Query whether timeout has expired.

#### Returns

Expiry state of timeout

Definition at line 77 of file [poll\\_timeout\\_kipclock](#).

The documentation for this class was generated from the following file:

- `l4/re/util/poll_timeout_kipclock`

## 15.180 L4::Proto\_t< P > Struct Template Reference

Data type for defining protocol numbers.

```
#include <__typeinfo.h>
```

Collaboration diagram for L4::Proto\_t< P >:

### 15.180.1 Detailed Description

```
template<I4\_proto\_t P = PROTO_EMPTY>
struct L4::Proto_t< P >
```

Data type for defining protocol numbers.

#### Template Parameters

<i>P</i>	The protocol number itself
----------	----------------------------

This type must be used when specifying a protocol number with [Kobject\\_x](#).

Definition at line [1181](#) of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

## 15.181.1 Detailed Description

Interface for kernel objects that allow to receive IPC from them.

Such an object is for example an [lpc\\_gate](#) (with server rights) or an [lrq](#). Those objects can be bound to a thread that shall receive IPC from these objects via [bind\\_thread\(\)](#) or [bind\\_snd\\_destination\(\)](#).

Definition at line 30 of file [rcv\\_endpoint](#).

## 15.181.2 Member Function Documentation

### 15.181.2.1 bind\_snd\_destination()

```
l4_msgtag_t L4::Rcv_endpoint::bind_snd_destination (
    Cap< Snd_destination > snd_dst,
    l4_umword_t label) [inline]
```

Bind a send destination (a thread or thread group) to an IPC receive endpoint.

#### Parameters

<i>snd_dst</i>	Snd_destination object (a thread or thread group) that shall be bound to this receive endpoint. See <a href="#">bind_thread()</a> and <a href="#">bind_snd_destination()</a> for binding a thread or thread group object.
<i>label</i>	Label to assign to this receive endpoint. For IPC gates, the two least significant bits must be set to zero.

#### Returns

Syscall return tag containing one of the following return codes.

#### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	snd_dst is not a thread or thread group object or other arguments were malformed.
<i>-L4_EPERM</i>	No <a href="#">L4_CAP_FPAGE_S</a> right on snd_dst or the capability used to invoke this operation.

#### Precondition

If this operation is invoked using an IPC gate capability without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread bound to the IPC gate, blocking the caller if no thread or thread group is bound yet.

The specified *label* is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread or thread group. In this case, IPC already in flight will be delivered with the old label to the previously bound thread or thread group unless [L4::Thread::modify\\_senders\(\)](#) is used to change these labels.

Definition at line 101 of file [rcv\\_endpoint](#).

References [L4::Cap\\_base::cap\(\)](#), [L4::Kobject::cap\(\)](#), and [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#).

Here is the call graph for this function:

### 15.181.2.2 `bind_thread()`

```
l4_msgtag_t L4::Rcv_endpoint::bind_thread (
    ipc::Cap< Thread > t,
    l4_umword_t label)
```

Bind the IPC receive endpoint to a thread.

#### Parameters

<i>t</i>	<a href="#">Thread</a> object this receive endpoint shall be bound to.
<i>label</i>	Label to assign to <code>this</code> receive endpoint. For IPC gates, the two least significant bits must be set to zero.

#### Returns

Syscall return tag containing one of the following return codes.

#### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	<i>t</i> is not a thread object or other arguments were malformed.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.

#### Precondition

The invoked capability and the capability *t* both must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

**Deprecated** Use [bind\\_snd\\_destination\(\)](#) instead.

#### Precondition

If this operation is invoked using an IPC gate capability without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) right, the kernel will not perform the operation. Instead, the underlying IPC message will be forwarded to the thread the IPC gate is bound to, blocking the caller if the IPC gate was not bound yet.

The specified *label* is passed to the receiver of the incoming IPC. It is possible to re-bind a receive endpoint to the same or a different thread. In this case, IPC already in flight will be delivered with the old label to the previously bound thread unless [L4::Thread::modify\\_senders\(\)](#) is used to change these labels.

*Register o as server-side object for synchronous RPC.*
- virtual [L4::Cap< L4::Irq >](#) [register\\_irq\\_obj](#) ([L4::Epiface](#) \*o)=0  
*Register o as server-side object for asynchronous IRQs.*
- virtual [L4::Cap< L4::Rcv\\_endpoint >](#) [register\\_obj](#) ([L4::Epiface](#) \*o, [L4::Cap< L4::Rcv\\_endpoint >](#) ep)=0  
*Register o as server-side object for a pre-allocated capability.*
- virtual void [unregister\\_obj](#) ([L4::Epiface](#) \*o, bool unmap=true)=0  
*Unregister the given object o from the server.*

### 15.182.1 Detailed Description

Abstract interface for object registries.

An object registry allows to register [L4::Epiface](#) objects at a server loop either for synchronous RPC messages or for asynchronous IRQ messages.

Definition at line 322 of file [ipc\\_epiface](#).

### 15.182.2 Member Function Documentation

#### 15.182.2.1 [register\\_irq\\_obj\(\)](#)

```
virtual L4::Cap< L4::Irq > L4::Registry\_iface::register\_irq\_obj (  
    L4::Epiface * o) [pure virtual]
```

Register o as server-side object for asynchronous IRQs.

#### Parameters

<a href="#">o</a>	Pointer to an <a href="#">Epiface</a> object that shall be registered as server-side object for IRQs.
-------------------	---

#### Return values

<a href="#">L4::Cap&lt;L4::Irq&gt;</a>	Capability to a new IRQ object on success.
<a href="#">L4::Cap&lt;L4::Irq&gt;::Invalid</a>	The allocation of the IRQ has failed.

After successful registration `o->obj_cap()` will be the capability of the allocated IRQ object.

The function may allocate a capability slot for the object. In that case [unregister\\_obj\(\)](#) is responsible for freeing the slot as well.

Implemented in [L4Re::Util::Object\\_registry](#).

**15.182.2.2 register\_obj() [1/3]**

```
virtual L4::Cap< void > L4::Registry_iface::register_obj (
    L4::Epiface * o) [pure virtual]
```

Register *o* as server-side object for synchronous RPC.

**Parameters**

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered as server-side object for RPC.
----------	--

**Return values**

<a href="#">L4::Cap&lt; void &gt;</a>	A valid capability to a new IPC gate.
<a href="#">L4::Cap&lt; void &gt;::Invalid</a>	The allocation of the IPC gate has failed.

After successful registration *o*→*obj\_cap()* will be the capability of the allocated IPC gate.

The function may allocate a capability slot for the object. In that case [unregister\\_obj\(\)](#) is responsible for freeing the slot as well.

Implemented in [L4Re::Util::Object\\_registry](#).

**15.182.2.3 register\_obj() [2/3]**

```
virtual L4::Cap< void > L4::Registry_iface::register_obj (
    L4::Epiface * o,
    char const * service) [pure virtual]
```

Register an [L4::Epiface](#) for an IPC gate available in the applications environment under the name *service*.

**Parameters**

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered.
<i>service</i>	Name of the capability that shall be used to connect <i>o</i> to as a server-side object.

**Return values**

<a href="#">L4::Cap&lt; void &gt;</a>	The capability known as <i>service</i> on success.
<a href="#">L4::Cap&lt; void &gt;::Invalid</a>	No capability with the given name found.

After a successful call to this function *o*→*obj\_cap()* is equal to the capability in the environment with the name given by *service*.

Implemented in [L4Re::Util::Object\\_registry](#).

**15.182.2.4 register\_obj()** [3/3]

```
virtual L4::Cap< L4::Rcv_endpoint > L4::Registry_iface::register_obj (
    L4::Epiface * o,
    L4::Cap< L4::Rcv_endpoint > ep) [pure virtual]
```

Register *o* as server-side object for a pre-allocated capability.

**Parameters**

<i>o</i>	Pointer to an <a href="#">Epiface</a> object that shall be registered as server-side object.
<i>ep</i>	Capability to an already allocated capability where <i>o</i> shall be attached as server-side handler. The capability may point to an IPC gate or an IRQ.

**Return values**

<a href="#">L4::Cap&lt;L4::Rcv_endpoint&gt;</a>	Capability <i>ep</i> on success.
<a href="#">L4::Cap&lt;L4::Rcv_endpoint&gt;::Invalid</a>	The IRQ attach operation has failed.

After successful registration *o*→*obj\_cap()* will be equal to *ep*.

Implemented in [L4Re::Util::Object\\_registry](#).

**15.182.2.5 unregister\_obj()**

```
virtual void L4::Registry_iface::unregister_obj (
    L4::Epiface * o,
    bool unmap = true) [pure virtual]
```

Unregister the given object *o* from the server.

**Parameters**

<i>o</i>	Pointer to the <a href="#">Epiface</a> object that shall be unregistered. The object must have been registered with any of the register methods if <a href="#">Registry_iface</a> .
<i>unmap</i>	If true the capability <i>o</i> → <i>obj_cap()</i> shall be unmapped from the local object space.

The function always unmaps and frees the capability if it was allocated by either [Registry\\_iface::register\\_irq\\_obj\(L4::Epiface \\*\)](#), or by [Registry\\_iface::register\\_obj\(L4::Epiface \\*\)](#).

Implemented in [L4Re::Util::Object\\_registry](#).

### 15.183.1 Detailed Description

[Exception](#) for an abstract runtime error.

This is the base class for a set of exceptions that cover all errors that have a C error value (see [l4\\_error\\_code\\_t](#)).

Definition at line [128](#) of file [exceptions](#).

### 15.183.2 Constructor & Destructor Documentation

#### 15.183.2.1 Runtime\_error()

```
L4::Runtime_error::Runtime_error (
    long err_no,
    char const * extra = 0) [inline], [explicit], [noexcept]
```

Create a new [Runtime\\_error](#).

#### Parameters

<i>err_no</i>	Error value for this runtime error.
<i>extra</i>	Description of what happened when the error occurred.

Definition at line [141](#) of file [exceptions](#).

References [err\\_no\(\)](#).

Referenced by [L4::Out\\_of\\_memory::Out\\_of\\_memory\(\)](#).

*Helper to check for protocol conflicts.***15.184.1 Detailed Description**

C++ interface of the [Scheduler](#) kernel object, see [Scheduler](#) for the C interface.

The [Scheduler](#) interface allows a client to manage CPU resources. The API provides functions to query scheduler information, check the online state of CPUs, query CPU idle time and to start threads on defined CPU sets.

The scheduler offers IRQ number 0, which triggers when the number of online cores changes, e.g. due to hotplug events.

The [Scheduler](#) interface inherits from [L4::Icu](#) and [L4::Irq\\_eoi](#) for managing the scheduler virtual device IRQ which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

It depends on the platform, which hotplug events actually trigger the IRQ. Many platforms only support triggering the IRQ when a CPU core different from the boot CPU goes online.

**Include File**

```
#include <l4/sys/scheduler>
```

Definition at line 46 of file [scheduler](#).

## 15.184.2 Member Function Documentation

### 15.184.2.1 idle\_time()

```
l4_msgtag_t L4::Scheduler::idle_time (
    l4_sched_cpu_set_t const & cpus,
    l4_kernel_clock_t * us)
```

Query the idle time (in  $\mu$ s) of a CPU.

#### Parameters

	<i>cpus</i>	Set of CPUs to query. Only the idle time of the first selected CPU in <code>cpus.map</code> is queried.
out	<i>us</i>	Idle time of queried CPU in $\mu$ s.

#### Return values

<i>0</i>	Success.
<i>-L4_EINVAL</i>	Invalid CPU requested in cpu set.

This function retrieves the idle time in  $\mu$ s of the first selected CPU in `cpus.map`. The idle time is the accumulated time a CPU has spent in the idle thread since its last reset. To calculate a load estimate  $l$  one has to retrieve the idle time at the beginning ( $i1$ ) and the end ( $i2$ ) of a known time interval  $t$ . The load is then calculated as  $l = 1 - (i2 - i1)/t$ .

The idle time is only defined for online CPUs. Reading the idle time from offline CPUs is undefined and may result in either getting `-L4_EINVAL` or calculating an estimated (incorrect) load of 1.

#### Note

The idle time statistics of remote CPUs is updated on context switch events only, hence may not be up-to-date when requested cross-CPU. To get up-to-date idle time you should use a thread running on the same CPU of which the idle time is requested.

Referenced by [run\\_thread\(\)](#).

Here is the caller graph for this function:

### 15.184.2.2 info()

```
l4_msgtag_t L4::Scheduler::info (
    l4_umword_t * cpu_max,
    l4_sched_cpu_set_t * cpus,
    l4_umword_t * sched_classes = nullptr,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
```

Get scheduler information.

#### Parameters

out	<i>cpu_max</i>	Maximum number of CPUs ever available. Optional, can be nullptr.
in, out	<i>cpus</i>	<i>cpus.offset</i> is first CPU of interest. <i>cpus.granularity</i> (see <a href="#">l4_sched_cpu_set_t</a> ). <i>cpus.map</i> Bitmap of online CPUs. Must not be nullptr.
out	<i>sched_classes</i>	A bitmap of available scheduling classes (see <a href="#">L4_scheduler_classes</a> ). Pass nullptr to omit this information.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

0	Success.
-L4_ERANGE	The given CPU offset is larger than the maximum number of CPUs.

Definition at line 74 of file [scheduler](#).

References [L4::Kobject\\_t< Scheduler, Icu, L4\\_PROTO\\_SCHEDULER, Type\\_info::Demand\\_t< 1 > >::c\(\)](#), [l4\\_sched\\_cpu\\_set\\_t::gran\\_offset](#), and [l4\\_sched\\_cpu\\_set\\_t::map](#).

Here is the call graph for this function:

### 15.184.2.3 is\_online()

```
bool L4::Scheduler::is_online (
    l4_umword_t cpu,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
```

Query if a CPU is online.

**Parameters**

<i>cpu</i>	CPU number whose online status should be queried.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Return values**

<i>true</i>	The CPU is online.
<i>false</i>	The CPU is offline

Definition at line 154 of file [scheduler](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.184.2.4 run\_thread()**

```

l4_msgtag_t L4::Scheduler::run_thread (
    Ipc::Cap< Thread > thread,
    l4_sched_param_t const & sp)
  
```

Run a thread on a [Scheduler](#).

**Parameters**

<i>thread</i>	Capability of the thread to run.
<i>sp</i>	Scheduling parameters.

**Return values**

<i>0</i>	Success.
<i>-L4_EINVAL</i>	Invalid size of the scheduling parameter.

This function launches a thread on a CPU determined by the scheduling parameter `sp.affinity`. A thread can be intentionally stopped by migrating it on an offline or an invalid CPU. The thread is only guaranteed to run if the CPU it is migrated to is currently online.

**Note**

If the target CPU is currently not online, there is no guarantee that the thread will ever run, even if the CPU comes online later on.

A scheduler may impose a policy with regard to selecting CPUs. However the scheduler is required to ensure the following two properties:

- Two threads with disjoint CPU sets must be scheduled to different CPUs.
- Two threads with identical CPU sets selecting only a single CPU must be scheduled to the same CPU.

References [idle\\_time\(\)](#), [L4\\_SCHEDULER\\_IDLE\\_TIME\\_OP](#), and [run\\_thread\(\)](#).

Referenced by [run\\_thread\(\)](#).

## 15.185.1 Detailed Description

C++ Kernel-provided semaphore interface, see [Kernel-provided semaphore](#) for the C interface.

This is the interface for kernel-provided semaphore objects. The object provides the classical functions `up()` and `down()` for counting the semaphore and blocking. The semaphore is a [Triggerable](#) with respect to the `up()` function, this means that a semaphore can be bound to an interrupt line at an ICU ([L4::lcu](#)) and incoming interrupts increment the semaphore counter.

The `down()` method decrements the semaphore counter and blocks if the counter is already zero. Blocking on a semaphore may—as all blocking operations—either return successfully, or be aborted due to an expired timeout provided to the `down()` operation, or due to an [L4::Thread::ex\\_regs\(\)](#) operation with the [L4\\_THREAD\\_EX\\_REGS\\_CANCEL](#) flag set.

A semaphore object is initialized with counter value 0.

The main reason for using a semaphore instead of an [L4::Irq](#) is to ensure that incoming trigger signals do not interfere with any open-wait operations, as used for example in a server loop.

Note that this is a kernel-level semaphore primitive that shall be used to implement user-level, application-usable synchronization primitives. For example, use `pthread_mutex` functions in applications if possible. When implementing a synchronization primitive, please ensure to only use [L4::Semaphore](#) in the case of contention, and use atomic operations for the non-contended case.

Definition at line 51 of file [semaphore](#).

