    l4_cap_idx_t cap,
    l4_umword_t id,
    char const * reason)
```

Acquire an inhibitor lock.

Parameters

| | |
|---------------|--|
| <i>cap</i> | Capability for the Inhibitor object (see L4Re::Inhibitor) |
| <i>id</i> | ID of the inhibitor lock that shall be acquired. |
| <i>reason</i> | Reason why the inhibitor lock is acquired. (Used for informing the user or debugging.) |

Returns

```

Get information for the next available inhibitor lock.

Parameters

| | |
|-------------------|---|
| <i>cap</i> | Capability to the Inhibitor object (see L4Re::Inhibitor) |
| <i>name</i> | A pointer to a buffer for the name of the lock. |
| <i>len</i> | The length of the available buffer (usually L4Re::Inhibitor::Name_max is used). |
| <i>current_id</i> | The ID of the last available lock, use -1 to get the first lock. |

Return values

| | |
|-------------------|---|
| <i>>0</i> | The ID of the next available lock if there is one (in this case name shall contain the name of the inhibitor lock). |
| <i>-L4_ENODEV</i> | if there are no more locks. |
| <i><0</i> | Any other negative failure value. |

16.309.1 Detailed Description

Kumem allocator utility C interface.

Definition in file [kumem_alloc.h](#).

16.309.2 Function Documentation

16.309.2.1 l4re_util_kumem_alloc()

```
L4_BEGIN_DECLS int l4re_util_kumem_alloc (
    l4_addr_t * mem,
    unsigned pages_order,
    l4_cap_idx_t task,
    l4_cap_idx_t rm)
```

Allocate state area.

Parameters

| | | |
|-----|--------------------|--|
| out | <i>mem</i> | Pointer to memory that has been allocated. |
| | <i>pages_order</i> | Size to allocate, in log2 pages. |
| | <i>task</i> | Task to use for allocation. |
| | <i>rm</i> | Region manager to use for allocation. |

Return values

| | |
|----|-----------------------|
| 0 | for success |
| <0 | error code on failure |

Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

16.428.1 Function Documentation

16.428.1.1 l4shmc_rb_attach_receiver()

```
void l4shmc_rb_attach_receiver (
    l4shmc_ringbuf_t * buf,
    l4_cap_idx_t owner)
```

Attach to receiver signal of a ring buffer.

Attach owner to the receiver-side signal of a ring buffer, which is triggered whenever new data has been produced.

This is split from initialization, because you may not know the owner cap when initializing the buffer.

Parameters

| | |
|------------|-------------------------------|
| <i>buf</i> | pointer to ring buffer struct |
|------------|-------------------------------|

| | |
|--------------|--------------|
| <i>owner</i> | owner thread |
|--------------|--------------|

References [L4_CV](#).

16.428.1.2 l4shmc_rb_attach_sender()

```
int l4shmc_rb_attach_sender (  
    l4shmc_ringbuf_t * buf,  
    char const * signal_name,  
    l4_cap_idx_t owner)
```

Attach to sender signal of a ring buffer.

Attach owner to the sender-side signal of a ring buffer, which is triggered whenever new space has been freed in the buffer for the sender to write to.

This is split from initialization, because you may not know the owner cap when initializing the buffer.

Parameters

| | |
|--------------------|-------------------------------|
| <i>buf</i> | pointer to ring buffer struct |
| <i>signal_name</i> | signal base name |
| <i>owner</i> | owner thread |

Returns

0 on success, error otherwise

References [L4_CV](#).

16.428.1.3 l4shmc_rb_deinit_buffer()

```
void l4shmc_rb_deinit_buffer (  
    l4shmc_ringbuf_t * buf)
```

De-init a ring buffer.

Parameters

| | |
|------------|-------------------------------|
| <i>buf</i> | pointer to ring buffer struct |
|------------|-------------------------------|

References [L4_CV](#).