## 15.185.2 Member Function Documentation

### 15.185.2.1 `down()`

```
l4_msgtag_t L4::Semaphore::down (
    l4_timeout_t timeout = L4_IPC_NEVER,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

[Semaphore](#) down operation.

#### Parameters

---

<i>timeout</i>	Timeout for blocking the semaphore down operation. Note: The receive timeout of this timeout-pair is significant for blocking, the send part is usually non-blocking.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag. Use [l4\\_error\(\)](#) to check for errors.

**Return values**

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
------------------------	---

**Precondition**

The invoked [Semaphore](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

This method decrements the semaphore counter by one, or blocks if the counter is already zero, until either a timeout or cancel condition hits or the counter is increased by an [up\(\)](#) operation.

Definition at line 89 of file [semaphore](#).

References [L4::Kobject::cap\(\)](#), and [L4\\_IPC\\_NEVER](#).

Here is the call graph for this function:

**15.185.2.2 up()**

```

l4_msgtag_t L4::Semaphore::up (
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

[Semaphore](#) up operation (wrapper for [trigger\(\)](#)).

**Parameters**

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .
-------------	--

**Returns**

Syscall return tag for a send-only operation, this means there is no return value except [L4\\_MSGTAG\\_ERROR](#) indicating success or failure of the send operation. Use [l4\\_ipc\\_error\(\)](#) to check for errors and **do not** use [l4\\_error\(\)](#).

Increases the semaphore counter by one if it is smaller than an unspecified limit. The unspecified limit is guaranteed to be at least  $2^{31}-1$ .

Definition at line 67 of file [semaphore](#).

References [L4::Triggerable::trigger\(\)](#).

Here is the call graph for this function:

### 15.186.1 Detailed Description

```
template<typename LOOP_HOOKS = ipc_svr::Default_loop_hooks>
class L4::Server< LOOP_HOOKS >
```

Basic server loop for handling client requests.

#### Parameters

<i>LOOP_HOOKS</i>	the server inherits from LOOP_HOOKS and calls the hooks defined in LOOP_HOOKS in the server loop. See <a href="#">ipc_svr::Default_loop_hooks</a> , <a href="#">ipc_svr::Ignore_errors</a> , <a href="#">ipc_svr::Default_timeout</a> , <a href="#">ipc_svr::Compound_reply</a> , and <a href="#">ipc_svr::Br_manager_no_buffers</a> .
-------------------	--

This is basically a simple server loop that uses a single message buffer for receiving requests and sending replies. The dispatcher determines how incoming messages are handled.

Definition at line 307 of file [ipc\\_server\\_loop](#).

### 15.186.2 Constructor & Destructor Documentation

#### 15.186.2.1 Server()

```
template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
L4::Server< LOOP_HOOKS >::Server (
    l4_utcb_t * ) [inline], [explicit]
```

Initializes the server loop.

Note that this variant is deprecated. The UTCB can be specified with the server loop function ([l4\\_utcb\(\)](#) is the default). (2021-10)

Definition at line 319 of file [ipc\\_server\\_loop](#).

### 15.186.3 Member Function Documentation

#### 15.186.3.1 internal\_loop()

```
template<typename L>
template<typename DISPATCH>
L4_NORETURN void L4::Server< L >::internal_loop (
    DISPATCH dispatch,
    l4_utcb_t * utcb) [inline]
```

The server loop.

This function usually never returns, it waits for incoming messages calls the dispatcher, sends a reply and waits again.

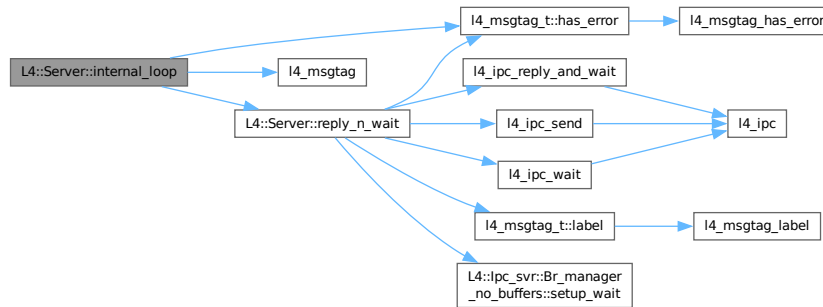

Definition at line 405 of file [ipc\\_server\\_loop](#).

References [l4\\_msgtag\\_t::has\\_error\(\)](#), [L4\\_ENOREPLY](#), [l4\\_msgtag\(\)](#), and [reply\\_n\\_wait\(\)](#).

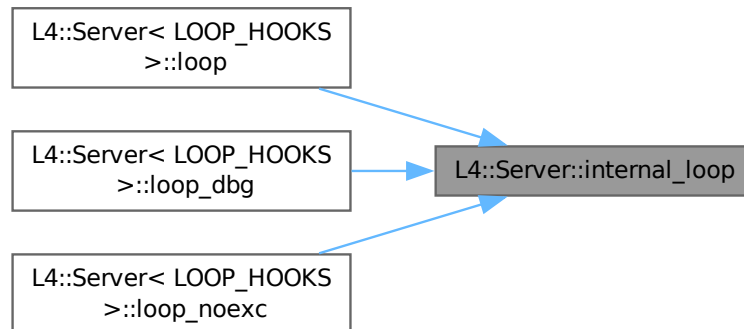

Referenced by [loop\(\)](#), [loop\\_dbg\(\)](#), and [loop\\_noexc\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 15.186.3.2 loop()

```

template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
template<typename EXC, typename R>
L4_NORETURN void L4::Server< LOOP_HOOKS >::loop (
    R r,
    l4_utcb_t * u = l4_utcb()) [inline]
  
```

[Server](#) loop with internal exception handling.

This server loop translates [L4::Runtime\\_error](#) exceptions into negative error return codes sent to the caller.

Definition at line 355 of file [ipc\\_server\\_loop](#).

### 15.186.3.3 loop\_dbg()

```
template<typename LOOP_HOOKS = Ipc_svr::Default_loop_hooks>
template<typename EXC, typename R, typename Printer>
L4_NORETURN void L4::Server< LOOP_HOOKS >::loop_dbg (
    R r,
    Printer p,
    l4_utcb_t * u = l4_utcb()) [inline]
```

Server loop with internal exception handling including message printing.

Exceptions are translated into error codes, just like in [loop\(\)](#). In addition, error messages are printed using the Printer argument.

Definition at line 368 of file [ipc\\_server\\_loop](#).

The documentation for this class was generated from the following file:

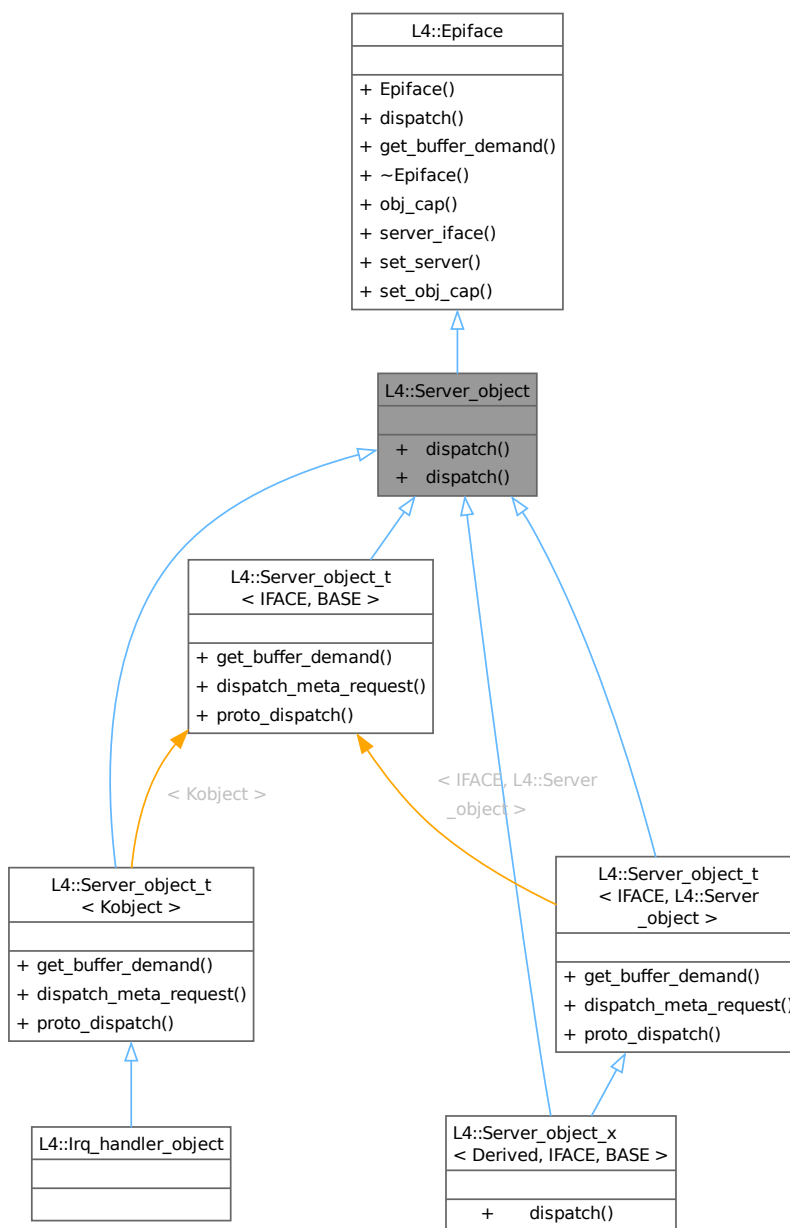

- [l4/sys/cxx/ipc\\_server\\_loop](#)

## 15.187 L4::Server\_object Class Reference

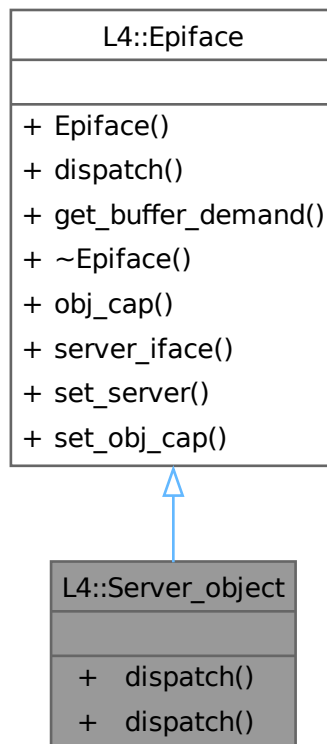

Abstract server object to be used with [L4::Server](#) and [L4::Basic\\_registry](#).

```
#include <ipc_server>
```

Inheritance diagram for L4::Server\_object:

## 15.187.1 Detailed Description

Abstract server object to be used with [L4::Server](#) and [L4::Basic\\_registry](#).

### Note

Usually [L4::Server\\_object\\_t](#) is used as a base class when writing server objects.

This server object provides an abstract interface that is used by the [L4::Registry\\_dispatcher](#) model. You can derive subclasses from this interface and implement application specific server objects.

Definition at line 38 of file [ipc\\_server](#).

## 15.187.2 Member Function Documentation

### 15.187.2.1 dispatch() [1/2]

```
l4_msgtag_t L4::Server_object::dispatch (
    l4_msgtag_t tag,
    unsigned rights,
    l4_utcb_t * utcb) [inline], [override], [virtual]
```

The abstract handler for client requests to the object.

### Parameters

<i>tag</i>	The message tag for this invocation.
<i>rights</i>	The rights bits in the invoked capability.
<i>utcb</i>	The UTCB used for the invocation.

### Return values

<code>-L4_ENOREPLY</code>	No reply message is send.
<code>&lt;0</code>	Error, reply with error code.
<code>&gt;=0</code>	Success, reply with return value.

This function must be implemented by application specific server objects.

Implements [L4::Epiface](#).

Definition at line 60 of file [ipc\\_server](#).

References [dispatch\(\)](#).

Here is the call graph for this function:

### 15.187.2.2 `dispatch()` [2/2]

```
virtual int L4::Server_object::dispatch (
    unsigned long rights,
    Ipc::Iostream & ios) [pure virtual]
```

The abstract handler for client requests to the object.

#### Parameters

<i>rights</i>	The rights bits in the invoked capability.
<i>ios</i>	The <a href="#">Ipc::Iostream</a> for reading the request and writing the reply.

#### Return values

<code>-L4_ENOREPLY</code>	Instructs the server loop to not send a reply.
<code>&lt; 0</code>	Error, reply with error code.
<code>&gt;= 0</code>	Success, reply with return value.

This function must be implemented by application specific server objects. The implementation must unmarshall data from the stream (`ios`) and create a reply by marshalling to the stream (`ios`). For details about the IPC stream see [IPC stream operators](#).

#### Note

You need to extract the complete message from the `ios` stream before inserting any reply data or before doing any function call that may use the UTCB. Otherwise, the incoming message may get lost.

Implemented in [L4::Server\\_object\\_x< Derived, IFACE, BASE >](#).

#### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), and [examples/libs/l4re/streammap/server.cc](#).

Referenced by [dispatch\(\)](#).

Here is the caller graph for this function:

static int [proto\\_dispatch](#) (THIS \*self, [l4\\_umword\\_t](#) rights, [L4::lpc::lostream](#) &ios)  
*Implementation of protocol-based dispatch for this server object.*

## 15.188.1 Detailed Description

```
template<typename IFACE, typename BASE = L4::Server_object>
struct L4::Server_object_t< IFACE, BASE >
```

Base class (template) for server implementing server objects.

### Template Parameters

<i>IFACE</i>	The IPC interface class that defines the interface that shall be implemented.
<i>BASE</i>	The server object base class (usually <a href="#">L4::Server_object</a> ).

### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), and [examples/libs/l4re/streammap/server.cc](#).

Definition at line 80 of file [ipc\\_server](#).

## 15.188.2 Member Function Documentation

### 15.188.2.1 dispatch\_meta\_request()

```
template<typename IFACE, typename BASE = L4::Server_object>
int L4::Server_object_t< IFACE, BASE >::dispatch_meta_request (
    L4::Ipc::Iostream & ios) [inline]
```

Implementation of the meta protocol based on *IFACE*.

#### Parameters

<i>ios</i>	The IO stream used for receiving the message.
------------	---

This function can be used to handle incoming [L4\\_PROTO\\_META](#) protocol requests. The implementation uses the [L4::Type\\_info](#) of *IFACE* to handle the requests. Call this function in the implementation of [Server\\_object::dispatch\(\)](#) when the received message tag has protocol [L4\\_PROTO\\_META](#) ([L4::Meta::Protocol](#)).

Definition at line 99 of file [ipc\\_server](#).

### 15.188.2.2 get\_buffer\_demand()

```
template<typename IFACE, typename BASE = L4::Server_object>
BASE::Demand L4::Server_object_t< IFACE, BASE >::get_buffer_demand () const [inline], [override],
[virtual]
```

#### Returns

the server-side buffer demand based in *IFACE*.

Implements [L4::Epiface](#).

Definition at line 86 of file [ipc\\_server](#).

### 15.188.2.3 proto\_dispatch()

```
template<typename IFACE, typename BASE = L4::Server_object>
template<typename THIS>
int L4::Server_object_t< IFACE, BASE >::proto_dispatch (
    THIS * self,
    l4_umword_t rights,
    L4::Ipc::Iostream & ios) [inline], [static]
```

Implementation of protocol-based dispatch for this server object.

#### Parameters

<i>self</i>	The this pointer for the object (inherits from <a href="#">Server_object_t</a> ).
-------------	---

<i>rights</i>	The rights from the received IPC (forwarded to <code>p_dispatch()</code> ).
<i>ios</i>	The message stream for the incoming and the reply message.

Server objects may call this function from their `dispatch()` function. This function reads the protocol ID from the message tag and uses the `p_dispatch` code to dispatch to overloaded `p_dispatch` functions of self.

Definition at line 114 of file `ipc_server`.

References `l4_msgtag_t::label()`, and `L4::Kobject_typeid< T >::proto_dispatch()`.

Referenced by `L4::Server_object_x< Derived, IFACE, BASE >::dispatch()`.

### 15.189.1 Detailed Description

```
template<typename Derived, typename IFACE, typename BASE = L4::Server_object>
struct L4::Server_object_x< Derived, IFACE, BASE >
```

Helper class to implement p\_dispatch based server objects.

#### Template Parameters

<i>Derived</i>	The data type of your server object class.
<i>IFACE</i>	The data type providing the interface definition for the object.
<i>BASE</i>	Optional data-type of the base server object (usually <a href="#">L4::Server_object</a> )

This class implements the standard [dispatch\(\)](#) function of [L4::Server\\_object](#) and forwards incoming messages to a set of overloaded p\_dispatch() functions. There must be a p\_dispatch() function in Derived for each interface provided by IFACE with the signature

```
int p_dispatch(Iface *, unsigned rights, L4::Ipc::Iostream &)
```

that is called for messages with protocol == Iface::Protocol.

Example signature for [L4Re::Dataspace](#) is:

```
int p_dispatch(L4Re::Dataspace *, unsigned, L4::Ipc::Iostream &)
```

Definition at line [143](#) of file [ipc\\_server](#).

The documentation for this struct was generated from the following file:

- [l4/cxx/ipc\\_server](#)

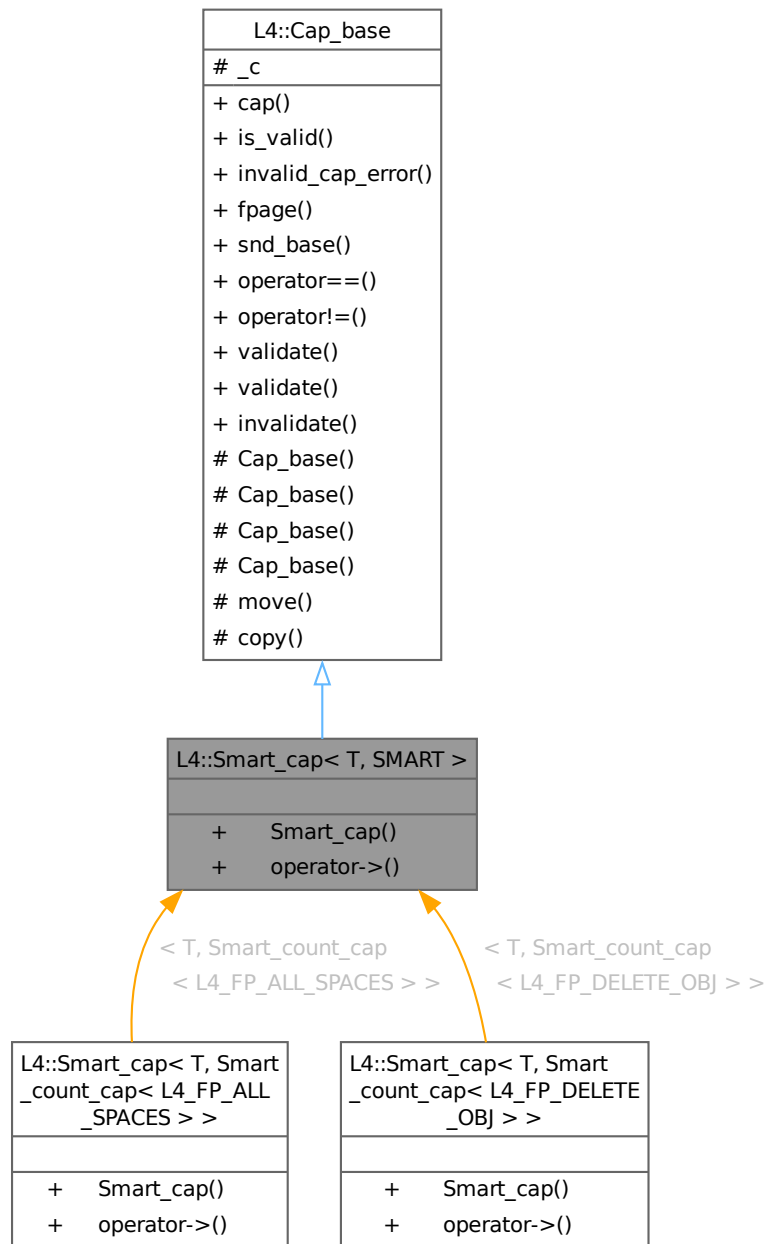

## 15.190 L4::Smart\_cap< T, SMART > Class Template Reference

Smart capability class.

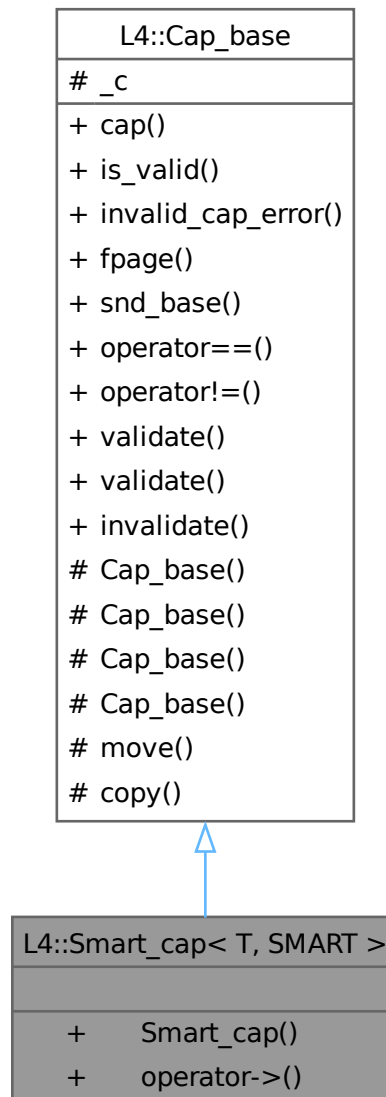

```
#include <smart_capability>
```

Inheritance diagram for L4::Smart\_cap< T, SMART >:

Collaboration diagram for L4::Smart\_cap< T, SMART >:

- `l4_cap_idx_t _c`  
*The C representation of a capability selector.*

### 15.190.1 Detailed Description

```
template<typename T, typename SMART>
class L4::Smart_cap< T, SMART >
```

Smart capability class.

Definition at line 25 of file [smart\\_capability](#).

### 15.190.2 Constructor & Destructor Documentation

#### 15.190.2.1 Smart\_cap()

```
template<typename T, typename SMART>
template<typename O>
L4::Smart_cap< T, SMART >::Smart_cap (
    Cap< O > const & p) [inline], [noexcept]
```

Internal constructor, use to generate a capability from a `this` pointer.

#### Attention

This constructor is only useful to generate a capability from the `this` pointer of an objected that is an [L4::Kobject](#). Do *never* use this constructor for something else!

#### Parameters

<i>p</i>	The <code>this</code> pointer of the <a href="#">Kobject</a> or derived object
----------	--

- static void **\_\_check\_protocols** () noexcept  
*Helper to check for protocol conflicts.*

## 15.192.1 Detailed Description

C++ interface of the [Task](#) kernel object, see [Task](#) for the C interface.

The [L4::Task](#) class represents a combination of the address spaces provided by the [L4Re](#) micro kernel. A task consists of at least a memory address space and an object address space. On IA32 there is also an IO-port address space associated with an [L4::Task](#).

[L4::Task](#) objects are created using the [L4::Factory](#) interface.

### Include File

```
#include <l4/sys/task>
```

Definition at line 33 of file [task](#).

## 15.192.2 Member Function Documentation

### 15.192.2.1 add\_ku\_mem()

```
l4_msgtag_t L4::Task::add_ku_mem (
    l4_fpage_t * fpage,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Add kernel-user memory.

#### Parameters

<i>in, out</i>	<i>fpage</i>	Flexpage describing the virtual area the memory goes to. On systems without MMU, the flexpage is adjusted to reflect the actually allocated physical address.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag

Kernel-user memory (ku\_mem) is memory that is shared between the kernel and user-space. It is needed for the UTCB area of threads (see [L4::Thread::Attr::bind\(\)](#)) and for (extended) vCPU state. Note that existing kernel-user memory cannot be unmapped or mapped somewhere else.

## Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page ([L4\\_PAGESIZE](#)). A portable implementation should not depend on allocations greater than 16KiB to succeed.

This function is only guaranteed to work on [L4::Task](#) objects. It might or might not work on [L4::Vm](#) objects or on [L4Re::Dma\\_space](#) objects but there is no practical use for adding kernel-user memory to [L4::Vm](#) objects or to [L4Re::Dma\\_space](#) objects.

Definition at line 281 of file [task](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.192.2.2 cap\_equal()

```

l4_msgtag_t L4::Task::cap_equal (
    Cap< void > const & cap_a,
    Cap< void > const & cap_b,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Test whether two capabilities point to the same object with the same permissions (only considering selected permissions).

#### Parameters

<i>cap<sub>a</sub></i>	Capability selector for the first capability to compare.
<i>cap<sub>b</sub></i>	Capability selector for the second capability to compare.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

<i>l4_msgtag_t::label()</i> = 1	The compared capabilities point to the same object with same considered permission.
<i>l4_msgtag_t::label()</i> = 0	The compared capabilities do <b>not</b> point to the same object or differ in the considered permission.

- For [L4::lpc\\_gate](#) objects, only the permissions [L4\\_CAP\\_FPAGE\\_W](#), [L4\\_CAP\\_FPAGE\\_S](#), and [L4\\_FPAGE\\_C\\_OBJ\\_RIGHT1](#) are considered for the comparison. Differences in other permissions are ignored.

- For other objects, only the permissions [L4\\_CAP\\_FPAGE\\_W](#) and [L4\\_CAP\\_FPAGE\\_S](#) are considered for the comparison. Differences in other permissions are ignored.

Note that having the [L4\\_CAP\\_FPAGE\\_R](#) permission is implicit in possessing the capability.

Definition at line 251 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.192.2.3 cap\_valid()

```

l4_msgtag_t L4::Task::cap_valid (
    Cap< void > const & cap,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Check whether a capability is present (refers to an object).

#### Parameters

<i>cap</i>	Valid capability to check for presence.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

<i>l4_msgtag_t::label()</i> > 0	Capability is present (refers to an object).
<i>l4_msgtag_t::label()</i> == 0	No capability present (void object).

A capability is considered present when it refers to an existing kernel object.

**Precondition**

`cap` must be a valid capability (i.e. `cap.is_valid() == true`). If you are unsure about the validity of your capability use [L4::Cap.validate\(\)](#) instead.

Definition at line 222 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.192.2.4 delete\_obj()**

```

l4_msgtag_t L4::Task::delete_obj (
    L4::Cap< void > obj,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Release capability and delete object.

**Parameters**

<i>obj</i>	Capability index of the object to delete.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

If `obj` has the delete permission, initiates the deletion of the object. This implies that all capabilities for that object are gone afterwards. However, kernel-internally, objects are not destroyed until all other kernel objects holding a reference to it drop the reference. Hence, quota used by that object might not be freed immediately.

If `obj` does not have the delete permission, no error will be reported and only the capability `obj` is removed. (Note that, depending on the object's reference counter, this might still imply initiation of deletion.)

This operation is equivalent to [unmap\(\)](#) with [L4\\_FP\\_DELETE\\_OBJ](#) flag.

Definition at line 180 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.192.2.5 map()

```

l4_msgtag_t L4::Task::map (
    Cap< Task > const & src_task,
    l4_fpage_t const & snd_fpage,
    l4_umword_t snd_base,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Map resources available in the source task to a destination task.

#### Parameters

<i>src_task</i>	Capability selector of the source task.
<i>snd_fpage</i>	Send flexpage that describes an area in the address space or object space of the source task.
<i>snd_base</i>	Send base that describes an offset in the receive window of the destination task. The lower bits contain additional map control flags (see <a href="#">l4_fpage_cacheability_opt_t</a> for memory mappings, <a href="#">Attributes and additional permissions for object send items</a> for object mappings, and <a href="#">L4_MAP_ITEM_GRANT</a> ; also see <a href="#">l4_map_control()</a> and <a href="#">l4_map_obj_control()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag. The function [l4\\_error\(\)](#) shall be used to test if the map operation was successful.

#### Return values

<code>L4_EOK</code>	Operation successful (but see notes below).
<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>-L4_EINVAL</code>	Invalid source task capability.
<code>-L4_IPC_SEMAPFAILED</code>	The map operation failed due to limited quota.

**Precondition**

The invoked [Task](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

This method allows for asynchronous transfer of capabilities, memory mappings, and IO-port mappings (on IA32) from one task to another. The destination task is the task referenced by the capability on which the map is invoked, and the receive window is the whole address space of that task. By specifying proper rights in the `snd_fpage` and `snd_base`, it is possible to remove rights during transfer.

**Note**

If the send flexpage is of type [L4\\_FPAGE\\_OBJ](#), the [L4\\_CAP\\_FPAGE\\_S](#) right is removed from the transferred capability unless both the source and destination task capabilities possess the [L4\\_CAP\\_FPAGE\\_S](#) right themselves.

Even with [l4\\_error\(\)](#) returning `L4_EOK` there might be cases where not all pages of the send flexpage were mapped respectively granted to the destination task, for instance, if the corresponding mapping in the destination task does already exist.

For more information on spaces and mappings, see [Spaces and Mappings](#). The flexpage API is described in more detail at [Flexpages](#).

**Note**

For peculiarities when using grant, see [L4\\_MAP\\_ITEM\\_GRANT](#).

Definition at line 85 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.192.2.6 release\_cap()**

```

l4_msgtag_t L4::Task::release_cap (
    L4::Cap< void > cap,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Release object capability.

**Parameters**

<i>cap</i>	Capability selector of the object to release.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

This operation unmaps the capability from `this` task. This operation is equivalent to unmapping a single object capability by specifying all object rights as unmap mask.

**Note**

If the reference counter of the kernel object referenced by [cap](#) goes down to zero, the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line 201 of file [task](#).

References [L4::Cap\\_base::cap\(\)](#), and [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.192.2.7 unmap()**

```

l4_msgtag_t L4::Task::unmap (
    l4_fpage_t const & fpage,
    l4_unword_t map_mask,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Revoke rights from the task.

**Parameters**

<i>fpage</i>	Flexpage that describes an area in one capability space of <code>this</code> task and the rights to revoke.
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a>

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

## Returns

Syscall return tag

This method allows to revoke rights from the destination task. The rights to revoke are specified in the flexpage, see [l4\\_fpage\\_rights\(\)](#). For a flexpage describing IO ports or memory, it also revokes rights from all the tasks that got the rights delegated from the destination task (i.e., this operation does a recursive rights revocation). The capability is unmapped if certain rights are specified, see below for details. It is guaranteed that the rights revocation is completed before this function returns.

Note that this function cannot be used to revoke the reference counting permission (see [L4\\_FPAGE\\_C\\_REF\\_CNT](#)) or the IPC-gate server permission (see [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#)) from object capabilities.

It depends on the platform and the object type which rights need to be specified in the `rights` field of `fpage` to unmap a capability:

- An object capability is unmapped if and only if the [L4\\_CAP\\_FPAGE\\_R](#) right bit is set.
- An IO port is unmapped if and only if any right bit is set.
- Memory is unmapped if and only if the [L4\\_FPAGE\\_RO](#) right bit is set.

## Note

Depending on the page-table features supported by the hardware, revocation of certain rights from a memory capability can be a no-op (i.e., the rights are not revoked). Further, revocation of certain rights may grant other rights which were not present before. For instance, on an architecture without support for NX, revoking X does nothing. For another example, revoking only X from an execute-only page grants read permission (because the mapping remains present in the page table).

If the reference counter of a kernel object referenced in `fpage` goes down to zero (as a result of deleting capabilities), the deletion of the object is initiated. Objects are not destroyed until all other kernel objects holding a reference to it drop the reference.

Definition at line [135](#) of file [task](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

### 15.192.2.8 unmap\_batch()

```
l4_msgtag_t L4::Task::unmap_batch (
    l4_fpage_t const * fpages,
    unsigned num_fpages,
    l4_umword_t map_mask,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Revoke rights from a task.

#### Parameters

<i>fpages</i>	An array of flexpages. Each item describes an area in one capability space of <code>this</code> task.
<i>num_fpages</i>	Number of fpages in the <code>fpages</code> array.
<i>map_mask</i>	Unmap mask, see <a href="#">l4_unmap_flags_t</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

Revoke rights for an array of flexpages, see [unmap](#) for details.

#### Precondition

The caller needs to take care that `num_fpages` is not bigger than `L4_UTCB_GENERIC_DATA_SIZE - 2`.

### 15.193.1 Detailed Description

C++ [L4](#) kernel thread interface, see [Thread](#) for the C interface.

The [Thread](#) class defines a thread of execution in the [L4](#) context. Usually user-level and kernel threads are mapped 1:1 to each other. [Thread](#) kernel objects are created using a factory, see the [L4::Factory](#) API ([L4::Factory::create\(\)](#)).

Amongst other things an [L4::Thread](#) encapsulates:

- CPU state
  - General-purpose registers
  - Program counter
  - Stack pointer
- FPU state
- Scheduling parameters, see the [L4::Scheduler](#) API
- Execution state
  - Blocked, Runnable, Running

[Thread](#) objects provide an API for

- [Thread](#) configuration and manipulation
- [Thread](#) switching.