16.428.1.4 l4shmc_rb_init_buffer()

    l4shmc_ringbuf_t * buf,
    l4shmc_area_t * area,
    char const * chunk_name,
    char const * signal_name,
    unsigned size)
```

Initialize a ring buffer by creating an SHMC chunk and the corresponding signals.

This needs to be done by one of the participating parties when setting up communication channel.

Precondition

area has been attached using [l4shmc_attach\(\)](#).

Parameters

| | |
|--------------------|--------------------------------------|
| <i>buf</i> | pointer to ring buffer struct |
| <i>area</i> | pointer to SHMC area |
| <i>chunk_name</i> | name of SHMC chunk to create in area |
| <i>signal_name</i> | base name for SHMC signals to create |
| <i>size</i> | chunk size |

Returns

0 on success, error otherwise

References [L4_CV](#).

16.428.1.5 l4shmc_rb_init_receiver()

```
int l4shmc_rb_init_receiver (
    l4shmc_ringbuf_t * buf,
    l4shmc_area_t * area,
    char const * chunk_name,
    char const * signal_name)
```

Initialize receive buffer.

Initialize the receiver-side of a ring buffer. This requires the underlying SHMC chunk and the corresponding signals to be valid already (read: to be initialized by the sender).

Precondition

chunk & signals have been created and initialized by the sender side

Parameters

| | |
|--------------------|--------------------------------------|
| <i>buf</i> | pointer to ring buffer struct |
| <i>area</i> | pointer to SHMC area |
| <i>chunk_name</i> | name of SHMC chunk to create in area |
| <i>signal_name</i> | base name for SHMC signals to create |

Returns

0 on success, error otherwise

References [L4_CV](#).

16.428.1.6 l4shmc_rb_receiver_copy_out()

```
int l4shmc_rb_receiver_copy_out (
    l4shmc_ringbuf_head_t * head,
    char * target,
    unsigned * tsize)
```

Copy data out of the buffer.

Parameters

| | | |
|----------------|---------------|--|
| | <i>head</i> | ring buffer head pointer |
| | <i>target</i> | valid target buffer |
| <i>in, out</i> | <i>tsize</i> | size of target buffer (must be \geq packet size!); contains the real data size |

Returns

0 on success, negative error otherwise

References [L4_CV](#).

16.428.1.7 l4shmc_rb_receiver_notify_done()

```
void l4shmc_rb_receiver_notify_done (
    l4shmc_ringbuf_t * buf)
```

Notify producer that space is available.

Parameters

| | |
|------------|-------------------------------|
| <i>buf</i> | pointer to ring buffer struct |

```
int l4shmc_rb_receiver_read_next_size (  
    l4shmc_ringbuf_head_t * head)
```

Have a look at the ring buffer and see which size the next packet to be read has.

Does not modify anything.

Returns

size of next buffer or -1 if no data available

References [L4_CV](#), and [L4_END_DECLS](#).

16.428.1.9 l4shmc_rb_receiver_wait_for_data()