On ARM newly created threads run in EL0 by default and the exception level can be changed there with [ex\\_regs\(\)](#).

#### Include File

```
#include <l4/sys/thread>
```

For the C interface see the [Thread](#) API. For more elaborated documentation on the vCPU feature see [vCPU API](#).

Definition at line 52 of file [thread](#).

### 15.193.2 Member Function Documentation

#### 15.193.2.1 control()

```
l4_msgtag_t L4::Thread::control (
    Attr const & attr) [inline], [noexcept]
```

Commit the given thread-attributes object.

#### Parameters

<i>attr</i>	the attribute object to commit to the thread.
-------------	---

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

<code>L4_EOK</code>	Operation successful.
<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>-L4_EINVAL</code>	Malformed thread-attributes.

**Precondition**

The invoked [Thread](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#). When using [Attr::bind\(\)](#), also the respective [Task](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_S](#).

Definition at line [243](#) of file [thread](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**15.193.2.2 ex\_regs() [1/2]**

```

l4_msgtag_t L4::Thread::ex_regs (
    l4_addr_t * ip,
    l4_addr_t * sp,
    l4_umword_t * flags,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Exchange basic thread registers and return previous values.

**Parameters**

in, out	<i>ip</i>	New instruction pointer, use <code>~0UL</code> to leave the instruction pointer unchanged, return previous instruction pointer.
in, out	<i>sp</i>	New stack pointer, use <code>~0UL</code> to leave the stack pointer unchanged, returns previous stack pointer.
in, out	<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> , return previous CPU flags of the thread.

	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
--	-------------	--

### Returns

System call return tag. [out] parameters are only valid if the function returns successfully. Use [l4\\_error\(\)](#) to check.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see [flags](#)). If the thread is in an IPC operation or if [L4\\_THREAD\\_EX\\_REGS\\_TRIGGER\\_EXCEPTION](#) forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see [L4\\_thread\\_ex\\_regs\\_flags\\_arm](#) and [L4\\_thread\\_ex\\_regs\\_flags\\_arm64](#).

The thread is started using [L4::Scheduler::run\\_thread\(\)](#). However, if at the time [L4::Scheduler::run\\_thread\(\)](#) is called, the instruction pointer of the thread is invalid, a later call to [ex\\_regs\(\)](#) with a valid instruction pointer might start the thread.

Definition at line 119 of file [thread](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_thread\\_ex\\_regs\\_ret\\_u\(\)](#).

Here is the call graph for this function:

### 15.193.2.3 ex\_regs() [2/2]

```

l4_msgtag_t L4::Thread::ex_regs (
    l4_addr_t ip,
    l4_addr_t sp,
    l4_umword_t flags,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]

```

Exchange basic thread registers.

### Parameters

<i>ip</i>	New instruction pointer, use ~0UL to leave the instruction pointer unchanged.
<i>sp</i>	New stack pointer, use ~0UL to leave the stack pointer unchanged.
<i>flags</i>	Ex-regs flags, see <a href="#">L4_thread_ex_regs_flags</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

System call return tag.

This method allows to manipulate and start a thread. The basic functionality is to set the instruction pointer and the stack pointer of a thread. Additionally, this method allows also to cancel ongoing IPC operations and to force the thread to raise an artificial exception (see `flags`). If the thread is in an IPC operation or if `L4_THREAD_EX_REGS_TRIGGER_EXCEPTION` forces an IPC then changes in IP and SP take effect directly after returning from this IPC. On ARM this method allows to change the exception level, see `L4_thread_ex_regs_flags_arm` and `L4_thread_ex_regs_flags_arm64`.

The thread is started using `L4::Scheduler::run_thread()`. However, if at the time `L4::Scheduler::run_thread()` is called, the instruction pointer of the thread is invalid, a later call to `ex_regs()` with a valid instruction pointer might start the thread.

Definition at line 84 of file `thread`.

References `L4::Kobject::cap()`, and `l4_thread_ex_regs_u()`.

Here is the call graph for this function:

**15.193.2.4 modify\_senders()**

```
l4_msgtag_t L4::Thread::modify_senders (
    Modify_senders const & todo) [inline], [noexcept]
```

Apply sender modification rules.

**Parameters**

<i>todo</i>	Prepared sender modification rules.
-------------	-------------------------------------

**Returns**

System call return tag.

The modification rules are applied to all IPCs to the thread (whether directly or by IPC gate) that are already in flight, that is that the sender is already blocking on.

See `Modify_senders` for a detailed description when applying sender modification rules is required.

**Note**

Modifying the senders of a thread running on a different CPU core is not supported.

To ensure that no in-flight senders are missed, either the thread itself must execute `modify_senders`, or the thread executing the `modify_senders` must synchronize with the target thread. This synchronization must ensure the following:

1. Before `modify_senders` is executed the target thread must execute at least shortly (so that pending DRQs are handled).
2. The target thread must pause its IPC dispatch, until `modify_senders` is completed. In other words, the target thread must not be receive ready, because otherwise an IPC message with an unmodified label can be transferred to its UTCB or vCPU state.

**See also**

[l4\\_thread\\_modify\\_sender\\_commit\(\)](#)

Definition at line 525 of file [thread](#).

References [L4::Kobject::cap\(\)](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), and [L4\\_PROTO\\_THREAD](#).

**15.193.2.5 register\_del\_irq()**

```

l4_msgtag_t L4::Thread::register_del_irq (
    Cap< Irq > irq,
    l4_utcb_t * u = l4_utcb()) [inline], [noexcept]

```

Register an IRQ that will trigger upon deletion events.

**Parameters**

<i>irq</i>	Capability selector for the IRQ object to be triggered.
<i>u</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

### Returns

System call return tag containing the return code.

### Return values

<code>-L4_BUSY</code>	A deletion IRQ is already bound to this thread.
<code>-L4_EPERM</code>	Insufficient permissions; see precondition.

### Precondition

The capability `irq` must have the permission `L4_CAP_FPAGE_W`.

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered deletion `irq` can only be deregistered by deleting the `irq` or the thread.

List of deletion events:

- deletion of one or several IPC gates bound to this thread.

When the deletion event is delivered, there is no indication about which IPC gate was deleted.

### See also

```
l4_msgtag_t L4::Thread::register_doorbell_irq (
    Cap< Irq > irq,
    l4_utcb_t * u = l4_utcb()) [inline], [noexcept]
```

Register an IRQ that will trigger when a forwarded virtual interrupt is pending.

#### Parameters

<i>irq</i>	Capability selector for the IRQ object to be triggered.
<i>u</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Returns

System call return tag containing the return code.

#### Return values

-L4_BUSY	A doorbell IRQ is already bound to this thread.
-L4_EPERM	Insufficient permissions; see precondition.

#### Precondition

The capability `irq` must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

See [Irq::bind\\_vcpu\(\)](#) for more details about how interrupts can be forwarded directly by the kernel to extended vCPU user mode.

In case the `irq` is already bound to an interrupt source, it is unbound first. When `irq` is deleted, it will be deregistered first. A registered doorbell [irq](#) can only be deregistered by deleting the [irq](#) or the thread.

**15.193.2.9 vcpu\_control()**

```

l4_msgtag_t L4::Thread::vcpu_control (
    l4_addr_t vcpu_state,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Enable the vCPU feature for the thread.

**Parameters**

<i>vcpu_state</i>	A virtual address pointing to a <a href="#">l4_vcpu_state_t</a> . It must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

This function enables the vCPU feature of `this` thread

The kernel-user memory starting at `vcpu_state` must be at least 128-byte aligned and must cover the size of [l4\\_vcpu\\_state\\_t](#).

The asynchronous IPC handling is described at [vCPU API](#).

**Note**

Disabling of the vCPU feature is optional and currently not supported.

Definition at line 358 of file [thread](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_thread\\_vcpu\\_control\\_u\(\)](#).

Here is the call graph for this function:

**15.193.2.10 vcpu\_control\_ext()**

```

l4_msgtag_t L4::Thread::vcpu_control_ext (
    l4_addr_t ext_vcpu_state,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Enable the extended vCPU feature for the thread.

**Parameters**

<i>ext_vcpu_state</i>	The virtual address where the kernel shall store the vCPU state in case of vCPU exits. The address must be a valid kernel-user-memory address (see <a href="#">L4::Task::add_ku_mem()</a> ).
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

The extended vCPU feature allows the use of hardware-virtualization features such as Intel's VT-x (VMX) or AMD's AMD-V (SVM).

This function enables the extended vCPU feature of `this` thread. Enabling the extended vCPU feature also enables the vCPU feature.

The kernel-user memory area starting at `ext_vcpu_state` must be at least 4 KiB aligned and must cover a size of `L4_PAGESIZE`. It includes the data of [l4\\_vcpu\\_state\\_t](#) at offset 0, the extended vCPU state at offset `L4_VCPU_OFFSET_EXT_STATE`, and, on some platforms, the extended vCPU information at offset `L4_VCPU_OFFSET_EXT_INFOS`.

On Intel's VT-x (VMX), the extended vCPU state is [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#) and the extended vCPU information is [l4\\_vm\\_vmx\\_vcpu\\_infos\\_t](#). Furthermore, the extended vCPU state needs to be associated with a vCPU context (see [l4\\_vm\\_vmx\\_set\\_hw\\_vmcs\(\)](#)).

On AMD's AMD-V (SVM), the extended vCPU state is [l4\\_vm\\_svm\\_vmcb\\_t](#).

**Note**

Enabling the extended vCPU feature for a thread running on a different CPU core is currently not supported.

Disabling of the extended vCPU feature is currently not supported.

Upgrading from non-extended vCPU feature to extended vCPU feature is currently not supported.

Definition at line 398 of file [thread](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_thread\\_vcpu\\_control\\_ext\\_u\(\)](#).

Here is the call graph for this function:

**15.193.2.11 vcpu\_resume\_commit()**

```

l4_msgtag_t L4::Thread::vcpu_resume_commit (
    l4_msgtag_t tag,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Resume from vCPU asynchronous IPC handler, commit.

**Parameters**

<i>tag</i>	Tag to use, returned by <a href="#">l4_thread_vcpu_resume_start()</a> .
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

0	Indicates a VM exit, provided that <code>thread</code> is in extended vCPU mode with virtual interrupts cleared.
1	Indicates an incoming IPC message, provided that the <code>thread</code> is in extended vCPU mode with virtual interrupts cleared.
-L4_EPERM	The user task capability set in the vCPU state is missing the <a href="#">L4_CAP_FPAGE_S</a> right. On Intel's VT-x (VMX): The vCPU context capability set in the extended vCPU state is missing the <a href="#">L4_CAP_FPAGE_S</a> right.
-L4_ENOENT	The user task capability set in the vCPU state is invalid.

<code>-L4_EINVAL</code>	<code>thread</code> is not the current running thread, or does not have the vCPU feature enabled. On Intel's VT-x (VMX): No vCPU context associated with the extended vCPU state.
<code>-L4_EBUSY</code>	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state is already active on a different CPU.
<code>-L4_ENODEV</code>	On Intel's VT-x (VMX): The vCPU context associated with the extended vCPU state cannot be initialized or activated.
<code>&lt;0</code>	A supplied mapping failed.

All flexpages in the UTCB (added with [l4\\_sndfpage\\_add\(\)](#) after [l4\\_thread\\_vcpu\\_resume\\_start\(\)](#)) are unconditionally mapped into the user task configured in the vCPU state.

To resume into another address space, the capability to the target [Task](#) (or [L4::Vm](#)) must be set in [l4\\_vcpu\\_state\\_t::user\\_task](#) together with [L4\\_VCPU\\_F\\_USER\\_MODE](#). The capability selector must have all lower bits clear (see [L4\\_CAP\\_MASK](#)). The kernel adds the [L4\\_SYSF\\_SEND](#) flag there to indicate that the capability has been referenced in the kernel. Consecutive resumes will not reference the task capability again until all lower bits are cleared again. To release a task use a different task capability or use an invalid capability with the [L4\\_SYSF\\_REPLY](#) flag set.

The asynchronous IPC handling is described at [vCPU API](#).

Here is the call graph for this function:

### 15.193.2.12 vcpu\_resume\_start()

```

l4_msgtag_t L4::Thread::vcpu_resume_start (
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
  
```

Resume from vCPU asynchronous IPC handler, start.

#### Parameters

<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .
-------------	--

**Returns**

Message tag to be used for [l4\\_sndfpage\\_add\(\)](#) and [l4\\_thread\\_vcpu\\_resume\\_commit\(\)](#)

The vCPU resume functionality is split in multiple functions to allow the specification of additional send-flexpages using [l4\\_sndfpage\\_add\(\)](#).

The asynchronous IPC handling is described at [vCPU API](#).

*Bind the thread to a task.*
- void [alien](#) (int on) noexcept  
*Enable alien mode.*

## Friends

- class [L4::Thread](#)

### 15.194.1 Detailed Description

[Thread](#) attributes used for [control\(\)](#).

This class is responsible for initializing various attributes of a thread in a UTCB for the [control\(\)](#) method.

#### Note

Instantiation of this class starts the preparation of the UTCB. Do not invoke any non-Attr functions between the instantiation and the call to [L4::Thread::control\(\)](#).

#### See also

[Thread control](#) for some more details.

Definition at line 137 of file [thread](#).

## 15.194.2 Constructor & Destructor Documentation

### 15.194.2.1 Attr()

```
L4::Thread::Attr::Attr (  
    l4_utcb_t * utcb = l4_utcb()) [inline], [explicit], [noexcept]
```

Create a thread-attribute object with the given UTCB.

#### Parameters

<i>utcb</i>	The UTCB to use for the later <a href="#">L4::Thread::control()</a> function. Usually this is the UTCB of the calling thread. See <a href="#">l4_utcb()</a> .
-------------	---

Definition at line 151 of file [thread](#).

## 15.194.3 Member Function Documentation

### 15.194.3.1 alien()

```
void L4::Thread::Attr::alien (  
    int on) [inline], [noexcept]
```

Enable alien mode.

#### Parameters

<i>on</i>	Boolean value defining the state of the feature.
-----------	--

For a thread in alien mode the kernel produces just an exception IPC for each IPC and exception caused by the alien thread instead of handling these events regularly. (Page faults of alien threads and interrupts occurring while the alien thread is running are always handled regularly.) While the alien thread is blocking, the exception handler can inspect and modify the state of the alien thread and potentially also the system call arguments. If the exception handler replies with [L4\\_PROTO\\_ALLOW\\_SYSCALL](#) as message tag, the kernel handles the next IPC or exception of the alien thread in a regular way. If the exception handler leaves certain thread state unchanged (in particular the instruction pointer), this will be the IPC or exception that caused the call of the exception handler. For a regularly processed IPC or exception of the alien thread the kernel also performs an exception IPC on kernel exit.

This feature can be used to attach a debugger to a thread and trace all object invocations and their results. It could also be used to handle other systems that use the same syscall instruction as [L4Re](#).

Definition at line 224 of file [thread](#).

### 15.194.3.2 bind()

```
void L4::Thread::Attr::bind (
    l4_utcb_t * thread_utcb,
    Cap< Task > const & task) [inline], [noexcept]
```

Bind the thread to a task.

#### Parameters

<i>thread_utcb</i>	The thread's UTCB address within the task it shall be bound to. The address must be aligned (architecture dependent; at least word aligned) and it must point to at least <a href="#">L4_UTCB_OFFSET</a> bytes of kernel-user memory.
<i>task</i>	The task the thread shall be bound to.

#### Precondition

The thread must not be bound to a task yet.

The capability `task` must have the permission [L4\\_CAP\\_FPAGE\\_S](#), otherwise the later call to [L4::Thread::control\(\)](#) with this [Attr](#) object will fail with [L4\\_EPERM](#).

A thread may execute code in the context of a task if and only if the thread is bound to the task. To actually start execution, [L4::Thread::ex\\_regs\(\)](#) needs to be used. Execution in the context of the task means that the code has access to all the task's resources (and only those). The executed code itself must be one of those resources. A thread can be bound at most once to a task.

#### Note

The UTCBs of different threads in the same task should not overlap in order to prevent data corruption.

Definition at line [218](#) of file [thread](#).

### 15.194.3.3 exc\_handler() [1/2]

```
Cap< void > L4::Thread::Attr::exc_handler () [inline], [noexcept]
```

Get the capability selector used for exception messages.

#### Returns

The capability selector used to send exception messages. The selector is valid in the task the thread is bound to.

Definition at line [189](#) of file [thread](#).

**15.194.3.4 exc\_handler()** [2/2]

```
void L4::Thread::Attr::exc_handler (
    Cap< void > const & exc_handler) [inline], [noexcept]
```

Set the exception-handler capability selector.

**Parameters**

<i>exc_handler</i>	The capability selector that shall be used for exception messages. This capability selector must be valid within the task the thread is bound to.
--------------------	---

Definition at line 180 of file [thread](#).

References [exc\\_handler\(\)](#).

Referenced by [exc\\_handler\(\)](#).

Here is the caller graph for this function:

**15.194.3.5 pager()** [1/2]

```
Cap< void > L4::Thread::Attr::pager () [inline], [noexcept]
```

Get the capability selector used for page-fault messages.

**Returns**

The capability selector used to send page-fault messages. The selector is valid in the task the thread is bound to.

Definition at line 170 of file [thread](#).

### 15.194.3.6 pager() [2/2]

```
void L4::Thread::Attr::pager (
    Cap< void > const & pager) [inline], [noexcept]
```

Set the pager capability selector.

#### Parameters

<i>pager</i>	The capability selector that shall be used for page-fault messages. This capability selector must be valid within the task the thread is bound to.
--------------	--

Definition at line 161 of file [thread](#).

References [pager\(\)](#).

Referenced by [pager\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

## 15.195 L4::Thread::Modify\_senders Class Reference

[Class](#) wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.

```
#include <thread>
```

Collaboration diagram for L4::Thread::Modify\_senders:

### Public Member Functions

- `int add(l4_umword_t match_mask, l4_umword_t match, l4_umword_t del_bits, l4_umword_t add_bits) noexcept`  
*Add a rule.*

### 15.195.1 Detailed Description

[Class](#) wrapping a list of rules which modify the sender label of IPC messages inbound to this thread.

Use the [add\(\)](#) function to add modification rules, and use [modify\\_senders\(\)](#) to commit. Do not use the UTCB in between as it is used by [add\(\)](#) and [modify\\_senders\(\)](#).

This mechanism shall be used to change the source object labels of every pending IPC of an IPC gate or an IRQ if the labels in such pending IPC become invalid for the receiving thread, potentially because:

- an IPC gate / IRQ was unbound from a thread, or
- an IPC gate / IRQ was removed, or
- the label of an IPC gate / IRQ bound to a thread was changed.

It is not required to perform the `modify_sender` mechanism after an IPC gate or an IRQ was bound to a thread for the first time.

Definition at line [448](#) of file [thread](#).

## 15.195.2 Member Function Documentation

### 15.195.2.1 add()

```
int L4::Thread::Modify_senders::add (
    l4_umword_t match_mask,
    l4_umword_t match,
    l4_umword_t del_bits,
    l4_umword_t add_bits) [inline], [noexcept]
```

Add a rule.

#### Parameters

<i>match_mask</i>	Bitmask of bits to match the label.
<i>match</i>	Bitmask that must be equal to the label after applying match_mask.
<i>del_bits</i>	Bits to be deleted from the label.
<i>add_bits</i>	Bits to be added to the label.

#### Returns

0 on success, <0 on error

In pseudo code: if ((sender\_label & match\_mask) == match) { sender\_label = (sender\_label & ~del\_bits) | add\_bits; }

Only the first match is applied.

#### See also

Helper to check for protocol conflicts.

## 15.196.1 Detailed Description

C++ [L4](#) kernel thread group interface, see [Thread groups](#) for the C interface.

An [L4](#) thread group is a collection of threads used as indirection for IPC gate and IRQ objects such that these objects can have multiple receivers, from which the kernel selects one according to a policy.

The primary use case for thread groups are multi-threaded servers and CPU core local IRQ / IPC delivery.

A thread can be bound to at most one thread group. Before binding a thread to a thread group, the thread must be bound to a task. All threads bound to the same thread group must belong to the same task.

Definition at line 34 of file [thread\\_group](#).

## 15.196.2 Member Function Documentation

### 15.196.2.1 add()

```
l4\_msgtag\_t L4::Thread_group::add (
    Cap< Thread > thread,
    l4\_utcb\_t * utcb = l4\_utcb\(\)) [inline], [noexcept]
```

Add thread to a thread group.

#### Parameters

<i>thread</i>	<a href="#">Thread</a> to add to the thread group.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag containing one of the following return codes.

**Return values**

<i>L4_EOK</i>	No error occurred.
<i>-L4_EINVAL</i>	<code>thread</code> is not a thread object.
<i>-L4_EEXIST</i>	<code>thread</code> already bound to this thread group.
<i>-L4_EBUSY</i>	<code>thread</code> already bound to a different thread group.
<i>-L4_ENOENT</i>	<a href="#">Thread</a> group doesn't exist.

## 15.199.2 Constructor & Destructor Documentation

### 15.199.2.1 Demand()

```
L4::Type_info::Demand::Demand (
    unsigned char caps = 0,
    unsigned char flags = 0,
    unsigned char mem = 0,
    unsigned char ports = 0) [inline], [explicit], [noexcept]
```

Make [Demand](#) object.

#### Parameters

<i>caps</i>	number of capability receive buffers
<i>flags</i>	flags, such as the need for timeouts (TBD).
<i>mem</i>	number of memory receive windows.
<i>ports</i>	number of IO-port receive windows.

Definition at line 527 of file [\\_\\_typeinfo.h](#).

References [caps](#), [flags](#), [mem](#), and [ports](#).

Referenced by [operator|\(\)](#).

Here is the caller graph for this function:

## 15.199.3 Member Function Documentation

### 15.199.3.1 no\_demand()

```
bool L4::Type_info::Demand::no_demand () const [inline], [noexcept]
```

### Returns

true if there is no demand at all

Definition at line 532 of file [\\_\\_typeinfo.h](#).

References [caps](#), [flags](#), [mem](#), and [ports](#).

Referenced by [L4::lpc\\_svr::Br\\_manager\\_no\\_buffers::alloc\\_buffer\\_demand\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

## 15.200 L4::Type\_info::Demand\_t< CAPS, FLAGS, MEM, PORTS > Struct Template Reference

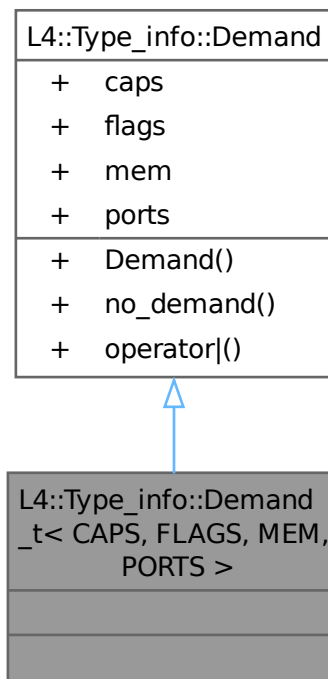

Template type statically describing demand of receive buffers.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Type\_info::Demand\_t< CAPS, FLAGS, MEM, PORTS >:

Collaboration diagram for L4::Type\_info::Demand\_t< CAPS, FLAGS, MEM, PORTS >:

### Public Types

- enum { `Caps` = CAPS , `Flags` = FLAGS , `Mem` = MEM , `Ports` = PORTS }

### Additional Inherited Members

### Public Member Functions inherited from L4::Type\_info::Demand

- `Demand` (unsigned char `caps`=0, unsigned char `flags`=0, unsigned char `mem`=0, unsigned char `ports`=0) noexcept  
*Make `Demand` object.*
- bool `no_demand` () const noexcept
- `Demand operator|` (`Demand` const &rhs) const noexcept  
*get the combined demand of this and rhs*

### Data Fields inherited from L4::Type\_info::Demand

- unsigned char **caps**  
*number of capability receive buffers.*
- unsigned char **flags**  
*flags, such as the need for timeouts (TBD).*
- unsigned char **mem**  
*number of memory receive buffers.*
- unsigned char **ports**  
*number of IO-port receive buffers.*

### 15.200.1 Detailed Description

```
template<unsigned char CAPS = 0, unsigned char FLAGS = 0, unsigned char MEM = 0, unsigned char
PORTS = 0>
struct L4::Type_info::Demand_t< CAPS, FLAGS, MEM, PORTS >
```

Template type statically describing demand of receive buffers.

#### Template Parameters

<i>CAPS</i>	number of capability receive buffers needed.
<i>FLAGS</i>	flags, such as the need for timeouts (TBD).
<i>MEM</i>	number of memory receive windows needed.
<i>PORTS</i>	number of IO-port receive windwows needed.

Definition at line 553 of file [\\_\\_typeinfo.h](#).

### 15.200.2 Member Enumeration Documentation

#### 15.200.2.1 anonymous enum

```
template<unsigned char CAPS = 0, unsigned char FLAGS = 0, unsigned char MEM = 0, unsigned char
PORTS = 0>
anonymous enum
```

#### Enumerator

Caps	number of capability receive buffers.
Flags	flags, such as the need for timeouts.
Mem	number of memory receive windows.
Ports	number of IO-port receive windows.

Definition at line 555 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

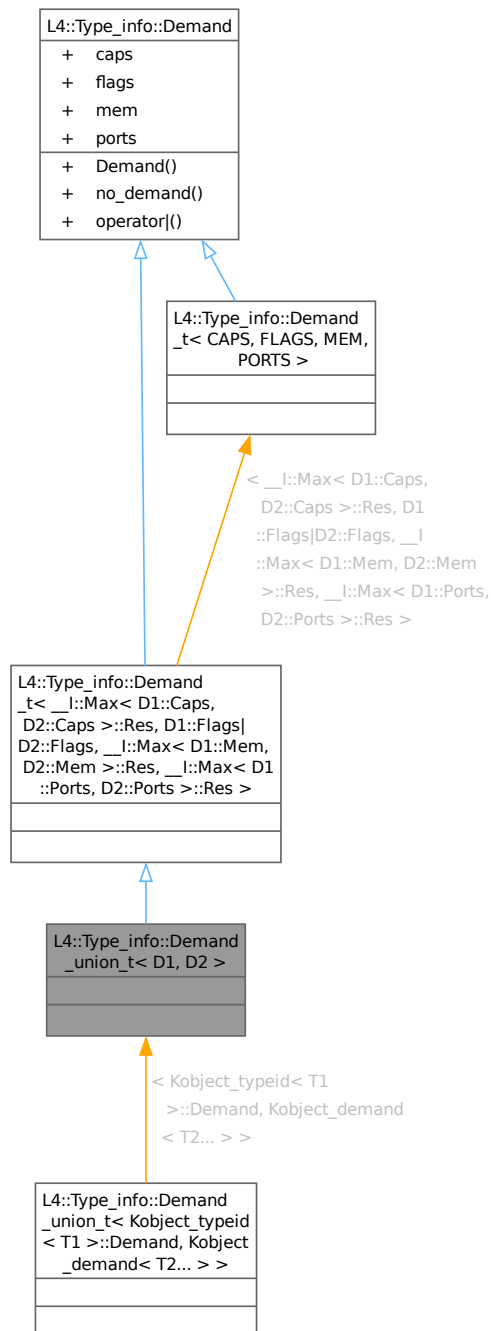

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.201 L4::Type\_info::Demand\_union\_t< D1, D2 > Struct Template Reference

Template type statically describing the combination of two [Demand](#) object.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Type\_info::Demand\_union\_t< D1, D2 >:

Collaboration diagram for L4::Type\_info::Demand\_union\_t< D1, D2 >:

## Additional Inherited Members

### Public Types inherited from

[L4::Type\\_info::Demand\\_t](#)< [\\_\\_l::Max](#)< [D1::Caps](#), [D2::Caps](#) >::Res, [D1::Flags](#)|[D2::Flags](#), [\\_\\_l::Max](#)< [D1::](#)

*number of IO-port receive buffers.*

## 15.201.1 Detailed Description

```
template<typename D1, typename D2>
struct L4::Type_info::Demand_union_t< D1, D2 >
```

Template type statically describing the combination of two [Demand](#) object.

### Template Parameters

<i>D1</i>	first demand object.
<i>D2</i>	second demand object.

Definition at line [573](#) of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.202 L4::Typeid::Detail::\_Rpc< OPCODE, O, X > Struct Template Reference

Empty list of RPCs.

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, X >:

Collaboration diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, X >:

### 15.202.1 Detailed Description

```
template<typename OPCODE, unsigned O, typename ... X>
struct L4::Typeid::Detail::_Rpc< OPCODE, O, X >
```

Empty list of RPCs.

Definition at line 365 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.203 L4::Typeid::Detail::\_Rpc< OPCODE, O, Default\_op< R > >::Rpc< Y > Struct Template Reference

Find the given RPC in the list.

```
#include <__typeinfo.h>
```

Collaboration diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, Default\_op< R > >::Rpc< Y >:

### 15.203.1 Detailed Description

```
template<typename OPCODE, unsigned O, typename R>
template<typename Y>
struct L4::Typeid::Detail::_Rpc< OPCODE, O, Default_op< R > >::Rpc< Y >
```

Find the given RPC in the list.

Definition at line 399 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

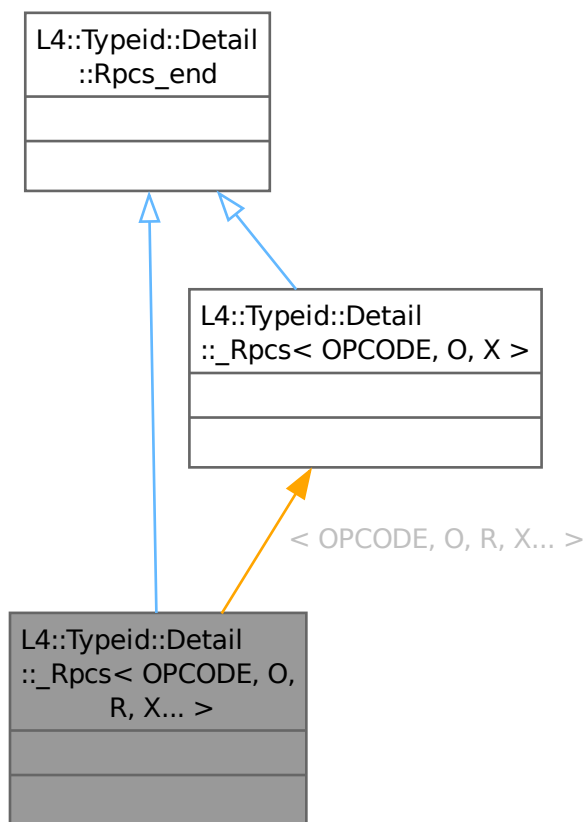

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.204 L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... > Struct Template Reference

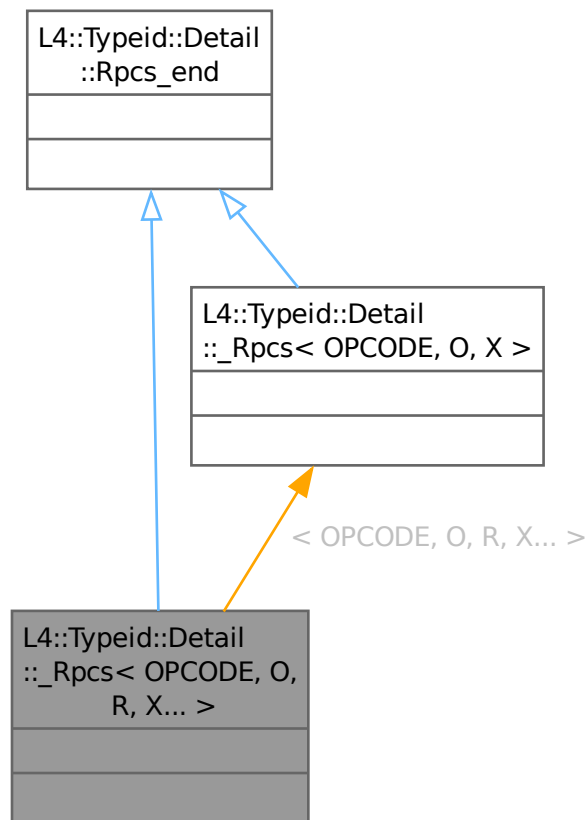

Non-empty list of RPCs.

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... >:

Collaboration diagram for L4::Typeid::Detail::\_Rpccs< OPCODE, O, R, X... >:

## Data Structures

- struct [Rpc](#)

*Find the given RPC in the list.*

## Public Types

- enum  
*The opcode value to use for this RPC, may be bogus if the [opcode\\_type](#) is void.*
- typedef [\\_Rpccs](#) **type**  
*The list element itself.*
- typedef OPCODE **opcode\_type**  
*The data type for the opcode.*
- typedef R **rpc**  
*The RPC type L4::lpc::Msg::Rpc\_call or L4::lpc::Msg::Rpc\_inline\_call.*
- typedef [\\_Rpccs](#)< OPCODE, \_Get\_opcode< R, O >::value+1, X... >::type **next**  
*The next RPC in the list or [Rpccs\\_end](#) if this is the last.*

### 15.204.1 Detailed Description

```
template<typename OPCODE, unsigned O, typename R, typename ... X>
struct L4::Typeid::Detail::_Rpc< OPCODE, O, R, X... >
```

Non-empty list of RPCs.