```
int l4shmc_rb_receiver_wait_for_data (  
    l4shmc_ringbuf_t * buf,  
    int blocking)
```

Check if (and optionally block until) new data is ready.

Parameters

| | |
|-----------------|--|
| <i>buf</i> | pointer to ring buffer struct |
| <i>blocking</i> | block if data is not available immediately |

    l4shmc_ringbuf_head_t * head,
    unsigned psize)

Parameters

| | |
|--------------|--------------------------|
| <i>head</i> | ring buffer head pointer |
| <i>psize</i> | packet size |

| <i>data</i> | valid buffer |
| <i>size</i> | data size |
| <i>block_if_necessary</i> | bool: block if buffer currently full |

Parameters

| | |
|-------------|--|
| <i>pfc</i> | Capability of the SMC kernel object. The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters. |
| <i>func</i> | Function identifier. <ul style="list-style-type: none"> • Bit 31 has to be set: This marks the call as <i>Fast Call</i>. <i>Yielding Calls</i> (bit 31 unset) are rejected by the kernel. • Bit 30 defines the calling convention: • Bit 30 == 1: 64-bit calling convention. • Bit 30 == 0: 32-bit calling convention. • Bits 24..29 determine the service call ID. The permitted IDs are set in the kernel configuration. By default only service IDs >= 0x30000000 (<i>Trusted Application Calls</i> and <i>Trusted OS Calls</i>) are allowed. |

| | | |
|-----|------------------|--|
| in | <i>in0</i> | First input parameter. |
| in | <i>in1</i> | Second input parameter. |
| in | <i>in2</i> | Third input parameter. |
| in | <i>in3</i> | Fourth input parameter. |
| in | <i>in4</i> | Fifth input parameter. |
| in | <i>in5</i> | Sixth input parameter. |
| out | <i>out0</i> | First output parameter. |
| out | <i>out1</i> | Second output parameter. |
| out | <i>out2</i> | Third output parameter. |
| out | <i>out3</i> | Fourth output parameter. |
| in | <i>client_id</i> | Client ID. According to the specification, this value might be ignored by certain functions. |

Return values

| | |
|-------------------------|---|
| <code>-L4_ENOSYS</code> | Either bit 31 of the function call not set or service ID outside the range permitted by kernel configuration. |
| <code>-L4_EINVAL</code> | Invalid number of parameters. |
| <code><0</code> | Other L4 error. |
| <code>0</code> | Success. |

16.472.2.1 anonymous enum

anonymous enum

Defaults for local thread priorities.

Priorities are to be seen as local. These are used by the loader and libpthread. They are to be understood as 'local', which means the actual priority of the thread (as seen by the kernel) is the base priority as defined by the scheduler plus the local priority.

16.474.1 Detailed Description

Common constants.

Definition in file [consts.h](#).

16.474.2 Macro Definition Documentation

16.474.2.1 L4_CAP_SIZE

```
#define L4_CAP_SIZE (1UL << L4\_CAP\_SHIFT)
```

Deprecated Superseded by [L4_CAP_OFFSET](#).

Definition at line 139 of file [consts.h](#).

16.474.2.2 L4_REPLY_CAP_BIT

```
#define L4_REPLY_CAP_BIT
```

Mark this capability selector as index into the reply cap space instead of the regular capability space.

Send phase: The sender wants to use an explicit reply cap slot from its reply cap space, instead of the otherwise used per-thread implicit reply cap slot.

Receive phase: The receiver wants to store the caller in an explicit reply cap slot from its reply cap space, instead of the otherwise used per-thread implicit reply cap slot.

Note

Only valid in combination with [L4_SYSF_REPLY](#), [L4_SYSF_WAIT](#) and [L4_SYSF_REPLY_AND_WAIT](#).

Definition at line [172](#) of file [consts.h](#).

16.474.2.3 L4_SYSF_CALL

```
#define L4_SYSF_CALL
```

Call flags (combines send and receive).

Combines [L4_SYSF_SEND](#) and [L4_SYSF_RECV](#).

Definition at line [107](#) of file [consts.h](#).

Referenced by [l4_ipc_call\(\)](#).

16.474.2.4 L4_SYSF_OPEN_WAIT

```
#define L4_SYSF_OPEN_WAIT
```

Open-wait flag.

This flag indicates that the receive operation (see [L4_SYSF_RECV](#)) shall be an *open wait*. *Open wait* means that the invoking thread shall wait for a message from any possible sender and *not* from the sender denoted by the capability.

Definition at line [90](#) of file [consts.h](#).

16.474.2.5 L4_SYSF_RECV