Definition at line 369 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.205 L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... >::Rpc< Y > Struct Template Reference

Find the given RPC in the list.

```
#include <__typeinfo.h>
```

Collaboration diagram for L4::Typeid::Detail::\_Rpc< OPCODE, O, R, X... >::Rpc< Y >:

### 15.205.1 Detailed Description

```
template<typename OPCODE, unsigned O, typename R, typename ... X>
template<typename Y>
struct L4::Typeid::Detail::_Rpc< OPCODE, O, R, X... >::Rpc< Y >
```

Find the given RPC in the list.

Definition at line 382 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.206 L4::Typeid::Detail::Rpccs\_end Struct Reference

Internal end-of-list marker.

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Typeid::Detail::Rpccs\_end:

Collaboration diagram for L4::Typeid::Detail::Rpccs\_end:

### 15.206.1 Detailed Description

Internal end-of-list marker.

Definition at line 317 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.207 L4::Typeid::P\_dispatch< LIST > Struct Template Reference

Use for protocol based dispatch stage.

```
#include <__typeinfo.h>
```

Collaboration diagram for L4::Typeid::P\_dispatch< LIST >:

### 15.207.1 Detailed Description

```
template<typename LIST>
struct L4::Typeid::P_dispatch< LIST >
```

Use for protocol based dispatch stage.

Definition at line 308 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

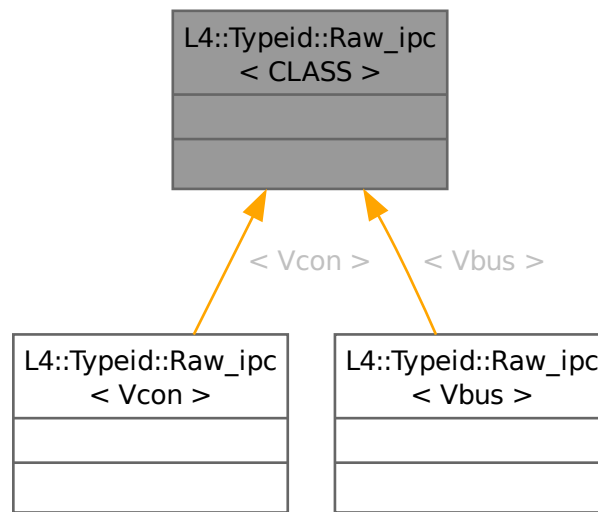

- l4/sys/[\\_\\_typeinfo.h](#)

## 15.208 L4::Typeid::Raw\_ipc< CLASS > Struct Template Reference

RPCs list for passing raw incoming IPC to the server object.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Raw\_ipc< CLASS >:

Collaboration diagram for L4::Typeid::Raw\_ipc< CLASS >:

### 15.208.1 Detailed Description

```
template<typename CLASS>
struct L4::Typeid::Raw_ipc< CLASS >
```

RPCs list for passing raw incoming IPC to the server object.

#### Template Parameters

<b>CLASS</b>	The type of the interface (e.g., <a href="#">L4::lcu</a> )
--------------	--

This template allows to have fully handcrafted IPC protocols.

Definition at line 412 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

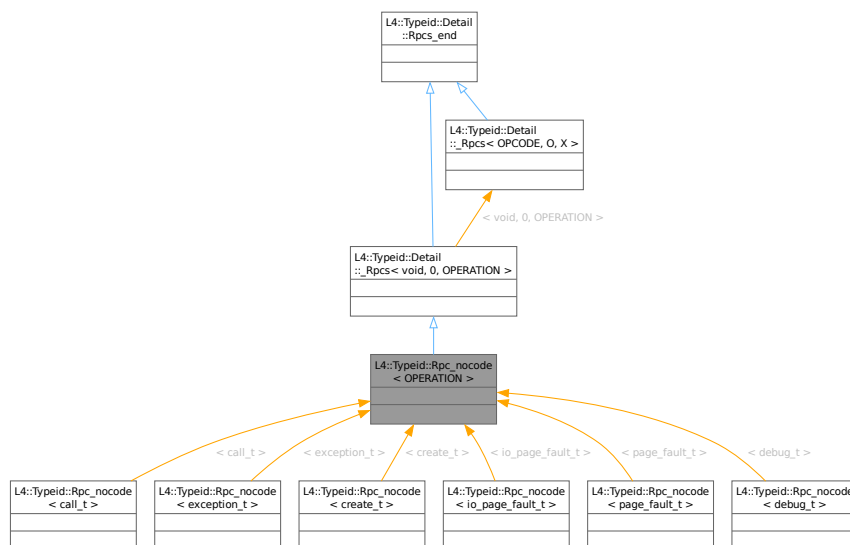

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.209 L4::Typeid::Rpc\_nocode< OPERATION > Struct Template Reference

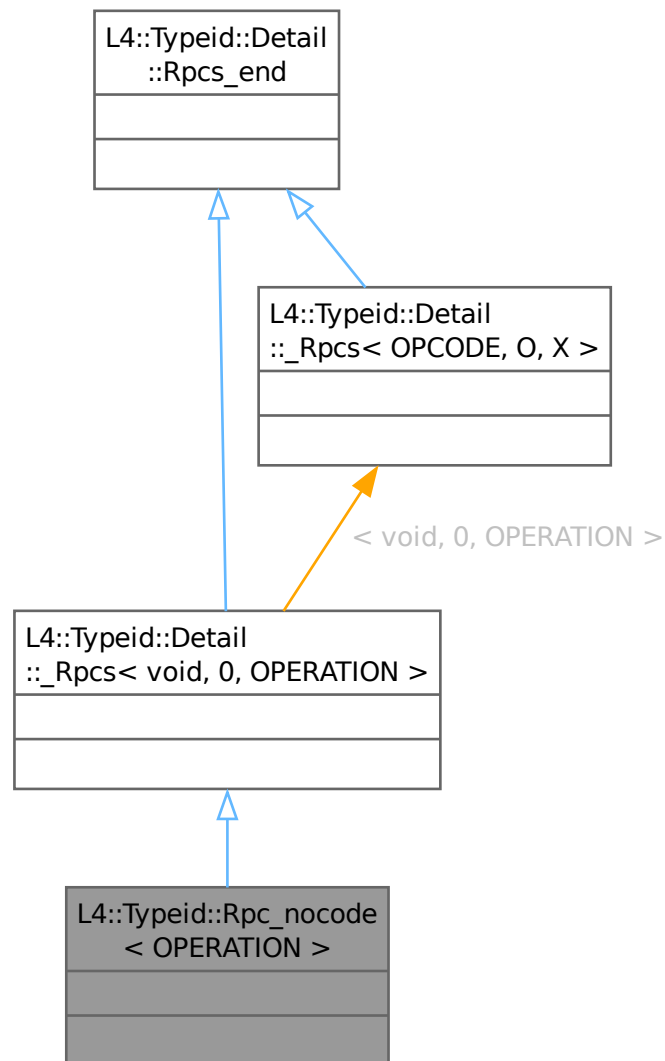

List of RPCs of an interface using a single operation without an opcode.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpc\_nocode< OPERATION >:

Collaboration diagram for L4::Typeid::Rpc\_nocode< OPERATION >:

### 15.209.1 Detailed Description

```
template<typename OPERATION>
struct L4::Typeid::Rpc_nocode< OPERATION >
```

List of RPCs of an interface using a single operation without an opcode.

#### Template Parameters

<i>OPERATION</i>	The RPC operation as defined by L4_RPC etc.
------------------	---

Definition at line 454 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.210 L4::Typeid::Rpc< RPCS > Struct Template Reference

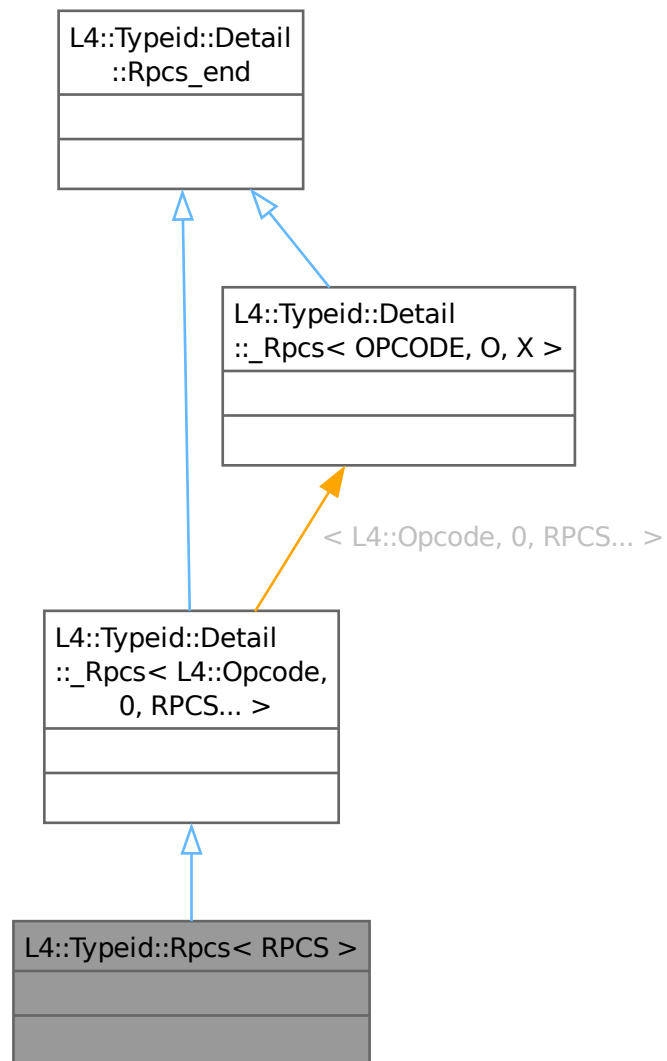

Standard list of RPCs of an interface.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpc< RPCS >:

Collaboration diagram for L4::Typeid::Rpc< RPCS >:

### 15.210.1 Detailed Description

```
template<typename ... RPCS>
struct L4::Typeid::Rpc< RPCS >
```

Standard list of RPCs of an interface.

#### Template Parameters

<i>RPCS</i>	list of RPC types as defined by L4_RPC etc.
-------------	---

This is the default list for RPC functions of an interface, it uses [L4::Opcode](#) as opcode type and uses opcodes starting from 0.

#### Examples

[examples/clntsrv/src/shared.h](#).

Definition at line 428 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

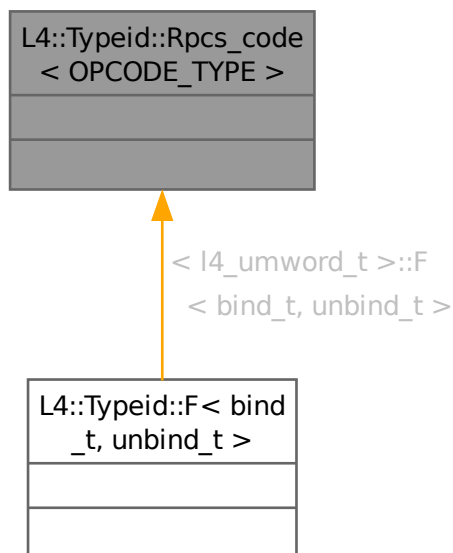

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.211 L4::Typeid::Rpc\_code< OPCODE\_TYPE > Struct Template Reference

List of RPCs of an interface using a special opcode type.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpc\_code< OPCODE\_TYPE >:

Collaboration diagram for L4::Typeid::Rpc\_code< OPCODE\_TYPE >:

## Data Structures

- struct [F](#)

### 15.211.1 Detailed Description

```
template<typename OPCODE_TYPE>
struct L4::Typeid::Rpc_code< OPCODE_TYPE >
```

List of RPCs of an interface using a special opcode type.

#### Template Parameters

<i>OPCODE_TYPE</i>	The data type of the opcode.
--------------------	------------------------------

List for RPC functions of an interface, using OPCODE\_TYPE as data type for the opcode, opcodes starting from 0.

Definition at line [439](#) of file [\\_\\_typeinfo.h](#).

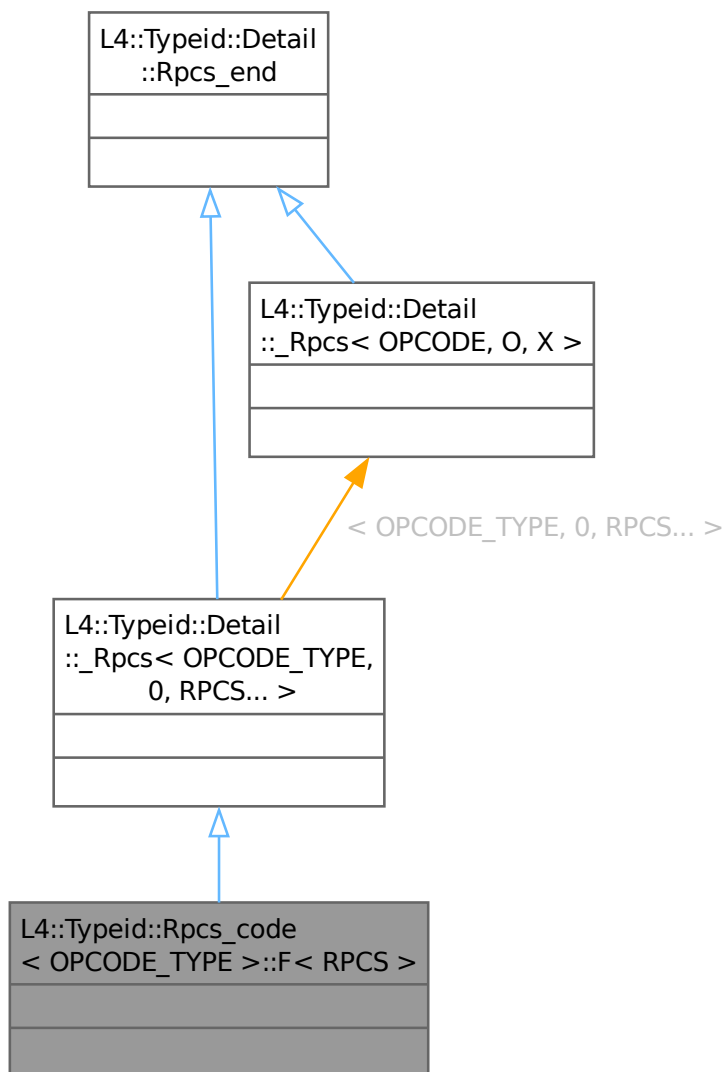

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

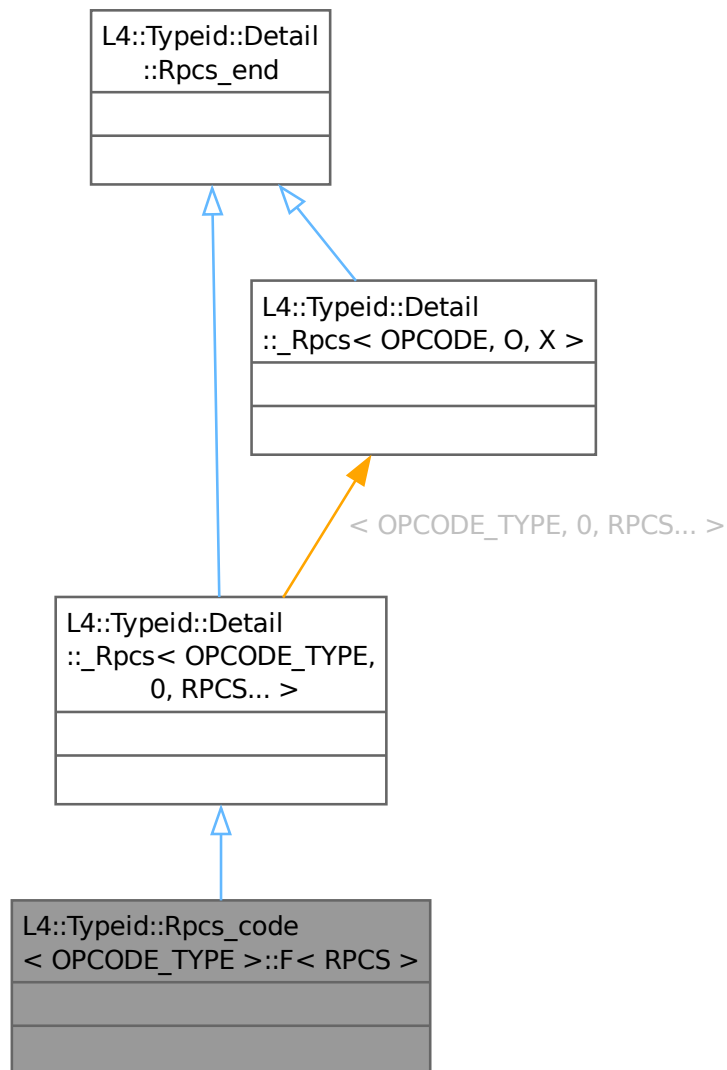

## 15.212 L4::Typeid::Rpc\_code< OPCODE\_TYPE >::F< RPCS > Struct Template Reference

```
#include <__typeinfo.h>
```

Inheritance diagram for L4::Typeid::Rpc\_code< OPCODE\_TYPE >::F< RPCS >:

Collaboration diagram for L4::Typeid::Rpc\_code< OPCODE\_TYPE >::F< RPCS >:

### 15.212.1 Detailed Description

```

template<typename OPCODE_TYPE>
template<typename ... RPCS>
struct L4::Typeid::Rpc_code< OPCODE_TYPE >::F< RPCS >

```

#### Template Parameters

<i>RPCS</i>	list of RPC types as defined by L4_RPC etc.
-------------	---

Definition at line 445 of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.213 L4::Typeid::Rpcsys< ARG > Struct Template Reference

List of RPCs typically used for kernel interfaces.

```
#include <l4/sys/capability>
```

Inheritance diagram for L4::Typeid::Rpcsys< ARG >:

Collaboration diagram for L4::Typeid::Rpcsys< ARG >:

### 15.213.1 Detailed Description

```
template<typename ... ARG>
struct L4::Typeid::Rpcsys< ARG >
```

List of RPCs typically used for kernel interfaces.