```
#define L4_SYSF_RECV
```

Receive-phase flag.

Setting this flag in a capability selector induces a receive phase, this means the invoking thread waits for a message from the object denoted by the capability. For a send phase see [L4_SYSF_SEND](#).

Definition at line [79](#) of file [consts.h](#).

Referenced by [l4_ipc_receive\(\)](#).

16.474.2.6 L4_SYSF_REPLY

```
#define L4_SYSF_REPLY
```

Reply flag.

This flag indicates that the send phase shall use the in-kernel reply capability instead of the capability denoted by the selector index.

Definition at line 99 of file [consts.h](#).

Referenced by [l4_ipc_reply\(\)](#).

16.474.2.7 L4_SYSF_REPLY_AND_WAIT

```
#define L4_SYSF_REPLY_AND_WAIT
```

Reply-and-wait flags.

Combines [L4_SYSF_SEND](#), [L4_SYSF_REPLY](#), and [L4_SYSF_WAIT](#).

Definition at line 131 of file [consts.h](#).

Referenced by [l4_ipc_reply_and_wait\(\)](#), and [L4::Server< LOOP_HOOKS >::reply_n_wait\(\)](#).

16.474.2.8 L4_SYSF_SEND

```
#define L4_SYSF_SEND
```

Send-phase flag.

Setting this flag in a capability selector induces a send phase, this means a message is sent to the object denoted by the capability. For receive phase see [L4_SYSF_RECV](#).

In [l4_vcpu_state_t::user_task](#) this flag means that the kernel has cached the user task capability internally, see [l4_thread_vcpu_resume_commit\(\)](#).

Definition at line 68 of file [consts.h](#).

Referenced by [l4_ipc_reply\(\)](#), and [l4_ipc_send\(\)](#).

16.474.2.9 L4_SYSF_SEND_AND_WAIT

```
#define L4_SYSF_SEND_AND_WAIT
```

Send-and-wait flags.

Combines [L4_SYSF_SEND](#) and [L4_SYSF_WAIT](#).

Definition at line 123 of file [consts.h](#).

Referenced by [l4_ipc_send_and_wait\(\)](#).

16.474.2.10 L4_SYSF_WAIT

```
#define L4_SYSF_WAIT
```

Wait flags (combines receive and open wait).

Combines [L4_SYSF_RECV](#) and [L4_SYSF_OPEN_WAIT](#).

Definition at line 115 of file [consts.h](#).

Referenced by [l4_ipc_wait\(\)](#), and [L4::Server< LOOP_HOOKS >::reply_n_wait\(\)](#).

16.486.1.1 L4_RPC_DEF

```
#define L4_RPC_DEF(  
    name)
```

Value:

```
template struct L4::Ipc::Msg::Rpc_call \  
    <name##_t, name##_t::class_type, name##_t::ipc_type, name##_t::flags_type>
```

Generate the definition of an RPC stub.

Parameters

| | |
|-------------|--|
| <i>name</i> | The fully qualified method name to be implemented, this means <code>class::method</code> . |
|-------------|--|

This macro generates the definition (implementation) for the given RPC interface method.

{                                                                 \  
    using type = L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args>; \  
    L4_INLINE_RPC_SRV_FORWARD(name); \  
}
```

Define an inline RPC call type (the type only, no callable).

Parameters

| | |
|-------------|--|
| <i>res</i> | The result type of the RPC call |
| <i>name</i> | The name of the function (<i>name_t</i> is used for the type.) |
| <i>args</i> | The argument list of the RPC function, and RPC attributes (L4::Ipc::Call , L4::Ipc::Call_t etc.). |

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.

16.489.2.3 L4_INLINE_RPC_NF_OP

```
#define L4_INLINE_RPC_NF_OP (
    op,

    enum { Opcode = (op) }; \
    L4_INLINE_RPC_SRV_FORWARD(name); \
}

```

Define an inline RPC call type with specific opcode (the type only, no callable).

Parameters

| | |
|-------------|--|
| <i>op</i> | The opcode number for this function |
| <i>res</i> | The result type of the RPC call |
| <i>name</i> | The name of the function (<i>name_t</i> is used for the type.) |

Data Structures

- struct [L4::lpc::In_out< T >](#)
Mark an argument as in-out argument.
- struct [L4::lpc::As_value< T >](#)
Pass the argument as plain data value.
- struct [L4::lpc::Opt< T >](#)
Attribute for defining an optional RPC argument.
- class [L4::lpc::Small_buf](#)
A receive item for receiving a single object capability.
- class [L4::lpc::Gen_fpage](#)
Generic RPC base for typed message items.
- class [L4::lpc::Snd_fpage](#)
Send item or return item.
- class [L4::lpc::Rcv_fpage](#)
Non-small receive item.
- class [L4::lpc::Cap< T >](#)
Capability type for RPC interfaces (see [L4::Cap< T >](#)).

Namespaces

- namespace [L4](#)
L4 low-level kernel interface.

16.533.1 Detailed Description

The C IPC gate interface, see [L4::ipc_gate](#) for the C++ interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [Thread](#) the IPC gate is *bound* to (cf. [l4_rcv_ep_bind_thread\(\)](#) and [l4_rcv_ep_bind_snd_destination\(\)](#)). If the capability has the [L4_FPAGE_C_IPCGATE_SVR](#) permission, only IPC using a protocol different from the [L4_PROTO_KOBJECT](#) protocol is forwarded. Without the [L4_FPAGE_C_IPCGATE_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.

Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the [Thread](#) interface of that thread is not accessible via an IPC gate. The [IPC-Gate API](#) of an IPC gate is only accessible if the capability used has the [L4_FPAGE_C_IPCGATE_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4_FPAGE_C_IPCGATE_SVR](#) permission, [IPC-Gate API](#) calls are forwarded to the thread or thread group the IPC gate is bound to instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4_FPAGE_C_IPCGATE_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. [l4_rcv_ep_bind_thread\(\)](#) and [l4_rcv_ep_bind_snd_destination\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the [L4_CAP_FPAGE_S](#) and [L4_CAP_FPAGE_W](#) permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to upon receive (or to the

selected thread from the thread group the IPC gate is bound to). However, the configured label of an IPC gate can also be queried via [l4_ipc_gate_get_infos\(\)](#) if the capability used has the [L4_FPAGE_C_IPCGATE_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [l4_thread_modify_sender_start\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.

When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

16.565.2 Function Documentation

16.565.2.1 l4_debugger_query_obj_infos()

```
l4_msgtag_t l4_debugger_query_obj_infos (
    l4_cap_idx_t cap,
    l4_addr_t ku_mem_addr,
    l4_size_t ku_mem_size,
    l4_umword_t skip,
    l4_umword_t * result_cnt,
    l4_umword_t * result_all) [inline]
```

Retrieve information from the kernel about all objects in the mapping database and write data to the passed KU memory.

Parameters

| | | |
|-----|--------------------|---|
| | <i>cap</i> | Capability of the debugger object. |
| | <i>ku_mem_addr</i> | Address of the KU memory for writing the information. |
| | <i>ku_mem_size</i> | Size of the KU memory for writing the information. |
| | <i>skip</i> | Number of objects to skip. |
| out | <i>result_cnt</i> | Number of objects in the mapping database. |
| out | <i>result_all</i> | Number of objects written to the KU memory. |

Note

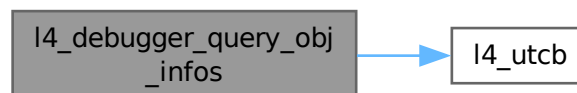

The kernel will only write a number of object information which fits to the passed KU memory. To retrieve missing object information, repeat the call and adapt the *skip* parameter accordingly.

If this system call is performed several times, the number of kernel objects might have changed in the meantime.

Functions

- `void * umalloc_area_create (size_t area_size) L4_NOTHROW`
Create a new heap area.