#### Template Parameters

<i>RPCS</i>	list of RPC types as defined by L4_RPC etc.
-------------	---

This list of RPC functions uses [l4\\_umword\\_t](#) as type for the opcode as most kernel protocol do.

Definition at line [465](#) of file [\\_\\_typeinfo.h](#).

The documentation for this struct was generated from the following file:

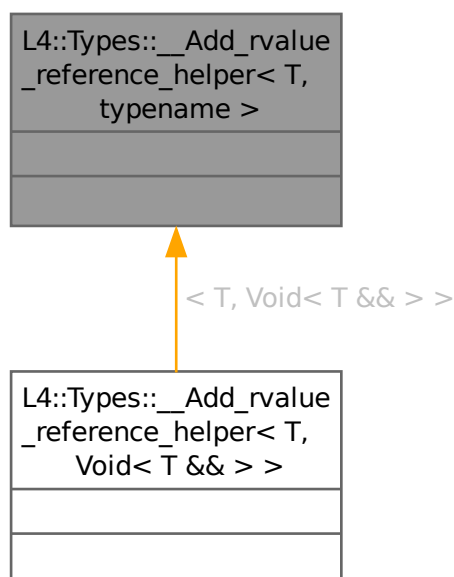

- [l4/sys/\\_\\_typeinfo.h](#)

## 15.214 L4::Types::\_\_Add\_rvalue\_reference\_helper< T, typename > Struct Template Reference

Helper template for [Add\\_rvalue\\_reference](#).

```
#include <types>
```

Inheritance diagram for L4::Types::\_\_Add\_rvalue\_reference\_helper< T, typename >:

Collaboration diagram for L4::Types::\_\_Add\_rvalue\_reference\_helper< T, typename >:

### 15.214.1 Detailed Description

```
template<typename T, typename = void>
struct L4::Types::__Add_rvalue_reference_helper< T, typename >
```

Helper template for [Add\\_rvalue\\_reference](#).

Definition at line 280 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

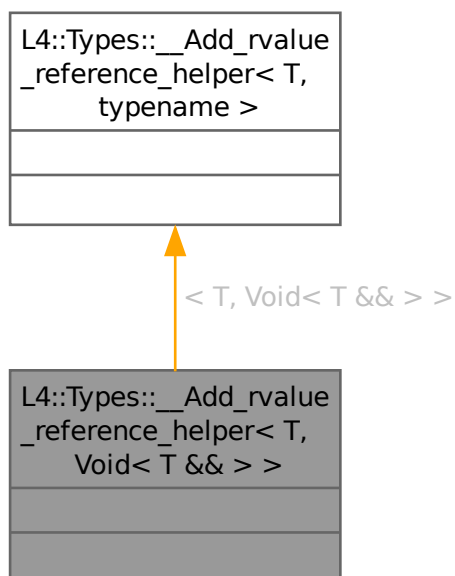

## 15.215 L4::Types::\_\_Add\_rvalue\_reference\_helper< T, Void< T && > > Struct Template Reference

Helper template for [Add\\_rvalue\\_reference](#).

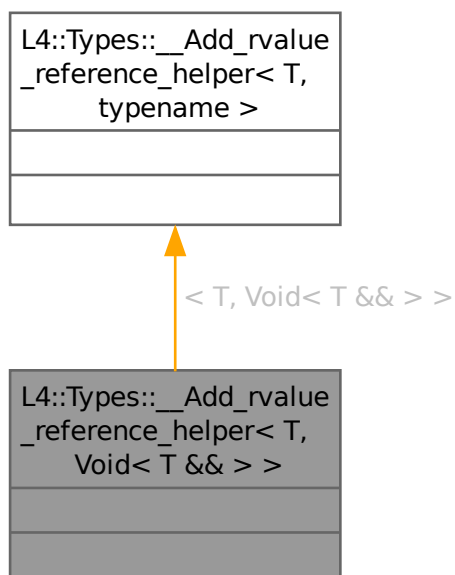

```
#include <types>
```

Inheritance diagram for L4::Types::\_\_Add\_rvalue\_reference\_helper< T, Void< T && > >:

Collaboration diagram for L4::Types::\_\_Add\_rvalue\_reference\_helper< T, Void< T && > >:

### 15.215.1 Detailed Description

```
template<typename T>
struct L4::Types::__Add_rvalue_reference_helper< T, Void< T && > >
```

Helper template for [Add\\_rvalue\\_reference](#).

Definition at line 284 of file [types](#).

The documentation for this struct was generated from the following file:

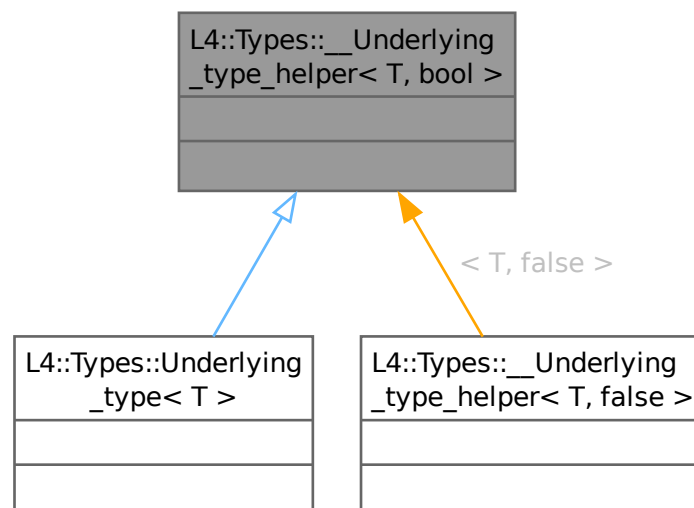

- [l4/sys/cxx/types](#)

### 15.216 L4::Types::\_\_Underlying\_type\_helper< T, bool > Struct Template Reference

Helper template for [Underlying\\_type](#).

```
#include <types>
```

Inheritance diagram for L4::Types::\_\_Underlying\_type\_helper< T, bool >:

Collaboration diagram for L4::Types::\_\_Underlying\_type\_helper< T, bool >:

### 15.216.1 Detailed Description

```
template<typename T, bool = Is_enum<T>::value>
struct L4::Types::__Underlying_type_helper< T, bool >
```

Helper template for [Underlying\\_type](#).

#### Note

The implementation relies on the intrinsic `__underlying_type()` compiler type trait that is provided by the mainstream C++ compilers. There is no fully portable and future-proof way of implementing this template (the only fragile and unmaintainable possibility is to evaluate all possible underlying types).

#### Template Parameters

<i>T</i>	Enumeration type to get the underlying type of.
----------	---

Definition at line 359 of file [types](#).

The documentation for this struct was generated from the following file:

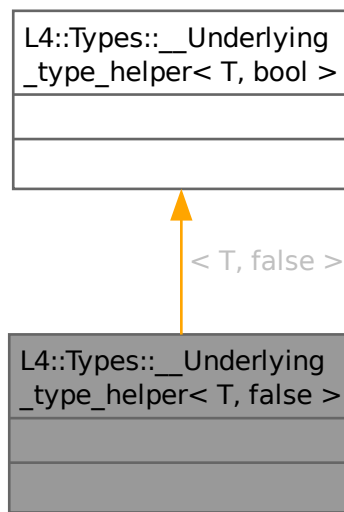

- [l4/sys/cxx/types](#)

## 15.217 L4::Types::\_\_Underlying\_type\_helper< T, false > Struct Template Reference

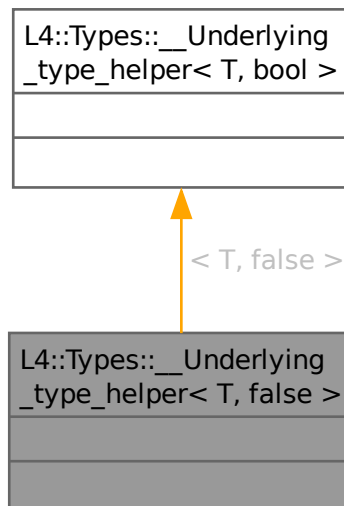

Helper template for [Underlying\\_type](#).

```
#include <types>
```

Inheritance diagram for L4::Types::\_\_Underlying\_type\_helper< T, false >:

Collaboration diagram for L4::Types::\_\_Underlying\_type\_helper< T, false >:

### 15.217.1 Detailed Description

```
template<typename T>
struct L4::Types::__Underlying_type_helper< T, false >
```

Helper template for [Underlying\\_type](#).

Definition at line 362 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.218 L4::Types::Add\_rvalue\_reference< T > Struct Template Reference

Create an rvalue reference of the given type.

```
#include <types>
```

Collaboration diagram for L4::Types::Add\_rvalue\_reference< T >:

L4::Types::Add_rvalue _reference< T >

### 15.218.1 Detailed Description

```
template<typename T>
struct L4::Types::Add_rvalue_reference< T >
```

Create an rvalue reference of the given type.

Definition at line 288 of file [types](#).

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

**Template Parameters**

V	The boolean value
---	-------------------

Definition at line [309](#) of file [types](#).

The documentation for this struct was generated from the following file:

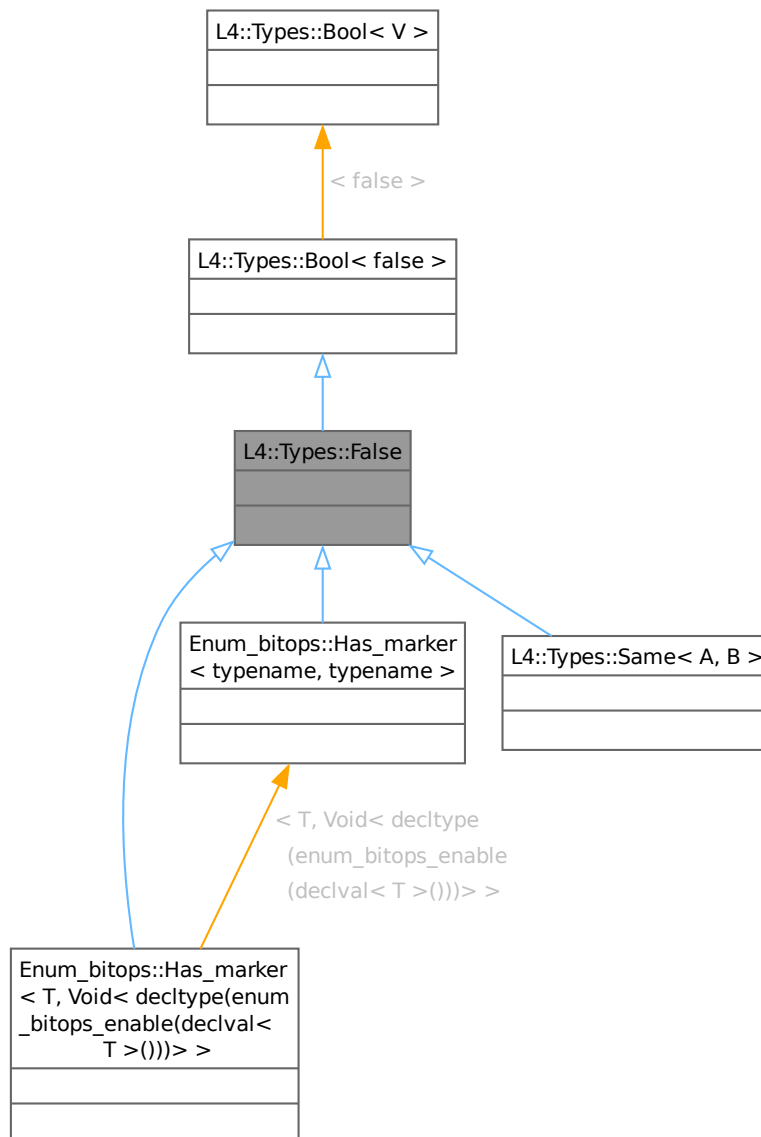

- [l4/sys/cxx/types](#)

## 15.220 L4::Types::False Struct Reference

[False](#) meta value.

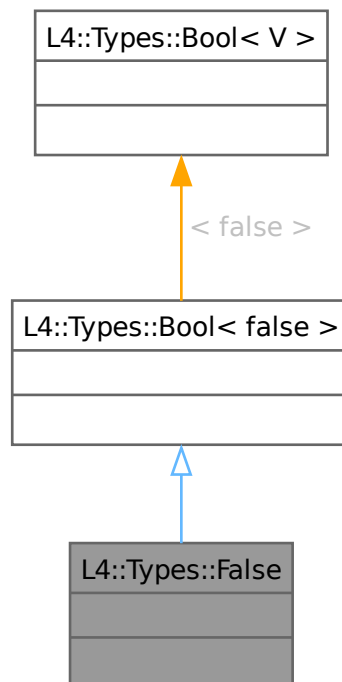

```
#include <types>
```

Inheritance diagram for L4::Types::False:

Collaboration diagram for L4::Types::False:

#### Additional Inherited Members

#### Public Types inherited from `L4::Types::Bool< false >`

- typedef `Bool< V >` **type**  
*The meta type itself.*

### 15.220.1 Detailed Description

`False` meta value.

Definition at line 317 of file `types`.