Variables

- `L4_BEGIN_DECLS size_t umalloc_area_granularity`
Heap area granularity.

16.639.1 Detailed Description

Public API for the basic next-fit memory allocator.

The user of this allocator is required to provide the implementation of the `umalloc_area_create()` function and provide the `umalloc_area_granularity` symbol with a value.

Note

The current implementation is NOT thread-safe. If the user wants to use this allocator concurrently, they need to deploy their custom mutual exclusion mechanism around the public calls to the allocator.

Definition in file `umalloc.h`.

16.639.2 Function Documentation

16.639.2.1 `umalloc_area_create()`

```
void * umalloc_area_create (
    size_t area_size)
```

Create a new heap area.

Parameters

| | |
|------------------------|---|
| <code>area_size</code> | Requested heap area size. Always a multiple of the heap area granularity as reported by <code>umalloc_area_granularity()</code> . |
|------------------------|---|

Returns

Pointer to the successfully created heap area of (at least) the requested size. It is assumed that the pointer satisfies at least the `umalloc::Base_alignment` alignment. If the value is `nullptr`, then it is assumed that the creation of the heap area failed.

References `L4_END_DECLS`, and `L4_NOTHROW`.

16.639.3 Variable Documentation

16.639.3.1 umalloc_area_granularity

`L4_BEGIN_DECLS` `size_t` `umalloc_area_granularity` `[extern]`

Heap area granularity.

The allocator only requests the creation of heap areas with this granularity.

Value:

```
l4_assert_fn(!(expr), __FILE__ ":" L4_stringify(__LINE__) ": Assertion \"" \

```

Low-level assert.

Parameters

| | |
|-------------|---|
| <i>expr</i> | Expression to be evaluated for the assertion. |
|-------------|---|

This assertion is a low-level implementation that directly uses kernel primitives. Only use `l4_assert()` when the standard `assert()` functionality is not available.

```

Cycle through kernel features given in the KIP.

Cycles through all KIP kernel feature strings. *s* must be a character pointer (`char const *`) initialized with [l4_kip_version_string\(\)](#).

```
int l4_kip_kernel_has_feature (  
    l4_kernel_info_t const * kip,  
    char const * str) [inline]
```

Check if kernel supports a feature.

Parameters

| | |
|------------|--|
| <i>kip</i> | Pointer to the kernel info page (KIP). |
| <i>str</i> | Feature name to check. |

Returns

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.

16.689.1 Detailed Description

Shared-memory multiple-producer multiple-consumer head-drop ring buffer implementation.

This implements a generic ring buffer for transferring fixed-sized items in shared memory between producers and consumers without coupling. This means that the pace of producers is never affected by the pace of consumers (producers never block and never wait for the consumers).

When consumers are unable to dequeue items from the ring buffer quickly enough, they lose access to the oldest items (head-drop policy), but this condition is always detected.

When there are more producers than the total number of items actively enqueueing items into the ring buffer, the state of the ring buffer is undefined. When the sequence/generation counter of the items in the ring buffer overflow, the state of the ring buffer is undefined.

16.702.1 Detailed Description

This header contains the definition of VBUS sub-interfaces and convenience functions to work with the interface IDs.

Definition in file [vbus_interfaces.h](#).

16.702.2 Typedef Documentation

16.702.2.1 l4vbus_iface_type_t

```
typedef enum l4vbus_iface_type_t l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.

The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.

The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see L4VBUS_IFACE_SHIFT). They also make up a bitmask that specify the type of the device, i.e. from the point of view of the client a device is defined by the kinds of sub-interfaces it supports.

Check if a vbus device supports a given sub-interface.

Parameters

| | |
|-------------------|--|
| <i>dev_type</i> | Device type as reported in l4vbus_device_t . |

enum [l4vbus_resource_flags_t](#)

Description of vbus resource flags.

Enumerator