The documentation for this struct was generated from the following file:

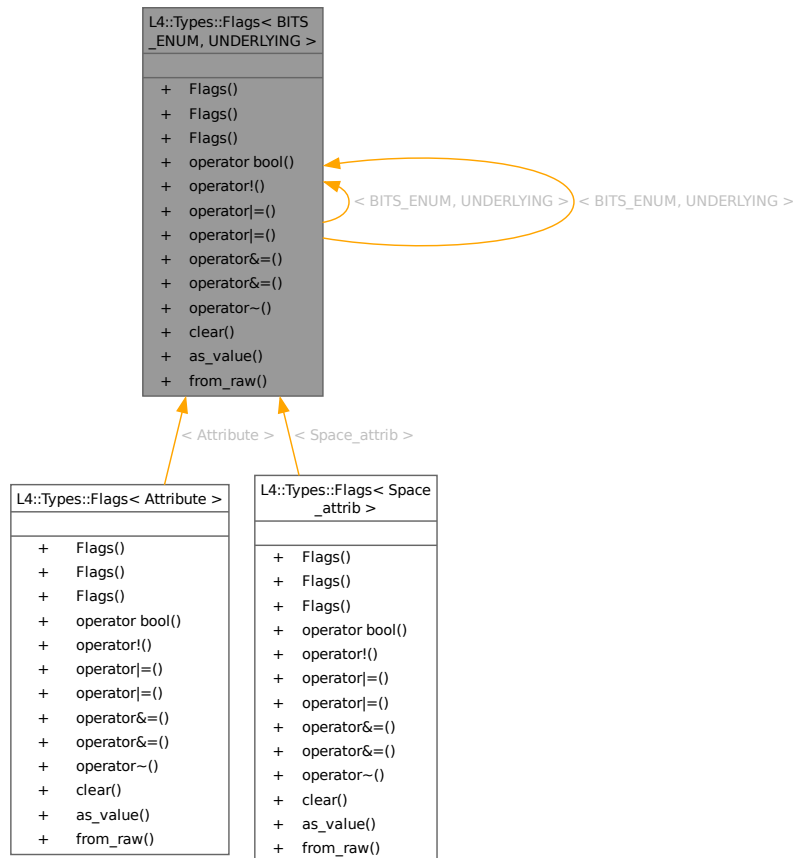

- `l4/sys/cxx/types`

## 15.221 L4::Types::Flags< BITS\_ENUM, UNDERLYING > Class Template Reference

Template for defining typical [Flags](#) bitmaps.

```
#include <types>
```

Inheritance diagram for L4::Types::Flags< BITS\_ENUM, UNDERLYING >:

Collaboration diagram for L4::Types::Flags< BITS\_ENUM, UNDERLYING >:

L4::Types::Flags< BITS_ENUM, UNDERLYING >
<ul style="list-style-type: none"> <li>+ Flags()</li> <li>+ Flags()</li> <li>+ Flags()</li> <li>+ operator bool()</li> <li>+ operator!()</li> <li>+ operator =()</li> <li>+ operator =()</li> <li>+ operator&amp;=()</li> <li>+ operator&amp;=()</li> <li>+ operator~()</li> <li>+ clear()</li> <li>+ as_value()</li> <li>+ from_raw()</li> </ul>

## Public Types

- enum [None\\_type](#) { [None](#) }  
*The none type to get an empty bitmap.*
- typedef UNDERLYING **value\_type**  
*type of the underlying value*
- typedef BITS\_ENUM **bits\_enum\_type**  
*enum type defining a name for each bit*
- typedef Flags< BITS\_ENUM, UNDERLYING > **type**  
*the Flags<> type itself*

## Public Member Functions

- constexpr [Flags](#) ([None\\_type](#))  
*Make an empty bitmap.*
- constexpr **Flags** ()  
*Make default [Flags](#).*
- constexpr [Flags](#) (BITS\_ENUM e)  
*Make flags from bit name.*
- constexpr **operator bool** () const  
*Support for `if (flags)` syntax (test for non-empty flags).*

- constexpr bool **operator!** () const  
*Support for `if (!flags)` syntax (test for empty flags).*
- constexpr **type** & **operator|** = (type rhs)  
*Support `|` of two compatible [Flags](#) types.*
- constexpr **type** & **operator|** = (bits\_enum\_type rhs)  
*Support `|` of [Flags](#) type and bit name.*
- constexpr **type** & **operator&=** (type rhs)  
*Support `&=` of two compatible [Flags](#) types.*
- constexpr **type** & **operator&=** (bits\_enum\_type rhs)  
*Support `&=` of [Flags](#) type and bit name.*
- constexpr **type** **operator~** () const  
*Support `~` for [Flags](#) types.*
- constexpr **type** & **clear** (bits\_enum\_type flag)  
*Clear the given flag.*
- constexpr **value\_type** **as\_value** () const  
*Get the underlying value.*

### Static Public Member Functions

- static constexpr **type from\_raw** (value\_type v)  
*Make flags from a raw value of [value\\_type](#).*

### Friends

- constexpr **type operator|** (type lhs, type rhs)  
*Support `|` of two compatible [Flags](#) types.*
- constexpr **type operator|** (type lhs, bits\_enum\_type rhs)  
*Support `|` of [Flags](#) type and bit name.*
- constexpr **type operator&** (type lhs, type rhs)  
*Support `&` of two compatible [Flags](#) types.*
- constexpr **type operator&** (type lhs, bits\_enum\_type rhs)  
*Support `&` of [Flags](#) type and bit name.*

## 15.221.1 Detailed Description

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
class L4::Types::Flags< BITS_ENUM, UNDERLYING >
```

Template for defining typical [Flags](#) bitmaps.

### Template Parameters

<i>BITS_ENUM</i>	enum type that defines a name for each bit in the bitmap. The values of the enum members must be the number of the bit ( <i>not</i> a mask).
<i>UNDERLYING</i>	The underlying data type used to represent the bitmap.

The resulting data type provides a type-safe version that allows bitwise `and` and `or` operations with the `BITS_ENUM` members. As well as, test for `0` or `!0`.

Example:

```
enum Test_flag
{
    Do_weak_tests,
    Do_strong_tests
};

typedef L4::Types::Flags<Test_flag> Test_flags;

Test_flags x = Do_weak_tests;

if (x & Do_strong_tests) { ... }
x |= Do_strong_tests;
if (x & Do_strong_tests) { ... }
```

Definition at line 52 of file [types](#).

## 15.221.2 Member Enumeration Documentation

### 15.221.2.1 None\_type

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
enum L4::Types::Flags::None_type
```

The none type to get an empty bitmap.

#### Enumerator

None	Use this to get an empty bitmap.
------	----------------------------------

Definition at line 68 of file [types](#).

## 15.221.3 Constructor & Destructor Documentation

### 15.221.3.1 Flags() [1/2]

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
L4::Types::Flags< BITS_ENUM, UNDERLYING >::Flags (
    None_type ) [inline], [constexpr]
```

Make an empty bitmap.

Usually used for implicit conversion from [Flags::None](#).

```
Flags x = Flags::None;
```

Definition at line 78 of file [types](#).

### 15.221.3.2 Flags() [2/2]

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
L4::Types::Flags< BITS_ENUM, UNDERLYING >::Flags (
    BITS_ENUM e) [inline], [constexpr]
```

Make flags from bit name.

Usually used for implicit conversion for a bit name.

```
Test_flags f = Do_strong_tests;
```

Definition at line 91 of file [types](#).

## 15.221.4 Member Function Documentation

### 15.221.4.1 clear()

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
type & L4::Types::Flags< BITS_ENUM, UNDERLYING >::clear (
    bits_enum_type flag) [inline], [constexpr]
```

Clear the given flag.

#### Parameters

<i>flag</i>	The flag that shall be cleared.
-------------	---------------------------------

`flags.clear(The_flag)` is a shortcut for `flags &= ~Flags(The_flag)`.

Definition at line 146 of file [types](#).

### 15.221.4.2 from\_raw()

```
template<typename BITS_ENUM, typename UNDERLYING = unsigned long>
constexpr type L4::Types::Flags< BITS_ENUM, UNDERLYING >::from_raw (
    value_type v) [inline], [static], [constexpr]
```

Make flags from a raw value of [value\\_type](#).

This function may be used for example in C wrapper code.

Definition at line 98 of file [types](#).

The documentation for this class was generated from the following file:

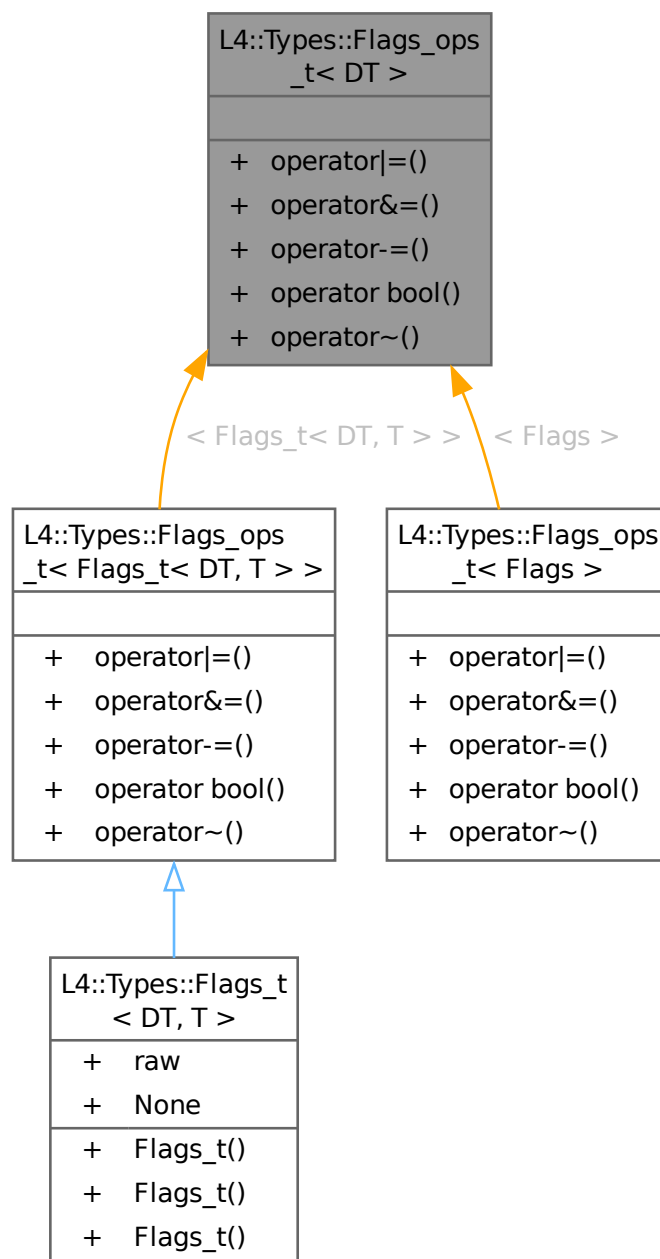

- [l4/sys/cxx/types](#)

## 15.222 L4::Types::Flags\_ops\_t< DT > Struct Template Reference

Mixin class to define a set of friend bitwise operators on `DT`.

```
#include <types>
```

Inheritance diagram for L4::Types::Flags\_ops\_t< DT >:

*inequality for DT*

### 15.222.1 Detailed Description

```
template<typename DT>
struct L4::Types::Flags_ops_t< DT >
```

Mixin class to define a set of friend bitwise operators on `DT`.

#### Template Parameters

<i>DT</i>	The type usually inheriting from <a href="#">Flags_ops_t</a> with a member <i>raw</i> of enum or integral type.
-----------	---

Definition at line 200 of file [types](#).

The documentation for this struct was generated from the following file:

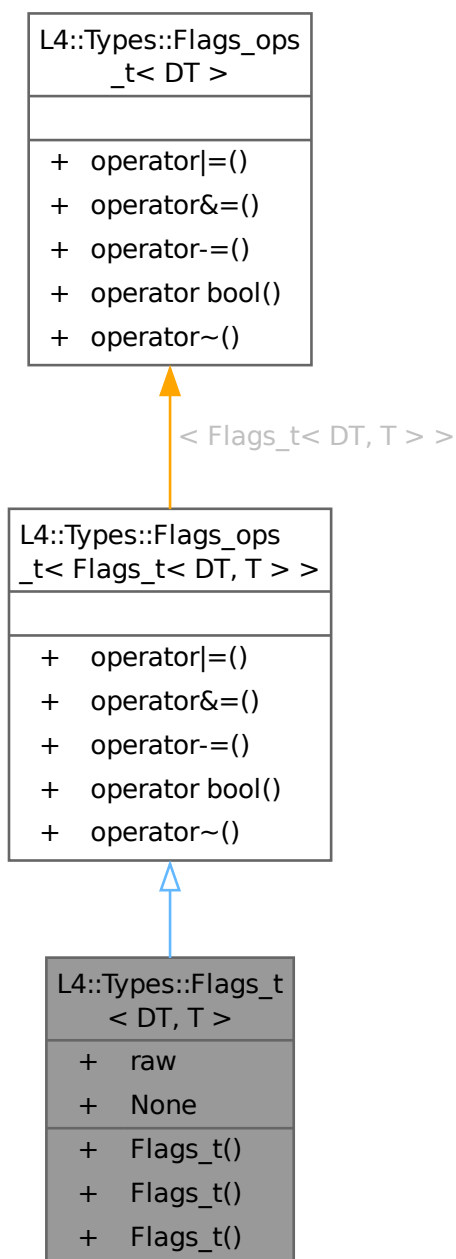

- [l4/sys/cxx/types](#)

## 15.223 L4::Types::Flags\_t< DT, T > Struct Template Reference

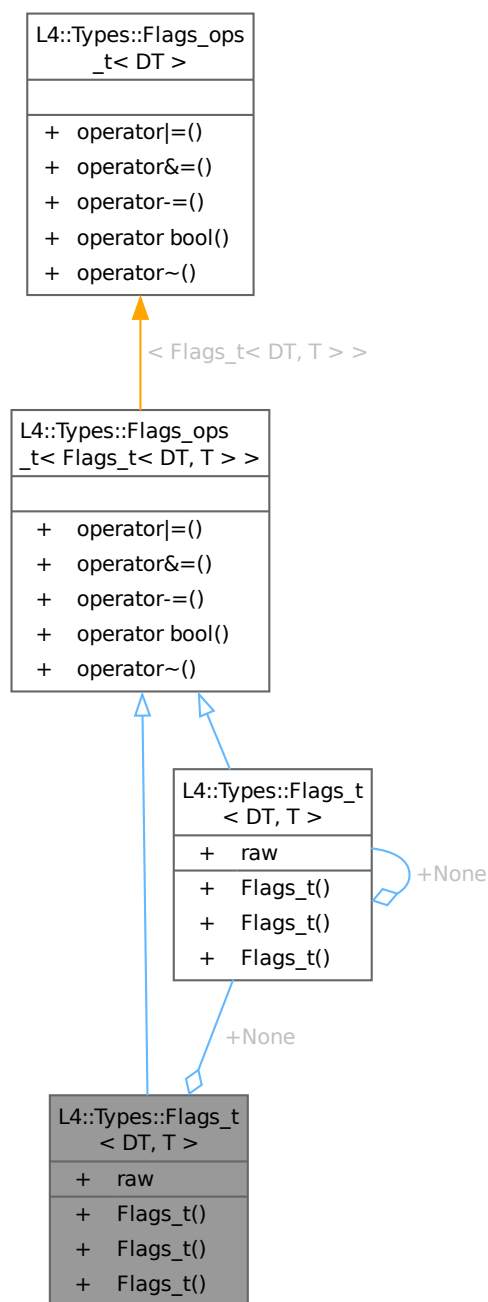

Template type to define a flags type with bitwise operations.

```
#include <types>
```

- constexpr **Flags\_t** (DT f)  
*Initialization from determinator type.*
- constexpr **Flags\_t** (T f)  
*Explicit initialization from the underlying type.*

## Public Member Functions inherited from [L4::Types::Flags\\_ops\\_t< Flags\\_t< DT, T > >](#)

- constexpr DT & **operator**|= (DT const r)  
*bitwise or assignment for DT*
- constexpr DT & **operator**&= (DT const r)  
*bitwise and assignment for DT*
- constexpr DT & **operator**-= (DT const r)  
*Bitwise difference (clear bits) assignment for DT.*
- constexpr **operator** bool () const  
*explicit conversion to bool for tests*
- constexpr DT **operator**~ () const  
*bitwise negation for DT*

## Data Fields

- T **raw** = 0  
*Raw integral value.*

## Static Public Attributes

- static constexpr [Flags\\_t](#) **None** = [Flags\\_t](#)()  
*Empty flags literal.*

## 15.223.1 Detailed Description

```
template<typename DT, typename T>
struct L4::Types::Flags_t< DT, T >
```

Template type to define a flags type with bitwise operations.

### Template Parameters

<i>DT</i>	determinator type to make the resulting type unique (unused).
<i>T</i>	underlying type used to store the bits, usually an integral type.

Definition at line [261](#) of file [types](#).

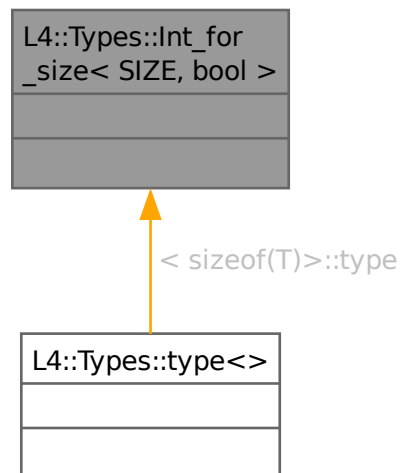

The documentation for this struct was generated from the following file:

- [l4/sys/cxx/types](#)

## 15.224 L4::Types::Int\_for\_size< SIZE, bool > Struct Template Reference

Metafunction to get an unsigned integral type for the given size.

Inheritance diagram for L4::Types::Int\_for\_size< SIZE, bool >:

Collaboration diagram for L4::Types::Int\_for\_size< SIZE, bool >:

### 15.224.1 Detailed Description

```
template<unsigned SIZE, bool = true>
struct L4::Types::Int_for_size< SIZE, bool >
```

Metafunction to get an unsigned integral type for the given size.

**Template Parameters**

<i>SIZE</i>	The size of the integer in bytes.
-------------	-----------------------------------

Definition at line 158 of file [types](#).
